- ☐ 4. a 55-year-old Asian who has hypertension and two siblings with type 2 diabetes.
- ☐ 5. a 12-year-old who is overweight.

23. An adult with type 2 diabetes mellitus has been NPO since 2200 in preparation for having a nephrectomy the next day. At 0600 on the day of surgery, the nurse reviews the client’s medical record and laboratory results. Which finding should the nurse report to the healthcare provider (HCP)?

- ☐ 1. urine output of 350 mL in 8 hours
- ☐ 2. urine specific gravity of 1.015

- ☐ 3. potassium of 4.0 mEq (4 mmol/L)
- ☐ 4. blood glucose of 140 mg/dL (7.8 mmol/L)

24. The nurse is checking the laboratory results of an adult client with type 1 diabetes (see chart). What laboratory result indicates a problem that should be managed?

Laboratory Results	
Test	Result
Blood glucose	192 mg/dL (10.7 mmol/L)
Total cholesterol	250 mg/dL (6.5 mmol/L)
Hemoglobin	12.3 mg/dL (123 g/L)
Low-density lipoprotein cholesterol	125 mg/dL (3.2 mmol/L)

- ☐ 1. blood glucose
- ☐ 2. total cholesterol
- ☐ 3. hemoglobin
- ☐ 4. low-density lipoprotein (LDL) cholesterol

25. A client with type 1 diabetes mellitus has diabetic ketoacidosis. Which finding has the **greatest** effect on fluid loss?

- ☐ 1. hypotension
- ☐ 2. decreased serum potassium level
- ☐ 3. rapid, deep respirations
- ☐ 4. warm, dry skin

26. A client is to receive glargine insulin in addition to a dose of aspart. When the nurse checks the blood glucose level at the bedside, it is >200 mg/dL (11.1 mmol/L). How should the nurse administer the insulins?

- ☐ 1. Put air into the glargine insulin vial and then air into the aspart insulin vial, and draw up the correct dose of aspart insulin first.

- ☐ 2. Roll the glargine insulin vial, and then roll the aspart insulin vial. Draw up the longer-acting glargine insulin first.
- ☐ 3. Shake both vials of insulin before drawing up each dose in separate insulin syringes.
- ☐ 4. Put air into the glargine insulin vial, and draw up the correct dose in an insulin syringe; then with a different insulin syringe, put air into the aspart vial, and draw up the correct dose.

27. The client with type 2 insulin-requiring diabetes asks the nurse about having alcoholic beverages. Which is the **best** response by the nurse?

- ☐ 1. "You can have one or two drinks a day as long as you have something to eat with them."
- ☐ 2. "Alcohol is detoxified in the liver, so it is not a good idea for you to drink anything with alcohol."
- ☐ 3. "If you are going to have a drink, it is best to consume alcohol on an empty stomach."
- ☐ 4. "If you do have a drink, the blood glucose value may be elevated at bedtime, and you should skip having a snack."

28. An adult client with type 2 diabetes is taking metformin 1,000 mg two times every day. After the nurse provides instructions regarding the interaction of alcohol and metformin, the nurse evaluates that the client understands the instructions when the client says:

- ☐ 1. "If I know I will be having alcohol, I must not take metformin; I could develop lactic acidosis."
- ☐ 2. "If my healthcare provider approves, I may drink alcohol with my metformin."
- ☐ 3. "Adverse effects I should watch for are feeling excessively energetic, unusual muscle stiffness, low back pain, and a rapid heartbeat."
- ☐ 4. "If I feel bloated, I should call my healthcare provider."

29. Before supper, an adult client who has type 2 diabetes and requires insulin tells the nurse about having tremors and being weak and anxious. The nurse should:

- ☐ 1. tell the client to lie down for 30 minutes.
- ☐ 2. have the client drink a glass of milk or orange juice.

- ☐ 3. contact the client's healthcare provider (HCP) to decrease the insulin dose.
- ☐ 4. administer the next dose of insulin.

30. The healthcare provider (HCP) has prescribed insulin detemir for a client with type 2 diabetes requiring insulin. The nurse should tell the client:

- ☐ 1. "You may increase the carbohydrates in your diet when using this insulin."
- ☐ 2. "You do not need to rotate injection sites with this insulin."
- ☐ 3. "You do not mix insulin detemir; the solution is clear."
- ☐ 4. "You may refill the detemir insulin pen."

31. When evaluating teaching a client how to administer insulin, which action indicates that additional teaching is necessary?

- ☐ 1. Client draws up the regular insulin first and then the NPH.
- ☐ 2. Client rotates sites from legs to arms.
- ☐ 3. Client identifies that the syringe is U-100.
- ☐ 4. Client waits 30 minutes to eat breakfast after injecting rapid-acting insulin.

32. A client with newly diagnosed type 1 diabetes is scheduled to receive regular insulin 10 units and NPH insulin 20 units every morning. When should the nurse schedule the administration of these medications?

- ☐ 1. regular insulin with breakfast; NPH after breakfast
- ☐ 2. both insulins 0.5 hours before breakfast
- ☐ 3. in two separate syringes with breakfast
- ☐ 4. NPH 1 hour before and regular 0.5 hours before breakfast

33. Which information should the nurse include when developing a teaching plan for a client newly diagnosed with type 2 diabetes mellitus? Select all that apply.

- ☐ 1. A major risk factor for complications is obesity and central abdominal obesity.
- ☐ 2. Supplemental insulin is mandatory for controlling the disease.
- ☐ 3. Exercise increases insulin resistance.
- ☐ 4. The primary nutritional source requiring monitoring in the diet is

carbohydrates.

☐ 5. Annual eye and foot examinations are recommended by the American and Canadian Diabetes Associations.

34. When teaching the diabetic client about foot care, the nurse should instruct the client to:

- ☐ 1. avoid going barefoot.
- ☐ 2. buy shoes a half size larger.
- ☐ 3. cut toenails at angles.
- ☐ 4. use heating pads for sore feet.

35. A client with diabetes mellitus asks the nurse to recommend something to remove corns from the toes. The nurse should advise the client to:

- ☐ 1. apply a high-quality corn plaster to the area.
- ☐ 2. consult a healthcare provider (HCP) about removing the corns.
- ☐ 3. apply iodine to the corns before peeling them off.
- ☐ 4. soak the feet in borax solution to peel off the corns.

36. A client with diabetes mellitus presents to the clinic for a regular 3-month follow-up appointment. The nurse notes several small bandages covering cuts on the client's hands. The client says, "I am so clumsy. I am always cutting my finger cooking or burning myself on the iron." Which response by the nurse would be **most** appropriate?

- ☐ 1. "Wash all wounds in isopropyl alcohol."
- ☐ 2. "Keep all cuts clean and covered."
- ☐ 3. "Could you have your children do the cooking and ironing?"
- ☐ 4. "You really should be fine as long as you take your daily medication."

37. The client with diabetes mellitus says, "If I could just avoid what you call carbohydrates in my diet, I guess I would be okay." The nurse should base the response to this comment on the knowledge that diabetes affects metabolism of which nutrients?

- ☐ 1. carbohydrates only
- ☐ 2. fats and carbohydrates only
- ☐ 3. protein and carbohydrates only
- ☐ 4. proteins, fats, and carbohydrates

38. A client with type 1 diabetes mellitus is admitted to the emergency department. Which respiratory pattern in a client with diabetes mellitus requires immediate action?

- ☐ 1. deep, rapid respirations with long expirations
- ☐ 2. shallow respirations alternating with long expirations
- ☐ 3. regular depth of respirations with frequent pauses
- ☐ 4. short expirations and inspirations

39. The client has been recently diagnosed with type 2 diabetes and is taking metformin two times per day, 1,000 mg before breakfast and 1,000 mg before supper. The client is experiencing diarrhea, nausea, vomiting, abdominal bloating, and anorexia on admission to the hospital. The admission prescriptions include metformin. What should the nurse do? Select all that apply.

- ☐ 1. Discontinue the metformin.
- ☐ 2. Administer glargine insulin rather than the metformin.
- ☐ 3. Inform the client that the adverse effects of diarrhea, nausea, and upset stomach gradually subside over time.
- ☐ 4. Assess the client's renal function.
- ☐ 5. Monitor the client's glucose value prior to each meal.

40. A client is prescribed exenatide. What should the nurse instruct the client to do? Select all that apply.

- ☐ 1. Review the one-time setup for each new pen.
- ☐ 2. Inject in the thigh, abdomen, or upper arm.
- ☐ 3. Administer the drug within 60 minutes before morning and evening meals.
- ☐ 4. Understand that there is a low incidence of hypoglycemia when exenatide is taken with insulin.
- ☐ 5. Take the dose of exenatide as soon as the client remembers a dose has been missed.

41. The nurse is administering the initial dose of a rapid-acting insulin to a client with type 1 diabetes. The nurse should assess the client for hypoglycemia within:

- ☐ 1. 0.5 hours.
- ☐ 2. 1 hour.
- ☐ 3. 2 hours.
- ☐ 4. 3 hours.

42. The nurse notes grapefruit juice on the breakfast tray of a client who is taking repaglinide. The nurse should:

- ☐ 1. contact the manager of the Food and Nutrition Department.
- ☐ 2. request that the dietitian discuss the drug-food interaction between repaglinide and grapefruit juice with the client.
- ☐ 3. Substitute a half grapefruit in place of the grapefruit juice.
- ☐ 4. Remove the grapefruit juice from the client's tray and bring another juice of the client's preference.

43. Which finding should the nurse report to the client's healthcare provider (HCP) for a client with unstable type 1 diabetes mellitus? Select all that apply.

- ☐ 1. systolic blood pressure, 145 mm Hg
- ☐ 2. diastolic blood pressure, 87 mm Hg
- ☐ 3. high-density lipoprotein (HDL), 30 mg/dL (1.7 mmol/L)
- ☐ 4. glycosylated hemoglobin (HbA_{1c}), 10.2% (0.1)
- ☐ 5. triglycerides, 425 mg/dL (23.6 mmol/L)
- ☐ 6. urine ketones, negative

44. The nurse should caution the client with diabetes mellitus who is taking a sulfonylurea that alcoholic beverages should be avoided while taking these drugs because they can cause:

- ☐ 1. hypokalemia.
- ☐ 2. hyperkalemia.
- ☐ 3. hypocalcemia.
- ☐ 4. disulfiram-like symptoms.

45. To reduce the risk of developing type 2 diabetes mellitus, the nurse should instruct the client to:

- ☐ 1. stop smoking cigarettes.

- ☐ 2. obtain a high-cholesterol diet.
- ☐ 3. maintain weight in normal limits.
- ☐ 4. prevent hypertension.

46. Which indicates a potential complication of diabetes mellitus?

- ☐ 1. inflamed, painful joints
- ☐ 2. blood pressure of 160/100 mm Hg
- ☐ 3. stooped appearance
- ☐ 4. hemoglobin of 9 g/dL (90 g/L)

47. The nurse is teaching the client about home blood glucose monitoring. Which blood glucose measurement indicates hypoglycemia?

- ☐ 1. 59 mg/dL (3.3 mmol/L)
- ☐ 2. 75 mg/dL (4.2 mmol/L)
- ☐ 3. 108 mg/dL (6 mmol/L)
- ☐ 4. 119 mg/dL (6.6 mmol/L)

48. Assessment of the diabetic client for common complications should include examination of the:

- ☐ 1. abdomen.
- ☐ 2. lymph glands.
- ☐ 3. pharynx.
- ☐ 4. eyes.

49. The client with type 1 diabetes mellitus is taught to take isophane insulin suspension NPH at 1700 each day. The client should be instructed that the **greatest** risk of hypoglycemia will occur at about what time?

- ☐ 1. 1100, shortly before lunch
- ☐ 2. 1300, shortly after lunch
- ☐ 3. 1800, shortly after dinner
- ☐ 4. 0100, while sleeping

50. A nurse is teaching a client with type 1 diabetes mellitus who jogs daily about the preferred sites for insulin absorption. What is the **most** appropriate site for a client who jogs?

- ☐ 1. arms

- ☐ 2. legs
- ☐ 3. abdomen
- ☐ 4. iliac crest

51. A client with diabetes is taking insulin lispro injections. The nurse should advise the client to eat:

- ☐ 1. within 10 to 15 minutes after the injection.
- ☐ 2. 1 hour after the injection.
- ☐ 3. at any time because timing of meals with lispro injections is unnecessary.
- ☐ 4. 2 hours before the injection.

52. The **best** indicator that the client has learned how to give an insulin self-injection correctly is when the client can:

- ☐ 1. perform the procedure safely and correctly.
- ☐ 2. critique the nurse's performance of the procedure.
- ☐ 3. explain all steps of the procedure correctly.
- ☐ 4. obtain 100% correct answers on a posttest.

53. The nurse is instructing the client on insulin administration. The client is performing a return demonstration for preparing the insulin. The client's morning dose of insulin is 10 units of regular and 22 units of NPH. The nurse checks the dose accuracy with the client. The nurse determines that the client has prepared the correct dose when the syringe reads how many units? Record your answer using a whole number.
units.

54. Angiotensin-converting enzyme (ACE) inhibitors may be prescribed for the client with diabetes mellitus to reduce vascular changes and possibly prevent or delay development of:

- ☐ 1. chronic obstructive pulmonary disease (COPD).
- ☐ 2. pancreatic cancer.
- ☐ 3. renal failure.
- ☐ 4. cerebrovascular accident.

55. The nurse should teach the diabetic client that which symptom is **most**

indicative of hypoglycemia?

- ☐ 1. nervousness
- ☐ 2. anorexia
- ☐ 3. Kussmaul's respirations
- ☐ 4. bradycardia

56. The nurse is assessing the client's understanding of the use of medications. Which medication may cause a complication with the treatment plan of a client with diabetes?

- ☐ 1. aspirin
- ☐ 2. steroids
- ☐ 3. sulfonylureas
- ☐ 4. angiotensin-converting enzyme (ACE) inhibitors

57. A client with type 1 diabetes mellitus has influenza. The nurse should instruct the client to:

- ☐ 1. increase the frequency of self-monitoring (blood glucose testing).
- ☐ 2. reduce food intake to diminish nausea.
- ☐ 3. discontinue that dose of insulin if unable to eat.
- ☐ 4. take half of the normal dose of insulin.

58. Which goal is a **priority** for the diabetic client who is taking insulin and has nausea and vomiting from a viral illness or influenza?

- ☐ 1. obtaining adequate food intake
- ☐ 2. managing own health
- ☐ 3. relieving pain
- ☐ 4. increasing activity

59. A client with diabetes begins to cry and says, "I just cannot stand the thought of having to give myself a shot every day." What would be the **best** response by the nurse?

- ☐ 1. "If you do not give yourself your insulin shots, you will be at greater risk for complications."
- ☐ 2. "We can teach a family member to give the shots so you will not have to do it."

- ☐ 3. "I can arrange to have a home care nurse give you the shots every day."
- ☐ 4. "What is it about giving yourself the insulin shots that bothers you?"

The Client with Pituitary Adenoma

60. A client is to have a transsphenoidal hypophysectomy to remove a large, invasive pituitary tumor. The nurse should instruct the client that the surgery will be performed through an incision in the:

- ☐ 1. back of the mouth.
- ☐ 2. nose.
- ☐ 3. sinus channel below the right eye.
- ☐ 4. upper gingival mucosa in the space between the upper gums and lip.

61. To minimize the risk of postoperative respiratory complications after a hypophysectomy, the nurse should instruct the client how to:

- ☐ 1. limit use of pain medications.
- ☐ 2. turn in bed.
- ☐ 3. take deep breaths.
- ☐ 4. clear the throat and cough.

62. Following a transsphenoidal hypophysectomy, the nurse should assess the client for:

- ☐ 1. cerebrospinal fluid (CSF) leak.
- ☐ 2. fluctuating blood glucose levels.
- ☐ 3. Cushing's syndrome.
- ☐ 4. cardiac arrhythmias.

63. A male client expresses concern about how a hypophysectomy will affect his sexual function. Which statement provides the **most** accurate information about the physiologic effects of hypophysectomy in a male?

- ☐ 1. Removing the source of excess hormone should restore the client's libido, erectile function, and fertility.
- ☐ 2. Potency will be restored, but the client will remain infertile.
- ☐ 3. Fertility will be restored, but impotence and decreased libido will persist.

- ☐ 4. Exogenous hormones will be needed to restore erectile function after the adenoma is removed.

64. Initial treatment for a cerebrospinal fluid (CSF) leak after transsphenoidal hypophysectomy would **most** likely involve:

- ☐ 1. repacking the nose with pressure dressings.
- ☐ 2. returning the client to surgery to close the leak.
- ☐ 3. maintaining bed rest with the head of the bed elevated to 30 degrees.
- ☐ 4. administering high-dose corticosteroid therapy.

65. To provide oral hygiene for a client recovering from transsphenoidal hypophysectomy, the nurse should instruct the client to:

- ☐ 1. rinse the mouth with saline.
- ☐ 2. perform frequent toothbrushing.
- ☐ 3. clean the teeth with an electric toothbrush.
- ☐ 4. floss the teeth thoroughly.

66. The nurse teaches the client to report signs and symptoms of which potential complication after hypophysectomy?

- ☐ 1. acromegaly
- ☐ 2. Cushing's disease
- ☐ 3. diabetes mellitus
- ☐ 4. hypopituitarism

67. After pituitary surgery, the nurse should assess the client for:

- ☐ 1. urine specific gravity <1.010.
- ☐ 2. urine output between 1 and 2 L/day.
- ☐ 3. blood glucose level higher than 300 mg/dL (16.7 mmol/L).
- ☐ 4. urine negative for glucose and ketones.

68. Vasopressin is administered to the client with diabetes insipidus because it:

- ☐ 1. decreases blood pressure.
- ☐ 2. increases tubular reabsorption of water.
- ☐ 3. increases release of insulin from the pancreas.
- ☐ 4. decreases glucose production within the liver.

69. Which indicates that the client with diabetes insipidus understands how to manage care?

- ☐ 1. The client will maintain normal fluid and electrolyte balance.
- ☐ 2. The client will select a diabetic diet correctly.
- ☐ 3. The client will state dietary restrictions.
- ☐ 4. The client will exhibit serum glucose level within normal range.

The Client with Addison's Disease

70. The nurse is instructing a college student with Addison's disease how to adjust the dose of glucocorticoids. The nurse should explain that the client may need an increased dosage of glucocorticoids in which situation?

- ☐ 1. completing the spring semester of school
- ☐ 2. gaining 4 lb (1.8 kg)
- ☐ 3. becoming engaged
- ☐ 4. having wisdom teeth extracted

71. Which goal is the **priority** for a client in addisonian crisis?

- ☐ 1. controlling hypertension
- ☐ 2. preventing irreversible shock
- ☐ 3. preventing infection
- ☐ 4. relieving anxiety

72. Which is an expected finding in a client with adrenal crisis (addisonian crisis)?

- ☐ 1. fluid retention
- ☐ 2. pain
- ☐ 3. peripheral edema
- ☐ 4. hunger

73. A client with Addison's disease is taking corticosteroid replacement therapy. The nurse should instruct the client about which side effects of corticosteroids? Select all that apply.

- ☐ 1. hyperkalemia
- ☐ 2. skeletal muscle weakness

- ☐ 3. mood changes
- ☐ 4. hypocalcemia
- ☐ 5. increased susceptibility to infection
- ☐ 6. hypotension

74. The client is receiving an IV infusion of 5% dextrose in normal saline running at 125 mL/h. When hanging a new bag of fluid, the nurse notes swelling and hardness at the infusion site. The nurse should **first**:

- ☐ 1. discontinue the infusion.
- ☐ 2. apply a warm soak to the site.
- ☐ 3. stop the flow of solution temporarily.
- ☐ 4. irrigate the needle with normal saline.

75. The client's wife asks the nurse whether the IV infusion is meeting her husband's nutritional needs because he has vomited several times. The nurse's response should be based on the knowledge that 1 L of 5% dextrose in normal saline delivers:

- ☐ 1. 170 cal.
- ☐ 2. 250 cal.
- ☐ 3. 340 cal.
- ☐ 4. 500 cal.

76. A client with Addison's disease has fluid and electrolyte loss due to inadequate fluid intake and to fluid loss secondary to inadequate adrenal hormone secretion. As the client's oral intake increases, which fluids would be **most** appropriate?

- ☐ 1. milk and diet soda
- ☐ 2. water and eggnog
- ☐ 3. chicken broth and juice
- ☐ 4. coffee and milkshakes

77. After stabilization of Addison's disease, the nurse teaches the client about stress management. The nurse should instruct the client to:

- ☐ 1. remove all sources of stress from daily life.
- ☐ 2. use relaxation techniques such as music.
- ☐ 3. take antianxiety drugs daily.

- ☐ 4. avoid discussing stressful experiences.

78. When teaching a client newly diagnosed with primary Addison's disease, the nurse should explain that the disease results from:

- ☐ 1. insufficient secretion of growth hormone (GH).
- ☐ 2. dysfunction of the hypothalamic pituitary.
- ☐ 3. idiopathic atrophy of the adrenal gland.
- ☐ 4. oversecretion of the adrenal medulla.

79. The nurse is conducting discharge education with a client newly diagnosed with Addison's disease. Which information should be included in the client and family teaching plan? Select all that apply.

- ☐ 1. Addison's disease will resolve over a few weeks, requiring no further treatment.
- ☐ 2. Avoiding stress and maintaining a balanced lifestyle will minimize risk for exacerbations.
- ☐ 3. Fatigue, weakness, dizziness, and mood changes need to be reported to the healthcare provider (HCP).
- ☐ 4. A medical identification bracelet should be worn.
- ☐ 5. Family members need to be informed about the warning signals of adrenal crisis.
- ☐ 6. Dental work or surgery will require adjustment of daily medication.

80. The nurse should assess a client with Addison's disease for:

- ☐ 1. weight gain.
- ☐ 2. hunger.
- ☐ 3. lethargy.
- ☐ 4. muscle spasms.

81. Which topic is **most** important to include in the teaching plan for a client newly diagnosed with Addison's disease who will be taking corticosteroids?

- ☐ 1. The importance of watching for signs of hyperglycemia
- ☐ 2. The need to adjust the steroid dose based on dietary intake and exercise
- ☐ 3. To notify the healthcare provider (HCP) when the blood pressure is suddenly high

- ☐ 4. How to decrease the dose of the corticosteroids when the client experiences stress

82. The client with Addison's disease is taking glucocorticoids at home. Which statement indicates that the client understands how to take the medication?

- ☐ 1. "Various circumstances increase the need for glucocorticoids, so I will need to adjust the dosage."
☐ 2. "My need for glucocorticoids will stabilize, and I will be able to take a predetermined dose once a day."
☐ 3. "Glucocorticoids are cumulative, so I will take a dose every third day."
☐ 4. "I must take a dose every 6 hours to ensure consistent blood levels of glucocorticoids."

83. Cortisone acetate and fludrocortisone acetate are prescribed as replacement therapy for a client with Addison's disease. What administration schedule should be followed for this therapy?

- ☐ 1. Take both drugs three times a day.
☐ 2. Take the entire dose of both drugs first thing in the morning.
☐ 3. Take all the fludrocortisone acetate and two-thirds of the cortisone acetate in the morning, and take the remaining cortisone acetate in the afternoon.
☐ 4. Take half of each drug in the morning and the remaining half of each drug at bedtime.

84. When teaching a client about taking oral glucocorticoids, how should the nurse instruct the client to take the medication?

- ☐ 1. with a full glass of water
☐ 2. on an empty stomach
☐ 3. at bedtime to increase absorption
☐ 4. with meals or with an antacid

85. Which indicator is **best** for determining whether a client with Addison's disease is receiving the correct amount of glucocorticoid replacement?

- ☐ 1. skin turgor

- ☐ 2. temperature
- ☐ 3. thirst
- ☐ 4. daily weight

86. Which outcome is a **priority** for the client with Addison's disease?

- ☐ 1. maintenance of medication compliance
- ☐ 2. avoidance of normal activities with stress
- ☐ 3. adherence to a 2-g sodium diet
- ☐ 4. prevention of hypertensive episodes

87. The client with Addison's disease should anticipate the need for increased glucocorticoid supplementation when:

- ☐ 1. returning to work after a weekend.
- ☐ 2. going on vacation.
- ☐ 3. having oral surgery.
- ☐ 4. having a routine medical checkup.

88. The nurse should teach the client with Addison's disease that the bronze-colored skin is thought to be caused by:

- ☐ 1. hypersensitivity to sun exposure.
- ☐ 2. increased serum bilirubin level.
- ☐ 3. adverse effects of the glucocorticoid therapy.
- ☐ 4. increased secretion of adrenocorticotrophic hormone (ACTH).

The Client with Cushing's Disease

89. A client reports that she has gained weight and that her face and body are "rounder," while her legs and arms have become thinner. A tentative diagnosis of Cushing's disease is made. The nurse should further assess the client for:

- ☐ 1. orthostatic hypotension.
- ☐ 2. muscle hypertrophy in the extremities.
- ☐ 3. bruised areas on the skin.
- ☐ 4. decreased body hair.

90. A client diagnosed with Cushing's syndrome is admitted to the

hospital and scheduled for a dexamethasone suppression test. During this test, the nurse should:

- ☐ 1. collect a 24-hour urine specimen to measure serum cortisol levels.
- ☐ 2. administer 1 mg of dexamethasone orally at night and obtain serum cortisol levels the next morning.
- ☐ 3. draw blood samples before and after exercise to evaluate the effect of exercise on serum cortisol levels.
- ☐ 4. administer an injection of adrenocorticotrophic hormone (ACTH) 30 minutes before drawing blood to measure serum cortisol levels.

91. The nurse should monitor the client with Cushing's disease for which finding?

- ☐ 1. postprandial hypoglycemia
- ☐ 2. hypokalemia
- ☐ 3. hyponatremia
- ☐ 4. decreased urine calcium level

92. A client with Cushing's disease tells the nurse that the healthcare provider (HCP) said the morning serum cortisol level was within normal limits. The client asks, "How can that be? I am not imagining all these symptoms!" The nurse's response will be based on the fact that?

- ☐ 1. Some clients are very sensitive to the effects of cortisol and develop symptoms even with normal levels.
- ☐ 2. A single random blood test cannot provide reliable information about endocrine levels.
- ☐ 3. The excessive cortisol levels seen in Cushing's disease commonly result from loss of the normal diurnal secretion pattern.
- ☐ 4. Tumors tend to secrete hormones irregularly, and the hormones are generally not present in the blood.

93. The client with Cushing's disease needs to modify dietary intake to control symptoms. In addition to increasing protein, which strategy would be **most** appropriate?

- ☐ 1. Increase calories.
- ☐ 2. Restrict sodium.

- ☐ 3. Restrict potassium.
- ☐ 4. Reduce fat to 10%.

94. Bone resorption is a possible complication of Cushing's disease. To help the client prevent this complication, the nurse should recommend that the client:

- ☐ 1. increase the amount of potassium in the diet.
- ☐ 2. maintain a regular program of weight-bearing exercise.
- ☐ 3. limit dietary vitamin D intake.
- ☐ 4. perform isometric exercises.

95. A client has an adrenal tumor and is scheduled for a bilateral adrenalectomy. During preoperative teaching, the nurse teaches the client how to do deep-breathing exercises after surgery by telling the client to:

- ☐ 1. "Sit in an upright position, and take a deep breath."
- ☐ 2. "Hold your abdomen firmly with a pillow, and take several deep breaths."
- ☐ 3. "Tighten your stomach muscles as you inhale, and breathe normally."
- ☐ 4. "Raise your shoulders to expand your chest."

96. A **priority** in the first 24 hours after a bilateral adrenalectomy is:

- ☐ 1. beginning oral nutrition.
- ☐ 2. promoting self-care activities.
- ☐ 3. preventing adrenal crisis.
- ☐ 4. ambulating in the hallway.

97. A client undergoing a bilateral adrenalectomy has postoperative prescriptions for hydromorphone hydrochloride 2 mg to be administered subcutaneously every 4 hours PRN for pain. This drug is administered in relatively small doses **primarily** because it is:

- ☐ 1. less likely to cause dependency in small doses.
- ☐ 2. less irritating to subcutaneous tissues in small doses.
- ☐ 3. as potent as most other analgesics in larger doses.
- ☐ 4. excreted before accumulating in toxic amounts in the body.

98. The nurse is caring for a client who is scheduled for an adrenalectomy.

Which drug may be included in the preoperative prescriptions to prevent Addison's crisis following surgery?

- ☐ 1. prednisone orally
- ☐ 2. fludrocortisone subcutaneously
- ☐ 3. spironolactone intramuscularly
- ☐ 4. methylprednisolone sodium succinate intravenously

99. Adrenal function is affected by the drug ketoconazole, an antifungal agent used to treat severe fungal infections. How is this effect manifested?

- ☐ 1. Ketoconazole suppresses adrenal steroid secretion.
- ☐ 2. Ketoconazole destroys adrenocortical cells, resulting in a "medical" adrenalectomy.
- ☐ 3. Ketoconazole increases adrenocorticotrophic hormone (ACTH)-induced corticosteroid serum levels.
- ☐ 4. Ketoconazole decreases duration of adrenal suppression when administered with corticosteroids.

100. In the early postoperative period after a bilateral adrenalectomy, the client has an increased temperature. The nurse should assess the client specifically for signs of:

- ☐ 1. dehydration.
- ☐ 2. poor lung expansion.
- ☐ 3. wound infection.
- ☐ 4. urinary tract infection.

101. A client who is recovering from a bilateral adrenalectomy has a client-controlled analgesia (PCA) system with morphine sulfate. The nurse should:

- ☐ 1. observe the client at regular intervals for opioid addiction.
- ☐ 2. encourage the client to reduce analgesic use and tolerate the pain.
- ☐ 3. evaluate pain control at least every 2 hours.
- ☐ 4. increase the amount of morphine if the client does not administer the medication.

102. As the nurse assists the postoperative client out of bed, the client reports having gas pains in the abdomen. To reduce this discomfort, what

should the nurse do?

- ☐ 1. Encourage the client to ambulate.
- ☐ 2. Insert a rectal tube.
- ☐ 3. Insert a nasogastric (NG) tube.
- ☐ 4. Encourage the client to drink carbonated liquids.

103. Because of steroid excess after a bilateral adrenalectomy, the nurse should assess the client for:

- ☐ 1. postoperative confusion.
- ☐ 2. delayed wound healing.
- ☐ 3. emboli.
- ☐ 4. malnutrition.

104. The client who has undergone a bilateral adrenalectomy is concerned about persistent body changes and unpredictable moods. The nurse should teach the client that:

- ☐ 1. the body changes are permanent and the client will not be the same as before this condition.
- ☐ 2. the body and mood will gradually return to normal.
- ☐ 3. the physical changes are permanent, but the mood swings will disappear.
- ☐ 4. the physical changes are temporary, but the mood swings are permanent.

105. After a bilateral adrenalectomy for Cushing's disease, the client will receive periodic testosterone injections. The expected outcome of these injections is:

- ☐ 1. balanced reproductive cycle.
- ☐ 2. restored sodium and potassium balance.
- ☐ 3. stimulated protein metabolism.
- ☐ 4. stabilized mood swings.

106. Which information should the nurse include in the teaching plan of a female client with bilateral adrenalectomy?

- ☐ 1. The client will need steroid replacement for the rest of her life.

- ☐ 2. The client must decrease the dose of steroid medication carefully to prevent crisis.
- ☐ 3. The client will require steroids only until her body can manufacture sufficient quantities.
- ☐ 4. The client will need to take steroids whenever her life involves physical or emotional stress.

Managing Care, Quality, and Safety of Clients with Endocrine Health Problems

107. The nurse is reviewing the postoperative prescriptions (see chart) just written by a healthcare provider (HCP) for a client with type 1 diabetes who has returned to the surgery floor from the recovery room following surgery for a left hip replacement. The client has pain of 5 on a scale of 1 to 10. The hand-off report from the nurse in the recovery room indicated that the vital signs have been stable for the last 30 minutes. After obtaining the client's glucose level, the nurse should **first**:

Prescriptions

Vital signs every 15 minutes for 4 hours, then every hour for 8 hours.

Oxygen 2 L/min per nasal cannula.

1,000 mL NS every 8 hours.

10 mg morphine intramuscularly every 4 hours as needed.

10 U regular insulin stat.

- ☐ 1. administer the morphine.
- ☐ 2. contact the healthcare provider (HCP) to rewrite the insulin prescription.
- ☐ 3. administer oxygen per nasal cannula at 2 L/min.

- ☐ 4. take the vital signs.

108. The nurse is receiving results of a blood glucose level from the laboratory over the telephone. The nurse should:

- ☐ 1. write down the results, read back the results to the caller from the laboratory, and receive confirmation from the caller.
- ☐ 2. repeat the results to the caller from the laboratory, write the results on scrap paper, and then transfer the results to the medical record.
- ☐ 3. indicate to the caller that the nurse cannot receive results from lab tests over the telephone and ask the lab to bring the written results to the nurses' station.
- ☐ 4. request that the laboratory send the results by email to transfer to the client's medical record.

109. A client with type 1 diabetes is admitted to the emergency department with dehydration following the flu. The client has a blood glucose level of 325 mg/dL (18 mmol/L) and a serum potassium level of 3.5 mEq (3.5 mmol/L). The healthcare provider (HCP) has prescribed 1,000 mL 5% dextrose in water to be infused every 8 hours. Prior to implementing the HCP's prescriptions, the nurse should contact the HCP, explain the situation, provide background information, report the current assessment of the client, and:

- ☐ 1. suggest adding potassium to the fluids.
- ☐ 2. request an increase in the volume of intravenous fluids.
- ☐ 3. verify the prescription for 5% dextrose in water.
- ☐ 4. determine if the client should be placed in isolation.

110. Glulisine insulin is prescribed to be administered to a client before each meal. To assist the day-shift nurse who is receiving the report, the night-shift nurse gives the morning dose of glulisine. When the day-shift nurse goes to the room of the client who requires glulisine, the nurse finds that the client is not in the room. The client's roommate tells the nurse that the client "went for a test." What should the nurse do **next**?

- ☐ 1. Bring a small glass of juice, and locate the client.
- ☐ 2. Call the client's healthcare provider (HCP).
- ☐ 3. Check the computerized care plan to determine what test was

scheduled.

- ☐ 4. Send the nurse's assistant to the x-ray department to bring the client back to his room.

111. A young adult client who has been diagnosed with type 1 diabetes has an insulin drip to aid in lowering the serum blood glucose level of 600 mg/dL (33.3 mmol/L). The client is also receiving ciprofloxacin IV. The healthcare provider (HCP) prescribes discontinuation of the insulin drip. What should the nurse do **next**?

- ☐ 1. Discontinue the insulin drip, as prescribed.
- ☐ 2. Hang the next IV dose of antibiotic before discontinuing the insulin drip.
- ☐ 3. Inform the HCP that the client has not received any subcutaneous insulin yet.
- ☐ 4. Add glargine to the insulin drip before discontinuing it.

112. The elderly client with type 2 diabetes has hyperglycemic hyperosmolar syndrome (HHS). The nurse should monitor the infusion for too rapid correction of the blood glucose in order to prevent:

- ☐ 1. ketone body formation.
- ☐ 2. a major vascular accident.
- ☐ 3. fluid volume depletion.
- ☐ 4. cerebral edema.

Answers, Rationales, and Test-Taking Strategies

*The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in part 1 of this book.*

The Client with Disorders of the Thyroid

1. 2. Graves' disease, the most common type of thyrotoxicosis, is a state of hypermetabolism. The increased metabolic rate generates heat and produces tachycardia and fine muscle tremors. Anorexia is associated with hypothyroidism. Loss of weight, despite a good appetite and adequate caloric intake, is a common feature of hyperthyroidism. Cold skin is associated with hypothyroidism.

CN: Physiological adaptation; CL: Analyze

2. 3. A change in the menstrual interval, diminished menstrual flow (oligomenorrhea), or even the absence of menstruation (amenorrhea) may result from the hormonal imbalances of thyrotoxicosis. Oligomenorrhea in women and decreased libido and impotence in men are common features of thyrotoxicosis. Dysmenorrhea is painful menstruation. Metrorrhagia, blood loss between menstrual periods, is a symptom of hypothyroidism. Menorrhagia, excessive bleeding during menstrual periods, is a symptom of hypothyroidism.

CN: Physiological adaptation; CL: Analyze

3. 2,3,5,6. Clients with hypothyroidism exhibit symptoms indicating a lack of thyroid hormone. Bradycardia, decreased energy and lethargy, memory problems, weight gain, coarse hair, constipation, and menorrhagia are common signs and symptoms of hypothyroidism.

CN: Physiological adaptation; CL: Analyze

4. 1. The most serious adverse effects of PTU are leukopenia and agranulocytosis, which usually occur within the first 3 months of treatment. The client should be taught to promptly report to the **healthcare provider (HCP)**  signs and symptoms of infection, such as a sore throat and fever. Clients having a sore throat and fever should have an immediate white blood cell count and differential performed, and the drug must be withheld until the results are obtained. Painful menstruation, constipation, and increased urine output are not associated with PTU therapy.

CN: Pharmacological and parenteral therapies; CL: Synthesize

5. 2. A typical sign of thyrotoxicosis is irritability caused by the high levels of circulating thyroid hormones in the body. This symptom decreases as the client responds to therapy. Thyrotoxicosis does not cause confusion. The client may be worried about her illness, and stress may influence her mood; however, irritability is a common symptom of thyrotoxicosis, and the client should be informed of that fact rather than blamed.

CN: Psychosocial integrity; CL: Synthesize

6. 2. PTU is a prototype of thioamide antithyroid drugs. It inhibits production of thyroid hormones and peripheral conversion of T_4 to the more active T_3 . A client taking this antithyroid drug should be able to sleep and rest well at night since the level of thyroid hormones is reduced in the blood. Excess energy throughout the day, loss of weight, and perspiring through the day are symptoms of hyperthyroidism indicating the drug has not produced its outcome.

CN: Pharmacological and parenteral therapies; CL: Evaluate

7. 3. Propranolol hydrochloride is a nonselective beta-blocker of both cardiac and bronchial adrenoreceptors, which competes with epinephrine and norepinephrine for available beta-receptor sites. Propranolol blocks cardiac effects of beta-adrenergic stimulation; as a result, it reduces heart rate; a hypertensive effect is associated with decreased cardiac output. A contraindication of propranolol is bronchial asthma; propranolol can cause bronchiolar constriction even in normal clients. The nurse takes the apical pulse and BP before administering propranolol. The medication is withheld if the heart rate is <60 beats per minute or the systolic BP is <90 mm Hg.

CN: Pharmacological and parenteral therapies; CL: Synthesize

8. 3. Treatment of mild ophthalmopathy that may accompany thyrotoxicosis includes measures such as wearing sunglasses to protect the eyes from corneal irritation. Treatment of ophthalmopathy should be performed in consultation with an ophthalmologist. Massaging the eyes will not help to protect the cornea. An ophthalmic anesthetic is used to examine and possibly treat a painful eye, not protect the cornea. Covering the eyes with moist gauze pads is not a satisfactory nursing measure to protect the

eyes of a client with exophthalmos because treatment is not focused on moisture to the eye but rather on protecting the cornea and optic nerve. In exophthalmos, the retrobulbar connective tissues and extraocular muscle volume are expanded because of fluid retention. The pressure is also increased.

CN: Reduction of risk potential; CL: Synthesize

9. 3. The client needs to be educated about the need for lifelong thyroid hormone replacement. Permanent hypothyroidism is the major complication of radioactive iodine treatment. Lifelong medical follow-up and thyroid replacement are warranted. The client needs to monitor for signs and symptoms of hypothyroidism, not hyperthyroidism. Resting for 1 week is not necessary. Hypertension and tachycardia are signs of hyperthyroidism, not - hypothyroidism.

CN: Pharmacological and parenteral therapies; CL: Synthesize

10. 2. SSKI is frequently administered before a thyroidectomy because it helps decrease the vascularity of the thyroid gland. A highly vascular thyroid gland is very friable, a condition that presents a hazard during surgery. Preparation of the client for surgery includes depleting the gland of thyroid hormone and decreasing vascularity. SSKI does not decrease the progression of exophthalmos, and it does not decrease the body's ability to store thyroxine or increase the body's ability to excrete thyroxine.

CN: Pharmacological and parenteral therapies; CL: Apply

11. 3. SSKI should be diluted well in milk, water, juice, or a carbonated beverage before administration to help disguise the strong, bitter taste. Also, this drug is irritating to the mucosa if taken undiluted. The client should sip the diluted preparation through a drinking straw to help prevent staining of the teeth. Pouring the solution over ice chips will not sufficiently dilute the SSKI or cover the taste. Antacids are not used to dilute or cover the taste of SSKI. Mixing in a puree would put the SSKI in contact with the teeth.

CN: Pharmacological and parenteral therapies; CL: Apply

12. 3. Laryngeal nerve damage is a potential complication of thyroid surgery because of the proximity of the thyroid gland to the recurrent

laryngeal nerve. Asking the client to speak helps assess for signs of laryngeal nerve damage. Persistent or worsening hoarseness and weak voice are signs of laryngeal nerve damage and should be reported to the **healthcare provider (HCP)**  immediately. Internal hemorrhage is detected by changes in vital signs. The client's level of consciousness can be partially assessed by asking her to speak, but that is not the primary reason for doing so in this situation. Upper airway obstruction is detected by color and respiratory rate and pattern.

 CN: Reduction of risk potential; CL: Analyze

13. 4. Equipment for an emergency tracheotomy should be kept in the room, in case tracheal edema and airway occlusion occur. Laryngeal nerve damage can result in vocal cord spasm and respiratory obstruction. A tracheostomy set, oxygen and suction equipment, and a suture removal set (for respiratory distress from hemorrhage) make up the emergency equipment that should be readily available. Total parenteral nutrition is not anticipated for the client undergoing thyroidectomy. Arrhythmias requiring defibrillation is not an expected possible treatment after thyroidectomy. Tube feedings are not anticipated emergency care.

 CN: Reduction of risk potential; CL: Synthesize

14. 2. Tetany may occur after thyroidectomy if the parathyroid glands are accidentally injured or removed during surgery. This would cause a disturbance in serum calcium levels. An early sign of tetany is numbness and tingling of the fingers or toes and in the circumoral region. Tetany may occur from 1 to 7 days postoperatively. Late signs and symptoms of tetany include seizures, contraction of the glottis, and respiratory obstruction. The nurse should notify the **HCP**  . Exercising the joints in the fingers and toes will not relieve the tetany. The client is not exhibiting signs of thrombophlebitis. There is no indication of nerve damage that would cause the client not to be able to speak.

 CN: Physiological adaptation; CL: Synthesize

15. 2. The client with tetany is suffering from hypocalcemia, which is treated by administering an IV preparation of calcium, such as calcium gluconate or calcium chloride. Oral calcium is then necessary until normal

parathyroid function returns. Sodium phosphate is a laxative. Echthiophate iodide is an eye preparation used as a miotic for an antiglaucoma effect. Sodium bicarbonate is a potent systemic antacid.

CN: Pharmacological and parenteral therapies; CL: Apply

16. 2. Typical signs and symptoms of hypothyroidism include weight gain, fatigue, decreased energy, apathy, brittle nails, dry skin, cold intolerance, hair loss, constipation, and numbness and tingling in the fingers. Tachycardia is a sign of hyperthyroidism, not hypothyroidism. Diarrhea and nausea are not symptoms of hypothyroidism.

CN: Physiological adaptation; CL: Analyze

17. 4. A major problem for the person with hypothyroidism is fatigue. Other signs and symptoms include lethargy, personality changes, generalized edema, impaired memory, slowed speech, cold intolerance, dry skin, muscle weakness, constipation, weight gain, and hair loss. Incomplete closure of the eyelids, hypermetabolism, and diarrhea are associated with hyperthyroidism.

CN: Basic care and comfort; CL: Analyze

18. 4. Hypothyroidism may contribute to sadness and depression. It is good practice for clients with newly diagnosed depression to be monitored for hypothyroidism by checking serum thyroid hormone and thyroid-stimulating hormone levels. This client needs to know that these feelings may be related to her low thyroid hormone levels and may improve with treatment. Replacement therapy does not cause depression. Depression may accompany chronic illness, but it is not “normal.”

CN: Psychosocial integrity; CL: Analyze

19. 2. Levothyroxine must be given at the same time each day on an empty stomach, preferably $\frac{1}{2}$ to 1 hour before breakfast. Other medications may impair the action of levothyroxine absorption; the client should separate doses of other medications by 4 to 5 hours.

CN: Pharmacological and parenteral therapies; CL: Evaluate

The Client with Diabetes Mellitus

20. 3. Empowerment is an approach to clinical practice that emphasizes helping people discover and use their innate abilities to gain mastery over their own condition. Empowerment means that individuals with a health problem have the tools, such as knowledge, control, resources, and experience, to implement and evaluate their self-management practices. Involvement of others, such as asking the client about family involvement, implies that the others will provide the direct care needed rather than the client. Asking the client what the client needs to know implies that the nurse will be the one to provide the information. Telling the client what is required does not provide the client with options or lead to empowerment.

CN: Health promotion and maintenance; CL: Synthesize

21. 3. Lipodystrophy, specifically lipohypertrophy, involves swelling of the fat at the site of repeated injections, which can interfere with the absorption of insulin, resulting in erratic blood glucose levels. Because the client has been receiving insulin for many years, this is the most likely cause of poor control. Eating snacks between meals causes hyperglycemia. Adjusting insulin according to blood glucose levels would not cause **hypoglycemia** but normal levels. Initiating an insulin pump would not, of itself, cause the periods of hyperglycemia.

CN: Physiological Integrity; CL: Analyze

22. 1,2,4,5. The risk factors for developing type 2 diabetes include giving birth to an infant weighing more than 9 lb (4,100 g); obesity (BMI over 30); ethnicity of Asian, African, Native American, or First Nations; age >45 years; hypertension; and family history in parents or siblings. Childhood obesity is also a risk factor for type 2 diabetes. Maintaining an ideal weight, eating a low-fat diet, and exercising regularly decrease the risk of type 2 diabetes.

CN: Reduction of risk potential; CL: Analyze

23. 4. The client's blood glucose level is elevated, beyond levels accepted for fasting; normal blood glucose range is 70 to 120 mg/dL (3.9 to 6.7 mmol/L). The specific gravity is within normal range (1.001 to 1.030). Urine output should be 30 to 50 mL/h; thus, 350 mL is a normal urinary output over 8 hours. The potassium level is normal.

 CN: Reduction of risk potential; CL: Synthesize

24. 1. The normal range for blood glucose is 70 to 100 mg/dL; the elevated blood glucose level indicates hyperglycemia. The hemoglobin is normal. The client's cholesterol and LDL levels are both normal. The nurse should determine if there are standing orders for the hyperglycemia or notify the **healthcare provider (HCP)** .

 CN: Reduction of risk potential; CL: Analyze

25. 3. Due to the rapid, deep respirations, the client is losing fluid from vaporization from the lungs and skin (insensible fluid loss). Normally, about 900 mL of fluid is lost per day through vaporization. Decreased serum potassium level has no effect on insensible fluid loss. Hypotension occurs due to polyuria and inadequate fluid intake. It may decrease the flow of blood to the skin, causing the skin to be warm and dry.

 CN: Reduction of risk potential; CL: Analyze

26. 4. Glargine is a long-acting recombinant human insulin analog. Glargine should not be mixed with any other insulin product. Insulins should not be shaken; instead, if the insulin is cloudy, roll the vial or insulin pen between the palms of the hands.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

27. 1. A modest alcohol intake (1 to 2 drinks/day) may be incorporated into the nutrition plan for individuals who choose to drink. Alcohol is detoxified in the liver where glycogen reserves are stored and normally released in case of hypoglycemia. At the time alcohol is consumed, glucose values will likely rise because of the carbohydrate in the beer, wine, or mixed drinks; however, the later and more dangerous effect of alcohol is a hypoglycemic **effect**. Alcohol should be consumed with food; even if blood glucose values are elevated, the bedtime snack should not be skipped.

 CN: Health promotion and maintenance; CL: Synthesize

28. 1. Lactic acidosis is a rare but serious adverse effect of metformin when combined with alcohol use; half the cases are fatal. Ideally, one should stop metformin for 2 days before and 2 days after drinking alcohol. Signs and

symptoms of lactic acidosis are weakness, fatigue, unusual muscle pain, dyspnea, unusual stomach discomfort, dizziness or light-headedness, and bradycardia or cardiac arrhythmias. Bloating is not an adverse effect of metformin.

CN: Pharmacological and parenteral therapies; CL: Evaluate

29. 2. Hypoglycemia is a blood glucose level below 70 mg/dL. The signs and symptoms of hypoglycemia include confusion, irritability, diaphoresis, tremors, hunger, weakness, and visual disturbances. Untreated hypoglycemia can progress to loss of consciousness, seizures, coma, and death. With effective treatment, hypoglycemia can usually be quickly reversed. If the client has manifestations of hypoglycemia and monitoring equipment is not available, hypoglycemia is assumed, and treatment is initiated. Hypoglycemia is treated by ingesting 10 to 15 g of simple (fast-acting) carbohydrate, such as 4 to 8 ounces of fruit juice or regular (nondiet) soft drink or 8 ounces of low-fat milk. The nurse can tell the client to eat the regularly scheduled meal or a snack that has protein, such as cheese or peanut butter, to prevent hypoglycemia from recurring. Without treating the possible hypoglycemia, the blood glucose level will go down even lower and the client may lose consciousness, develop seizures, or go into a coma. Contacting the **HCP**  would delay treating the possible hypoglycemia. Decreasing the insulin dose or increasing the meal plan may prevent episodes of hypoglycemia in the future. Administering insulin would cause the blood sugar to go even lower.

CN: Physiological adaptation; CL: Synthesize

30. 3. Insulin detemir is used only if the solution appears clear and colorless with no visible particles. Insulin detemir is not diluted or mixed with any other insulin preparations. As with any insulin therapy, lipodystrophy may occur at the injection site and delay insulin absorption. Continuous rotation of the injection site within a given area may help to reduce or prevent this reaction. The client should continue to follow the prescribed diet and monitor glucose levels when taking insulin detemir. Insulin detemir is available in a prefilled insulin pen. When the insulin pen is empty, it may not be refilled; instead, the pen is discarded.

CN: Pharmacological and parenteral therapies; CL: Synthesize

31. 4. The nurse instructs the client to not wait any longer than 5 to 15 minutes to eat after injecting rapid-acting insulin, which has an onset action of 5 minutes and a duration of 1 hour. The client is using proper technique for mixing the insulins, rotating sites, and using the U-100 syringe.

CN: Pharmacological and parenteral therapies; CL: Evaluate

32. 2. Regular and NPH insulins are scheduled together one-half hour before breakfast. They do not need to be given separately or in different syringes.

CN: Pharmacological and parenteral therapies; CL: Apply

33. 1,5. Being overweight and having a large waist-hip ratio (central abdominal obesity) increase insulin resistance, making control of diabetes more difficult. The American and Canadian Diabetes Associations recommend a yearly referral to an ophthalmologist and podiatrist. Exercise and weight management decrease insulin resistance. Insulin is not always needed for type 2 diabetes; diet, exercise, and oral medications are the first-line treatment. The client must monitor all nutritional sources for a balanced diet—fats, carbohydrates, and protein.

CN: Reduction of risk potential; CL: Create

34. 1. The client with diabetes is prone to serious foot injuries secondary to peripheral neuropathy and decreased circulation. The client should be taught to avoid going barefoot to prevent injury. Shoes that do not fit properly should not be worn because they will cause blisters that can become nonhealing, serious wounds for the diabetic client. Toenails should be cut straight across. A heating pad should not be used because of the risk of burns due to insensitivity to temperature.

CN: Reduction of risk potential; CL: Synthesize

35. 2. A client with diabetes should be advised to consult an **HCP**  or a podiatrist for corn removal because of the danger of traumatizing the foot tissue and potential development of ulcers. The diabetic client should never self-treat foot problems but should consult an HCP or a podiatrist.

CN: Reduction of risk potential; CL: Synthesize

36. 2. Proper and careful first aid treatment is important when a client with diabetes has a skin cut or laceration. The skin should be kept supple and as free of organisms as possible. Washing and bandaging the cut will accomplish this. Washing wounds with alcohol is too caustic and drying to the skin. Having the children help is an unrealistic suggestion and does not educate the client about proper care of wounds. Tight control of blood glucose levels through adherence to the medication regimen is vitally important; however, it does not mean that careful attention to cuts can be ignored.

CN: Reduction of risk potential; CL: Synthesize

37. 4. Diabetes mellitus is a multifactorial, systemic disease associated with problems in the metabolism of all food types. The client's diet should contain appropriate amounts of all three nutrients, plus adequate minerals and vitamins.

CN: Basic care and comfort; CL: Apply

38. 1. Deep, rapid respirations with long expirations are indicative of Kussmaul's respirations, which occur in metabolic acidosis. The respirations increase in rate and depth, and the breath has a "fruity" or acetone-like odor. This breathing pattern is the body's attempt to blow off carbon dioxide and acetone, thus compensating for the acidosis. The other breathing patterns listed are not related to ketoacidosis and would not compensate for the acidosis.

CN: Physiological adaptation; CL: Analyze

39. 3,4,5. The nurse may not discontinue a medication without a **healthcare provider's (HCP's)**  prescription, and the nurse may not substitute one medication for another. Maximum doses may be better tolerated if given with meals. Before therapy begins, and at least annually thereafter, assess the client's renal function; if renal impairment is detected, a different antidiabetic agent may be indicated. To evaluate the effectiveness of therapy, the client's glucose value must be monitored regularly. The prescriber must be notified if the glucose value increases, despite therapy.

CN: Pharmacological and parenteral therapies; CL: Synthesize

40. 1,2,3. Client teaching includes reviewing proper use and storage of the exenatide dosage pen, particularly the onetime setup for each new pen. The nurse should instruct the client to inject the drug in the thigh, abdomen, or upper arm. The drug should be administered within 60 minutes of the morning and evening meals; the client should not inject the drug after a meal. The nurse should review steps for managing hypoglycemia, especially if the client also takes a sulfonylurea or insulin. If a dose is missed, the client should resume treatment as prescribed, with the next scheduled dose.

CN: Pharmacological and parenteral therapies; CL: Synthesize

41. 4. Rapid-acting insulin has an onset in 15 minutes, peaks at 1 hour, and lasts for 3 to 4 hours. Rapid-acting insulin is administered right before or right after a meal. The nurse should assess the client for hypoglycemia 1 hour following administration of the drug.

CN: Pharmacological and parenteral therapies; CL: Apply

42. 4. There is a drug-food interaction between repaglinide and grapefruit juice that may inhibit metabolism of repaglinide; the fresh grapefruit also interacts with repaglinide. It is not necessary that the dietitian inform the client of the drug-food interaction first. To contact the manager of the Food and Nutrition Department is not an intervention that will bring about prompt removal of the juice.

CN: Pharmacological and parenteral therapies; CL: Synthesize

43. 1,2,3,4,5. The client with unstable diabetes mellitus is at risk for many complications. Heart disease is the leading cause of mortality in clients with diabetes. The goal blood pressure for diabetics is <130/80 mm Hg. Therefore, the nurse would need to report any findings >130/80 mm Hg. The goal of HbA_{1c} is <7% (0.07); thus, a level of 10.2% (0.1) must be reported. HDL <40 mg/dL (2.2 mmol/L) and triglycerides >150 mg/dL (8.3 mmol/L) are risk factors for heart disease. The nurse would need to report the client's HDL and triglyceride levels. The urine ketones are negative, but this is a late sign of complications when there is a profound insulin deficiency.

CN: Reduction of risk potential; CL: Analyze

44. 4. A client with diabetes who takes any first- or second-generation

sulfonylurea should be advised to avoid alcohol intake. Sulfonylureas in combination with alcohol can cause serious disulfiram-like reactions, including flushing, angina, palpitations, and vertigo. Serious reactions, such as seizures and possibly death, may also occur. Hypokalemia, hyperkalemia, and hypocalcemia do not result from taking sulfonylureas in combination with alcohol.

 CN: Physiological adaptation; CL: Apply

45. 3. The most important factor predisposing to the development of type 2 diabetes mellitus is obesity. Insulin resistance increases with obesity. Cigarette smoking is not a predisposing factor, but it is a risk factor that increases complications of diabetes mellitus. A high-cholesterol diet does not necessarily predispose to diabetes mellitus, but it may contribute to obesity and hyperlipidemia. Hypertension is not a predisposing factor, but it is a risk factor for developing complications of diabetes mellitus.

 CN: Health promotion and maintenance; CL: Apply

46. 2. The client with diabetes mellitus is especially prone to hypertension due to atherosclerotic changes, which leads to problems of the microvascular and macrovascular systems. This can result in complications in the heart, brain, and kidneys. Heart disease and stroke are twice as common among people with diabetes mellitus as among people without the disease. Painful, inflamed joints accompany rheumatoid arthritis. A stooped appearance accompanies osteoporosis with narrowing of the vertebral column. A low hemoglobin concentration accompanies anemia, especially iron deficiency anemia and anemia of chronic disease.

 CN: Reduction of risk potential; CL: Analyze

47. 1. Although some individual variation exists, when the blood glucose level decreases to <70 mg/dL (3.9 mmol/L), the client experiences or is at risk for hypoglycemia. Hypoglycemia can occur in both type 1 and type 2 diabetes mellitus, although it is more common when the client is taking insulin. The nurse should instruct the client on the prevention, detection, and treatment of hypoglycemia.

 CN: Physiological adaptation; CL: Analyze

48. 4. Diabetic retinopathy, cataracts, and glaucoma are common complications in diabetics, necessitating eye assessment and examination. The feet should also be examined at each client encounter, monitoring for thickening, fissures, or breaks in the skin; ulcers; and thickened nails. Although assessments of the abdomen, pharynx, and lymph glands are included in a thorough examination, they are not pertinent to common diabetic complications.

CN: Reduction of risk potential; CL: Analyze

49. 4. The client with diabetes mellitus who is taking NPH insulin in the evening is most likely to become hypoglycemic shortly after midnight because this insulin peaks in 6 to 8 hours. The client should eat a bedtime snack to help prevent hypoglycemia while sleeping.

CN: Pharmacological and parenteral therapies; CL: Apply

50. 3. If the client engages in an activity or exercise that focuses on one area of the body, that area may cause inconsistent absorption of insulin. A good regimen for a jogger is to inject the abdomen for 1 week and then rotate to the buttock. A jogger may have inconsistent absorption in the legs or arms with strenuous running. The iliac crest is not an appropriate site due to a lack of loose skin and subcutaneous tissue in that area.

CN: Pharmacological and parenteral therapies; CL: Apply

51. 1. Insulin lispro begins to act within 10 to 15 minutes and lasts approximately 4 hours. A major advantage of lispro is that the client can eat almost immediately after the insulin is administered. The client needs to be instructed regarding the onset, peak, and duration of all insulin, as meals need to be timed with these parameters. Waiting 1 hour to eat may precipitate hypoglycemia. Eating 2 hours before the insulin lispro could cause hyperglycemia if the client does not have circulating insulin to metabolize the carbohydrate.

CN: Pharmacological and parenteral therapies; CL: Synthesize

52. 1. The nurse should judge that learning has occurred from the evidence of a change in the client's behavior. A client who performs a procedure safely and correctly demonstrates that he or she has acquired a skill. Evaluation of

this skill acquisition requires performance of that skill by the client with observation by the nurse. The client must also demonstrate cognitive understanding, as shown by the ability to critique the nurse's performance. Explaining the steps demonstrates acquisition of knowledge at the cognitive level only. A posttest does not indicate the degree to which the client has learned a psychomotor skill.

CN: Pharmacological and parenteral therapies; CL: Evaluate

53. 32 units. Clients commonly need to mix insulin, requiring careful mixing and calculation. The total dosage is 10 units plus 22 units, for a total of 32 units.

CN: Pharmacological and parenteral therapies; CL: Apply

54. 3. Renal failure frequently results from the vascular changes associated with diabetes mellitus. ACE inhibitors increase renal blood flow and are effective in decreasing diabetic nephropathy. Chronic obstructive pulmonary disease is not a complication of diabetes nor is it prevented by ACE inhibitors. Pancreatic cancer is neither prevented by ACE inhibitors nor considered a complication of diabetes. Cerebrovascular accident is not directly prevented by ACE inhibitors, although management of hypertension will decrease vascular disease.

CN: Pharmacological and parenteral therapies; CL: Apply

55. 1. The four most commonly reported signs and symptoms of hypoglycemia are nervousness, weakness, perspiration, and confusion. Other signs and symptoms include hunger, incoherent speech, tachycardia, and blurred vision. Anorexia and Kussmaul's respirations are clinical manifestations of hyperglycemia or ketoacidosis. Bradycardia is not associated with hypoglycemia; tachycardia is.

CN: Reduction of risk potential; CL: Apply

56. 2. Steroids can cause hyperglycemia because of their effects on carbohydrate metabolism, making diabetic control more difficult. Aspirin is not known to affect glucose metabolism. Sulfonylureas are oral hypoglycemic agents used in the treatment of diabetes mellitus. ACE inhibitors are not known to affect glucose metabolism.

CN: Pharmacological and parenteral therapies; CL: Apply

57. 1. Colds and influenza present special challenges to the client with diabetes mellitus because the body's need for insulin increases during illness. Therefore, the client must take the prescribed insulin dose, increase the frequency of blood glucose testing, and maintain an adequate fluid intake to counteract the dehydrating effect of hyperglycemia. The nurse can encourage the client to drink clear fluids, juices, and electrolyte drinks. Not taking insulin when sick, or taking half the normal dose, may cause the client to develop ketoacidosis.

CN: Reduction of risk potential; CL: Synthesize

58. 1. The priority goal for the client with diabetes mellitus who is experiencing vomiting with influenza is to obtain adequate nutrition. The diabetic client should eat small, frequent meals of 50 g of carbohydrate or food equal to 200 cal. every 3 to 4 hours. If the client cannot eat the carbohydrates or take fluids, the **healthcare provider (HCP)**  should be called, or the client should go to the emergency department. The diabetic client is in danger of complications with dehydration, electrolyte imbalance, and ketoacidosis. Increasing the client's health management skills is important to lifestyle behaviors, but it is not a priority during this acute illness of influenza. Pain relief may be a need for this client, but it is not the priority at this time; neither is increasing activity during the illness.

CN: Basic care and comfort; CL: Analyze

59. 4. The best response is to allow the client to verbalize fears about performing self-injection. Tactics that increase fear such as threatening the client about complications are not effective in changing behavior. If possible, the client needs to be responsible for self-care, including giving self-injections. A nurse for home care visits is not justified if the client is capable of self-administration.

CN: Psychosocial integrity; CL: Synthesize

The Client with Pituitary Adenoma

60. 4. With transsphenoidal hypophysectomy, the sella turcica is entered

from below, through the sphenoid sinus. There is no external incision; the incision is made between the upper lip and gums.

 CN: Reduction of risk potential; CL: Apply

61. 3. Deep breathing is the best choice for helping prevent atelectasis. The client should be placed in the semi-Fowler's position (or as prescribed) and taught deep breathing, sighing, mouth breathing, and how to avoid coughing. The client should receive sufficient medication to control postoperative pain. Frequent position changes help loosen lung secretions, but deep breathing is most important in preventing atelectasis. Coughing is contraindicated because it increases intracranial pressure and can cause cerebrospinal fluid to leak from the point at which the sella turcica was entered.

 CN: Reduction of risk potential; CL: Synthesize

62. 1. A major focus of nursing care after transsphenoidal hypophysectomy is the prevention of and monitoring for a CSF leak. CSF leakage can occur if the patch or incision is disrupted. The nurse should monitor for signs of infection, including elevated temperature, increased white blood cell count, rhinorrhea, nuchal rigidity, and persistent headache. Hypoglycemia and adrenocortical insufficiency may occur. Monitoring for fluctuating blood glucose levels is not related specifically to transsphenoidal hypophysectomy. The client will be given IV fluids postoperatively to supply carbohydrates. Cushing's disease results from adrenocortical excess, not insufficiency. Monitoring for cardiac arrhythmias is important, but arrhythmias are not anticipated following a transsphenoidal hypophysectomy.

 CN: Reduction of risk potential; CL: Analyze

63. 1. The client's sexual problems are directly related to the excessive prolactin level. Removing the source of excessive hormone secretion should allow the client to return gradually to a normal physiologic pattern. Fertility will return, and erectile function and sexual desire will return to baseline as hormone levels return to normal.

 CN: Physiological adaptation; CL: Apply

64. 3. If CSF leakage is suspected or confirmed, the client is treated

initially with bed rest with the head of the bed elevated to decrease pressure on the graft site. Most leaks heal spontaneously, but occasionally, surgical repair of the site in the sella turcica is needed. Repacking the nose will not heal the leak at the graft site in the dura. The client will not be returned to surgery immediately because most leaks heal spontaneously. High-dose corticosteroid therapy is not effective in healing a CSF leak.

CN: Physiological adaptation; CL: Apply

65. 1. After transsphenoidal surgery, the client must be careful not to disturb the suture line while healing occurs. Frequent oral care should be provided with rinses of saline, and the teeth may be gently cleaned with oral swabs. Frequent or vigorous toothbrushing or flossing is contraindicated because it may disturb or cause tension on the suture line.

CN: Physiological adaptation; CL: Synthesize

66. 4. Most clients who undergo adenoma removal experience a gradual return of normal pituitary secretion and do not experience complications. However, hypopituitarism can cause growth hormone, gonadotropin, thyroid-stimulating hormone, and adrenocorticotrophic hormone deficits. The client should be taught to monitor for change in mental status, energy level, muscle strength, and cognitive function. In adults, changes in sexual function, impotence, or decreased libido should be reported. Acromegaly and Cushing's disease are conditions of hypersecretion. Diabetes mellitus is related to the function of the pancreas and is not directly related to the function of the pituitary.

CN: Reduction of risk potential; CL: Analyze

67. 1. Pituitary diabetes insipidus is a potential complication after pituitary surgery because of possible interference with the production of antidiuretic hormone (ADH). One major manifestation of diabetes insipidus is polyuria because lack of ADH results in insufficient water reabsorption by the kidneys. The polyuria leads to a decreased urine specific gravity (between 1.001 and 1.010). The client may drink and excrete 5 to 40 L of fluid daily. Diabetes insipidus does not affect metabolism. A blood glucose level higher than 300 mg/dL (16.7 mmol/L) is associated with impaired glucose metabolism or diabetes mellitus. Urine negative for sugar and ketones is

normal.

CN: Reduction of risk potential; CL: Analyze

68. 2. The major characteristic of diabetes insipidus is decreased tubular reabsorption of water due to insufficient amounts of antidiuretic hormone (ADH). Vasopressin is administered to the client with diabetes insipidus because it has pressor and ADH activities. Vasopressin works to increase the concentration of the urine by increasing tubular reabsorption, thus preserving up to 90% water. Vasopressin is administered to the client with diabetes insipidus because it is a synthetic ADH. The administration of vasopressin results in increased tubular reabsorption of water, and it is effective for emergency treatment or daily maintenance of mild diabetes insipidus. Vasopressin does not decrease blood pressure or affect insulin production or glucose metabolism nor is insulin production a factor in diabetes insipidus.

CN: Pharmacological and parenteral therapies; CL: Apply

69. 1. Because diabetes insipidus involves excretion of large amounts of fluid, maintaining normal fluid and electrolyte balance is a priority for this client. Special dietary programs or restrictions are not indicated in treatment of diabetes insipidus. Serum glucose levels are priorities in diabetes mellitus but not in diabetes insipidus.

CN: Physiological adaptation; CL: Evaluate

The Client with Addison's Disease

70. 4. Adrenal crisis can occur with physical stress, such as surgery, dental work, infection, flu, trauma, and pregnancy. In these situations, glucocorticoid and mineralocorticoid dosages are increased. Weight loss, not gain, occurs with adrenal insufficiency. Psychological stress has less effect on corticosteroid need than physical stress.

CN: Reduction of risk potential; CL: Synthesize

71. 2. Addison's disease is caused by a deficiency of adrenal corticosteroids and can result in severe hypotension and shock because of uncontrolled loss of sodium in the urine and impaired mineralocorticoid function. This results in loss of extracellular fluid and dangerously low blood

volume. Glucocorticoids must be administered to reverse hypotension. Preventing infection is not an appropriate goal of care in this life-threatening situation. Relieving anxiety is appropriate when the client's condition is stabilized, but the calm, competent demeanor of the emergency department staff will be initially reassuring.

CN: Physiological adaptation; CL: Synthesize

72. 2. Adrenal hormone deficiency can cause profound physiologic changes. The client may experience severe pain (headache, abdominal pain, back pain, or pain in the extremities). Inhibited gluconeogenesis commonly produces hypoglycemia, and impaired sodium retention causes decreased, not increased, fluid volume. Edema would not be expected. Gastrointestinal disturbances, including nausea and vomiting, are expected findings in Addison's disease, not hunger.

CN: Physiological adaptation; CL: Analyze

73. 2,3,4,5. The long-term administration of corticosteroids in therapeutic doses often leads to serious complications or side effects. Corticosteroid therapy is not recommended for minor chronic conditions; the potential benefits of treatment must always be weighed against the risks. Hypokalemia may develop; corticosteroids act on the renal tubules to increase sodium reabsorption and enhance potassium and hydrogen excretion. Corticosteroids stimulate the breakdown of protein for gluconeogenesis, which can lead to skeletal muscle wasting. CNS adverse effects are euphoria, headache, insomnia, confusion, and psychosis. The nurse watches for changes in mood and behavior, emotional stability, sleep pattern, and psychomotor activity, especially with long-term therapy. Hypocalcemia related to anti-vitamin D effect may occur. Corticosteroids cause atrophy of the lymphoid tissue, suppress the cell-mediated immune responses, and decrease the production of antibodies. The nurse must be alert to the possibility of masked infection and delayed healing (anti-inflammatory and immunosuppressive actions). Retention of sodium (and subsequently water) increases blood volume and, therefore, blood pressure.

CN: Pharmacological parenteral therapies; CL: Apply

74. 1. Signs of infiltration include slowing of the infusion and swelling,

pain, hardness, pallor, and coolness of the skin at the site. If these signs occur, the IV line should be discontinued and restarted at another infusion site. The new anatomic site, time, and type of cannula used should be documented. The nurse may apply a warm soak to the site, but only after the IV line is discontinued. Parenteral administration of fluids should not be stopped intermittently. Stopping the flow does not treat the problem nor does it address the client's needs for fluid replacement. Infiltrated IV sites should not be irrigated; doing so will only cause more swelling and pain.

CN: Pharmacological and parenteral therapies; CL: Synthesize

75. 1. Each liter of 5% dextrose in normal saline contains 170 cal. The nurse should consult with the **healthcare provider (HCP)**  and dietitian when a client is on IV therapy or is on nothing-by-mouth status for an extended period because further electrolyte supplementation or alimentation therapy may be needed.

CN: Pharmacological and parenteral therapies; CL: Apply

76. 3. Electrolyte imbalances associated with Addison's disease include hypoglycemia, hyponatremia, and hyperkalemia. Regular salted (not low-salt) chicken or beef broth and fruit juices provide glucose and sodium to replenish these deficits. Diet soda does not contain sugar. Water could cause further sodium dilution. Coffee's diuretic effect would aggravate the fluid deficit. Milk contains potassium and sodium.

CN: Basic care and comfort; CL: Apply

77. 2. Finding alternative methods of dealing with stress, such as relaxation techniques, is a cornerstone of stress management. Removing all sources of stress from one's life is not possible. Antianxiety drugs are prescribed for temporary management during periods of major stress, and they are not an intervention in stress management classes. Avoiding discussion of stressful situations will not necessarily reduce stress.

CN: Psychosocial integrity; CL: Synthesize

78. 3. Primary Addison's disease refers to a problem in the gland itself that results from idiopathic atrophy of the glands. The process is believed to be autoimmune in nature. The most common causes of primary adrenocortical

insufficiency are autoimmune destruction (70%) and tuberculosis (20%). Insufficient secretion of GH causes dwarfism or growth delay. Hyposecretion of glucocorticoids, aldosterone, and androgens occurs with Addison's disease. Pituitary dysfunction can cause Addison's disease, but this is not a primary disease process. Oversecretion of the adrenal medulla causes pheochromocytoma.

CN: Physiological adaptation; CL: Apply

79. 2,3,4,5,6. Addison's disease occurs when the client does not produce enough steroids from the adrenal cortex. Lifetime steroid replacement is needed. The client should be taught lifestyle management techniques to avoid stress and maintain rest periods. A medical identification bracelet should be worn, and the family should be taught signs and symptoms that indicate an impending adrenal crisis, such as fatigue, weakness, dizziness, or mood changes. Dental work, infections, and surgery commonly require an adjusted dosage of steroids.

CN: Physiological adaptation; CL: Create

80. 3. Although many of the disease signs and symptoms are vague and nonspecific, most clients experience lethargy and depression as early symptoms. Other early signs and symptoms include mood changes, emotional lability, irritability, weight loss, muscle weakness, fatigue, nausea, and vomiting. Most clients experience a loss of appetite. Muscles become weak, not spastic, because of adrenocortical insufficiency.

CN: Physiological adaptation; CL: Analyze

81. 1. Since Addison's disease can be life threatening, treatment often begins with administration of corticosteroids. Corticosteroids, such as prednisone, may be taken orally or intravenously, depending on the client. A serious adverse effect of corticosteroids is hyperglycemia. Clients do not adjust their steroid dose based on dietary intake and exercise; insulin is adjusted based on diet and exercise. Addisonian crisis can occur secondary to hypoadrenocorticism, resulting in a crisis situation of acute hypotension, not increased blood pressure. Addison's disease is a disease of inadequate adrenal hormone, and therefore, the client will have inadequate response to stress. If the client takes more medication than prescribed, there can be a

potential increase in potassium depletion, fluid retention, and hyperglycemia. Taking less medication than was prescribed can trigger addisonian crisis state, which is a medical emergency manifested by signs of shock.

CN: Physiological adaptation; CL: Synthesize

82. 1. The need for glucocorticoids changes with circumstances. The basal dose is established when the client is discharged, but this dose covers only normal daily needs and does not provide for additional stressors. As the manager of the medication schedule, the client needs to know signs and symptoms of excessive and insufficient dosages. Glucocorticoid needs fluctuate. Glucocorticoids are not cumulative and must be taken daily. They must never be discontinued suddenly; in the absence of endogenous production, addisonian crisis could result. Two-thirds of the daily dose should be taken at about 0800 and the remainder at about 1600. This schedule approximates the diurnal pattern of normal secretion, with highest levels between 0400 and 0600 and lowest levels in the evening.

CN: Pharmacological and parenteral therapies; CL: Evaluate

83. 3. Fludrocortisone acetate can be administered once a day, but cortisone acetate administration should follow the body's natural diurnal pattern of secretion, in which greater amounts of cortisol are secreted during the daytime to meet the increased demand of the body. To mimic this pattern, baseline administration of cortisone acetate is typically 25 mg in the morning and 12.5 mg in the afternoon. Taking it three times a day would result in an excessive dose. Taking the drug only in the morning would not meet the needs of the body later in the day and evening.

CN: Pharmacological and parenteral therapies; CL: Apply

84. 4. Oral steroids can cause gastric irritation and ulcers and should be administered with meals, if possible, or otherwise with an antacid. Only instructing the client to take the medication with a full glass of water will not help prevent gastric complications from steroids. Steroids should never be taken on an empty stomach. Glucocorticoids should be taken in the morning, not at bedtime.

CN: Pharmacological and parenteral therapies; CL: Apply

85. 4. Measuring daily weight is a reliable, objective way to monitor fluid balance. Rapid variations in weight reflect changes in fluid volume, which suggests insufficient control of the disease and the need for more glucocorticoids in the client with Addison's disease. Nurses should instruct clients taking oral steroids to weigh themselves daily and to report any unusual weight loss or gain. Skin turgor testing does supply information about fluid status, but daily weight monitoring is more reliable. Temperature is not a direct measurement of fluid balance. Thirst is a nonspecific and very late sign of weight loss.

CN: Pharmacological and parenteral therapies; CL: Evaluate

86. 1. Medication compliance is an essential part of the self-care required to manage Addison's disease. The client must learn to adjust the glucocorticoid dose in response to the normal and unexpected stresses of daily living. The nurse should instruct the client never to stop taking the drug without consulting the **healthcare provider (HCP)**  to avoid an addisonian crisis. Regularity in daily habits makes adjustment easier, but the client should not be encouraged to withdraw from normal activities to avoid stress. The client does not need to restrict sodium. The client is at risk for hyponatremia. Hypotension, not hypertension, is more common with Addison's disease.

CN: Reduction of risk potential; CL: Evaluate

87. 3. Illness or surgery places tremendous stress on the body, necessitating increased glucocorticoid dosage. Extreme psychological stress also necessitates dosage adjustment. Increased dosages are needed in times of stress to prevent drug-induced adrenal insufficiency. Returning to work after the weekend, a vacation, or a routine checkup usually will not alter glucocorticoid dosage needs.

CN: Reduction of risk potential; CL: Synthesize

88. 4. Bronzing, or general deepening of skin pigmentation, is a classic sign of Addison's disease and is caused by melanocyte-stimulating hormone produced in response to increased ACTH secretion. The hyperpigmentation is typically found in the distal portion of extremities and in areas exposed to the sun. Additionally, areas that may not be exposed to the sun, such as the

nipples, genitalia, tongue, and knuckles, become bronze colored. Treatment of Addison's disease usually reverses the hyperpigmentation. Bilirubin level is not related to the pathophysiology of Addison's disease.

Hyperpigmentation is not related to the effects of the glucocorticoid therapy.

CN: Physiological adaptation; CL: Apply

The Client with Cushing's Disease

89. 3. Skin bruising from increased skin and blood vessel fragility is a classic sign of Cushing's disease. Hyperpigmentation and bruising are caused by the hypersecretion of glucocorticoids. Fluid retention causes hypertension, not hypotension. Muscle wasting occurs in the extremities. Hair on the head thins, while body hair increases.

CN: Physiological adaptation; CL: Analyze

90. 2. When Cushing's syndrome is suspected, a 24-hour urine collection for free cortisol is performed. Levels of 50 to 100 mcg/day (1,379 to 2,756 mmol/L) in adults indicate Cushing's syndrome. If these results are borderline, a high-dose dexamethasone suppression test is done. The dexamethasone is given at 2300 to suppress secretion of the corticotrophin-releasing hormone. A plasma cortisol sample is drawn at 0800. Normal cortisol level <5 mcg/dL (140 mmol/L) indicates normal adrenal response.

CN: Management of care; CL: Apply

91. 2. Sodium retention is typically accompanied by potassium depletion. Hypertension, hypokalemia, edema, and heart failure may result from the hypersecretion of aldosterone. The client with Cushing's disease exhibits postprandial or persistent hyperglycemia. Clients with Cushing's disease have hypernatremia, not hyponatremia. Bone resorption of calcium increases the urine calcium level.

CN: Reduction of risk potential; CL: Analyze

92. 3. Cushing's disease is commonly caused by loss of the diurnal cortisol secretion pattern. The client's random morning cortisol level may be within normal limits, but secretion continues at that level throughout the entire day. Cortisol levels should normally decrease after the morning peak.

Analysis of a 24-hour urine specimen is often useful in identifying the cumulative excess. Clients will not have symptoms with normal cortisol levels. Hormones are present in the blood.

CN: Reduction of risk potential; CL: Apply

93. 2. A primary dietary intervention is to restrict sodium, thereby reducing fluid retention. Increased protein catabolism results in loss of muscle mass and necessitates supplemental protein intake. The client may be asked to restrict total calories to reduce weight. The client should be encouraged to eat potassium-rich foods because serum levels are typically depleted. Although reducing fat intake as part of an overall plan to restrict calories is appropriate, fat intake of <20% of total calories is not recommended.

CN: Basic care and comfort; CL: Synthesize

94. 2. Osteoporosis is a serious outcome of prolonged cortisol excess because calcium is resorbed out of the bone. Regular daily weight-bearing exercise (e.g., brisk walking) is an effective way to drive calcium back into the bones. The client should also be instructed to have a dietary or supplemental intake of calcium of 1,500 mg daily. Potassium levels are not relevant to prevention of bone resorption. Vitamin D is needed to aid in the absorption of calcium. Isometric exercises condition muscle tone but do not build bones.

CN: Reduction of risk potential; CL: Synthesize

95. 2. Effective splinting for a high incision reduces stress on the incision line, decreases pain, and increases the client's ability to deep breathe effectively. Deep breathing should be done hourly by the client after surgery. Sitting upright ignores the need to splint the incision to prevent pain. Tightening the stomach muscles is not an effective strategy for promoting deep breathing. Raising the shoulders is not a feature of deep-breathing exercises.

CN: Physiological adaptation; CL: Apply

96. 3. The priority in the first 24 hours after adrenalectomy is to identify and prevent adrenal crisis. Monitoring of vital signs is the most important

evaluation measure. Hypotension, tachycardia, orthostatic hypotension, and arrhythmias can be indicators of pending vascular collapse and hypovolemic shock that can occur with adrenal crisis. Beginning oral nutrition is important, but not necessarily in the first 24 hours after surgery, and it is not more important than preventing adrenal crisis. Promoting self-care activities is not as important as preventing adrenal crisis. Ambulating in the hallway is not a priority in the first 24 hours after adrenalectomy.

CN: Physiological adaptation; CL: Synthesize

97. 3. Hydromorphone hydrochloride is about five times more potent than morphine sulfate, from which it is prepared. Therefore, it is administered only in small doses. Hydromorphone hydrochloride can cause dependency in any dose; however, fear of dependency developing in the postoperative period is unwarranted. The dose is determined by the client's need for pain relief. Hydromorphone hydrochloride is not irritating to subcutaneous tissues. As with opioid analgesics, excretion depends on normal liver function.

CN: Pharmacological and parenteral therapies; CL: Apply

98. 4. A glucocorticoid preparation will be administered intravenously or intramuscularly in the immediate preoperative period to a client scheduled for an adrenalectomy. Methylprednisolone sodium succinate protects the client from developing acute adrenal insufficiency (Addison's crisis) that occurs as a result of the adrenalectomy. Spironolactone is a potassium-sparing diuretic. Prednisone is an oral corticosteroid. Fludrocortisone is a mineral corticoid.

CN: Physiological integrity; CL: Apply

99. 1. Ketoconazole suppresses adrenal steroid secretion and may cause acute hypoadrenalism. The adverse effect should reverse when the drug is discontinued. Ketoconazole does not destroy adrenal cells; mitotane destroys the cells and may be used to obtain a medical adrenalectomy. Ketoconazole decreases, not increases, ACTH-induced serum corticosteroid levels. It increases the duration of adrenal suppression when given with steroids.

CN: Pharmacological and parenteral therapies; CL: Apply

100. 2. Poor lung expansion from bed rest, pain, and retained anesthesia is a common cause of slight postoperative temperature elevation. Nursing care

includes turning the client and having the client cough and deep breathe every 1 to 2 hours or more frequently as prescribed. The client will have postoperative IV fluid replacement prescribed to prevent dehydration. Wound infections typically appear 4 to 7 days after surgery. Urinary tract infections would not be typical with this surgery.

 CN: Physiological adaptation; CL: Analyze

101. 3. Pain control should be evaluated at least every 2 hours for the client with a PCA system. Addiction is not a common problem for the postoperative client. A client should not be encouraged to tolerate pain; in fact, other nursing actions besides PCA should be implemented to enhance the action of opioids. One of the purposes of PCA is for the client to determine frequency of administering the medication; the nurse should not interfere unless the client is not obtaining pain relief. The nurse should ensure that the client is instructed on the use of the PCA control button and that the button is always within reach.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

102. 1. Decreased mobility is one of the most common causes of abdominal distention related to retained gas in the intestines. Peristalsis has been inhibited by general anesthesia, analgesics, and inactivity during the immediate postoperative period. Ambulation increases peristaltic activity and helps move gas. Walking can prevent the need for a rectal tube, which is a more invasive procedure. An NG tube is also a more invasive procedure and requires a prescription. It is not a preferred treatment for gas postoperatively. Walking should prevent the need for further interventions. Carbonated liquids can increase gas formation.

 CN: Reduction of risk potential; CL: Synthesize

103. 2. Persistent cortisol excess undermines the collagen matrix of the skin, impairing wound healing. It also carries an increased risk of infection and of bleeding. The wound should be observed and documentation performed regarding the status of healing. Confusion and emboli are not expected complications after adrenalectomy. Malnutrition also is not an expected complication after adrenalectomy. Nutritional status should be regained postoperatively.

 CN: Reduction of risk potential; CL: Analyze

104. 2. As the body readjusts to normal cortisol levels, mood and physical changes will gradually return to a normal state. The body changes are not permanent, and the mood swings should level off.

 CN: Physiological adaptation; CL: Synthesize

105. 3. Testosterone is an androgen hormone that is responsible for protein metabolism as well as maintenance of secondary sexual characteristics; therefore, it is needed by both males and females. Removal of both adrenal glands necessitates replacement of glucocorticoids and androgens. Testosterone does not balance the reproductive cycle, stabilize mood swings, or restore sodium and potassium balance.

 CN: Physiological adaptation; CL: Apply

106. 1. Bilateral adrenalectomy requires lifelong adrenal hormone replacement therapy. If unilateral surgery is performed, most clients gradually reestablish a normal secretion pattern. The client and family will require extensive teaching and support to maintain self-care management at home. Information on dosing, adverse effects, what to do if a dose is missed, and follow-up examinations is needed in the teaching plan. Although steroids are tapered when given for an intermittent or onetime problem, they are not discontinued when given to clients who have undergone bilateral adrenalectomy because the clients will not regain the ability to manufacture steroids. Steroids must be taken on a daily basis, not just during periods of physical or emotional stress.

 CN: Physiological adaptation; CL: Synthesize

Managing Care, Quality, and Safety of Clients with Endocrine Health Problems

107. 2. Insulin is on the list of error-prone medications, and the nurse should ask the HCP  to rewrite the prescription to spell out the word “units” and to indicate the route by which the drug is to be administered. The nurse should contact the HCP immediately as the nurse is to administer the insulin now. The nurse can then also report the most current glucose level.

While waiting for the insulin prescription to be rewritten, the nurse can administer the pain medication if needed, start the oxygen, and check the client's vital signs.

CN: Safety and infection control; CL: Synthesize

108. 1. To assure client safety, the nurse first writes the results on the chart, then reads them back to the caller, and waits for the caller to confirm that the nurse has understood the results. The nurse may receive results by telephone; and although electronic transfer to the client's **medical record** is appropriate, the nurse can also accept the telephone results if the laboratory has called the results to the nurses' station.

CN: Management of Care; CL: Apply

109. 3. The client needs fluid volume replacement due to the dehydration. However, the nurse should verify the prescription for IV dextrose with the **HCP**  due to the risk of hyperglycemia that dextrose would present when administered to a client with diabetes. The potassium level is within normal limits. The client does not have restrictions on oral fluids, and the nurse can encourage the client to drink fluids. The client does not need to be placed in isolation at this time.

CN: Management of care; CL: Synthesize

110. 3. Glulisine is a rapid-acting insulin with an action onset of 15 minutes. The client could experience hypoglycemia with the insulin in the bloodstream and no breakfast. It is not necessary to call the client's **HCP** ; the nurse should determine what test was scheduled and then locate the client and provide either breakfast or 4 oz (120 mL) of fruit juice. To bring the client back to the room would be wasting valuable time needed to prevent or correct hypoglycemia.

CN: Management of care; CL: Synthesize

111. 3. Because subcutaneous administration of insulin has a slower rate of absorption than IV insulin, there must be an adequate level of insulin in the bloodstream before discontinuing the insulin drip; otherwise, the glucose level will rise. Adding an IV antibiotic has no influence on the insulin drip; it should not be piggy-backed into the insulin drip. Glargine cannot be

administered IV and should not be mixed with other insulins or solutions.

CN: Management of care; CL: Synthesize

112. 4. HHS can be caused by acute illness, such as an infection like pneumonia or sepsis. In HHS, there is a residual amount of insulin that suppresses ketosis but cannot control hyperglycemia. This leads to severe dehydration and impaired renal function. Ketone bodies are usually absent in HHS, and they do not form as a result of too rapid correction of blood glucose. The nurse should assess the client for a major vascular accident in the elderly as an etiology for a hyperglycemic crisis. Volume depletion must be treated first in HHS. Cerebral edema is a risk with too rapid correction of blood glucose.

CN: Reduction of risk potential; CL: Apply

The Client with Urinary Tract Health Problems

- The Client with Chronic Renal Failure
- The Client with Urinary Incontinence
- Managing Care, Quality, and Safety of Clients with Urinary Tract Health Problems
- Answers, Rationales, and Test-Taking Strategies

The Client with Cancer of the Bladder

1. A client has undergone a cystectomy and an ileal conduit diversion. What should the nurse include in the discharge instructions? Select all that apply.

- ☐ **1.** Drink at least 3,000 mL of fluid each day.
- ☐ **2.** Minimize daily activities.
- ☐ **3.** Keep urine alkaline to prevent urinary tract infections.
- ☐ **4.** Avoid odor-producing foods, such as onions, fish, eggs, and cheese.
- ☐ **5.** Wear snug clothing over the stoma to encourage urine flow into the drainage bag.

2. A nurse is caring for a client with an ileal conduit. When assessing the stoma, which outcomes are not desirable? Select all that apply.

- ☐ **1.** dermatitis

- ☐ 2. bleeding
- ☐ 3. fungal infection
- ☐ 4. use of adhesive solvent on the skin around the stoma
- ☐ 5. placing skin cement on the faceplate of the collection bag

3. A client is admitted to the recovery room after cystoscopy with biopsy. Before the nurse can discharge the client, the nurse should be sure the client:

- ☐ 1. has a bowel movement.
- ☐ 2. has received the first dose of pain medication.
- ☐ 3. has voided.
- ☐ 4. has no blood in the urine.

4. The nurse should conduct a focused assessment for the client with suspected bladder cancer for which common sign of the disease?

- ☐ 1. suprapubic pain
- ☐ 2. dysuria
- ☐ 3. painless hematuria
- ☐ 4. urine retention

5. Which symptom indicates that a client has developed a complication after a cystoscopy?

- ☐ 1. dizziness
- ☐ 2. chills
- ☐ 3. pink-tinged urine
- ☐ 4. bladder spasms

6. If the client develops lower abdominal pain after a cystoscopy, what should the nurse instruct the client to do?

- ☐ 1. Apply an ice pack to the pubic area.
- ☐ 2. Massage the abdomen gently.
- ☐ 3. Ambulate as much as possible.
- ☐ 4. Sit in a tub of warm water.

7. A client who has been diagnosed with bladder cancer is scheduled for an ileal conduit. Preoperatively, the nurse reinforces the client's understanding of the surgical procedure by explaining that an ileal conduit:

- ☐ 1. is a temporary procedure that can be reversed later.
- ☐ 2. diverts urine into the sigmoid colon, where it is expelled through the rectum.
- ☐ 3. conveys urine from the ureters to a stoma opening on the abdomen.
- ☐ 4. creates an opening in the bladder that allows urine to drain into an external pouch.

8. After surgery for an ileal conduit, the nurse should closely assess the client for the occurrence of which complication specifically related to this pelvic surgery?

- ☐ 1. peritonitis
- ☐ 2. thrombophlebitis
- ☐ 3. ascites
- ☐ 4. inguinal hernia

9. The nurse is assessing the urine of a client who has had an ileal conduit and notes that there is a moderate amount of mucus in the urine. The nurse should:

- ☐ 1. change the appliance bag.
- ☐ 2. notify the healthcare provider (HCP).
- ☐ 3. obtain a urine specimen for culture.
- ☐ 4. encourage a high fluid intake.

10. When teaching the client to care for an ileal conduit, the nurse instructs the client to empty the appliance frequently. Which outcome indicates that the client is following instructions?

- ☐ 1. The skin around the stoma is red.
- ☐ 2. The urine is a deep yellow.
- ☐ 3. There is no odor present.
- ☐ 4. The seal around the stoma is intact.

11. The nurse should teach the client with an ileal conduit to prevent urine leakage when changing the appliance by:

- ☐ 1. inserting a gauze wick into the stoma.
- ☐ 2. closing the opening temporarily with a cellophane seal.
- ☐ 3. suctioning the stoma before changing the appliance.

- ☐ 4. avoiding oral fluids for several hours before changing the appliance.

12. The client with an ileal conduit will be using a reusable appliance at home. The nurse should teach the client to clean the appliance routinely with which product?

- ☐ 1. baking soda
- ☐ 2. soap
- ☐ 3. hydrogen peroxide
- ☐ 4. alcohol

13. The nurse is evaluating the discharge teaching for a client who has an ileal conduit. Which statements indicate that the client has correctly understood the teaching? Select all that apply.

- ☐ 1. "If I limit my fluid intake, I will not have to empty my ostomy pouch as often."
- ☐ 2. "I can place an aspirin tablet in my pouch to decrease odor."
- ☐ 3. "I can usually keep my ostomy pouch on for 3 to 7 days before changing it."
- ☐ 4. "I must use a skin barrier to protect my skin from urine."
- ☐ 5. "I should empty my ostomy pouch of urine when it is full."

14. A client has an ileal conduit. Which solutions will be useful to help control odor in the urine collecting bag after it has been cleaned?

- ☐ 1. salt water
- ☐ 2. vinegar
- ☐ 3. ammonia
- ☐ 4. bleach

15. A female client who has a urinary diversion tells the nurse, "This urinary pouch is embarrassing. Everyone will know that I am not normal. I do not see how I can go out in public anymore." The **most** appropriate goal for this client is to:

- ☐ 1. manage her anxiety about her health.
- ☐ 2. learn how to care for the urinary diversion.
- ☐ 3. overcome feelings of worthlessness.
- ☐ 4. express fears about the urinary diversion.

16. The nurse teaches the client with a urinary diversion to attach the appliance to a standard urine collection bag at night. The **most** important reason for doing this is to prevent:

- ☐ 1. urine reflux into the stoma.
- ☐ 2. appliance separation.
- ☐ 3. urine leakage.
- ☐ 4. the need to restrict fluids.

17. The nurse is teaching the client with an ileal conduit how to prevent a urinary tract infection. Which measure would be **most** effective?

- ☐ 1. Avoid people with respiratory tract infections.
- ☐ 2. Maintain a daily fluid intake of 2,000 to 3,000 mL.
- ☐ 3. Use sterile technique to change the appliance.
- ☐ 4. Irrigate the stoma daily.

18. The nurse evaluates the effectiveness of the client's postoperative plan of care. Which outcome is expected for a client with an ileal conduit?

- ☐ 1. The client verbalizes the understanding that physical activity must be curtailed.
- ☐ 2. The client will place an aspirin in the drainage pouch to help control odor.
- ☐ 3. The client demonstrates how to catheterize the stoma.
- ☐ 4. The client will empty the drainage pouch frequently throughout the day.

19. A client is scheduled to undergo weekly intravesical chemotherapy for bladder cancer for the next 8 weeks. Which statement indicates that the client understands how to manage the urine as a biohazard? The client will:

- ☐ 1. void into a bedpan and then empty the urine into the toilet.
- ☐ 2. disinfect the urine and toilet with bleach for 6 hours following a treatment.
- ☐ 3. clean the bathroom daily with disinfectant wipes.
- ☐ 4. use a separate bathroom from the rest of the family for the next 8 weeks.

20. A nurse is planning care for a client who underwent a percutaneous needle biopsy of the kidney. What should the nurse plan to do immediately after the biopsy? Select all that apply.

- ☐ 1. Assess the biopsy site.
- ☐ 2. Take vital signs every hour.
- ☐ 3. Assess urine for hematuria.
- ☐ 4. Place the client in a prone position.
- ☐ 5. Assess the client for chest pain.

The Client with Renal Calculi

21. A client had a lithotripsy to treat renal calculi. The client is having ureteral spasms and hematuria. What should the nurse do? Select all that apply.

- ☐ 1. Strain all urine.
- ☐ 2. Apply a heating pad to the lower back area.
- ☐ 3. Contact the healthcare provider (HCP) to report hematuria.
- ☐ 4. Encourage fluid intake of 1,000 mL/day.
- ☐ 5. Assess pain level.

22. A client has renal colic due to renal lithiasis. What is the nurse's **first** priority in managing care for this client?

- ☐ 1. Do not allow the client to ingest fluids.
- ☐ 2. Encourage the client to drink at least 500 mL of water each hour.
- ☐ 3. Request the central supply department to send supplies for straining urine.
- ☐ 4. Administer an opioid analgesic as prescribed.

23. A client is admitted to the hospital with a diagnosis of renal calculi. The client is experiencing severe flank pain and nausea; the temperature is 100.6°F (38.1°C). Which outcome is a **priority** for this client?

- ☐ 1. prevention of urinary tract complications
- ☐ 2. alleviation of nausea
- ☐ 3. alleviation of pain
- ☐ 4. maintenance of fluid and electrolyte balance

24. The client is scheduled to have a kidney, ureter, and bladder (KUB) radiograph. To prepare the client for this procedure, the nurse should explain to the client that:

- ☐ 1. fluid and food will be withheld the morning of the examination.
- ☐ 2. a tranquilizer will be given before the examination.
- ☐ 3. an enema will be given before the examination.
- ☐ 4. no special preparation is required for the examination.

25. In addition to nausea and severe flank pain, a female client with renal calculi has pain in the groin and bladder. The nurse should assess the client further for signs of:

- ☐ 1. nephritis.
- ☐ 2. referred pain.
- ☐ 3. urine retention.
- ☐ 4. additional stone formation.

26. Which is likely to provide the **most** relief from the pain associated with renal colic?

- ☐ 1. applying moist heat to the flank area
- ☐ 2. administering meperidine
- ☐ 3. encouraging high fluid intake
- ☐ 4. maintaining complete bed rest

27. A client who has been diagnosed with renal calculi reports that the pain is intermittent and less colicky. Which nursing action is **most** important at this time?

- ☐ 1. Report hematuria to the healthcare provider (HCP).
- ☐ 2. Strain the urine carefully.
- ☐ 3. Administer meperidine every 3 hours.
- ☐ 4. Apply warm compresses to the flank area.

28. The client is scheduled for an intravenous pyelogram (IVP) to determine the location of the renal calculi. Which action would be **most** important for the nurse to include in pretest preparation?

- ☐ 1. Ensure adequate fluid intake on the day of the test.

- ☐ 2. Prepare the client for the possibility of bladder spasms during the test.
- ☐ 3. Check the client's history for allergy to iodine.
- ☐ 4. Determine when the client last had a bowel movement.

29. After an intravenous pyelogram (IVP), the nurse should include which measure in the client's plan of care?

- ☐ 1. Maintain bed rest.
- ☐ 2. Encourage adequate fluid intake.
- ☐ 3. Assess for hematuria.
- ☐ 4. Administer a laxative.

30. A client has a ureteral catheter in place after renal surgery. A **priority** nursing action for care of the ureteral catheter is to:

- ☐ 1. irrigate the catheter with 30 mL of normal saline every 8 hours.
- ☐ 2. ensure that the catheter is draining freely.
- ☐ 3. clamp the catheter every 2 hours for 30 minutes.
- ☐ 4. ensure that the catheter drains at least 30 mL/h.

31. Which would be the **most** appropriate measure for preventing the development of a paralytic ileus in a client who has undergone renal surgery?

- ☐ 1. Encourage the client to ambulate every 2 to 4 hours.
- ☐ 2. Offer 3 to 4 oz (90 to 120 mL) of a carbonated beverage periodically.
- ☐ 3. Encourage use of a stool softener.
- ☐ 4. Continue IV fluid therapy.

32. The nurse is conducting a postoperative assessment of a client on the first day after renal surgery. The nurse should report which finding to the healthcare provider (HCP)?

- ☐ 1. temperature, 99.8°F (37.7°C)
- ☐ 2. urine output, 20 mL/h
- ☐ 3. absence of bowel sounds
- ☐ 4. a 2" × 2" (5 cm × 5 cm) area of serosanguineous drainage on the flank dressing

33. A client with a history of renal calculi formation is being discharged after surgery to remove the calculus. What instruction should the nurse

include in the client's discharge teaching plan?

- ☐ 1. Increase daily fluid intake to at least 2 to 3 L.
- ☐ 2. Strain urine at home regularly.
- ☐ 3. Eliminate dairy products from the diet.
- ☐ 4. Follow measures to alkalinize the urine.

34. Because a client's renal stone was found to be composed of uric acid, a low-purine, alkaline-ash diet was prescribed. Incorporation of which food items into the home diet would indicate that the client understands the necessary diet modifications?

- ☐ 1. milk, apples, tomatoes, and corn
- ☐ 2. eggs, spinach, dried peas, and gravy
- ☐ 3. salmon, chicken, caviar, and asparagus
- ☐ 4. grapes, corn, cereals, and liver

35. Allopurinol, 200 mg/day, is prescribed for the client with renal calculi to take at home. The nurse should teach the client about which adverse effect of this medication?

- ☐ 1. retinopathy
- ☐ 2. maculopapular rash
- ☐ 3. nasal congestion
- ☐ 4. dizziness

36. A client has been prescribed allopurinol for renal calculi that are caused by high uric acid levels. Which symptoms indicate the client is experiencing adverse effects of this drug? Select all that apply.

- ☐ 1. nausea
- ☐ 2. rash
- ☐ 3. constipation
- ☐ 4. flushed skin
- ☐ 5. bone marrow depression

37. The nurse is reviewing laboratory reports for a client who is taking allopurinol. Which finding indicates that the drug has had a therapeutic effect?

- ☐ 1. decreased urine alkaline phosphatase level
- ☐ 2. increased urine calcium excretion
- ☐ 3. increased serum calcium level
- ☐ 4. decreased serum uric acid level

The Client with Acute Renal Failure

38. A client is to receive peritoneal dialysis. To prepare for the procedure, the nurse should:

- ☐ 1. assess the dialysis access for a bruit and thrill.
- ☐ 2. insert an indwelling urinary catheter and drain all urine from the bladder.
- ☐ 3. ask the client to turn toward the left side.
- ☐ 4. warm the dialysis solution in the warmer.

39. A client has been admitted with acute renal failure. What should the nurse do? Select all that apply.

- ☐ 1. Elevate the head of the bed 30 to 45 degrees.
- ☐ 2. Take vital signs.
- ☐ 3. Establish an IV access site.
- ☐ 4. Call the admitting healthcare provider (HCP) for prescriptions.
- ☐ 5. Contact the hemodialysis unit.

40. Which initial manifestation of acute renal failure is the **most** common?

- ☐ 1. dysuria
- ☐ 2. anuria
- ☐ 3. hematuria
- ☐ 4. oliguria

41. A client developed cardiogenic shock after a severe myocardial infarction and has now developed acute renal failure. The client's family asks the nurse why the client has developed acute renal failure. The nurse should base the response on the knowledge that there was:

- ☐ 1. a decrease in the blood flow through the kidneys.
- ☐ 2. an obstruction of urine flow from the kidneys.

- ☐ 3. a blood clot formed in the kidneys.
- ☐ 4. structural damage to the kidney resulting in acute tubular necrosis.

42. The client who is in acute renal failure has an elevated blood urea nitrogen (BUN). What is the **likely** cause of this finding?

- ☐ 1. fluid retention
- ☐ 2. hemolysis of red blood cells
- ☐ 3. below-normal metabolic rate
- ☐ 4. reduced renal blood flow

43. The client's serum potassium level is elevated in acute renal failure, and the nurse administers sodium polystyrene sulfonate. The mechanism of action for this drug is to:

- ☐ 1. increase potassium excretion from the colon.
- ☐ 2. release hydrogen ions for sodium ions.
- ☐ 3. increase calcium absorption in the colon.
- ☐ 4. exchange sodium for potassium ions in the colon.

44. A client with acute renal failure has an increase in the serum potassium level. The nurse should monitor the client for:

- ☐ 1. cardiac arrest.
- ☐ 2. pulmonary edema.
- ☐ 3. circulatory collapse.
- ☐ 4. hemorrhage.

45. A high-carbohydrate, low-protein diet is prescribed for the client with acute renal failure. The intended outcome of this diet is to:

- ☐ 1. act as a diuretic.
- ☐ 2. reduce demands on the liver.
- ☐ 3. help maintain urine acidity.
- ☐ 4. prevent the development of ketosis.

46. The client with acute renal failure asks the nurse for a snack. Because the client's potassium level is elevated, which snack is **most** appropriate?

- ☐ 1. a gelatin dessert
- ☐ 2. yogurt

- ☐ 3. an orange
- ☐ 4. peanuts

47. In the oliguric phase of acute renal failure, the nurse should assess the client for:

- ☐ 1. pulmonary edema.
- ☐ 2. metabolic alkalosis.
- ☐ 3. hypotension.
- ☐ 4. hypokalemia.

48. The client in acute renal failure has an external cannula inserted in the forearm for hemodialysis. Which nursing measure is appropriate for the care of this client?

- ☐ 1. Use the unaffected arm for blood pressure measurements.
- ☐ 2. Draw blood from the cannula for routine laboratory work.
- ☐ 3. Percuss the cannula for bruits each shift.
- ☐ 4. Inject heparin into the cannula each shift.

49. During dialysis, the client has disequilibrium syndrome. The nurse should **first**:

- ☐ 1. administer oxygen per nasal cannula.
- ☐ 2. slow the rate of dialysis.
- ☐ 3. reassure the client that the symptoms are normal.
- ☐ 4. place the client in Trendelenburg's position.

50. Which abnormal blood value would not be improved by dialysis treatment?

- ☐ 1. elevated serum creatinine level
- ☐ 2. hyperkalemia
- ☐ 3. decreased hemoglobin concentration
- ☐ 4. hypernatremia

51. The nurse teaches the client how to recognize infection in the shunt by telling the client to assess the shunt each day for:

- ☐ 1. absence of a bruit.
- ☐ 2. sluggish capillary refill time.

- ☐ 3. coolness of the involved extremity.
- ☐ 4. swelling at the shunt site.

52. The client with acute renal failure is recovering and asks the nurse, “Will my kidneys ever function normally again?” The nurse’s response is based on knowledge that the client’s renal status will **most** likely:

- ☐ 1. continue to improve over a period of weeks.
- ☐ 2. result in the need for permanent hemodialysis.
- ☐ 3. improve only if the client receives a renal transplant.
- ☐ 4. result in end-stage renal failure.

The Client with Urinary Tract Infection

53. The nurse is teaching an older adult with a urinary tract infection about the importance of increasing fluids in the diet. What puts this client at a risk for not obtaining sufficient fluids?

- ☐ 1. diminished liver function
- ☐ 2. increased production of antidiuretic hormone
- ☐ 3. decreased production of aldosterone
- ☐ 4. decreased ability to detect thirst

54. A client with a urinary tract infection is to take nitrofurantoin four times each day. The client asks the nurse, “What should I do if I forget a dose?” What should the nurse tell the client?

- ☐ 1. “You can wait and take the next dose when it is due.”
- ☐ 2. “Double the amount prescribed with your next dose.”
- ☐ 3. “Take the prescribed dose as soon as you remember it, and if it is very close to the time for the next dose, delay that next dose.”
- ☐ 4. “Take a lot of water with a double amount of your prescribed dose.”

55. What should the nurse do to prevent catheter-associated urinary tract infection (CAUTI)? Select all that apply.

- ☐ 1. Change the catheter daily.
- ☐ 2. Provide perineal care several times a day.
- ☐ 3. Monitor the temperature as an indicator of the infection.

- ☐ 4. Encourage the client to drink 3,000 mL fluids daily.
- ☐ 5. Recommend the healthcare provider (HCP) prescribe antibiotics.

56. A nurse is assessing a client with a urinary tract infection who takes an antihypertensive drug. The nurse reviews the client's urinalysis results (see chart). The nurse should:

Laboratory Results

Test	Result
pH	6.8
Red blood cells	3 per high power field
Color	Yellow
Specific gravity	1.030

- ☐ 1. encourage the client to increase fluid intake.
- ☐ 2. withhold the next dose of antihypertensive medication.
- ☐ 3. restrict the client's sodium intake.
- ☐ 4. encourage the client to eat at least half of a banana per day.

57. A client has nephropathy. The healthcare provider (HCP) prescribes a 24-hour urine collection for creatinine clearance. Which action is necessary to ensure proper collection of the specimen?

- ☐ 1. Collect the urine in a preservative-free container and keep it on ice.
- ☐ 2. Inform the client to discard the last voided specimen at the conclusion of urine collection.
- ☐ 3. Obtain a self-report of the client's weight before beginning the collection of urine.
- ☐ 4. Request a prescription for insertion of an indwelling urinary catheter.

58. A client who weighs 207 lb (94.1 kg) is to receive 1.5 mg/kg of

gentamicin sulfate IV three times each day. How many milligrams of medication should the nurse administer for each dose? Round to the nearest whole number.

_____ mg.

59. A 24-year-old female client comes to an ambulatory care clinic in moderate distress with a probable diagnosis of acute cystitis. When obtaining the client's history, the nurse should ask the client if she has had:

- ☐ 1. fever and chills.
- ☐ 2. frequency and burning on urination.
- ☐ 3. flank pain and nausea.
- ☐ 4. hematuria.

60. The client asks the nurse, "How did I get this urinary tract infection?" The nurse should explain that in **most** instances, cystitis is caused by:

- ☐ 1. congenital strictures in the urethra.
- ☐ 2. an infection elsewhere in the body.
- ☐ 3. urinary stasis in the urinary bladder.
- ☐ 4. an ascending infection from the urethra.

61. The client, who is a newlywed, is afraid to discuss her diagnosis of cystitis with her husband. Which approach would be **best**?

- ☐ 1. Arrange a meeting with the client, her husband, the healthcare provider (HCP), and the nurse.
- ☐ 2. Insist that the client talk with her husband because good communication is necessary for a successful marriage.
- ☐ 3. Talk first with the husband alone and then with both of them together to share the husband's reactions.
- ☐ 4. Spend time with the client addressing her concerns and then, if the client requests, stay with her while she talks with her husband.

62. The nurse teaches a female client who has cystitis methods to relieve her discomfort until the antibiotic takes effect. Which response by the client would indicate that she understands the nurse's instructions?

- ☐ 1. "I will place ice packs on my perineum."
- ☐ 2. "I will take hot tub baths."

- ☐ 3. "I will drink a cup of warm tea every hour."
- ☐ 4. "I will void every 5 to 6 hours."

63. The client with first-time bacterial cystitis is being treated with an antibiotic to be taken for 7 days. The nurse should instruct the client to:

- ☐ 1. limit fluids to 1,000 mL/day.
- ☐ 2. notify the healthcare provider (HCP) when the urine is clear.
- ☐ 3. take the entire prescription as ordered.
- ☐ 4. use condoms if having sex.

64. When teaching the client with a urinary tract infection about taking a prescribed antibiotic for 7 days, the nurse should tell the client to report which symptoms to the healthcare provider (HCP)? Select all that apply.

- ☐ 1. cloudy urine for the first few days
- ☐ 2. blood in the urine
- ☐ 3. rash
- ☐ 4. mild nausea
- ☐ 5. fever above 100°F (37.8°C)
- ☐ 6. urinating every 3 to 4 hours

65. A client has been prescribed nitrofurantoin for treatment of a lower urinary tract infection. Which instructions should the nurse include when teaching the client about this medication? Select all that apply.

- ☐ 1. "Take the medication on an empty stomach."
- ☐ 2. "Your urine may become brown in color."
- ☐ 3. "Increase your fluid intake."
- ☐ 4. "Take the medication until your symptoms subside."
- ☐ 5. "Take the medication with an antacid to decrease gastrointestinal distress."

66. Nitrofurantoin, 75 mg four times per day, has been prescribed for a client with a lower urinary tract infection. The medication comes in an oral suspension of 25 mg/5 mL. How many milliliters should the nurse administer for each dose? Record your answer using a whole number.

_____ mL.

67. Which statements by a female client would indicate that she is at high risk for a recurrence of cystitis?

- ☐ 1. "I can usually go 8 to 10 hours without needing to empty my bladder."
- ☐ 2. "I take a tub bath every evening."
- ☐ 3. "I wipe from front to back after voiding."
- ☐ 4. "I work out by lifting weights three times a week."

68. To prevent recurrence of cystitis, the nurse should plan to encourage the female client to include which measure in her daily routine?

- ☐ 1. wearing cotton underpants
- ☐ 2. increasing citrus juice intake
- ☐ 3. douching regularly with 0.25% acetic acid
- ☐ 4. using vaginal sprays

69. The nurse explains to the client the importance of drinking large quantities of fluid to prevent cystitis. The nurse should tell the client to drink:

- ☐ 1. twice as much fluid as usual.
- ☐ 2. at least 1,000 mL more than usual.
- ☐ 3. as much water or juice, as possible.
- ☐ 4. at least 3,000 mL of fluids daily.

The Client with Pyelonephritis

70. A client is at risk for acute pyelonephritis. The nurse should instruct the client about which health promotion behaviors that will be **most** effective in preventing pyelonephritis?

- ☐ 1. Wash the perineum with warm water and soap, cleaning from front to back.
- ☐ 2. Treat fungal infections such as athlete's foot immediately.
- ☐ 3. Have a pneumonia immunization to prevent streptococcal infection.
- ☐ 4. Treat skin lesions with antibiotics, and cover any open lesions.

71. A client is diagnosed with acute pyelonephritis. What should the nurse instruct the client to do?

- ☐ 1. Urinate frequently.

- ☐ 2. Take bubble baths instead of showers.
- ☐ 3. Take antibiotics for the rest of the client's life.
- ☐ 4. Decrease fluid intake.

72. Which factor would put the client at increased risk for pyelonephritis?

- ☐ 1. history of hypertension
- ☐ 2. intake of large quantities of cranberry juice
- ☐ 3. fluid intake of 2,000 mL/day
- ☐ 4. history of diabetes mellitus

73. The client with pyelonephritis asks the nurse, "How will I know whether the antibiotics are effectively treating my infection?" What should the nurse tell the client?

- ☐ 1. "After you take the antibiotics for 2 weeks, you will not have any infection."
- ☐ 2. "Your healthcare provider can tell by the color and odor of your urine."
- ☐ 3. "Your healthcare provider will take a urine culture."
- ☐ 4. "When your symptoms disappear, you will know that your infection is gone."

74. The nurse is to administer 1,200 mg of an antibiotic. The drug is prepared with 6 g of the drug in 2 mL of solution. The nurse should administer how many milliliters of the drug? Record your answer using one decimal point.

_____ mL.

75. The client with acute pyelonephritis wants to know the possibility of developing chronic pyelonephritis. The nurse's response is based on knowledge of which disorder that **most** commonly leads to chronic pyelonephritis?

- ☐ 1. acute pyelonephritis
- ☐ 2. recurrent urinary tract infections
- ☐ 3. acute renal failure
- ☐ 4. glomerulonephritis

76. A client is diagnosed with pyelonephritis. Which nursing action is a

priority for care now?

- ☐ 1. Monitor hemoglobin levels.
- ☐ 2. Insert a urinary catheter.
- ☐ 3. Stress importance of use of long-term antibiotics.
- ☐ 4. Ensure sufficient hydration.

The Client with Chronic Renal Failure

77. A client with end-stage renal failure has an internal arteriovenous fistula in the left arm for vascular access during hemodialysis. What should the nurse instruct the client to do? Select all that apply.

- ☐ 1. Remind healthcare providers (HCPs) to draw blood from veins on the left side.
- ☐ 2. Avoid sleeping on the left arm.
- ☐ 3. Wear wristwatch on the right arm.
- ☐ 4. Assess fingers on the left arm for warmth.
- ☐ 5. Obtain BP from the left arm.

78. A client with end-stage chronic renal failure is admitted to the hospital with a serum potassium level of 7 mEq/L. In what order of priority from first to last does the nurse perform the prescriptions? All options must be used.

1. Administer calcium gluconate.

2. Start an IV access site.

3. Administer sodium polystyrene sulfonate.

4. Attach the client to a cardiac monitor.

79. A client with chronic renal failure is receiving hemodialysis three times a week. In order to protect the fistula, the nurse should:

- ☐ 1. take the blood pressure in the arm with the fistula.
- ☐ 2. report the loss of a thrill or bruit on the arm with the fistula.
- ☐ 3. maintain a pressure dressing on the shunt.
- ☐ 4. start a second IV in the arm with the fistula.

80. A client with chronic renal failure who receives hemodialysis three times a week is experiencing severe nausea. What should the nurse advise the client to do to manage the nausea? Select all that apply.

- ☐ 1. Drink fluids before eating solid foods.
- ☐ 2. Have limited amounts of fluids only when thirsty.
- ☐ 3. Limit activity.
- ☐ 4. Keep all dialysis appointments.
- ☐ 5. Eat smaller, more frequent meals.

81. The dialysis solution is warmed before use in peritoneal dialysis primarily to:

- ☐ 1. encourage the removal of serum urea.
- ☐ 2. force potassium back into the cells.
- ☐ 3. add extra warmth to the body.
- ☐ 4. promote abdominal muscle relaxation.

82. A client is receiving peritoneal dialysis. While the dialysis solution is dwelling in the client's abdomen, the nurse should:

- ☐ 1. assess for urticaria.
- ☐ 2. observe respiratory status.
- ☐ 3. check capillary refill time.
- ☐ 4. monitor electrolyte status.

83. During the peritoneal dialysis, the nurse observes that the solution draining from the client's abdomen is consistently blood tinged. The client

has a permanent peritoneal catheter in place. The nurse should recognize that the bleeding:

- ☐ 1. is expected with a permanent peritoneal catheter.
- ☐ 2. indicates abdominal blood vessel damage.
- ☐ 3. can indicate kidney damage.
- ☐ 4. is caused by too-rapid infusion of the dialysate.

84. During peritoneal dialysis, the nurse observes that the flow of dialysate stops before all the solution has drained out. The nurse should:

- ☐ 1. have the client sit in a chair.
- ☐ 2. turn the client from side to side.
- ☐ 3. reposition the peritoneal catheter.
- ☐ 4. have the client walk.

85. A client undergoing long-term peritoneal dialysis at home is currently experiencing a reduced outflow from the dialysis catheter. To determine if the catheter is obstructed, the nurse should inquire whether the client has:

- ☐ 1. diarrhea.
- ☐ 2. vomiting.
- ☐ 3. flatulence.
- ☐ 4. constipation.

86. Which should be included in the client's plan of care during dialysis therapy?

- ☐ 1. Limit the client's visitors.
- ☐ 2. Monitor the client's blood pressure.
- ☐ 3. Pad the side rails of the bed.
- ☐ 4. Keep the client on nothing-by-mouth (NPO) status.

87. The client performs self peritoneal dialysis. What should the nurse teach the client about preventing peritonitis? Select all that apply.

- ☐ 1. Broad-spectrum antibiotics may be administered to prevent infection.
- ☐ 2. Antibiotics may be added to the dialysate to treat peritonitis.
- ☐ 3. Clean technique is permissible for prevention of peritonitis.
- ☐ 4. Peritonitis is characterized by cloudy dialysate drainage and abdominal

discomfort.

☐ 5. Peritonitis is the most common and serious complication of peritoneal dialysis.

88. After completion of peritoneal dialysis, the nurse should assess the client for:

- ☐ 1. hematuria.
- ☐ 2. weight loss.
- ☐ 3. hypertension.
- ☐ 4. increased urine output.

89. Aluminum hydroxide gel is prescribed for the client with chronic renal failure to take at home. What is the expected outcome of giving this drug?

- ☐ 1. relieving the pain of gastric hyperacidity
- ☐ 2. preventing Curling's stress ulcers
- ☐ 3. binding phosphate in the intestine
- ☐ 4. reversing metabolic acidosis

90. The nurse teaches the client with chronic renal failure when to take aluminum hydroxide gel. Which statement indicates that the client understands the teaching?

- ☐ 1. "I will take it every 4 hours around the clock."
- ☐ 2. "I will take it between meals and at bedtime."
- ☐ 3. "I will take it when I have an upset stomach."
- ☐ 4. "I will take it with meals and bedtime snacks."

91. Which teaching approach for the client with chronic renal failure who has difficulty concentrating due to high uremia levels would be **most** appropriate?

- ☐ 1. Provide all needed teaching in one extended session.
- ☐ 2. Validate the client's understanding of the material frequently.
- ☐ 3. Conduct a one-on-one session with the client.
- ☐ 4. Use video clips to reinforce the material as needed.

92. The nurse is instructing the client with chronic renal failure to maintain adequate nutritional intake. Which diet would be **most** appropriate?

- ☐ 1. high-carbohydrate, high-protein
- ☐ 2. high-calcium, high-potassium, high-protein
- ☐ 3. low-protein, low-sodium, low-potassium
- ☐ 4. low-protein, high-potassium

93. The nurse is discussing concerns about sexual activity with a client with chronic renal failure. Which strategy would be **most** useful?

- ☐ 1. Help the client to accept that sexual activity will be decreased.
- ☐ 2. Suggest using alternative forms of sexual expression and intimacy.
- ☐ 3. Tell the client to plan rest periods after sexual activity.
- ☐ 4. Refer the client to a counselor.

94. A client with chronic renal failure has asked to be evaluated for a home continuous ambulatory peritoneal dialysis (CAPD) program. The nurse should explain that the major advantage of this approach is that it:

- ☐ 1. is relatively low in cost.
- ☐ 2. allows the client to be more independent.
- ☐ 3. is faster and more efficient than standard peritoneal dialysis.
- ☐ 4. has fewer potential complications than does standard peritoneal dialysis.

95. The client asks about diet changes when using continuous ambulatory peritoneal dialysis (CAPD). Which response by the nurse would be **best**?

- ☐ 1. "Diet restrictions are more rigid with CAPD because standard peritoneal dialysis is a more effective technique."
- ☐ 2. "Diet restrictions are the same for both CAPD and standard peritoneal dialysis."
- ☐ 3. "Diet restrictions with CAPD are fewer than with standard peritoneal dialysis because dialysis is constant."
- ☐ 4. "Diet restrictions with CAPD are fewer than with standard peritoneal dialysis because CAPD works more quickly."

96. A client is receiving continuous ambulatory peritoneal dialysis (CAPD). The nurse should assess the client for which sign of peritoneal - infection?

- ☐ 1. cloudy dialysate fluid

- ☐ 2. swelling in the legs
- ☐ 3. poor drainage of the dialysate fluid
- ☐ 4. redness at the catheter insertion site

The Client with Urinary Incontinence

97. A client who is 70 years of age and lives alone has stress incontinence. To prevent incontinence, the nurse advises the client to:

- ☐ 1. ask someone else to lift heavy objects.
- ☐ 2. wear disposable protective underwear.
- ☐ 3. perform perineal muscle exercises (i.e., Kegel exercises).
- ☐ 4. apply estrogen vaginal cream to the urinary meatus after each intentional voiding.

98. What should the nurse teach the client to do to prevent stress incontinence? Select all that apply.

- ☐ 1. Use techniques that strengthen the sphincter and structural supports of the bladder, such as Kegel exercises.
- ☐ 2. Avoid natural diuretics such as caffeine or alcoholic beverages.
- ☐ 3. Carry an extra incontinence pad when away from home.
- ☐ 4. Maintain a fluid intake of 500 mL/day.
- ☐ 5. Refrain from coughing or laughing.

99. A client has stress incontinence. Which data from the client's history contribute to the client's incontinence?

- ☐ 1. the client's intake of 2 to 3 L of fluid per day
- ☐ 2. the client's history of three full-term pregnancies
- ☐ 3. the client's age of 45 years
- ☐ 4. the client's history of competitive swimming

100. The **primary** goal of nursing care for a client with stress incontinence is to:

- ☐ 1. help the client adjust to the frequent episodes of incontinence.
- ☐ 2. eliminate all episodes of incontinence.
- ☐ 3. prevent the development of urinary tract infections.

- ☐ 4. decrease the number of incontinence episodes.

101. The nurse is developing a teaching plan for a client with stress incontinence. Which instruction should be included?

- ☐ 1. Avoid activities that are stressful and upsetting.
- ☐ 2. Avoid caffeine and alcohol.
- ☐ 3. Do not wear a girdle.
- ☐ 4. Limit physical exertion.

102. A client has urge incontinence. When obtaining the health history, the nurse should ask if the client has:

- ☐ 1. inability to empty the bladder.
- ☐ 2. loss of urine when coughing.
- ☐ 3. involuntary urination with minimal warning.
- ☐ 4. frequent dribbling of urine.

103. Which nursing action is **most** appropriate for a client who has urge incontinence?

- ☐ 1. Have the client urinate on a timed schedule.
- ☐ 2. Provide a bedside commode.
- ☐ 3. Administer prophylactic antibiotics.
- ☐ 4. Teach the client intermittent self-catheterization technique.

Managing Care, Quality, and Safety of Clients with Urinary Tract Health Problems

104. Which hospitalized client is at **highest** risk for catheter-associated urinary tract infection (CAUTI)?

- ☐ 1. client with diabetes mellitus
- ☐ 2. client who had one course of antibiotic therapy
- ☐ 3. client with a family history of UTIs
- ☐ 4. client with a urinary calculus

105. A client is scheduled for an intravenous pyelogram (IVP). The evening before the procedure, the nurse learns that the client has a sensitivity to shellfish. The nurse should:

- ☐ 1. administer a cathartic to the client to empty the colon.
- ☐ 2. administer an antiflatulent to the client to relieve gas.
- ☐ 3. keep the client on nothing-by-mouth (NPO) status.
- ☐ 4. cancel the IVP and notify the healthcare provider (HCP).

106. The nurse finds a container with the client's urine specimen sitting on a counter in the bathroom. The client states that the specimen has been sitting in the bathroom for at least 2 hours. The nurse should:

- ☐ 1. discard the urine and obtain a new specimen.
- ☐ 2. send the urine to the laboratory as quickly as possible.
- ☐ 3. add fresh urine to the collected specimen and send the specimen to the laboratory.
- ☐ 4. refrigerate the specimen until it can be transported to the laboratory.

107. A client with early acute renal failure has anemia, tachycardia, hypotension, and shortness of breath. The healthcare provider (HCP) has -prescribed 2 units of packed red blood cells (RBCs). What should the nurse determine prior to initiating the blood transfusion? Select all that apply.

- ☐ 1. There is an IV access with the appropriate tubing and normal saline as the priming solution.
- ☐ 2. There is a signed informed consent for transfusion therapy.
- ☐ 3. Blood typing and cross-matching are documented in the medical record.
- ☐ 4. The vital signs have been taken and documented in accordance with facility policy and procedure.
- ☐ 5. There is the second unit of blood in the medication room.
- ☐ 6. The client has an identification bracelet.

108. The nurse is instructing the unlicensed assistive personnel (UAP) about the correct technique for obtaining a clean-catch urine culture from a female client. Which statement indicates that the UAP has understood the instructions?

- ☐ 1. "I will have the client completely empty her bladder into the specimen cup."
- ☐ 2. "I will need to catheterize the client to get the urine specimen."

- ☐ 3. “I will ask the client to clean her labia, void into the toilet, and then into the specimen cup.”
- ☐ 4. “I will obtain the specimen in the afternoon after the client has had plenty of fluids.”

109. An elderly client admitted with new-onset confusion, headache, poor skin turgor, bounding pulse, and urinary incontinence has been drinking copious amounts of water. Upon reviewing the lab results, the nurse discovers a sodium level of 122 mEq/L (122 mmol/L). A report to the healthcare provider (HCP) should include what recommendations? Select all that apply.

- ☐ 1. fluid restriction
- ☐ 2. encourage fluids
- ☐ 3. vital signs every 4 hours instead of every shift
- ☐ 4. bed alarm
- ☐ 5. Foley catheter
- ☐ 6. strict intake and output
- ☐ 7. repeat electrolytes, urine for sodium and specific gravity in the morning
- ☐ 8. 2-g sodium diet

110. Which of the responsibilities related to the care of a client with a Foley catheter are appropriate for the nurse to delegate to the unlicensed assistive personnel (UAP)? Select all that apply.

- ☐ 1. Flush the catheter as needed to ensure patency.
- ☐ 2. Empty drainage bag, and record output at specified times.
- ☐ 3. Apply catheter-securing device to client’s leg.
- ☐ 4. Perform bladder irrigation as prescribed.
- ☐ 5. Provide Foley catheter and perineal care each shift.
- ☐ 6. Ensure the urine drainage bag is below the level of the bladder at all times.

111. The client is to receive antibiotic intravenous (IV) therapy in the home. The nurse should develop a teaching plan to ensure that the client and family can manage the IV fluid and infusion correctly and avoid complications. What should the nurse instruct the client to do? Select all that

apply.

- ☐ 1. Report signs of redness or inflammation at the site.
- ☐ 2. Wear sterile gloves to change the fluids.
- ☐ 3. Call the healthcare provider (HCP) for a temperature above 100°F (37.8°C).
- ☐ 4. Cleanse the port with alcohol wipes.
- ☐ 5. Place the IV bag on a table level with the client's arm.

112. Prior to discharging a client with end-stage cancer of the bladder from the hospital, what should the nurse do? Select all that apply.

- ☐ 1. Determine if the client is likely to become suicidal.
- ☐ 2. Give a list of the client's medications to the client before discharge.
- ☐ 3. Instruct the client to update information when medications are discontinued, doses are changed, or new medications are added.
- ☐ 4. Explain the need to carry medication information with the client at all times.
- ☐ 5. Instruct the client that the use of over-the-counter products need not be reported to the healthcare provider (HCP).

Answers, Rationales, and Test-Taking Strategies

*The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in Part 1 of this book.*

The Client with Cancer of the Bladder

1. 1,4. An adequate fluid intake aids in the prevention of urinary calculi and infection. Odor-producing foods can produce offensive odors that may

impact the client's lifestyle and relationships. Lack of activity leads to urinary stasis, which promotes urinary calculi development and infection. Acidic urine helps prevent urinary tract infections. Tight clothing over the stoma obstructs blood circulation and urine flow.

CN: Reduction of risk potential; CL: Synthesize

2. 1,2,3. Dermatitis with alkaline encrustations may occur when alkaline urine comes in contact with exposed skin. Yeast infections (or fungal infections) are another common peristomal skin problem. If the stoma is irritated from rubbing, there will be bleeding. The nurse and client should avoid irritating the stoma. Adhesive solvent should be used on a gauze pad to remove old adhesive and should, therefore, not contact the stoma directly. Only a minimal amount of skin cement is applied to the faceplate of the collection bag and skin to secure the appliance over the stoma, so obstruction of the stoma by the cement would not be possible if correct technique is followed.

CN: Physiological adaptation; CL: Evaluate

3. 3. The nurse should verify that the client has voided prior to discharge in order to evaluate bladder function. Bowel function is not expected to be affected by this procedure. There may not be a need for pain medication immediately postprocedure and before discharge, but the nurse should assess the client's pain status and inform the client about the use and side effects of the medication. It is normal for the client to have hematuria because of the procedure.

CN: Management of care; CL: Synthesize

4. 3. Painless hematuria is the most common clinical finding in bladder cancer. Other symptoms include urinary frequency, dysuria, and urinary urgency, but these are not as common as hematuria. Suprapubic pain and urine retention do not occur in bladder cancer.

CN: Physiological adaptation; CL: Analyze

5. 2. Chills could indicate the onset of acute infection that can progress to septic shock. Dizziness would not be an anticipated symptom after a cystoscopy. Pink-tinged urine and bladder spasms are common after

cystoscopy.

CN: Reduction of risk potential; CL: Analyze

6. 4. Lower abdominal pain after a cystoscopy is frequently caused by bladder spasms. Warm water can help relax muscles. Ice is not effective in relieving spasms. Massage and ambulation may increase bladder irritability.

CN: Basic care and comfort; CL: Synthesize

7. 3. An ileal conduit is a permanent urinary diversion in which a portion of the ileum is surgically resected and one end of the segment is closed. The ureters are surgically attached to this segment of the ileum, and the open end of the ileum is brought to the skin surface on the abdomen to form the stoma. The client must wear a pouch to collect the urine that continually flows through the conduit. The bladder is removed during the surgical procedure, and the ileal conduit is not reversible. Diversion of urine to the sigmoid colon is called a *ureteroileosigmoidostomy*. An opening in the bladder that allows urine to drain externally is called a *cystostomy*.

CN: Reduction of risk potential; CL: Apply

8. 2. After pelvic surgery, there is an increased chance of thrombophlebitis owing to the pelvic manipulation that can interfere with circulation and promote venous stasis. Peritonitis is a potential complication of any abdominal surgery, not just pelvic surgery. Ascites is most frequently an indication of liver disease. Inguinal hernia may be caused by an increase in intra-abdominal pressure or a congenital weakness of the abdominal wall; ventral hernia occurs at the site of a previous abdominal incision.

CN: Reduction of risk potential; CL: Analyze

9. 4. Mucus is secreted by the intestinal segment used to create the conduit and is a normal occurrence. The client should be encouraged to maintain a large fluid intake to help flush the mucus out of the conduit. Because mucus in the urine is expected, it is not necessary to change the appliance bag or to notify the **HCP** . The mucus is not an indication of an infection, so a urine culture is not necessary.

CN: Reduction of risk potential; CL: Synthesize

10. 4. If the appliance becomes too full, it is likely to pull away from the skin completely or to leak urine onto the skin; thus, if the seal is intact, the client is emptying the appliance regularly. The skin around the seal should not be red or irritated, which could indicate a leak. There will likely be an odor from the urine. Deep yellow urine indicates that the client should be increasing fluid intake.

CN: Physiological adaptation; CL: Evaluate

11. 1. Inserting a gauze wick into the stoma helps prevent urine leakage when changing the appliance. The stoma should not be sealed or suctioned. Oral fluids do not need to be avoided.

CN: Physiological adaptation; CL: Synthesize

12. 2. A reusable appliance should be routinely cleaned with soap and water. Other products are not necessary and may damage the appliance or be caustic to the client's skin.

CN: Physiological adaptation; CL: Apply

13. 3,4. The client with an ileal conduit must learn self-care activities related to care of the stoma and ostomy appliances. The client should be taught to increase fluid intake to about 3,000 mL/day and should not limit intake. Adequate fluid intake helps to flush mucus from the ileal conduit. The ostomy appliance should be changed approximately every 3 to 7 days and whenever a leak develops. A skin barrier is essential to protecting the skin from the irritation of the urine. An aspirin should not be used as a method of odor control because it can be an irritant to the stoma and lead to ulceration. The ostomy pouch should be emptied when it is one-third to one-half full to prevent the weight of the urine from pulling the appliance away from the skin.

CN: Reduction of risk potential; CL: Evaluate

14. 2. A distilled vinegar solution acts as a good deodorizing agent after an appliance has been cleaned well with soap and water. If the client prefers, a commercial deodorizer may be used. Salt solution does not deodorize. Ammonia and bleaching agents may damage the appliance.

CN: Basic care and comfort; CL: Apply

15. 4. It is normal for clients to express fears and concerns about the body changes associated with a urinary diversion. Allowing the client time to verbalize concerns in a supportive environment and suggesting that she discuss these concerns with people who have successfully adjusted to ostomy surgery can help her begin coping with these changes in a positive manner. Although the client may be anxious about this situation and may be feeling worthless, the underlying problem is a disturbance in body image. There are no data to indicate that the client does not know how to care for the urinary diversion.

CN: Psychosocial integrity; CL: Analyze

16. 1. The most important reason for attaching the appliance to a standard urine collection bag at night is to prevent urine reflux into the stoma and ureters, which can result in infection. Use of a standard collection bag also keeps the appliance from separating from the skin and helps prevent urine leakage from an overly full bag, but the primary purpose is to prevent reflux of urine. A client with a urinary diversion should drink 2,000 to 3,000 mL of fluid each day; it would be inappropriate to suggest decreasing fluid intake.

CN: Physiological adaptation; CL: Apply

17. 2. Maintaining a fluid intake of 2,000 to 3,000 mL/day is likely to be most effective in preventing urinary tract infection. A high fluid intake results in high urine output, which prevents urinary stasis and bacterial growth. Avoiding people with respiratory tract infections will not prevent urinary tract infections. Clean, not sterile, technique is used to change the appliance. An ileal conduit stoma is not irrigated.

CN: Physiological adaptation; CL: Synthesize

18. 4. It is important that the client empty the drainage pouch throughout the day to decrease the risk of leakage. The client does not normally need to curtail physical activity. Aspirin should never be placed in a pouch because aspirin can irritate or ulcerate the stoma. The client does not catheterize an ileal conduit stoma.

CN: Physiological adaptation; CL: Evaluate

19. 2. After intravesical chemotherapy, the client must treat the urine as a

biohazard; this involves disinfecting the urine and the toilet with household bleach for 6 hours following a treatment. It is not necessary to use a bedpan and then empty the urine in the toilet; the client can use the toilet, but must disinfect the urine with bleach. The bathroom does not need to be cleaned daily with disinfectant wipes. The client does not need to use a separate bathroom as long as the client's urine is disinfected with bleach.

CN: Physiological integrity; CL: Evaluate

20. 1,3,4. The nurse should assess the biopsy site for bleeding and hematoma formation. The client should remain prone for 8 to 24 hours after the biopsy. A pressure dressing will aid in blood coagulation. Vital signs assessment should be taken every 5 to 15 minutes for the first hour and then less often if the client is stable. The urine does not need to be collected and kept on ice. The nurse should collect serial urine specimens to assess for hematuria. A renal biopsy does not put the client at increased risk for chest pain.

CN: Reduction of risk potential; CL: Synthesize

The Client with Renal Calculi

21. 1,2,5. Following lithotripsy, the nurse strains all urine to collect and identify stone composition. Providing heat to the flank area may be helpful to relieve muscle spasms when renal colic is present; the nurse assesses the client's pain level and administers analgesics as needed. Hematuria is common after lithotripsy, and it is not necessary to notify the **HCP** 📖. The nurse should promote a fluid intake of at least 2,000 mL/day to flush stones and clots through the urinary tract.

CN: Physiological adaptation; CL: Synthesize

22. 4. If infection or blockage caused by calculi is present, a client can experience sudden severe pain in the flank area, known as *renal colic*. Pain from a kidney stone is considered an emergency situation and requires analgesic intervention. Withholding fluids will make urine more concentrated and stones more difficult to pass naturally. Forcing large quantities of fluid may cause hydronephrosis if urine is prevented from flowing past calculi. Straining urine for small stones is important, but does not take priority over

pain management.

CN: Management of care; CL: Synthesize

23. 3. The priority nursing goal for this client is to alleviate the pain, which can be excruciating. Prevention of urinary tract complications and alleviation of nausea are appropriate throughout the client's hospitalization, but relief of the severe pain is a priority. The client is at little risk for fluid and electrolyte imbalance.

CN: Physiological adaptation; CL: Synthesize

24. 4. A KUB radiographic examination ordinarily requires no preparation. It is usually done while the client lies supine and does not involve the use of radiopaque substances. It is not necessary for the client to withhold fluids; the client will not need to take a tranquilizer; an enema is not included in the preparation.

CN: Reduction of risk potential; CL: Apply

25. 2. The pain associated with renal colic due to calculi is commonly referred to the groin and bladder in female clients and to the testicles in male clients. Nausea, vomiting, abdominal cramping, and diarrhea may also be present. Nephritis or urine retention is an unlikely cause of the referred pain. The type of pain described in this situation is unlikely to be caused by additional stone formation.

CN: Physiological adaptation; CL: Analyze

26. 2. During episodes of renal colic, the pain is excruciating. It is necessary to administer opioid analgesics to control the pain. Application of heat, encouraging high fluid intake, and limitation of activity are important interventions, but they will not relieve the renal colic pain.

CN: Reduction of risk potential; CL: Synthesize

27. 2. Intermittent pain that is less colicky indicates that the calculi may be moving along the urinary tract. Fluids should be encouraged to promote movement, and the urine should be strained to detect passage of the stone. Hematuria is to be expected from the irritation of the stone. Analgesics should be administered when the client needs them, not routinely. Moist heat

to the flank area is helpful when renal colic occurs, but it is less necessary as pain is lessened.

CN: Physiological adaptation; CL: Synthesize

28. 3. A client scheduled for an IVP should be assessed for allergies to iodine and shellfish. Clients with such allergies may be allergic to the IVP dye and be at risk for an anaphylactic reaction. Adequate fluid intake is important after the examination. Bladder spasms are not common during an IVP. Bowel preparation is important before an IVP to allow visualization of the ureters and bladder, but checking for allergies is most important.

CN: Reduction of risk potential; CL: Synthesize

29. 2. After an IVP, the nurse should encourage fluids to decrease the risk of renal complications caused by the contrast agent. There is no need to place the client on bed rest or administer a laxative. An IVP would not cause hematuria.

CN: Reduction of risk potential; CL: Synthesize

30. 2. The ureteral catheter should drain freely without bleeding at the site. The catheter is rarely irrigated, and any irrigation would be done by the **healthcare provider (HCP)** . The catheter is never clamped. The client's total urine output (ureteral catheter plus voiding or indwelling urinary catheter output) should be at least 30 mL/h.

CN: Reduction of risk potential; CL: Synthesize

31. 1. Ambulation stimulates peristalsis. A client with paralytic ileus is kept on nothing-by-mouth status until peristalsis returns. Carbonated beverages will increase gas and distention but will not stimulate peristalsis. A stool softener will not stimulate peristalsis. IV fluid infusion is a routine postoperative prescription that does not have any effect on preventing paralytic ileus.

CN: Physiological adaptation; CL: Synthesize

32. 2. The decrease in urine output may reflect inadequate renal perfusion and should be reported immediately. Urine output of 30 mL/h or greater is considered acceptable. A slight elevation in temperature is expected after

surgery. Peristalsis returns gradually, usually the second or third day after surgery. Bowel sounds will be absent until then. A small amount of serosanguineous drainage is to be expected.

CN: Physiological adaptation; CL: Analyze

33. 1. A high daily fluid intake is essential for all clients who are at risk for calculi formation because it prevents urinary stasis and concentration, which can cause crystallization. Depending on the composition of the stone, the client also may be instructed to institute specific dietary measures aimed at preventing stone formation. Clients may need to limit purine, calcium, or oxalate. Urine may need to be either alkaline or acid. There is no need to strain urine regularly.

CN: Basic care and comfort; CL: Synthesize

34. 1. Because a high-purine diet contributes to the formation of uric acid, a low-purine diet is advocated. An alkaline-ash diet is also advocated because uric acid crystals are more likely to develop in acid urine. Foods that may be eaten as desired in a low-purine diet include milk, all fruits, tomatoes, cereals, and corn. Foods allowed on an alkaline-ash diet include milk, fruits (except cranberries, plums, and prunes), and vegetables (especially legumes and green vegetables). Gravy, which can be made with organ meats such as liver, chicken, and liver are high in purine. In the absence of specific information from the **healthcare provider (HCP)**  or dietician about limiting calcium, the client can include dairy products in this diet.

CN: Basic care and comfort; CL: Evaluate

35. 2. Allopurinol is used to treat renal calculi composed of uric acid. Adverse effects of allopurinol include drowsiness, maculopapular rash, anemia, abdominal pain, nausea, vomiting, and bone marrow depression. Clients should be instructed to report rashes and unusual bleeding or bruising. Retinopathy, nasal congestion, and dizziness are not adverse effects of allopurinol.

CN: Pharmacological and parenteral therapies; CL: Synthesize

36. 1,2,5. Common adverse effects of allopurinol include gastrointestinal distress, such as anorexia, nausea, vomiting, and diarrhea. A rash is another

potential adverse effect. A potentially life-threatening adverse effect is bone marrow depression. Constipation and flushed skin are not associated with this drug.

CN: Pharmacological and parenteral therapies; CL: Analyze

37. 4. By inhibiting uric acid synthesis, allopurinol decreases its excretion. The drug's effectiveness is assessed by evaluating for a decreased serum uric acid concentration. Allopurinol does not alter the level of alkaline phosphatase, nor does it affect urine calcium excretion or the serum calcium level.

CN: Pharmacological and parenteral therapies; CL: Evaluate

The Client with Acute Renal Failure

38. 4. Solution for peritoneal dialysis should be warmed to body temperature in a warmer or with a heating pad; do not use the microwave. Cold dialysate increases discomfort. Assessment for a bruit and thrill is necessary with hemodialysis when the client has a fistula, graft, or shunt. An indwelling urinary catheter is not required for this procedure. The nurse should position the client in a supine or low Fowler's position.

CN: Reduction of risk potential; CL: Synthesize

39. 1,2,3,4. Elevation of the head of the bed will promote ease of breathing. Respiratory manifestations of acute renal failure include shortness of breath, orthopnea, crackles, and the potential for pulmonary edema. Therefore, priority is placed on facilitation of respiration. The nurse should assess the vital signs because the pulse and respirations will be elevated. Establishing a site for IV therapy will become important because fluids will be administered IV in addition to orally. The **HCP** will need to be contacted for further prescriptions; there is no need to contact the hemodialysis unit.

CN: Physiological adaptation; CL: Synthesize

40. 4. Oliguria is the most common initial symptom of acute renal failure. Anuria is rarely the initial symptom. Dysuria and hematuria are not associated with acute renal failure.

CN: Physiological adaptation; CL: Analyze

41. 1. There are three categories of acute renal failure: prerenal, intrarenal, and postrenal. Causes of prerenal failure occur outside the kidney and include poor perfusion and decreased circulating volume resulting from such factors as trauma, septic shock, impaired cardiac function, and dehydration. In this case of severe myocardial infarction, there was a decrease in perfusion of the kidneys caused by impaired cardiac function. An obstruction within the urinary tract, such as from kidney stones, tumors, or benign prostatic hypertrophy, is called *postrenal failure*. Structural damage to the kidney resulting from acute tubular necrosis is called *intrarenal failure*. It is caused by such conditions as hypersensitivity (allergic disorders), renal vessel obstruction, and nephrotoxic agents.

CN: Physiological adaptation; CL: Apply

42. 4. Urea, an end product of protein metabolism, is excreted by the kidneys. Impairment in renal function caused by reduced renal blood flow results in an increase in the plasma urea level. Fluid retention, hemolysis of red blood cells, and lowered metabolic rate do not cause an elevated BUN value.

CN: Reduction of risk potential; CL: Analyze

43. 4. Polystyrene sulfonate, a cation-exchange resin, causes the body to excrete potassium through the gastrointestinal tract. In the intestines, particularly the colon, the sodium of the resin is partially replaced by potassium. The potassium is then eliminated when the resin is eliminated with feces. Although the result is to increase potassium excretion, the specific method of action is the exchange of sodium ions for potassium ions. Polystyrene sulfonate does not release hydrogen ions or increase calcium absorption.

CN: Pharmacological and parenteral therapies; CL: Apply

44. 1. Hyperkalemia places the client at risk for serious cardiac arrhythmias and cardiac arrest. Therefore, the nurse should carefully monitor the client for cardiac arrhythmias and be prepared to treat cardiac arrest when caring for a client with hyperkalemia. Increased potassium levels do not result in pulmonary edema, circulatory collapse, or hemorrhage.

CN: Pharmacological and parenteral therapies; CL: Analyze

45. 4. High-carbohydrate foods meet the body's caloric needs during acute renal failure. Protein is limited because its breakdown may result in accumulation of toxic waste products. The main goal of nutritional therapy in acute renal failure is to decrease protein catabolism. Protein catabolism causes increased levels of urea, phosphate, and potassium. Carbohydrates provide energy and decrease the need for protein breakdown. They do not have a diuretic effect. Some specific carbohydrates influence urine pH, but this is not the reason for encouraging a high-carbohydrate, low-protein diet. There is no need to reduce demands on the liver through dietary manipulation in acute renal failure.

CN: Basic care and comfort; CL: Apply

46. 1. Gelatin desserts contain little or no potassium and can be served to a client on a potassium-restricted diet. Foods high in potassium include bran and whole grains; most dried, raw, and frozen fruits and vegetables; most milk and milk products; and chocolate, nuts, raisins, coconut, and strong brewed coffee.

CN: Basic care and comfort; CL: Apply

47. 1. Pulmonary edema can develop during the oliguric phase of acute renal failure because of decreased urine output and fluid retention. Metabolic acidosis develops because the kidneys cannot excrete hydrogen ions, and bicarbonate is used to buffer the hydrogen. Hypertension may develop as a result of fluid retention. Hyperkalemia develops as the kidneys lose the ability to excrete potassium.

CN: Physiological adaptation; CL: Analyze

48. 1. The unaffected arm should be used for blood pressure measurement. The external cannula must be handled carefully and protected from damage and disruption. In addition, a tourniquet or clamps should be kept at the bedside because dislodgment of the cannula would cause arterial hemorrhage. The arm with the cannula is not used for blood pressure measurement, IV therapy, or venipuncture. Patency is assessed by auscultating for bruits every shift. Heparin is not injected into the cannula to maintain patency. Because it

is part of the general circulation, the cannula cannot be heparinized.

CN: Reduction of risk potential; CL: Synthesize

49. 2. If disequilibrium syndrome occurs during dialysis, the most appropriate intervention is to slow the rate of dialysis. The syndrome is believed to result from too-rapid removal of urea and excess electrolytes from the blood; this causes transient cerebral edema, which produces the symptoms. Administration of oxygen and position changes do not affect the symptoms. It would not be appropriate to reassure the client that the symptoms are normal.

CN: Reduction of risk potential; CL: Synthesize

50. 3. Dialysis has no effect on hemoglobin levels because some red blood cells are injured during the procedure; dialysis aggravates a low hemoglobin concentration and may contribute to anemia. Dialysis will clear metabolic waste products from the body and correct electrolyte imbalances, correct electrolyte imbalances such as creatinine, potassium and sodium levels.

CN: Reduction of risk potential; CL: Apply

51. 4. Signs and symptoms of an external access shunt infection include redness, tenderness, swelling, and drainage from around the shunt site. The absence of a bruit indicates closing of the shunt. Sluggish capillary refill time and coolness of the extremity indicate decreased blood flow to the extremity.

CN: Reduction of risk potential; CL: Analyze

52. 1. The kidneys have a remarkable ability to recover from serious insult. Recovery may take 3 to 12 months. The client should be taught how to recognize the signs and symptoms of decreasing renal function and to notify the **healthcare provider (HCP)**  if such problems occur. In a client who is recovering from acute renal failure, there is no need for renal transplantation or permanent hemodialysis. Chronic renal failure develops before end-stage renal failure.

CN: Physiological adaptation; CL: Apply

The Client with Urinary Tract Infection

53. 4. The sensation of thirst diminishes in those greater than 60 years of age; hence, fluid intake is decreased, and dissolved particles in the extracellular fluid compartment become more concentrated. There is no change in liver function in older adults, nor is there a reduction of ADH and aldosterone as a normal part of aging.

CN: Physiological adaptation; CL: Apply

54. 3. Antibiotics have the maximum effect when the level of the medication in the blood is maintained. However, because nitrofurantoin is readily absorbed from the gastrointestinal tract and is primarily excreted in urine, toxicity may develop by doubling the dose. The client should not skip a dose, if one dose is missed. Additional fluids, especially water, should be encouraged, but not forced, to promote elimination of the antibiotic from the body. Adequate fluid intake aids in the prevention of urinary tract infections, in addition to an acidic urine.

CN: Pharmacological and parenteral therapies; CL: Synthesize

55. 2,3,4. Catheter-associated urinary tract infection is the most frequent type of healthcare-acquired infection (HAI) and represents as much as 80% of HAIs in hospitals. The nurse should provide meticulous perineal care, encourage the client to obtain an adequate fluid intake, and assess the client for signs of infection such as an elevated temperature. It is not necessary to change the catheter daily. It is recommended that long-term use of an indwelling urinary catheter be evaluated carefully and other methods considered if the catheter will be in place longer than 2 weeks. It is not necessary to request a prescription for antibiotics as the client does not currently have an infection.

CN: Safety and infection control; CL: Synthesize

56. 1. The client's urine specific gravity is elevated. Specific gravity is a reflection of the concentrating ability of the kidneys. This level indicates that the urine is concentrated. By increasing fluid intake, the urine will become more dilute. Antihypertensives do not make urine more concentrated unless there is a diuretic component within them. The nurse should not hold a dose of antihypertensive medication. Sodium tends to pull water with it; by restricting sodium, less water, not more, will be present. Bananas do not aid

in the dilution of urine.

 CN: Reduction of risk potential; CL: Synthesize

57. 1. All urine for creatinine clearance determination must be saved in a container with no preservatives and refrigerated or kept on ice. The first urine voided at the beginning of the collection is discarded, not the last. A self-report of weight may not be accurate. It is not necessary to have an indwelling urinary catheter inserted for urine collection.

 CN: Reduction of risk potential; CL: Apply

58. 141 mg

 CN: Pharmacological and parenteral therapies; CL: Apply

59. 2. The classic symptoms of cystitis are severe burning on urination, urgency, and frequent urination. Systemic symptoms, such as fever and nausea and vomiting, are more likely to accompany pyelonephritis than cystitis. Hematuria may occur, but it is not as common as frequency and burning.

 CN: Physiological adaptation; CL: Analyze

60. 4. Although various conditions may result in cystitis, the most common cause is an ascending infection from the urethra. Strictures and urine retention can lead to infections, but these are not the most common cause. Systemic infections are rarely causes of cystitis.

 CN: Physiological adaptation; CL: Apply

61. 4. As newlyweds, the client and her husband need to develop a strong communication base. The nurse can facilitate communication by preparing and supporting the client. Given the situation, an interdisciplinary conference is inappropriate and would not promote intimacy for the client and her husband. Insisting that the client talk with her husband is not addressing her fears. Being present allows the nurse to facilitate the discussion of a difficult topic. Having the nurse speak first with the husband alone shifts responsibility away from the couple.

 CN: Psychosocial integrity; CL: Synthesize

62. 2. Hot tub baths promote relaxation and help relieve urgency, discomfort, and spasm. Applying heat to the perineum is more helpful than cold because heat reduces inflammation. Although liberal fluid intake should be encouraged, caffeinated beverages, such as tea, coffee, and cola, can be irritating to the bladder and should be avoided. Voiding at least every 2 to 3 hours should be encouraged because it reduces urinary stasis.

CN: Basic care and comfort; CL: Evaluate

63. 3. The client should take the prescription as ordered. The client should increase fluid intake to 3,000 mL/day to increase urination. Even though the urine may become clear in a short period, it is not necessary to notify the **HCP** . The client should continue to take the entire prescription of antibiotics. Cystitis is not sexually transmitted, so protection by using a condom is not necessary.

CN: Pharmacological and parenteral therapies; CL: Synthesize

64. 2,3,5. The nurse should instruct the client to report signs of adverse reaction to the antibiotic or indications that the urinary tract infection is not clearing. Blood in the urine is not an expected outcome, rash is an adverse response to the antibiotic, and an elevated temperature indicates a persistent infection. These signs should be reported to the **HCP** . Cloudy urine can be expected during the first few days of antibiotic treatment. Mild nausea is a side effect of antibiotic therapy, but it can be managed with eating small, frequent meals. Urinating every 3 to 4 hours or more is expected, particularly if the client is increasing the fluid intake as directed.

CN: Pharmacological and parenteral therapies; CL: Synthesis

65. 2,3. Clients who are taking nitrofurantoin should be instructed to take the medication with meals and to increase their fluid intake to minimize gastrointestinal distress. The urine may become brown in color. Although this change is harmless, clients need to be prepared for this color change. The client should be instructed to take the full prescription and not to stop taking the drug because symptoms have subsided. The medication should not be taken with antacids as this may interfere with the drug's absorption.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

66. 15 mL

The following formula is used to calculate the correct dosage:

$$\begin{aligned} 25 \text{ mg} / 5 \text{ mL} &= 75 \text{ mg} / X \text{ mL} \\ X &= 15 \text{ mL.} \end{aligned}$$

 CN: Pharmacological and parenteral therapies; CL: Apply

67. 1. Stasis of urine in the bladder is one of the chief causes of bladder infection, and a client who voids infrequently is at greater risk for reinfection. A tub bath does not promote urinary tract infections as long as the client avoids harsh soaps and bubble baths. Scrupulous hygiene and liberal fluid intake (unless contraindicated) are excellent preventive measures, but the client also should be taught to void every 2 to 3 hours during the day. Lifting weights is not a risk factor for cystitis.

 CN: Reduction of risk potential; CL: Analyze

68. 1. A woman can adopt several health promotion measures to prevent the recurrence of cystitis, including avoiding too-tight pants, noncotton underpants, and irritating substances, such as bubble baths and vaginal soaps and sprays. Increasing citrus juice intake can be a bladder irritant. Regular douching is not recommended; it can alter the pH of the vagina, increasing the risk of infection.

 CN: Health promotion and maintenance; CL: Synthesize

69. 4. Instructions should be as specific as possible, and the nurse should avoid general statements such as “a lot.” A specific goal is most useful. A mix of fluids will increase the likelihood of client compliance. It may not be sufficient to tell the client to drink twice as much as or 1 quart (950 mL) more than she usually drinks if her intake was inadequate to begin with.

 CN: Basic care and comfort; CL: Apply

The Client with Pyelonephritis

70. 1. Acute pyelonephritis usually begins with a bacterial infection of the lower urinary tract via the ascending urethral route; most infections are due to

gram-negative bacilli, such as *Escherichia coli*, normally found in the GI tract. Thorough perineal care using soap and warm water, and cleansing from front to back, decreases the likelihood that organisms will be introduced into the urinary tract and ascend upward toward the kidneys. Although preventing and treating all infections are appropriate, fungal infections from the feet and bacterial infections in the throat or skin are less likely to be immediate sources of infection causing pyelonephritis.

CN: Health promotion and maintenance; CL: Synthesize

71. 1. Pyelonephritis usually begins with colonization and infection of the lower urinary tract via the ascending urethral route, and the client should have an adequate intake of fluids to promote the flushing action of urination. Bubble baths and limiting fluid intake increase the risk of developing a urinary tract infection. Antibiotics should be used on a short-term basis because the risk of antibiotic resistance may lead to breakthrough infections with increasingly virulent pathogens.

CN: Health promotion and maintenance; CL: Synthesize

72. 4. A client with a history of diabetes mellitus, urinary tract infections, or renal calculi is at increased risk for pyelonephritis. Others at high risk include pregnant women and people with structural alterations of the urinary tract. A history of hypertension may put the client at risk for kidney damage, but not kidney infection. Intake of large quantities of cranberry juice and a fluid intake of 2,000 mL/day are not risk factors for pyelonephritis.

CN: Reduction of risk potential; CL: Analyze

73. 3. Antibiotics are usually prescribed for a 2- to 4-week period. A urine culture is needed to evaluate the effectiveness of antibiotic therapy. Urine must be examined microscopically to adequately determine the presence of bacteria; looking at the color of the urine or checking the odor is not sufficient. Symptoms usually disappear 48 to 72 hours after antibiotic therapy is started, but antibiotics may need to continue for up to 4 weeks.

CN: Pharmacological and parenteral therapies; CL: Evaluate

74. 0.4 mL

CN: Pharmacologic and parenteral therapy; CL: Apply

75. 2. Chronic pyelonephritis is most commonly the result of recurrent urinary tract infections. Chronic pyelonephritis can lead to chronic renal failure. Single cases of acute pyelonephritis rarely cause chronic pyelonephritis. Acute renal failure is not a cause of chronic pyelonephritis. Glomerulonephritis is an immunologic disorder, not an infectious disorder.

CN: Physiological adaptation; CL: Apply

76. 4. The nurse should ensure the client has adequate hydration. A urinary catheter is discouraged because of the risk of urinary tract infection. Monitoring of the hemoglobin level is not necessary for clients with pyelonephritis. Although antibiotics may be prescribed for long-term management and for chronic pyelonephritis, at this time the nurse should focus on helping the client maintain hydration.

CN: Physiologic adaptation; CL: Analyze

The Client with Chronic Renal Failure

77. 2,3,4. The nurse instructs the client to protect the site of the fistula. The client should avoid pressure on the involved arm such as sleeping on it, wearing tight jewelry, or obtaining BP. The client is also advised to assess the area distal to the fistula for adequate circulation, such as warmth and color. When the client is hospitalized, the nurse posts a sign on the client's bed not to draw blood or obtain BP on the left side; the client is also instructed to be sure that none of the healthcare team members do so.

CN: Physiological adaptation; CL: Synthesize

78. 2,4,1,3. The nurse first assures an IV access site in case the client has respiratory or cardiac arrest. Next, the nurse monitors the client's heart rate and rhythm: Cardiovascular signs of elevated serum potassium levels are irregular, slow heart rate; decreased BP; narrow, peaked T waves; widened QRS complexes, prolonged PR intervals, and flattened D waves; frequent ectopy; ventricular fibrillation; and ventricular standstill. The nurse then administers calcium gluconate, which has an immediate action to antagonize the effect of hyperkalemia on cardiac muscle. Last, the nurse administers polystyrene sulfonate, which is a cation-exchange resin that removes potassium from the body by exchanging sodium ion for potassium;

potassium-containing resin is then excreted; onset is in several hours to days.

CN: Physiological adaptation; CL: Synthesize

79. 2. The nurse must always auscultate for a bruit and palpate for a thrill in the arm with the fistula and promptly report the absence of either a thrill or bruit to the **healthcare provider (HCP)**  as it indicates an occlusion. The client should not have a pressure dressing on the shunt and should avoid wearing tight clothing or carrying heavy items such as purse over the area of the shunt to avoid restricting blood flow in the shunt. No procedures such as IV access, blood pressure measurements, or blood draws are done on an arm with a fistula as they could damage the fistula.

CN: Physiological adaptation; CL: Synthesize

80. 2,4,5. To manage nausea, the nurse can advise the client to drink limited amounts of fluid only when thirsty and eat food before drinking fluids to alleviate dry mouth, and encourage strict follow-up for blood work, dialysis, and **healthcare provider (HCP)**  visits. Smaller, more frequent meals may help to reduce nausea and facilitate medication taking. The client should be as active as possible to avoid immobilization because it increases bone demineralization. The client should also maintain the dialysis schedule because the dialysis will remove wastes that can contribute to nausea.

CN: Physiological adaptation; CL: Synthesize

81. 1. The main reason for warming the peritoneal dialysis solution is that the warm solution helps dilate peritoneal vessels, which increases urea clearance. Warmed dialyzing solution also contributes to client comfort by preventing chilly sensations, but this is a secondary reason for warming the solution. The warmed solution does not force potassium into the cells or promote abdominal muscle relaxation.

CN: Reduction of risk potential; CL: Apply

82. 2. During dwell time, the dialysis solution is allowed to remain in the peritoneal cavity for the time prescribed by the **healthcare provider (HCP)** (usually 20 to 45 minutes). During this time, the nurse should monitor the client's respiratory status because the pressure of the dialysis solution on the diaphragm can create respiratory distress. The dialysis solution would not

cause urticaria or affect circulation to the fingers. The client's laboratory values are obtained before beginning treatment and are monitored every 4 to 8 hours during the treatment, not just during the dwell time.

CN: Reduction of risk potential; CL: Analyze

83. 2. Because the client has a permanent catheter in place, blood-tinged drainage should not occur. Persistent blood-tinged drainage could indicate damage to the abdominal vessels, and the **healthcare provider (HCP)**  should be notified. The bleeding is originating in the peritoneal cavity, not the kidneys. Too-rapid infusion of the dialysate can cause pain, not blood-tinged drainage.

CN: Reduction of risk potential; CL: Analyze

84. 2. Fluid return with peritoneal dialysis is accomplished by gravity flow. Actions that enhance gravity flow include turning the client from side to side, raising the head of the bed, and gently massaging the abdomen. The client is usually confined to a recumbent position during the dialysis. The nurse should not attempt to reposition the catheter.

CN: Reduction of risk potential; CL: Synthesize

85. 4. Constipation may contribute to reduced urine outflow in part because peristalsis facilitates drainage outflow. For this reason, bisacodyl suppositories can be used prophylactically, even without a history of constipation. Diarrhea, vomiting, and flatulence typically do not cause decreased outflow in a peritoneal dialysis catheter.

CN: Physiological integrity; CL: Analyze

86. 2. Because hypotension is a complication associated with peritoneal dialysis, the nurse records intake and output, monitors vital signs, and observes the client's behavior. The nurse also encourages visiting and other diversional activities. A client on peritoneal dialysis does not need to be placed in a bed with padded side rails or kept on NPO status.

CN: Reduction of risk potential; CL: Synthesize

87. 1,2,4,5. Broad-spectrum antibiotics may be administered to prevent infection when a peritoneal catheter is inserted for peritoneal dialysis. If

peritonitis is present, antibiotics may be added to the dialysate. Aseptic technique is imperative. Peritonitis, the most common and serious complication of peritoneal dialysis, is characterized by cloudy dialysate drainage, diffuse abdominal pain, and rebound tenderness.

CN: Safety and infection control; CL: Synthesize

88. 2. Weight loss is expected because of the removal of fluid. The client's weight before and after dialysis is one measure of the effectiveness of treatment. Blood pressure usually decreases because of the removal of fluid. Hematuria would not occur after completion of peritoneal dialysis. Dialysis only minimally affects the damaged kidneys' ability to manufacture urine.

CN: Reduction of risk potential; CL: Evaluate

89. 3. A client in renal failure develops hyperphosphatemia that causes a corresponding excretion of the body's calcium stores, leading to renal osteodystrophy. To decrease this loss, aluminum hydroxide gel is prescribed to bind phosphates in the intestine and facilitate their excretion. Gastric hyperacidity is not necessarily a problem associated with chronic renal failure. Antacids will not prevent Curling's stress ulcers and do not affect metabolic acidosis.

CN: Pharmacological and parenteral therapies; CL: Evaluate

90. 4. Aluminum hydroxide gel is administered to bind the phosphates in ingested foods and must be given with or immediately after meals and snacks. There is no need for the client to take it on a 24-hour schedule. It is not administered to treat an upset stomach caused by hyperacidity in clients with chronic renal failure and therefore is not prescribed between meals.

CN: Pharmacological and parenteral therapies; CL: Evaluate

91. 2. Uremia can cause decreased alertness, so the nurse needs to validate the client's comprehension frequently. Because the client's ability to concentrate is limited, short lessons are most effective. If family members are present at the sessions, they can reinforce the material. Written materials that the client can review are superior to videos because the client may not be able to maintain alertness during the viewing of the videotape.

CN: Physiological adaptation; CL: Synthesize

92. 3. Dietary management for clients with chronic renal failure is usually designed to restrict protein, sodium, and potassium intake. Protein intake is reduced because the kidney can no longer excrete the by-products of protein metabolism. The degree of dietary restriction depends on the degree of renal impairment. The client should also receive a high-carbohydrate diet along with appropriate vitamin and mineral supplements. Calcium requirements remain 1,000 to 2,000 mg/day.

CN: Basic care and comfort; CL: Synthesize

93. 2. Altered sexual functioning commonly occurs in chronic renal failure and can stress marriages and relationships. Altered sexual functioning can be caused by decreased hormone levels, anemia, peripheral neuropathy, or medication. The client should not decrease or avoid sexual activity but instead should modify it. The client should rest before sexual activity. Unless the client provides additional information, it is not necessary to refer the client to counseling at this time.

CN: Psychosocial integrity; CL: Synthesize

94. 2. The major benefit of CAPD is that it frees the client from daily dependence on dialysis centers, healthcare personnel, and machines for life-sustaining treatment. This independence is a valuable outcome for some people. CAPD is costly and must be done daily. Adverse effects and complications are similar to those of standard peritoneal dialysis. Peritoneal dialysis usually takes less time but cannot be done at home.

CN: Reduction of risk potential; CL: Apply

95. 3. Dietary restrictions with CAPD are fewer than those with standard peritoneal dialysis because dialysis is constant, not intermittent. The constant slow diffusion of CAPD helps prevent accumulation of toxins and allows for a more liberal diet. CAPD does not work more quickly, but more consistently. Both types of peritoneal dialysis are effective.

CN: Basic care and comfort; CL: Synthesize

96. 1. Cloudy drainage indicates bacterial activity in the peritoneum. Other signs and symptoms of infection are fever, hyperactive bowel sounds, and abdominal pain. Swollen legs may indicate heart failure. Poor drainage of

dialysate fluid is probably the result of a kinked catheter. Redness at the insertion site indicates local infection, not peritonitis. However, a local infection that is left untreated can progress to the peritoneum.

CN: Reduction of risk potential; CL: Analyze

The Client with Urinary Incontinence

97. 3. Perineal muscle exercises (Kegel exercises) increase the tone of the urethral sphincters; the nurse teaches the client to perform the exercises in sets of at least 10 contractions, four to five times per day. Asking someone else to lift heavy loads may not always be practical. Wearing disposable protective underwear is only a temporary measure because long-term use discourages continence and can lead to skin problems. Applying estrogen vaginal cream to the urinary meatus after each intentional voiding can lead to UTIs. Drug therapy has a very limited role in the management of stress urinary incontinence.

CN: Health promotion and maintenance; CL: Synthesize

98. 1,2. Kegel exercises strengthen the sphincter and structural supports of the bladder, and the nurse should be sure the client knows how to do these exercises. Establishing a voiding schedule is more effective than carrying incontinence pads in preventing stress incontinence. In nonrestricted clients, a fluid intake of at least 2 to 3 L/day is encouraged; clients with stress incontinence may reduce their fluid intake to avoid incontinence at the risk of developing dehydration and urinary tract infections. Natural diuretics, such as caffeine and alcoholic beverages, may increase stress incontinence. It is unlikely that the client can prevent laughing or coughing or other activities that might put stress on the sphincter.

CN: Health promotion and maintenance; CL: Synthesize

99. 2. The history of three pregnancies is most likely the cause of the client's current episodes of stress incontinence. The client's fluid intake, age, or history of swimming would not create an increase in intra-abdominal pressure.

CN: Reduction of risk potential; CL: Analyze

100. 4. The primary goal of nursing care is to decrease the number of incontinence episodes and the amount of urine expressed in an episode. Behavioral interventions (e.g., diet and exercise) and medications are the nonsurgical management methods used to treat stress incontinence. Without surgical intervention, it may not be possible to eliminate all episodes of incontinence. Helping the client adjust to the incontinence is not treating the problem. Clients with stress incontinence are not prone to the development of urinary tract infection.

CN: Physiological adaptation; CL: Synthesize

101. 2. Clients with stress incontinence are encouraged to avoid substances that are bladder irritants, such as caffeine and alcohol. Emotional stressors do not cause stress incontinence. It is most commonly caused by relaxed pelvic musculature. Wearing girdles is not contraindicated. Although clients may want to limit physical exertion to avoid incontinence episodes, they should be encouraged to seek treatment instead of limiting their activities.

CN: Reduction of risk potential; CL: Create

102. 3. A characteristic of urge incontinence is involuntary urination with little or no warning. The inability to empty the bladder is urine retention. Loss of urine when coughing occurs with stress incontinence. Frequent dribbling of urine is common in male clients after some types of prostate surgery or may occur in women after the development of a vesicovaginal or urethrovaginal fistula.

CN: Physiological adaptation; CL: Analyze

103. 1. Instructing the client to void at regularly scheduled intervals can help decrease the frequency of incontinence episodes. Providing a bedside commode does not decrease the number of incontinence episodes and does not help the client who leads an active lifestyle. Infections are not a common cause of urge incontinence, so antibiotics are not an appropriate treatment. Intermittent self-catheterization is appropriate for overflow or reflux incontinence but not urge incontinence, because it does not treat the underlying cause.

 CN: Physiological adaptation; CL: Synthesize

Managing Care, Quality, and Safety of Clients with Urinary Tract Health Problems

104. 1. Clients who are immunosuppressed, have diabetes mellitus, or have undergone multiple courses of antibiotic therapy are prone to bacterial, fungal, and parasitic infections. Taking one course of antibiotic therapy or having a family history of UTIs does not make a client at high risk for development of a UTI. A predisposing factor for a UTI is ongoing problems of urinary calculi; one calculus would not place a client at high risk.

 CN: Management of care; CL: Analyze

105. 4. Sensitivity to shellfish or iodine may cause an anaphylactic reaction to the contrast material, which contains iodine. Administering a cathartic or antiflatulent will not prevent an anaphylactic reaction to the contrast material. Keeping a client on NPO status for 8 hours before the procedure is part of the usual preparation for such a procedure to prevent aspiration of food or fluids if the client vomits when lying on the x-ray table.

 CN: Reduction of risk potential; CL: Synthesize

106. 1. The appropriate action would be to discard the specimen and obtain a new one. Urine that is allowed to stand at room temperature will become alkaline, with multiplying bacteria. The specimen should be examined within 1 hour after urination.

 CN: Reduction of risk potential; CL: Synthesize

107. 1,2,3,4,6. Before prescribing and administering packed RBCs, the nurse should assess the IV site to make sure it has an 18G to 20G infusion set. The nurse should also ensure that normal saline solution is used to prime the tubing to prevent RBCs from adhering to the tubing. The client must indicate **informed consent** for the procedure by signing the consent form. The client's blood must be typed to determine ABO blood typing and Rh factor and ensure that the client receives compatible blood. Cross-matching is done to detect the presence of recipient antibodies to the donor's minor antigens. Vital signs provide a baseline reference for continuous monitoring

throughout the transfusion. An identification bracelet and red blood band are essential for client identification per facility policy. Two nurses must double-check the client's identification with the client listed on the unit of RBCs. The transfusion should be started within 30 minutes of the time that the RBC unit is checked out of the blood bank. Thus, no blood should be kept in the medication room before transfusion.

 CN: Safety and infection control; CL: Synthesize

108. 3. The correct technique for a clean-catch urine culture specimen is to have the female client clean the labia from front to back, void into the toilet, and then void into the cup. The client does not need to fully empty her bladder into the cup. It is not necessary to catheterize the client to obtain the specimen. The **first** voided specimen of the day has the highest bacterial counts.

 CN: Basic care and comfort; CL: Evaluate

109. 1,3,4,5,6,7. The client is hyponatremic; the nurse will closely monitor vital signs, restrict fluids, accurately record intake and output with the aid of a Foley catheter, prescribe labs for morning, and ensure client safety with use of a bed alarm. Encouraging fluids and restricting dietary sodium to 2 g may further exacerbate the hyponatremia. The nurse will also monitor for neurological changes and inform the **HCP** immediately of any change or if the client becomes unable to take food/fluids by mouth.

 CN: Management of care; CL: Synthesize

110. 2,3,5,6. While the scope of practice for a **UAP** may vary by state, province, or territory, as well as by place of employment, general duties include recording input and output, including emptying and recording urine output from a Foley catheter. A UAP with proper training may apply a securing device to maintain safety, provide regular Foley catheter and perineal care, and ambulate a client with a catheter, continually monitoring that the collection bag remains below the level of the bladder to help prevent infection. Activities such as irrigating or flushing a catheter should not be assigned to a UAP as these activities involve nursing assessment skills.

 CN: Management of care; CL: Evaluate

111. 1,3,4. When intravenous (IV) therapy must be administered in the home setting, teaching is essential. Written instructions as well as demonstration and return demonstration help reinforce key points. The client and/or caregiver is responsible for adhering to the established plan of care that includes the treatment plan, monitoring plan, potential for complications, expected outcome/outcomes, potential adverse effects, and plan for communicating with the **HCP** 📖. Periodic laboratory testing may be necessary to assess the effects of IV therapy and the client's progress. The client should report signs of redness or inflammation that could indicate infection, and also report an elevated temperature. Prior to changing the fluids, the caregiver should cleanse the port with alcohol wipes. It is not necessary to use sterile gloves; the IV bag should be elevated to promote gravity flow.

CN: Reduction of risk potential; CL: Create

112. 1,2,3,4. To ensure client safety, the nurse should assess clients that might be at risk for suicide, such as those with end-stage cancer. The nurse should also communicate accurate medication information by explaining the importance of managing medication information to the client when he/she is discharged from the hospital or at the end of an outpatient encounter. Examples include instructing the client to give a list of medications to his/her **HCP** ; to update the information when medications are discontinued, doses are changed, or new medications including over-the-counter products are added; and to carry medication information at all times in the event of emergency situations.

Managing Care, Quality, and Safety of Clients with Reproductive Health Problems

Answers, Rationales, and Test-Taking Strategies

The Client with a Vaginal Infection

1. A nurse is reviewing a client's medical record and notes the Papanicolaou smear laboratory report indicates visualization of clue cells and a vaginal pH of 3.8. What should the nurse teach this client? Select all that apply.

- ☐ **1.** Seek care if the vaginal discharge has a fishy odor.
- ☐ **2.** Seek care if experiencing white, adherent vaginal discharge.
- ☐ **3.** All vaginal infections are sexually transmitted infections.
- ☐ **4.** Do not douche unless instructed by a healthcare provider (HCP).
- ☐ **5.** Usually, vaginal infections can be treated with over-the-counter

preparations.

2. A nurse is teaching a client how to prevent a vaginal infection. Which activity puts the client at risk for altering the normal pH of her vagina?

- ☐ 1. consuming over four cups of coffee per day
- ☐ 2. having sexual intercourse during the menstrual cycle
- ☐ 3. douching unless instructed to do so by the healthcare provider (HCP)
- ☐ 4. using tampons during the menstrual cycle

3. A client is prescribed oral metronidazole for treatment of bacterial vaginosis. What should the nurse instruct the client to avoid during treatment and for 24 hours thereafter?

- ☐ 1. douching
- ☐ 2. sexual intercourse
- ☐ 3. hot tub baths
- ☐ 4. alcohol consumption

4. A female client with which condition would be at risk for increased severity of vulvovaginal candidiasis? Select all that apply.

- ☐ 1. uncontrolled diabetes
- ☐ 2. immunosuppression due to cancer
- ☐ 3. human immunodeficiency virus (HIV) infection
- ☐ 4. hypertension
- ☐ 5. asthma

5. A client taking oral contraceptives is placed on a 10-day course of antibiotics for an infection. Which instruction should the nurse include in the teaching plan?

- ☐ 1. "Use a barrier method of birth control for the rest of your cycle."
- ☐ 2. "You should stop taking the oral contraceptives while taking the antibiotic."
- ☐ 3. "Call your healthcare provider for increased hunger or fluid retention."
- ☐ 4. "Take the antibiotics 2 hours after the oral contraceptive."

6. A client is asking for information about using an intrauterine device (IUD). Which question when asked by the nurse would provide pertinent

information on whether or not a client is a candidate for an IUD?

- ☐ 1. “Do you smoke?”
- ☐ 2. “Do you have hypertension?”
- ☐ 3. “How often do you have sex?”
- ☐ 4. “Are you in a monogamous relationship?”

7. A nurse is caring for a hospitalized 22-year-old female client with type 1 diabetes mellitus and toxic shock syndrome (TSS). Which action should the nurse perform **first**?

- ☐ 1. Administer 5% dextrose in half-normal saline solution at 150 mL/h IV.
- ☐ 2. Administer 50 mg of meperidine IM every 4 hours as needed for pain.
- ☐ 3. Teach the client to use pads at night instead of tampons during her menstrual period.
- ☐ 4. Administer 400 mg of ciprofloxacin IV every 12 hours infused over 1 hour.

The Client with Uterine Fibroids

8. A 39-year-old female client has been experiencing intermittent vaginal bleeding for several months. Her healthcare provider (HCP) tells her that she has uterine fibroids and recommends an abdominal hysterectomy. When the client expresses fear about the surgery, the nurse should:

- ☐ 1. reassure the client of her HCP’s competence.
- ☐ 2. give the client opportunities to express her fears.
- ☐ 3. teach the client that fear impedes recovery.
- ☐ 4. change the topic of conversation.

9. A female with uterine fibroids has dysmenorrhea and menorrhagia. After reviewing the laboratory reports, the nurse should report which results to the healthcare provider (HCP)? Select all that apply.

- ☐ 1. hemoglobin, 9.0 g/dL (90 g/L)
- ☐ 2. hematocrit, 27.1% (0.27)
- ☐ 3. white blood cell count, 10,000 cells/mm³ ($10 \times 10^9/L$)
- ☐ 4. potassium, 4.0 mEq/L (4.0 mmol/L)
- ☐ 5. normocytic red blood cells

10. The client will have an abdominal hysterectomy tomorrow. Which information will be **most** important for the nurse to give to the client prior to admission to the hospital?

- ☐ 1. what to wear to the hospital
- ☐ 2. what she can eat and drink before admission
- ☐ 3. the type of pain medication that will be prescribed postoperatively
- ☐ 4. the amount of activity she can have after surgery

11. The nurse is witnessing the client's signature on the informed surgical consent for an abdominal hysterectomy. It is important to ascertain that the client understands that with this surgical procedure she will have:

- ☐ 1. decreased libido.
- ☐ 2. infertility.
- ☐ 3. depression.
- ☐ 4. weight gain.

12. Which is the correct order, from first to last, for proper placement of a urinary catheter? All options must be used.

1. Lubricate the catheter adequately with a water-soluble lubricant.

2. Ensure free flow of urine.

3. Insert the catheter far enough into the bladder to prevent trauma to the urethral tissue.

4. Prepare a sterile field.

13. Which physical sensation will the client who has had an abdominal hysterectomy **most** likely experience if she hyperventilates while performing deep-breathing exercises?

- ☐ 1. dyspnea
- ☐ 2. dizziness
- ☐ 3. blurred vision
- ☐ 4. mental confusion

14. Which nursing measure would **most** likely relieve postoperative gas pains after abdominal hysterectomy?

- ☐ 1. offering the client a hot beverage
- ☐ 2. providing extra warmth
- ☐ 3. applying a snugly fitting abdominal binder
- ☐ 4. helping the client walk

15. On the second postoperative day after an abdominal hysterectomy, the client develops a temperature of 100.4°F (38°C). The nurse's **first** action should be to:

- ☐ 1. increase the number of wound dressing changes to minimize infection.
- ☐ 2. obtain a culture and sensitivity study of the urine to determine the source of infection.
- ☐ 3. ensure that the client takes at least 10 deep breaths every hour.
- ☐ 4. change the site of the client's IV fluid catheter to reduce the risk of infection.

16. The nurse is changing the dressing of a client after an abdominal hysterectomy. If the dressing adheres to the client's incisional area, what should the nurse do?

- ☐ 1. Pull off the dressing quickly, and then apply slight pressure over the area.
- ☐ 2. Lift an easily moved portion of the dressing, and then remove it slowly.
- ☐ 3. Moisten the dressing with sterile normal saline solution, and then remove it.
- ☐ 4. Remove part of the dressing, and then remove the remainder gradually

over a period of several minutes.

17. The client with an abdominal hysterectomy is being prepared for discharge in the morning. The client has a handicapped adult son whom she cares for at home. The nurse should discuss with the healthcare provider (HCP) the need for referral to:

- ☐ 1. home health care.
- ☐ 2. social work.
- ☐ 3. pastoral care.
- ☐ 4. volunteer services.

18. When preparing discharge instructions for a client after an abdominal hysterectomy, the nurse should **first**:

- ☐ 1. have the client watch an educational video.
- ☐ 2. assess the client's available social supports.
- ☐ 3. call the social worker to evaluate the client.
- ☐ 4. read the discharge instructions to the client.

19. A client who had a hysterectomy 2 hours ago is returning to the postsurgical unit from the recovery room. The nurse is assessing the client. The vital signs are as follows: temperature 99°F (32°C), pulse 98 bpm, respirations 20 breaths/min, and BP 100/65 mm Hg. The urinary catheter is draining freely, and the client wants to try voiding without the catheter. The IV is infusing at 60 gtt/min. The perineal pad is saturated with bright red blood. The nurse reviews the progress notes from the recovery room (see notes).

Nurses Progress Notes

Date	Time	Progress Notes
5/24	1145	Client ready for transfer to room. Vital signs T = 37 °C, P = 78; R = 14, BP = 114/70, O ₂ Sat of 95% per pulse oximetry; catheter to straight drainage; IV in left cephalic vein infusing at keep open rate; client awake and oriented x3. Peri pad changed; moderately saturated. Bonnie Slater, RN

What should the nurse do **first**?

- ☐ 1. Change the perineal pad.
- ☐ 2. Contact the surgeon.
- ☐ 3. Increase the IV fluids.
- ☐ 4. Remove the urinary catheter.

20. When preparing a client for discharge 2 days after an abdominal hysterectomy, the nurse should instruct the client to avoid which activity until recovery is complete?

- ☐ 1. swimming in a pool treated with chlorine for 6 weeks after surgery
- ☐ 2. walking at a leisurely pace for 30 minutes at least once a day
- ☐ 3. driving until the client can push the brake pedal without pain
- ☐ 4. lifting >2 lb (0.9 kg) until the abdominal incision has healed

21. A client returned to the recovery room after a dilatation and curettage

has the postoperative medication prescriptions shown in the medical record. What should the nurse do **next**?

Prescriptions

Rx Meperidine 50 mg I.M. every 4 hours for severe pain
Acetaminophen P.O. every 4 hours for pain
Ibuprofen 800 mg P.O. every 4 hours for pain.

- ☐ 1. Ask the client to rate the intensity of her pain on a scale of 1 to 10, and administer the analgesia according to the intensity of the pain.
- ☐ 2. Administer the meperidine first because the client had surgery today.
- ☐ 3. Administer the acetaminophen first, and if it does not relieve the pain in 2 hours, administer the meperidine.
- ☐ 4. Administer the ibuprofen first, and if it does not relieve the pain, administer the meperidine.

22. On the second day following an abdominal hysterectomy, a client reports she has had three brown, loose stools in moderate amount. The morning medications include a prescription for 100 mg of docusate sodium daily or as needed. What should the nurse do **next**?

- ☐ 1. Administer the docusate sodium according to the prescription.
- ☐ 2. Ask the client if she is having gas pains or hunger.
- ☐ 3. Withhold the medication, and document the client's report of loose stools.
- ☐ 4. Administer the docusate sodium, and instruct the client to avoid high-fiber foods.

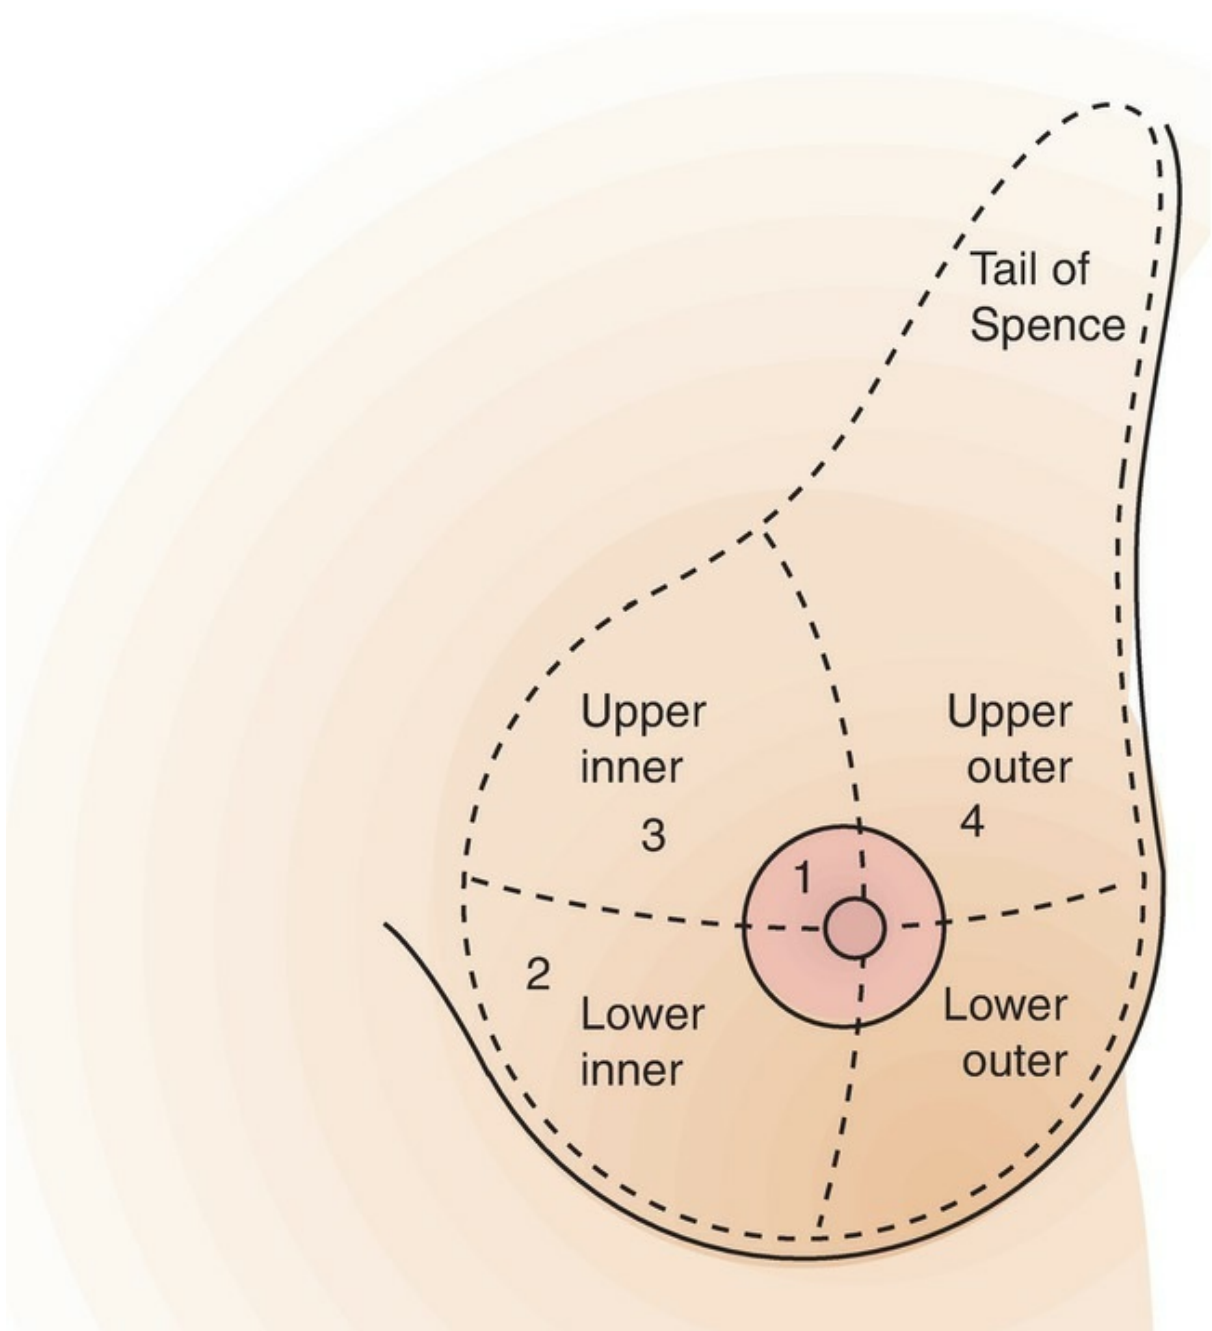

23. Which information should the nurse include when teaching a 55-year-old woman in the beginning of menopause? Select all that apply.

- ☐ 1. The average age of onset for menopause is 50 to 52 years.
- ☐ 2. Vaginal infections will increase.

- ☐ 3. Depression is very common as a result of menopause.
- ☐ 4. Hot flashes, especially at night, can occur in about 80% of women.
- ☐ 5. When periods become irregular, contraception is unnecessary.

The Client with Breast Cancer

24. A nurse is palpating a female client's breast while assessing for breast disease. In the illustration, indicate the area of the breast in which tumors are **most** commonly found.

25. The client states that she has noticed that her bra fits more snugly at certain times of the month. She asks the nurse if this is a sign of breast disease. The nurse should base the reply to this client on the knowledge that:

- ☐ 1. benign cysts tend to cause the breasts to vary in size.
- ☐ 2. it is normal for the breasts to increase in size before menstruation begins.
- ☐ 3. a change in breast size warrants further investigation.

- ☐ 4. differences in breast size are related to normal growth and development.

26. A 70-year-old client asks the nurse if she needs to have a mammogram. Which is the nurse's **best** response?

- ☐ 1. "Having a mammogram when you are older is less painful."
- ☐ 2. "The incidence of breast cancer increases with age."
- ☐ 3. "We need to consider your family history of breast cancer first."
- ☐ 4. "It will be sufficient if you perform breast examinations monthly."

27. Prior to surgery for a modified radical mastectomy, the client is extremely anxious and asks many questions. Which approach offers the **best** guide for the nurse to answer these questions?

- ☐ 1. Tell the client as much as she wants to know and is able to understand.
- ☐ 2. Delay discussing the client's questions with her until she is convalescing.
- ☐ 3. Delay discussing the client's questions with her until her apprehension subsides.
- ☐ 4. Explain to the client that she should discuss her questions first with the healthcare provider (HCP).

28. Following a simple mastectomy, the nurse is totaling the amount of drainage in 24 hours from a suction drain in the incision. The nurse notes there is 200 ml of serosanguineous drainage for the first 24 hours. The nurse should:

- ☐ 1. document the findings.
- ☐ 2. notify the surgeon.
- ☐ 3. remove the drain.
- ☐ 4. place the client's arm in a dependent position.

29. Atropine sulfate is included in the preoperative prescriptions for a client undergoing a modified radical mastectomy. The expected outcome is to:

- ☐ 1. promote general muscular relaxation.
- ☐ 2. decrease pulse and respiratory rates.
- ☐ 3. decrease nausea.

- ☐ 4. inhibit oral and respiratory secretions.

30. During the postoperative period after a modified radical mastectomy, the client confides in the nurse that she thinks she got breast cancer because she had an abortion and she did not tell her husband. What is the **best** response by the nurse?

- ☐ 1. "Cancer is not a punishment; it is a disease."
- ☐ 2. "You might feel better if you confided in your husband."
- ☐ 3. "Tell me more about your feelings about this."
- ☐ 4. "I can have the social worker talk to you if you would like."

31. Following a modified radical mastectomy, a client has an incisional drainage tube attached to Hemovac suction. The nurse determines the suction is effective when:

- ☐ 1. the intrathoracic pressure is decreased and the client breathes easier.
- ☐ 2. there is an increased collateral lymphatic flow toward the operative area.
- ☐ 3. accumulated serum and blood in the operative area are removed.
- ☐ 4. no adhesions are formed between the skin and chest wall in the operative area.

32. Which position would be **best** for a client's right arm when she returns to her room after a right modified radical mastectomy with multiple lymph node excisions?

- ☐ 1. across her chest wall
- ☐ 2. at her side at the same level as her body
- ☐ 3. in the position that affords her the greatest comfort without placing pressure on the incision
- ☐ 4. on pillows, with her hand higher than her elbow and her elbow higher than her shoulder

33. A client develops lymphedema after a left mastectomy with lymph node dissection. The nurse should include which points in the discharge teaching plan? Select all that apply.

- ☐ 1. Do not allow blood pressures or blood draws in the affected arm.
- ☐ 2. Avoid application of sunscreen on the left arm.

- ☐ 3. Use an electric razor for shaving.
- ☐ 4. Immobilize the left arm.
- ☐ 5. Elevate the left arm.
- ☐ 6. Perform hand pump exercises.

34. The client with breast cancer is prescribed tamoxifen 20 mg daily. The client states she does not like taking medicine and asks the nurse if the tamoxifen is really worth taking. The nurse should tell the client:

- ☐ 1. "This drug is part of your chemotherapy program."
- ☐ 2. "This drug has been found to decrease metastatic breast cancer."
- ☐ 3. "This drug will act as an estrogen in your breast tissue."
- ☐ 4. "This drug will prevent hot flashes since you cannot take hormone replacement."

35. A client undergoing chemotherapy after a modified radical mastectomy asks the nurse questions about breast prosthesis and wigs. After answering the questions directly, the nurse should also:

- ☐ 1. provide a list of resources, including the local breast cancer support group.
- ☐ 2. offer a referral to the social worker.
- ☐ 3. call the home healthcare agency.
- ☐ 4. contact the plastic surgeon.

36. A client is to have radiation therapy after a modified radical mastectomy. The nurse should teach the client to care for the skin at the site of therapy by:

- ☐ 1. washing the area with water.
- ☐ 2. exposing the area to dry heat.
- ☐ 3. applying an ointment to the area.
- ☐ 4. using talcum powder on the area.

37. The nurse should teach a client that a normal local tissue response to radiation following surgery for breast cancer is:

- ☐ 1. atrophy of the skin.
- ☐ 2. scattered pustule formation.
- ☐ 3. redness of the surface tissue.

- ☐ 4. sloughing of two layers of skin.

38. The nurse is providing discharge instructions about preventing infection to a client who had a modified radical mastectomy and will be pruning flowers when she returns to work. To prevent infection, what should the nurse instruct the client to do?

- ☐ 1. Wear protective gloves when gardening.
- ☐ 2. Avoid crowded areas.
- ☐ 3. Keep cuticles cut.
- ☐ 4. Remove underarm hair with a sharp razor.

The Client with Benign Prostatic Hypertrophy

39. An adult male client has been unable to void for the past 12 hours. The **best** method for the nurse to use when assessing for bladder distention in a male client is to check for:

- ☐ 1. a rounded swelling above the pubis.
- ☐ 2. dullness in the lower left quadrant.
- ☐ 3. rebound tenderness below the symphysis.
- ☐ 4. urine discharge from the urethral meatus.

40. When emptying the client's bladder during a urinary catheterization, the nurse should allow the urine to drain from the bladder slowly to prevent:

- ☐ 1. renal failure.
- ☐ 2. abdominal cramping.
- ☐ 3. possible shock.
- ☐ 4. atrophy of bladder musculature.

41. The **primary** reason for lubricating the urinary catheter generously before inserting the catheter into a male client is that this technique helps reduce:

- ☐ 1. spasms at the orifice of the bladder.
- ☐ 2. friction along the urethra when the catheter is being inserted.
- ☐ 3. the number of organisms gaining entrance to the bladder.
- ☐ 4. the formation of encrustations that may occur at the end of the catheter.

42. The **primary** reason for taping an indwelling catheter laterally to the thigh of a male client is to:

- ☐ 1. eliminate pressure at the penoscrotal angle.
- ☐ 2. prevent the catheter from kinking in the urethra.
- ☐ 3. prevent accidental catheter removal.
- ☐ 4. allow the client to turn without kinking the catheter.

43. The nurse is providing preoperative instructions to a client who is having a transurethral resection of the prostate. The nurse should tell the client:

- ☐ 1. "You will have a central venous access inserted just prior to the procedure."
- ☐ 2. "Plan on being in the hospital anywhere from 5 to 7 days following the procedure."
- ☐ 3. "You will be taught care of the incision and suture line prior to your discharge home."
- ☐ 4. "Expect blood in your urine in the first couple of days following the procedure."

44. When providing client teaching about continuous bladder irrigation following prostate surgery, the nurse should tell the client:

- ☐ 1. "The catheter is disconnected from the drainage tubing one time per shift to enable manual irrigation of the bladder."
- ☐ 2. "The purpose of the irrigation is to keep bladder drainage clear and to prevent the formation of blood clots in the bladder."
- ☐ 3. "The fluid drips into the bladder at a slow rate to prevent the effects of overhydration and hyponatremia."
- ☐ 4. "The catheter is clamped off approximately 4 hours after returning to the nursing unit."

45. When caring for a client with a history of benign prostatic hypertrophy (BPH), what should the nurse do? Select all that apply.

- ☐ 1. Provide privacy and time for the client to void.
- ☐ 2. Monitor intake and output.
- ☐ 3. Catheterize the client for postvoid residual urine.

- ☐ 4. Ask the client if he has urinary retention.
- ☐ 5. Test the urine for hematuria.

46. The nurse should specifically assess a client with prostatic hypertrophy for:

- ☐ 1. voiding at less frequent intervals.
- ☐ 2. difficulty starting the flow of urine.
- ☐ 3. painful urination.
- ☐ 4. increased force of the urine stream.

47. The nurse is reviewing the medication history of a client with benign prostatic hypertrophy (BPH). Which medication will likely aggravate BPH?

- ☐ 1. metformin
- ☐ 2. buspirone
- ☐ 3. inhaled ipratropium
- ☐ 4. ophthalmic timolol

48. A client is scheduled to undergo transurethral resection of the prostate. The procedure is to be done under spinal anesthesia. Postoperatively, the nurse should assess the client for:

- ☐ 1. seizures.
- ☐ 2. cardiac arrest.
- ☐ 3. renal shutdown.
- ☐ 4. respiratory paralysis.

49. A client with benign prostatic hypertrophy (BPH) is being treated with terazosin 2 mg at bedtime. The nurse should monitor the client's:

- ☐ 1. urine nitrites.
- ☐ 2. white blood cell count.
- ☐ 3. blood pressure.
- ☐ 4. pulse.

50. A client, who had a transurethral resection of the prostate (TURP), has a three-way indwelling urinary catheter with continuous bladder irrigation. In which circumstance should the nurse increase the flow rate of the continuous bladder irrigation?

- ☐ 1. when drainage is continuous but slow
- ☐ 2. when drainage appears cloudy and dark yellow
- ☐ 3. when drainage becomes bright red
- ☐ 4. when there is no drainage of urine and irrigating solution

51. A client is to receive belladonna and opium suppositories, as needed, postoperatively after transurethral resection of the prostate (TURP). The nurse should give the client these drugs when he demonstrates signs of:

- ☐ 1. a urinary tract infection.
- ☐ 2. urine retention.
- ☐ 3. frequent urination.
- ☐ 4. pain from bladder spasms.

52. An unlicensed assistive personnel (UAP) tells the nurse, "I think the client is confused. He keeps telling me he has to void, but that is not possible because he has a catheter in place that is draining well." The nurse should tell the UAP:

- ☐ 1. "His catheter is probably plugged. I will irrigate it."
- ☐ 2. "That is a common problem after prostate surgery. The client only imagines the urge to void."
- ☐ 3. "The urge to void is usually created by the large catheter, and he may be having some bladder spasms."
- ☐ 4. "I think he may be somewhat confused."

53. A healthcare provider (HCP) has prescribed amoxicillin 100 PO two times a day. What should the nurse instruct the client to do? Select all that apply.

- ☐ 1. Drink 300 to 500 mL of fluids daily.
- ☐ 2. Void frequently, at least every 2 to 3 hours.
- ☐ 3. Take time to empty the bladder completely.
- ☐ 4. Take the last dose of the antibiotic for the day at bedtime.
- ☐ 5. Take the antibiotic with or without food.

54. In discussing home care with a client after transurethral resection of the prostate (TURP), the nurse should teach the male client that dribbling of urine:

- ☐ 1. can be a chronic problem.
- ☐ 2. can persist for several months.
- ☐ 3. is an abnormal sign that requires intervention.
- ☐ 4. is a sign of healing within the prostate.

55. A client is being discharged to home 3 days after transurethral resection of the prostate (TURP). What should the nurse instruct the client to do? Select all that apply.

- ☐ 1. Drink at least 3,000 mL water per day.
- ☐ 2. Increase calorie intake by eating six small meals a day.
- ☐ 3. Report bright red bleeding to the healthcare provider (HCP).
- ☐ 4. Take deep breaths and cough every 2 hours.
- ☐ 5. Report a temperature over 99°F (37.2°C).

56. A client with benign prostatic hypertrophy (BPH) has an elevated prostate-specific antigen (PSA) level. The nurse should:

- ☐ 1. instruct the client to request having a colonoscopy before coming to conclusions about the PSA results.
- ☐ 2. instruct the client that a urologist will monitor the PSA level biannually when elevated.
- ☐ 3. determine if the prostatic palpation was done before or after the blood sample was drawn.
- ☐ 4. ask the client if he emptied his bladder before the blood sample was obtained.

The Client with a Sexually Transmitted Disease

57. What is **most** important information for the nurse to teach a client newly diagnosed with genital herpes?

- ☐ 1. Use condoms at all times during sexual intercourse.
- ☐ 2. A urologist should be seen only when lesions occur.
- ☐ 3. Oral sex is permissible without a barrier.
- ☐ 4. Determine if your partner has received a vaccine against herpes.

58. A nurse is planning care for a 25-year-old female client who has just been diagnosed with human immunodeficiency virus (HIV) infection. The

client asks the nurse, “How could this have happened?” The nurse responds to the question based on the **most** frequent mode of HIV transmission, which is:

- ☐ 1. hugging an HIV-positive sexual partner without using barrier precautions.
- ☐ 2. inhaling cocaine.
- ☐ 3. sharing food utensils with an HIV-positive person without proper cleaning of the utensils.
- ☐ 4. having sexual intercourse with an HIV-positive person without using a condom.

59. A client with human immunodeficiency virus (HIV) infection is taking zidovudine (AZT). The expected outcome of AZT is to:

- ☐ 1. destroy the virus.
- ☐ 2. enhance the body’s antibody production.
- ☐ 3. slow replication of the virus.
- ☐ 4. neutralize toxins produced by the virus.

60. Women who have human papillomavirus (HPV) are at risk for development of:

- ☐ 1. sterility.
- ☐ 2. cervical cancer.
- ☐ 3. uterine fibroid tumors.
- ☐ 4. irregular menses.

61. The **primary** reason that a herpes simplex virus (HSV) infection is a serious concern to a client with human immunodeficiency virus (HIV) infection is that it:

- ☐ 1. is an acquired immunodeficiency virus (AIDS)–defining illness.
- ☐ 2. is curable only after 1 year of antiviral therapy.
- ☐ 3. leads to cervical cancer.
- ☐ 4. causes severe electrolyte imbalances.

62. When teaching a client about human immunodeficiency virus (HIV), the nurse should take into account the fact that the **most** effective method known to control the spread of HIV infection is:

- ☐ 1. premarital serologic screening.
- ☐ 2. prophylactic treatment of exposed people.
- ☐ 3. laboratory screening of pregnant women.
- ☐ 4. ongoing sex education about preventive behaviors.

63. A male client with human immunodeficiency virus (HIV) infection becomes depressed and tells the nurse: "I have nothing worth living for now." Which statement would be the **best** response by the nurse?

- ☐ 1. "You are a young person and have a great deal to live for."
- ☐ 2. "You should not be too depressed; we are close to finding a cure for AIDS."
- ☐ 3. "You are right; it is very depressing to have HIV."
- ☐ 4. "Tell me more about how you are feeling about being HIV positive."

64. The typical chancre of syphilis appears as:

- ☐ 1. a grouping of small, tender pimples.
- ☐ 2. an elevated wart.
- ☐ 3. a painless, moist ulcer.
- ☐ 4. an itching, crusted area.

65. The nurse is interviewing a client with newly diagnosed syphilis. In order to prevent the spread of the disease, the nurse should focus the interview by:

- ☐ 1. motivating the client to undergo treatment.
- ☐ 2. obtaining a list of the client's sexual contacts.
- ☐ 3. increasing the client's knowledge of the disease.
- ☐ 4. reassuring the client that medical records are confidential.

66. Benzathine penicillin G, 2.4 million units IM, is prescribed as treatment for an adult client with primary syphilis. The nurse should administer the injection in the:

- ☐ 1. deltoid.
- ☐ 2. upper outer quadrant of the buttock.
- ☐ 3. quadriceps lateralis of the thigh.
- ☐ 4. midlateral aspect of the thigh.

67. An 18-year-old female is to have a pelvic exam. Which response by the nurse would be **best** when the client says that she is nervous about the upcoming pelvic examination?

- ☐ 1. "Can you tell me more about how you are feeling?"
- ☐ 2. "You are not alone. Most women feel uncomfortable about this examination."
- ☐ 3. "Do not worry about Dr. Smith. He is a specialist in female problems."
- ☐ 4. "We will do everything we can to avoid embarrassing you."

68. When educating a female client with gonorrhea, the nurse should emphasize that for women, gonorrhea:

- ☐ 1. is often marked by symptoms of dysuria or vaginal bleeding.
- ☐ 2. does not lead to serious complications.
- ☐ 3. can be treated but not cured.
- ☐ 4. may not cause symptoms until serious complications occur.

69. Which group has experienced the **greatest** rise in the incidence of sexually transmitted diseases (STDs) over the past two decades?

- ☐ 1. teenagers
- ☐ 2. divorced people
- ☐ 3. young married couples
- ☐ 4. older adults

70. A sexually active male client has burning on urination and a milky discharge from the urethral meatus. What documentation should be included on the client's medical record? Select all that apply.

- ☐ 1. history of unprotected sex (sex without a condom)
- ☐ 2. length of time since symptoms presented
- ☐ 3. history of fever or chills
- ☐ 4. presence of any enlarged lymph nodes on examination
- ☐ 5. names and phone numbers of all sexual contacts
- ☐ 6. allergies to any medications

71. A male client is diagnosed with a chlamydial infection. Azithromycin 1 g is prescribed. The supply of azithromycin is in 250-mg tablets. How

many tablets should the nurse administer? Record your answer using a whole number.

_____ tablets.

72. A female client with gonorrhea informs the nurse that she has had sexual intercourse with her boyfriend and asks the nurse, “Would he have any symptoms?” The nurse responds that in men, the symptoms of gonorrhea include:

- ☐ 1. impotence.
- ☐ 2. scrotal swelling.
- ☐ 3. urine retention.
- ☐ 4. dysuria.

73. The nurse assesses the mouth and oral cavity of a client with human immunodeficiency virus (HIV) infection because the **most** common opportunistic infection initially presents as:

- ☐ 1. herpes simplex virus (HSV) lesions on the lips.
- ☐ 2. oral candidiasis.
- ☐ 3. cytomegalovirus (CMV) infection.
- ☐ 4. aphthae on the gingiva.

74. The nurse is administering didanosine to a client with HIV. Before administering this medication, the nurse should check which lab test results? Select all that apply.

- ☐ 1. elevated serum creatinine
- ☐ 2. elevated blood urea nitrogen (BUN)
- ☐ 3. elevated aspartate aminotransferase (AST)
- ☐ 4. elevated alanine aminotransferase (ALT)
- ☐ 5. elevated serum amylase

75. The nurse is caring for a client from Southeast Asia who has HIV/AIDS. The client does not speak or comprehend the English language. What should the nurse do?

- ☐ 1. Contact the hospital’s chaplain.
- ☐ 2. Do an Internet search for the Joint United Nations Programme on HIV/AIDS.

- ☐ 3. Utilize language-appropriate interpreters.
- ☐ 4. Ask a family member to obtain informed consent.

The Client with Cancer of the Cervix

76. The nurse is preparing a 45-year-old female for a vaginal examination. The nurse should place the client in which position?

- ☐ 1. Sims' position
- ☐ 2. lithotomy position
- ☐ 3. genupectoral position
- ☐ 4. dorsal recumbent position

77. A client asks the nurse to explain the meaning of her abnormal Papanicolaou (Pap) smear result of atypical squamous cells. The nurse should tell the client that an atypical Pap smear means that:

- ☐ 1. abnormal viral cells were found in the smear.
- ☐ 2. cancer cells were found in the smear.
- ☐ 3. the Pap smear alone is not very important diagnostically because there are many false-positive results.
- ☐ 4. the cells could cause various conditions and help identify a problem early.

78. Which is a risk factor for cervical cancer?

- ☐ 1. sexual experiences with one partner
- ☐ 2. sedentary lifestyle
- ☐ 3. obesity
- ☐ 4. adolescent pregnancy

79. A woman tells the nurse, "There has been a lot of cancer in my family." The nurse should instruct the client to report which possible sign of cervical cancer?

- ☐ 1. pain
- ☐ 2. leg edema
- ☐ 3. urinary and rectal symptoms
- ☐ 4. light bleeding or watery vaginal discharge

80. A 30-year-old female client asks the nurse about douching. What information should the nurse include in the teaching plan?

- ☐ 1. Douching during menstruation is safe.
- ☐ 2. Daily douching will decrease vaginal odor.
- ☐ 3. Perfumed douches are recommended to decrease odors.
- ☐ 4. Douching removes natural mucus and changes the balance of normal vaginal flora.

81. A young woman will receive 6 months of chemotherapy for cervical cancer. She is a single parent of two young children and can no longer work. The nurse contacts a social worker to help plan continuing care. The client states, "I feel overwhelmed. How can the social worker help me?" Which responses by the nurse about the role of the social worker are appropriate? Select all that apply.

- ☐ 1. "The social worker is a part of a multidisciplinary team that provides care for clients with cancer."
- ☐ 2. "The social worker can assist in locating resources and programs to assist you during your treatment."
- ☐ 3. "Based on your financial situation and need to care for your children, the social worker can help you identify needed resources at this time."
- ☐ 4. "Your entire family will be included in the treatment plan. Your needs and those of your children will be assessed and determined so that referrals can be made to appropriate resources."
- ☐ 5. "The social worker can authorize temporary funds to help you with child care and to pay your bills while you are sick."

82. The husband of a client with cervical cancer says to the nurse, "The doctor told my wife that her cancer is curable. Is he just trying to make us feel better?" Which would be the nurse's **most** accurate response?

- ☐ 1. "When cervical cancer is detected early and treated aggressively, the cure rate is almost 100%."
- ☐ 2. "The 5-year survival rate is about 75%, which makes the odds pretty good."
- ☐ 3. "Saying a cancer is curable means that 50% of all women with the cancer survive at least 5 years."

- ☐ 4. “Cancers of the female reproductive tract tend to be slow growing and respond well to treatment.”

83. A client with suspected cervical cancer is undergoing a colposcopy with conization. The nurse gives instructions to the client about her menstrual periods, emphasizing that:

- ☐ 1. her periods will return to normal after 6 months.
- ☐ 2. her next two or three periods may be heavier and more prolonged than usual.
- ☐ 3. her next two or three periods will be lighter than normal.
- ☐ 4. she may skip her next two periods.

84. A client with cervical cancer is undergoing internal radium implant therapy. A lead-lined container and a pair of long forceps are kept in the client’s hospital room for:

- ☐ 1. disposal of emesis or other bodily secretions.
- ☐ 2. handling of a dislodged radiation source.
- ☐ 3. disposal of the client’s eating utensils.
- ☐ 4. storage of the radiation dose.

85. The mother of a client who has a radium implant asks why so many nurses are involved in her daughter’s care. She states, “The doctor said I can be in the room for up to 2 hours each day, but the nurses say they are restricted to 30 minutes.” The nurse explains that this variation is based on the fact that nurses:

- ☐ 1. touch the client, which increases their exposure to radiation.
- ☐ 2. work with many clients and could carry infection to a client receiving radiation therapy, if exposure is prolonged.
- ☐ 3. work with radiation on an ongoing basis, while visitors have infrequent exposure to radiation.
- ☐ 4. are at greater risk from the radiation because they are younger than the mother.

86. A client with human papillomavirus (HPV) infection is being treated by a colposcopy. The client asks the nurse if this procedure is really necessary. The nurse explains that the procedure to treat the warts is

important because HPV can lead to:

- ☐ 1. infertility.
- ☐ 2. cervical cancer.
- ☐ 3. pelvic inflammatory disease.
- ☐ 4. rectal cancer.

87. Which action should be included in the nursing care for a client with cervical cancer who has an internal radium implant in place?

- ☐ 1. Offer the bed pan every 2 hours.
- ☐ 2. Provide perineal care twice daily.
- ☐ 3. Check the position of the applicator hourly.
- ☐ 4. Offer a low-residue diet.

88. The nurse should carefully observe a client with internal radium implants for typical adverse effects associated with radiation therapy to the cervix. These effects include:

- ☐ 1. severe vaginal itching.
- ☐ 2. confusion.
- ☐ 3. high fever in the afternoon or evening.
- ☐ 4. nausea and a foul vaginal discharge.

The Client with Cancer of the Ovaries

89. When teaching a client about ovarian cancer, the nurse should include which information? Select all that apply.

- ☐ 1. details about the prognosis
- ☐ 2. staging and grading of ovarian cancer
- ☐ 3. need for routine colonoscopy beginning at age 30
- ☐ 4. procedures for diagnosis if there is a pelvic mass
- ☐ 5. symptoms occurring early in the disease process

90. Interprofessional management of ovarian cancer includes which measures? Select all that apply.

- ☐ 1. combination chemotherapy to cure the cancer
- ☐ 2. bilateral salpingo-oophorectomy to remove diseased organs

- ☐ 3. radiation therapy to eliminate all cancer cells
- ☐ 4. referral to social services for supportive care
- ☐ 5. nutrition therapy for parenteral lipids

91. A client with ovarian cancer asks the nurse, “What is the cause of this cancer?” Which is the **most** accurate response by the nurse?

- ☐ 1. Use of oral contraceptives increases the risk of ovarian cancer.
- ☐ 2. Women who have had at least two live births are protected from ovarian cancer.
- ☐ 3. There is less chance of developing ovarian cancer when one lives in an industrialized country.
- ☐ 4. The risk of developing ovarian cancer is related to environmental, endocrine, and genetic factors.

92. The nurse is planning a presentation about ovarian cancer to a group of women. Which topic should receive **priority** attention in the lesson plan?

- ☐ 1. Ovarian cancer signs and symptoms are often vague until late in development.
- ☐ 2. Ovarian cancer should be considered in any woman older than 30 years of age.
- ☐ 3. A rigid board-like abdomen is the most common sign.
- ☐ 4. Methods for early detection have made a dramatic reduction in the mortality rate due to ovarian cancer.

The Client with Testicular Disease

93. A 28-year-old male is diagnosed with acute epididymitis. The nurse should assess the client for:

- ☐ 1. burning and pain on urination.
- ☐ 2. severe tenderness and swelling in the scrotum.
- ☐ 3. foul-smelling ejaculate.
- ☐ 4. foul-smelling urine.

94. A 30-year-old client is being treated for epididymitis. Teaching for this client should include the fact that epididymitis is commonly a result of a:

- ☐ 1. virus.

- ☐ 2. parasite.
- ☐ 3. sexually transmitted infection.
- ☐ 4. protozoon.

95. When teaching a client to perform testicular self-examination, the nurse explains that the examination should be performed:

- ☐ 1. after intercourse.
- ☐ 2. at the end of the day.
- ☐ 3. after a warm bath or shower.
- ☐ 4. after exercise.

96. The nurse is assessing a client's testes. Which finding indicates the testes are normal?

- ☐ 1. soft
- ☐ 2. egg-shaped
- ☐ 3. spongy
- ☐ 4. lumpy

97. A client has a testicular nodule that is highly suspicious for testicular cancer. A laboratory test that supports this diagnosis is:

- ☐ 1. decreased alpha fetoprotein (AFP).
- ☐ 2. decreased beta-human chorionic gonadotropin (hCG).
- ☐ 3. increased testosterone.
- ☐ 4. increased AFP.

98. Although the cause of testicular cancer is unknown, it is associated with a history of:

- ☐ 1. undescended testes.
- ☐ 2. sexual relations at an early age.
- ☐ 3. seminal vesiculitis.
- ☐ 4. epididymitis.

99. Risk factors associated with testicular malignancies include:

- ☐ 1. African race.
- ☐ 2. residing in a rural area.
- ☐ 3. lower socioeconomic status.

- ☐ 4. age older than 40 years.

100. A client with a testicular malignancy undergoes a radical orchiectomy. In the immediate postoperative period, the nurse should particularly assess the client for:

- ☐ 1. bladder spasms.
- ☐ 2. urine output.
- ☐ 3. pain.
- ☐ 4. nausea.

101. A right orchiectomy is performed on a client with a testicular malignancy. The client expresses concerns regarding his sexuality. The nurse should base the response on the knowledge that the client:

- ☐ 1. is not a candidate for sperm banking.
- ☐ 2. should retain normal sexual drive and function.
- ☐ 3. will be impotent.
- ☐ 4. will have a change in secondary sexual characteristics.

102. A client diagnosed with seminomatous testicular cancer expresses fear and questions the nurse about his prognosis. The nurse should base the response on the knowledge that:

- ☐ 1. testicular cancer can be cured.
- ☐ 2. testicular cancer has a cure rate of 90% when diagnosed early.
- ☐ 3. surgery is the treatment of choice for testicular cancer.
- ☐ 4. testicular cancer has a 50% cure rate when diagnosed early.

The Client with Cancer of the Prostate

103. The nurse is developing an educational program about prostate cancer. The nurse should provide information about which topic?

- ☐ 1. The prostate-specific antigen (PSA) test is reliable for detecting the presence of prostate cancer.
- ☐ 2. For all men, age 50 and older, the American and Canadian Cancer Societies recommend an annual rectal examination.
- ☐ 3. Not lifting more than 20 lb (9.1 kg) aids in prevention of prostate cancer.
- ☐ 4. Regular sexual activity promotes health of the prostate gland to prevent

cancer.

104. The nurse is caring for a client who will have a bilateral orchiectomy. The client asks what is involved with this procedure. Which statement is the nurse's **most** appropriate response? "The surgery:

- ☐ 1. removes the entire prostate gland, prostatic capsule, and seminal vesicles."
- ☐ 2. tends to cause urinary incontinence and impotence."
- ☐ 3. freezes prostate tissue, killing cells."
- ☐ 4. results in reduction of the major circulating androgen, testosterone."

105. The nurse is teaching a client about prostate cancer. Which points should be included in the instruction? Select all that apply.

- ☐ 1. Prostate cancer is usually multifocal and slow growing.
- ☐ 2. Most prostate cancers are adenocarcinoma.
- ☐ 3. The incidence of prostate cancer is higher in men of African descent, and the onset is earlier.
- ☐ 4. A prostate-specific antigen (PSA) lab test >4 ng/mg will need to be monitored.
- ☐ 5. Cancer cells are detectable in the urine.

106. What should the nurse do for a client who is receiving hormone replacement for prostate cancer? Select all that apply.

- ☐ 1. Inform the client that increased libido is expected with hormone therapy.
- ☐ 2. Reassure the client that erectile dysfunction will not occur as a consequence of hormone therapy.
- ☐ 3. Provide the client the opportunity to communicate concerns and needs.
- ☐ 4. Utilize communication strategies that enable the client to gain some feeling of control.
- ☐ 5. Suggest that an appointment be made to see a psychiatrist.

107. A client asks the nurse why the prostate-specific antigen (PSA) level is determined before the digital rectal examination. The nurse's **best** response is:

- ☐ 1. "It is easier for the client."

- ☐ 2. "A prostate examination can possibly decrease the PSA."
- ☐ 3. "A prostate examination can possibly increase the PSA."
- ☐ 4. "If the PSA is normal, the client will not have to undergo the rectal examination."

108. The nurse is performing a digital rectal examination. Which finding is a **key** sign for prostate cancer?

- ☐ 1. a hard prostate, localized or diffuse
- ☐ 2. abdominal pain
- ☐ 3. a boggy, tender prostate
- ☐ 4. a nonindurated prostate

109. A client is undergoing a total prostatectomy for prostate cancer. The client asks questions about his sexual function. The **best** response by the nurse is "Loss of the prostate gland means that:

- ☐ 1. you will be impotent."
- ☐ 2. you will be infertile and there will be no ejaculation. You can still experience the sensations of orgasm."
- ☐ 3. you will have no loss of sexual function and drive."
- ☐ 4. your erectile capability will return immediately after surgery."

110. A 65-year-old client has been told by the healthcare provider (HCP) that his prostate cancer was graded at stage IIB. The client inquires if this means he is going to die soon. What is the **best** response by the nurse?

- ☐ 1. "Prostate cancer at this stage is very slow growing."
- ☐ 2. "Prostate cancer at this stage is very fast growing."
- ☐ 3. "Prostate cancer at this stage has spread to the bone."
- ☐ 4. "Prostate cancer at this stage is difficult to predict."

111. A client with prostate cancer is treated with a luteinizing hormone-releasing hormone agonist and antagonist goserelin. The nurse should instruct the client to expect to have:

- ☐ 1. tenderness of the scrotum.
- ☐ 2. flushing.
- ☐ 3. loss of pubic hair.
- ☐ 4. decreased blood pressure.

The Client with Erectile Dysfunction

112. The client is taking sildenafil orally for erectile dysfunction. What instruction should the nurse give the client?

- ☐ 1. Sildenafil may be taken more than one time per day.
- ☐ 2. The healthcare provider (HCP) should be notified promptly if the client experiences sudden or diminished vision.
- ☐ 3. Sildenafil offers protection against some sexually transmitted diseases (STDs).
- ☐ 4. Sildenafil does not require sexual stimulation to work.

113. A male client reports having impotence. The nurse examines the client's medication regimen and determines that a contributing factor to impotence could be:

- ☐ 1. aspirin.
- ☐ 2. antihypertensives.
- ☐ 3. nonsteroidal anti-inflammatory drugs.
- ☐ 4. anticoagulants.

114. A 65-year-old male client with erectile dysfunction (ED) asks the nurse, "Is all this just in my head? Am I crazy?" The **best** response by the nurse is based on the knowledge that:

- ☐ 1. ED is believed to be psychogenic in most cases.
- ☐ 2. more than 50% of the cases are attributed to organic causes.
- ☐ 3. evaluation of nocturnal erections does not help differentiate psychogenic or organic causes.
- ☐ 4. ED is an uncommon problem among men older than age 65.

115. The nurse should teach the client with erectile dysfunction (ED) to alter his lifestyle to:

- ☐ 1. avoid alcohol.
- ☐ 2. follow a low-salt diet.
- ☐ 3. decrease smoking.
- ☐ 4. increase attempts at sexual intercourse.

Managing Care, Quality, and Safety of Clients with Reproductive Health Problems

116. The nurse is assigning tasks to the unlicensed assistive personnel (UAP) for a client with an abdominal hysterectomy on the first postoperative day. Which task **cannot** be delegated to the UAP?

- ☐ 1. taking vital signs
- ☐ 2. recording intake and output
- ☐ 3. giving perineal care
- ☐ 4. assessing the incision site

117. The nurse-manager on a gynecologic surgical unit is addressing reports from clients that they have to wait too long on the night shift for their pain medication. Which course of action should the nurse-manager take **first**?

- ☐ 1. Change the staffing schedule on nights to include a medication nurse.
- ☐ 2. Consult the nursing supervisor.
- ☐ 3. Consult the nurses on the evening shift about their evaluation of the night nurses regarding these reports from the clients.
- ☐ 4. Complete a quality improvement study with the night nurses to document the waiting times for pain medication and other data, including staffing and client acuity.

118. A nurse is reviewing the healthcare provider's (HCP's) admitting prescriptions for a 52-year-old client scheduled for a dilatation and curettage. The nurse is unable to decipher the handwriting but thinks the medication prescription reads either metoprolol or topiramate. What should the nurse do **next**?

- ☐ 1. Ask the client if she has hypertension.
- ☐ 2. Ask the client if she has migraines.
- ☐ 3. Call the HCP to clarify the prescription.
- ☐ 4. Ask the pharmacist to interpret the prescription.

119. The unlicensed assistive personnel (UAP) reports to the nurse that the client with an abdominal hysterectomy who returned from the recovery room 1 hour earlier has saturated the blue pad with bright red blood. What should the nurse do?

- ☐ 1. Call the surgeon to report the bleeding.
- ☐ 2. Ask the UAP to obtain vital signs while the nurse calls the surgeon.
- ☐ 3. Ask the UAP to increase the flow of IV fluids to prevent shock.
- ☐ 4. Assess the client again in 15 minutes before the nurse takes any further action.

120. A nurse on the gynecologic surgery unit observes a respiratory therapist (RT) take a medication cup with pills that was sitting in the medication room. What course of action should the nurse take?

- ☐ 1. Report the situation to the supervisor of respiratory therapy.
- ☐ 2. Tell the RT that you saw her take the pills from the medication room.
- ☐ 3. Report the situation to the nursing supervisor.
- ☐ 4. Tell the nurse who was administering medications not to leave pills out.

Answers, Rationales, and Test-Taking Strategies

*The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in Part 1 of this book.*

The Client with a Vaginal Infection

1. 1,2,4. Bacterial vaginosis is a clinical syndrome resulting from the replacement of the normal vaginal *Lactobacillus* species with overgrowth of anaerobic bacteria that cause a cluster of symptoms. Presence of a thick, white, adherent vaginal discharge with a fishy odor is evidence for bacterial vaginosis, and the client should seek treatment. The client should not douche unless under medical prescriptions because douching can cause bacteria to

ascend into the uterus. Bacterial vaginosis is not sexually transmitted, and it does not require treatment of the partner. Vaginal infections commonly require an examination and diagnostic assessment.

 CN: Reduction of risk potential; CL: Synthesize

2. 3. Douching may disrupt the normal flora of the vaginal lactobacilli and change the pH, which could result in overgrowth of other bacteria. Coffee, intercourse during menses, and tampons are not related to changes in vaginal pH or the incidence of bacterial vaginosis.

 CN: Health promotion and maintenance; CL: Apply

3. 4. Metronidazole interacts with alcohol and can cause a serious disulfiram-type reaction, with severe, prolonged vomiting. The client should not douche unless following a medical prescription, but douching does not interact with metronidazole. Sexual intercourse and hot tub baths are not known to affect the incidence or treatment of bacterial vaginosis.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

4. 1,2,3. Women with underlying medical conditions, such as uncontrolled diabetes and HIV infection or cancer-causing immunosuppression, correlate with an increasing severity of candidiasis. Hypertension and asthma are not related to immunosuppression or complicated candidiasis.

 CN: Health promotion and maintenance; CL: Analyze

5. 1. Antibiotics may decrease the effectiveness of oral contraceptives. The client should be instructed to continue the contraceptives and use a barrier method as a backup method of birth control until the next menstrual cycle. The client should not stop taking her oral contraceptives, and there is no indication for or benefit to taking the antibiotic 2 hours after the contraceptive. There is no incidence of the adverse effects of increased hunger and fluid retention with the interaction of antibiotic therapy and oral contraceptives.

 CN: Pharmacological and parenteral therapies; CL: Create

6. 4. Due to the increased risk of pelvic inflammatory disease, candidates for the IUD should be in a monogamous relationship. Smoking and

hypertension are not contraindications for an IUD. The frequency of sexual relations will not affect IUD use.

CN: Pharmacological and parenteral therapies; CL: Analyze

7. 1. Fluid losses can occur from vomiting, diarrhea, and fever and can lead to hypovolemic shock. The first nursing action is to treat the hypovolemic shock that accompanies toxic shock, so the IV fluids must be administered immediately. The fluid replacement is critical to avoid circulatory collapse. Pain medication and teaching can be implemented later. Antibiotics will be given because TSS is caused by a staphylococcal infection; however, fluid replacement is initiated **first** to treat life-threatening hypovolemic shock.

CN: Reduction of risk potential; CL: Synthesize

The Client with Uterine Fibroids

8. 2. The best approach for a client who is fearful about having surgery is to allow the client opportunities to express her fears. Open-ended questions should elicit the client's individual and specific fears. This then gives the nurse the opportunity to provide clarification, information, and support and possibly to offer other resources. The other actions are not supportive and deny the client the opportunity to express her feelings.

CN: Psychosocial adaptation; CL: Synthesize

9. 1,2. A woman with uterine fibroids and dysmenorrhea is at risk for iron deficiency anemia. The hemoglobin and hematocrit indicate the likelihood that the fibroids causing heavy menstrual blood loss have resulted in anemia. A hemoglobin of <12 g/dL (120 g/L) in women is considered low. The white blood cell count and potassium levels are within normal parameters, and normocytic red blood cells are normal.

CN: Management of care; CL: Synthesize

10. 2. It is a priority that the client knows she will not be able to eat or drink for 8 hours before admission. A client who consumes food and fluid before receiving a general anesthetic is at risk for aspiration, which can lead to aspiration pneumonia, respiratory arrest, and even death. The clothing she

should wear to the hospital and the type of medication she will receive are important, but not the priority. Information on exercise and resumption of normal activities can be included in the discharge teaching.

CN: Basic care and comfort; CL: Synthesize

11. 2. The client needs to understand that with removal of the uterus, she will no longer be able to bear children or have menstrual periods. The surgical procedure should not change her libido or sexual functioning. Research does not support the idea that hysterectomy contributes to depression or weight gain. Research demonstrates that women who have managed health problems for some time before the hysterectomy may actually have a more positive effect, with less worry about their health condition, contraception, or pregnancy.

CN: Management of care; CL: Apply

12. 4,1,3,2. After gathering appropriate supplies, the nurse should prepare a sterile field. After lubricating the catheter adequately with a water-soluble lubricant to minimize trauma to the urethra, the nurse should insert the catheter far enough into the bladder so the retention balloon does not traumatize urethral tissues. Ensuring a free flow of urine prevents infection; improper drainage occurs when tubing is kinked or twisted.

CN: Safety and infection control; CL: Apply

13. 2. Hyperventilation occurs when the client breathes so rapidly and deeply that she exhales excessive amounts of carbon dioxide. A characteristic symptom of hyperventilation is dizziness. To avoid hyperventilation, the nurse should assist the client in the practice of slow, deep breathing in a regular breathing pattern. Dyspnea, blurred vision, and mental confusion are not associated with hyperventilation.

CN: Physiological adaptation; CL: Apply

14. 4. The discomfort associated with gas pains is likely to be relieved when the client ambulates. The gas will be more easily expelled with exercise. The anesthesia, analgesics, and immobility have altered normal peristalsis. Peristalsis will be stimulated by exercise. Offering a hot beverage, providing extra warmth, and applying an abdominal binder are not

recommended and could aggravate the discomfort of postoperative gas pains.

CN: Physiological adaptation; CL: Synthesize

15. 3. Elevated temperature on the second postoperative day is suggestive of a respiratory tract infection. Respiratory infections most often occur during the first 48 hours after surgery. The nurse should encourage the client to take deep breaths frequently. The nurse should also monitor the client's vital signs and report significant changes to the surgeon. Signs of infection, if present in the wound or urinary tract, are likely to occur later in the postoperative period. There is no indication that the IV catheter is the source of infection.

CN: Physiological adaptation; CL: Synthesize

16. 3. When a dressing sticks to a wound, it is best to moisten the dressing with sterile normal saline solution and then remove it carefully. Trying to remove a dry dressing is likely to irritate the skin and wound. This may contribute to tension or tearing along the suture line.

CN: Management of care; CL: Apply

17. 2. The social worker will be able to coordinate respite care for the son and other community resources for this family. Home health care would provide care for the client herself, but respite care for the son is the priority need for this family. Pastoral care provides spiritual care. The volunteer department would not be responsible for coordination of care at the client's home.

CN: Management of care; CL: Apply

18. 2. Assessment is the first step in planning client education. Assessing social support resources is a key aspect of discharge planning that begins when the client is admitted to the hospital. It is imperative to know what assistance and support the client has at home. Assessment includes obtaining data about any family or home responsibilities the client is concerned with during the recovery period. It is within the scope of nursing practice to provide discharge instructions. A social worker is not needed at this time. The nurse should assess the client's needs before determining whether using a video or reading instructions to the client is appropriate.

CN: Health promotion and maintenance; CL: Create

19. 2. The nurse's first action is to notify the surgeon as the amount of bleeding on the perineal pad is not normal. Excessive bleeding is also indicated by elevated heart rate and decreased BP. Urinary catheters are not removed until the second or third postoperative day. The surgeon may prescribe an increase in the rate of the IV fluids. The nurse changes the perineal pad and offers comfort measures once the client is stable.

CN: Physiological adaptation; CL: Synthesize

20. 3. The client should be prepared for what to expect after surgery. The client should not drive until she can use the brake pedal without abdominal pain. The nurse should teach the client to avoid activities that may increase pelvic congestion, such as dancing or brisk walking, for several months, whereas activities, such as swimming and leisurely walking, may be both physically and mentally helpful. Heavy lifting should be avoided for 2 months, but the client can lift up to 10 lb (4.5 kg) as long as there is no tension on the abdomen or abdominal pain.

CN: Physiological adaptation; CL: Synthesize

21. 1. The nurse must first assess the intensity of the client's pain before selecting the correct analgesia. A high score would necessitate administering the meperidine. If the intensity rating is low, an oral analgesic would be appropriate. If acetaminophen is given without assessing the intensity of the client's pain, the nurse must then wait 4 hours before administering another analgesic.

CN: Pharmacological and parenteral therapies; CL: Synthesize

22. 3. The nurse should withhold administering docusate sodium, a stool softener, and document that the woman has had loose stools. The nurse is responsible for assessing contraindications and adverse effects of medications, and administering the medication when the client already has loose stools is unsafe. The assessment should also include auscultation of bowel sounds and inquiry about gas pains, but the stool softener should still be withheld.

CN: Pharmacological and parenteral therapies; CL: Synthesize

23. 1,4. The average age of menopause is 50 to 52 years, although some

variation exists. Vaginal infections do not necessarily increase during menopause. Hot flashes occur in about 80% of women; they can range from mild to very debilitating with disruption of sleep patterns. Depression is not usual during menopause; if symptoms of depression do occur, the nurse should refer the woman to her **healthcare provider (HCP)** 📖.

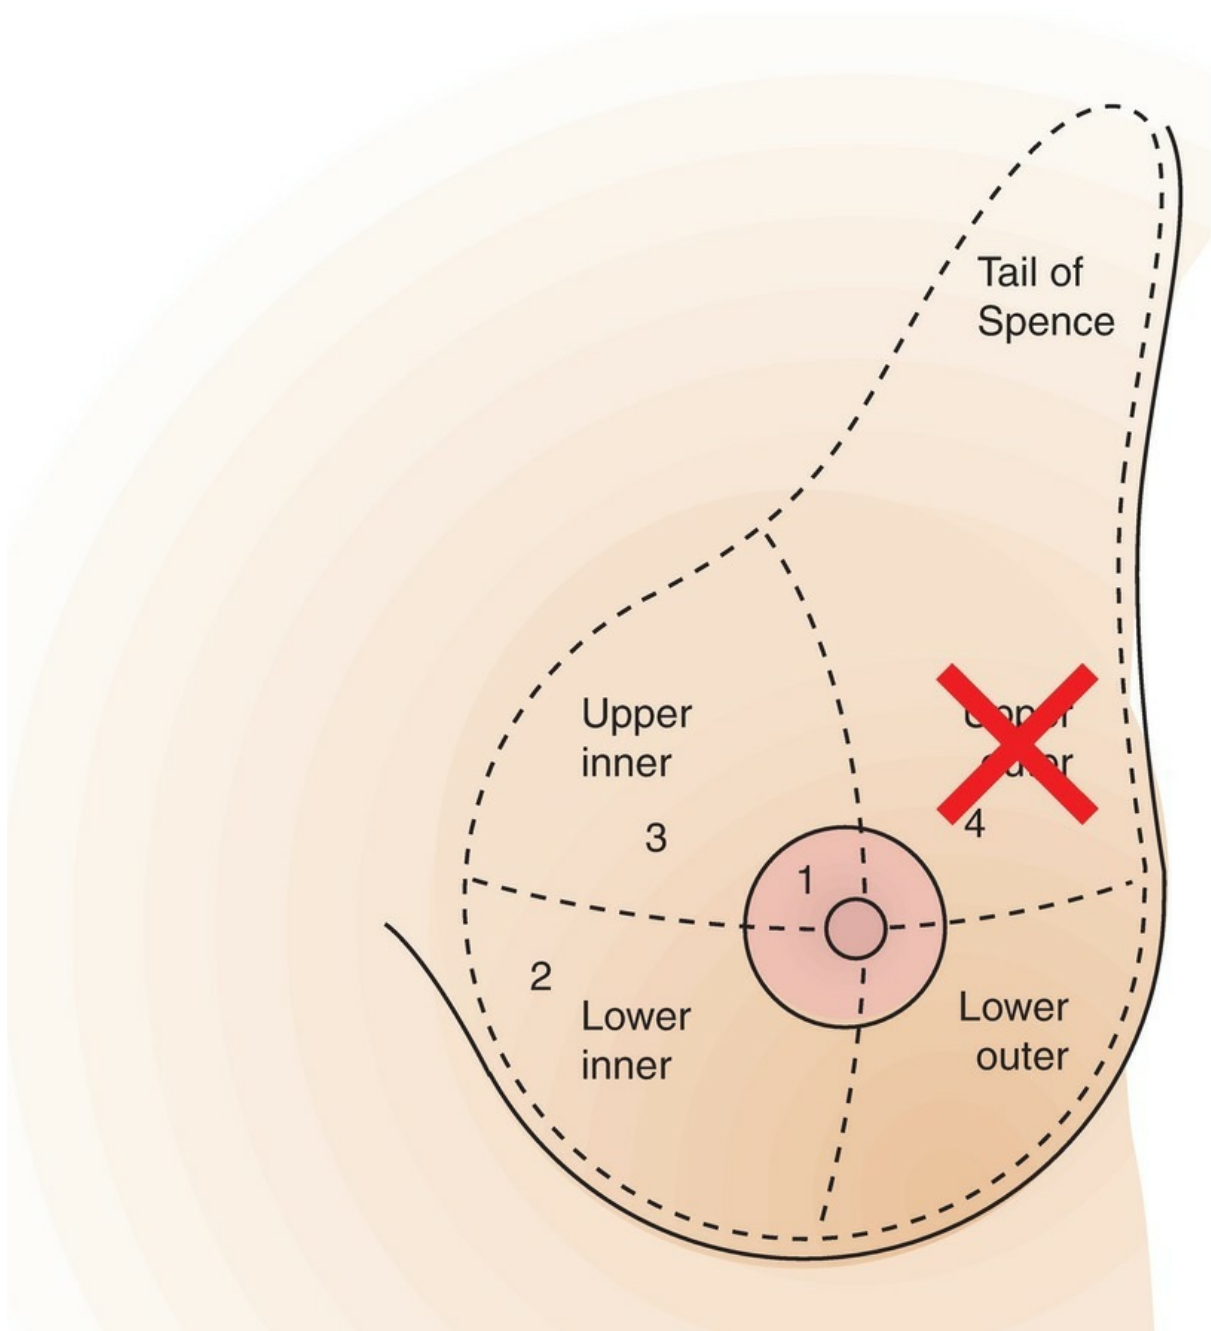

Contraception should be used until menses has ceased for a full year.

CN: Physiological adaptation; CL: Create

The Client with Breast Cancer

24. The upper outer quadrant is the area of the breast in which most breast tumors are found. This area should be palpated thoroughly. Although breast tumors can be found in any area of the breast, including the nipple, the tumors are most often in the upper outer quadrant.

CN: Health promotion and maintenance; CL: Apply

25. 2. The breasts may vary in size before menstruation because of breast engorgement caused by hormonal changes. A woman may then note that her bra fits more tightly than usual. Benign cysts do not cause variation in breast size. A change in breast size that does not follow hormonal changes could warrant further assessment. The breasts normally are about the same size, although some women have one breast slightly larger than the other.

 CN: Health promotion and maintenance; CL: Apply

26. 2. The nurse should explain that the incidence of breast cancer increases with age and current guidelines recommend women have a mammogram every 2 years until age 74. While mammograms are less painful as breast tissue becomes softer, the nurse should advise the woman to have the mammogram. Family history is important, but only about 5% of breast cancers are genetic. Several breast cancer screening guidelines recommend against breast self-examinations for women.

 CN: Health promotion and maintenance; CL: Synthesize

27. 1. An important nursing responsibility is preoperative teaching, and the most frequently recommended guide for teaching is to tell the client as much as she wants to know and is able to understand. Delaying discussion of issues about which the client has concerns is likely to aggravate the situation and cause the client to feel distrust. As a general guide, the client would not ask the question if she were not ready to discuss her situation. The nurse is available to answer the client's questions and concerns and should not delay discussing these with the client.

 CN: Psychosocial adaptation; CL: Synthesize

28. 1. The nurse documents serosanguineous drainage of 100 to 200 ml because this is normal during the first 24 hours after surgery. The nurse notifies the surgeon only if there is excessive or very bloody drainage. The surgeon removes the drain within 24 to 48 hours. The client is instructed to keep her arm on the affected side and supported in an adducted position.

 CN: Physiological adaptation; CL: Synthesize

29. 4. Atropine sulfate, a cholinergic blocking agent, is given preoperatively to reduce secretions in the mouth and respiratory tract, which assists in maintaining the integrity of the respiratory system during general anesthesia. Atropine is not used to promote muscle relaxation, decrease nausea and vomiting, or decrease pulse and respiratory rates. It causes the pulse to increase.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

30. 3. The nurse should respond with an open-ended statement that elicits further exploration of the client's feelings. Women with cancer may feel guilt or shame. Previous life decisions, sexuality, and religious beliefs may influence a client's adjustment to a diagnosis of cancer. The nurse should not contradict the client's feelings of punishment or offer advice such as confiding in the husband. A social worker referral may be beneficial in the future, but it is not the first response needed to elicit exploration of the client's feelings.

CN: Psychosocial adaptation; CL: Synthesize

31. 3. A drainage tube is placed in the wound after a modified radical mastectomy to help remove accumulated blood and fluid in the area. Removal of the drainage fluids assists in wound healing and is intended to decrease the incidence of hematoma, abscess formation, and infection. Drainage tubes placed in a wound do not decrease intrathoracic pressure, increase collateral lymphatic flow, or prevent adhesion formation.

CN: Reduction of risk potential; CL: Evaluate

32. 4. Lymph nodes can be removed from the axillary area when a modified radical mastectomy is done and each of the nodes is biopsied. To facilitate drainage from the arm on the affected side, the client's arm should be elevated on pillows with her hand higher than her elbow and her elbow higher than her shoulder. A sentinel node biopsy procedure is associated with a decreased risk of lymphedema because fewer nodes are excised.

CN: Physiological adaptation; CL: Synthesize

33. 1,3,5,6. Blood pressures or blood draws in the affected arm, sun exposure, trauma with a sharp razor, and immobilization increase the risk of lymphedema. Elevation of the arm and hand pump exercises promote lymph flow and reduce edema.

CN: Health promotion and maintenance; CL: Create

34. 2. Tamoxifen is an antiestrogen drug that has been found to be effective against metastatic breast cancer and to improve the survival rate. The drug causes hot flashes as an adverse effect.

CN: Pharmacological and parenteral therapies; CL: Synthesize

35. 1. Giving the client a list of community resources that could provide support and guidance assists the client to maintain her self-image and independence. The support group will include other women who have undergone similar therapies and can offer suggestions for breast products and wigs. Because the client is asking about specific resources, she does not need a referral to a social worker, home health agency, or plastic surgeon.

CN: Management of care; CL: Synthesize

36. 1. A client receiving radiation therapy should avoid lotions, ointments, and anything that may cause irritation to the skin, such as exposure to sunlight, heat, or talcum powder. The area may safely be washed with water if it is done gently and if care is taken not to injure the skin.

CN: Reduction of risk potential; CL: Synthesize

37. 3. The most common reaction of the skin to radiation therapy is redness of the surface tissues. Dryness, tanning, and capillary dilation are also common. Atrophy of the skin, pustules, and sloughing of two layers would not be expected and should be reported to the radiologist.

CN: Reduction of risk potential; CL: Apply

38. 1. This client is at risk for lymphedema and infection. Precautions to avoid creating an entry site for infection in the affected arm include wearing protective gloves, using cuticle cream, not cutting cuticles, using an electric razor, using a thimble when sewing, and avoiding having injections or blood drawn from that arm. She does not need to avoid crowds; she is not at high risk for respiratory infection.

CN: Reduction of risk potential; CL: Synthesize

The Client with Benign Prostatic Hypertrophy

39. 1. The best way to assess for a distended bladder in either a male or female client is to check for a rounded swelling above the pubis. This swelling represents the distended bladder rising above the pubis into the abdominal cavity. Dullness does not indicate a distended bladder. The client might experience tenderness or pressure above the symphysis. No urine discharge is expected; the urine flow is blocked by the enlarged prostate.

 CN: Reduction of risk potential; CL: Analyze

40. 3. Rapid emptying of an overdistended bladder may cause hypotension and shock due to the sudden change of pressure within the abdominal viscera. The nurse should empty the bladder slowly. Removal of urine from the bladder does not cause renal failure. The client may experience cramping, but the primary concern is the potential for shock. Bladder muscles will not atrophy because of a catheterization.

 CN: Reduction of risk potential; CL: Apply

41. 2. Liberal lubrication of the catheter before catheterization of a male reduces friction along the urethra and irritation and trauma to urethral tissues. Because the male urethra is tortuous, a liberal amount of lubrication is advised to ease catheter passage. The female urethra is not tortuous, and, although the catheter should be lubricated before insertion, less lubricant is necessary. Lubrication of the catheter will not decrease spasms. The nurse should use sterile technique to prevent introducing organisms. Crusts will not form immediately. Irrigating the catheter as needed will prevent clot and crust formation.

 CN: Reduction of risk potential; CL: Apply

42. 1. The primary reason for taping an indwelling catheter to a male client so that the penis is held in a lateral position is to prevent pressure at the penoscrotal angle. Prolonged pressure at the penoscrotal angle can cause a ureterocutaneous fistula.

 CN: Reduction of risk potential; CL: Apply

43. 4. Transurethral resection of the prostate (TURP) is a common surgical procedure used to treat male clients with benign prostate enlargement. The surgery commonly results in blood from the surgery in the urine for the first few days, and the client should not be concerned; the urine will become clear within 2 to 3 days. Central venous access is not expected for this type of surgery. Peripheral IV access can be expected. Clients are instructed to anticipate hospitalization for 1 to 3 days. Because the procedure is performed transurethrally (via the urethra), there is no outward incision.

 CN: Physiological adaptation; CL: Synthesize

44. 2. Continuous bladder irrigation (CBI) is performed when urinary surgery (typically prostate surgery) results in hematuria. It is accomplished using an indwelling Foley catheter with three lumens. One port is for the balloon, a second port allows irrigant inflow, and a third port enables outflow. The purpose of the irrigation is to achieve and maintain clear outflow and to prevent clot formation within the bladder. Manual irrigation is used as an intermittent type of bladder irrigation and is not the same as CBI. CBI involves irrigation of the bladder; it is not an intravascular infusion. The rate is often initially fast to achieve a clear outflow. Stopping and clamping the irrigant inflow is done only under a **healthcare provider's (HCP's)**  direction and is typically not expected until at least 1 day following the procedure.

CN: Physiological Adaptation; CL: Synthesize

45. 1,2,4,5. Because of the history of BPH, the nurse should provide privacy and time for the client to void. The nurse should also monitor intake and output, assess the client for urinary retention, and test the urine for hematuria. It is not necessary to catheterize the client.

CN: Physiological adaptation; CL: Synthesize

46. 2. Signs and symptoms of prostatic hypertrophy include difficulty starting the flow of urine, urinary frequency and hesitancy, decreased force of the urine stream, interruptions in the urine stream when voiding, and nocturia. The prostate gland surrounds the urethra, and these symptoms are all attributed to obstruction of the urethra resulting from prostatic hypertrophy. Nocturia from incomplete emptying of the bladder is common. Straining and urine retention are usually the symptoms that prompt the client to seek care. Painful urination is generally not a symptom of prostatic hypertrophy.

CN: Physiological adaptation; CL: Analyze

47. 3. Ipratropium is a bronchodilator, and its anticholinergic effects can aggravate urine retention. Metformin and buspirone do not affect the urinary system; timolol does not have a systemic effect.

CN: Pharmacological and parenteral therapies; CL: Apply

48. 4. If paralysis of vasomotor nerves in the upper spinal cord occurs when spinal anesthesia is used, the client is likely to develop respiratory paralysis. Artificial ventilation is required until the effects of the anesthesia subside. Seizures, cardiac arrest, and renal shutdown are not likely results of spinal anesthesia.

CN: Physiological adaptation; CL: Analyze

49. 3. Terazosin is an antihypertensive drug that is also used in the treatment of BPH. Blood pressure must be monitored to ensure that the client does not develop hypotension, syncope, or orthostatic hypotension. The client should be instructed to change positions slowly. Urine nitrates, white blood cell count, and pulse rate are not affected by terazosin.

CN: Pharmacological and parenteral therapies; CL: Analyze

50. 3. The decision by the surgeon to insert a catheter after TURP or prostatectomy depends on the amount of bleeding that is expected after the procedure. During continuous bladder irrigation after a TURP or prostatectomy, the rate at which the solution enters the bladder should be increased when the drainage becomes brighter red. The color indicates the presence of blood. Increasing the flow of irrigating solution helps flush the catheter well so that clots do not plug it. There would be no reason to increase the flow rate when the return is continuous or when the return appears cloudy and dark yellow. Increasing the flow would be contraindicated when there is no return of urine and irrigating solution.

CN: Pharmacological and parenteral therapies; CL: Synthesize

51. 4. Belladonna and opium suppositories are prescribed and administered to reduce bladder spasms that cause pain after TURP. Bladder spasms frequently accompany urologic procedures. Antispasmodics offer relief by eliminating or reducing spasms. Antimicrobial drugs are used to treat an infection. Belladonna and opium do not relieve urine retention or urinary frequency.

CN: Pharmacological and parenteral therapies; CL: Synthesize

52. 3. The indwelling urinary catheter creates the urge to void and can also cause bladder spasms. The nurse should ensure adequate bladder emptying by

monitoring urine output and characteristics. Urine output should be at least 50 mL/h. A plugged catheter, imagining the urge to void, and confusion are less likely reasons for the client's problem.

CN: Reduction of risk potential; CL: Synthesize

53. 2,3,4,5. Amoxicillin may be given with or without food, but the nurse should instruct the client to obtain an adequate fluid intake (2,500 to 3,000 mL) to promote urinary output and to flush out bacteria from the urinary tract. The nurse should also encourage the client to void frequently (every 2 to 3 hours) and empty the bladder completely. Taking the antibiotic at bedtime, after emptying the bladder, helps to ensure an adequate concentration of the drug during the overnight period.

CN: Physiological adaptation; CL: Synthesize

54. 2. Dribbling of urine can occur for several months after TURP. The client should be informed that this is expected and is not an abnormal sign. The nurse should teach the client perineal exercises to strengthen sphincter tone. The client may need to use pads for temporary incontinence. The client should be reassured that continence will return in a few months and will not be a chronic problem. Dribbling is not a sign of healing but is related to the trauma of surgery.

CN: Basic care and comfort; CL: Synthesize

55. 1,3,5. The nurse should instruct the client to drink a large amount of fluids (about 3,000 mL/day) to keep the urine clear. The urine should be almost without color. About 2 weeks after TURP, when desiccated tissue is sloughed out, a secondary hemorrhage could occur. The client should be instructed to call the surgeon or go to the emergency department if at any time the urine turns bright red. The nurse should also instruct the client to report signs of infection such as a temperature over 99°F (37.2°C). The client is not specifically at risk for nutritional problems after TURP and can resume a diet as tolerated. The client is not specifically at risk for airway problems because the procedure is done under spinal anesthesia and the client does not need to take deep breaths and cough.

CN: Physiological integrity; CL: Synthesize

56. 3. Rectal and prostate examinations can increase serum PSA levels. The prostatic palpation should be done after the blood sample is drawn. The PSA level must be monitored more often than biannually when it is elevated. Having a colonoscopy is not related to the findings of the PSA test. It is not necessary to void prior to having PSA blood levels tested.

CN: Health promotion and maintenance; CL: Synthesize

The Client with a Sexually Transmitted Disease

57. 1. The client should be taught to abstain from sexual intercourse while lesions are present. Condoms should be used at all times as the virus can be shed without lesions present. Multiple partners would promote the spread of genital herpes. There is no vaccine available to prevent genital herpes. Although periodic examinations should be advised, a urologist does not necessarily need to be seen when lesions occur.

CN: Physiological adaptation; CL: Synthesize

58. 4. HIV infection is transmitted through blood and body fluids, particularly vaginal and seminal fluids. A blood transfusion is one way the disease can be contracted. Other modes of transmission are sexual intercourse with an infected partner and sharing IV needles with an infected person. Women now have the highest rate of newly diagnosed HIV infection. Many of these women have contracted HIV from unprotected sex with male partners. HIV cannot be transmitted by hugging, inhaling cocaine, or sharing utensils.

CN: Safety and infection control; CL: Apply

59. 3. Zidovudine (AZT) interferes with replication of HIV and thereby slows progression of HIV infection to acquired immunodeficiency syndrome (AIDS). There is no known cure for HIV infection. Today, clients are not treated with monotherapy but are usually on triple therapy due to a much-improved clinical response. Decreased viral loads with the drug combinations have improved the longevity and quality of life in clients with HIV/AIDS. AZT does not destroy the virus, enhance the body's antibody production, or neutralize toxins produced by the virus.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

60. 2. Women who have HPV are much more likely to develop cervical cancer than women who have never had the disease. Cervical cancer is now considered a sexually transmitted disease. Regular examinations, including Papanicolaou tests, are recommended to detect and treat cervical cancer at an early stage. Girls and women as well as boys and men (around ages 9 to 26 depending on the vaccine) should receive a vaccine to prevent HPV. HPV does not cause sterility, uterine fibroid tumors, or irregular menses.

 CN: Health promotion and maintenance; CL: Analyze

61. 1. HSV infection is one of a group of disorders that, when diagnosed in the presence of HIV infection, are considered to be diagnostic for AIDS. Other AIDS-defining illnesses include Kaposi's sarcoma; cytomegalovirus of the liver, spleen, or lymph nodes; and *Pneumocystis carinii* pneumonia. HSV infection is not curable and does not cause severe electrolyte imbalances. Human papillomavirus can lead to cervical cancer.

 CN: Physiological adaptation; CL: Apply

62. 4. Education to prevent behaviors that cause HIV transmission is the primary method of controlling HIV infection. Behaviors that place people at risk for HIV infection include unprotected sexual intercourse and sharing of needles for IV drug injection. Educating clients about using condoms during sexual relations is a priority in controlling HIV transmission.

 CN: Safety and infection control; CL: Apply

63. 4. The nurse should respond with a statement that allows the client to express his thoughts and feelings. After sharing feelings about their diagnosis, clients will need information, support, and community resources. Statements of encouragement or agreement do not provide an opportunity for the client to express himself.

 CN: Psychosocial adaptation; CL: Synthesize

64. 3. The chancre of syphilis is characteristically a painless, moist ulcer. The serous discharge is very infectious. Because the chancre is usually painless and disappears, the client may not be aware of it or may not seek

care. The chancre does not appear as pimples or warts and does not itch, thus making diagnosis difficult.

CN: Physiological adaptation; CL: Analyze

65. 2. An important aspect of controlling the spread of sexually transmitted diseases (STDs) is obtaining a list of the sexual contacts of an infected client. These contacts, in turn, should be encouraged to obtain immediate care. Many people with STDs are reluctant to reveal their sexual contacts, which makes controlling STDs difficult. Increasing clients' knowledge of the disease and reassuring clients that their records are confidential can motivate them to seek treatment, which does help to control the spread of the disease, but it is not as critical as information about the client's sexual contacts.

CN: Physiological adaptation; CL: Synthesize

66. 2. Because of the large dose, the upper outer quadrant of the buttocks is the recommended site. The deltoid and the quadriceps lateralis of the thigh are not large enough for the recommended dose. In infants and small children, the midlateral aspect of the thigh may be preferred.

CN: Pharmacological and parenteral therapies; CL: Apply

67. 1. Asking the client to describe her nervousness gives her the opportunity to express her concerns. It also allows the nurse to understand her better and gives the nurse a base to respond to the client's stated fears, questions, or need for further information. Responses that make assumptions about the source of the concern or offer reinforcement are not supportive and block successful communication.

CN: Psychosocial adaptation; CL: Synthesize

68. 4. Many women do not seek treatment because they are unaware that they have gonorrhea. They may be symptom-free or have only very mild symptoms until the disease progresses to pelvic inflammatory disease. Dysuria and vaginal bleeding are not present in gonorrhea. Gonorrhea can lead to very serious complications. It can be cured with the proper treatment.

CN: Physiological adaptation; CL: Synthesize

69. 1. Statistics reveal that the incidence of STDs is rising more rapidly among teenagers than among any other age group. Many reasons have been given for this trend, including a change in societal mores and increasing sexual activity among teenagers. During this developmental stage, teenagers may engage in high-risk sexual behaviors because they often are living in the present and feel that it will not happen to them.

CN: Health promotion and maintenance; CL: Apply

70. 1,2,3,4,6. The client is suspected of having a sexually transmitted infection. Therefore, the client's sexual history, assessment, and examination must be documented, including symptoms (such as fever, chills, and enlarged glands) and their onset and duration. Allergies are critical to document for every client but are especially noteworthy in this case because antibiotics will be prescribed. If a sexually transmitted infection is confirmed, sexual contacts need to be treated. To protect privacy, the names and phone numbers should never be placed in the **medical record** . The public health department will also assist in obtaining information and treating known sexual contacts.

CN: Safety and infection control; CL: Analyze

71. 4 tablets

First, convert 1 g to milligrams:

$$1 \text{ g} = 1,000 \text{ mg.}$$

Next, divide the desired dose by the dose on hand:

$$1,000 \text{ mg} / 250 \text{ mg} = 4 \text{ tablets.}$$

CN: Pharmacological and parenteral therapies; CL: Apply

72. 4. Dysuria and a mucopurulent urethral discharge characterize gonorrhea in men. Gonococcal symptoms are so painful and bothersome for men that they usually seek treatment with the onset of symptoms. Impotence, scrotal swelling, and urine retention are not associated with gonorrhea.

CN: Physiological adaptation; CL: Apply

73. 2. The most common opportunistic infection in HIV infection initially

presents as oral candidiasis, or thrush. The client with HIV should always have an oral assessment. HSV and CMV are opportunistic infections that present later in acquired immunodeficiency syndrome. Aphthous stomatitis, or recurrent canker sores, is not an opportunistic infection, although the sores are thought to occur more often when the client is under stress.

CN: Health promotion and maintenance; CL: Apply

74. 3,4,5. The nurse should withhold the medication and notify the **healthcare provider (HCP)**  immediately if the client develops manifestations of pancreatitis or hepatic failure including nausea and vomiting, severe abdominal pain, elevated bilirubin, or elevated serum enzymes (e.g., amylase, AST, ALT). If both BUN and creatinine are elevated, the client may have kidney disease.

CN: Pharmacological and parenteral therapies; CL: Synthesize

75. 3. Interpreters are essential in enabling the nurses' communications to be understood accurately. The chaplain may not know the client's language. The Joint United Nations Programme on HIV/AIDS has the number of reported cases of AIDS. It is not necessary for the family member to obtain **informed consent** .

CN: Psychosocial adaptation; CL: Synthesize

The Client with Cancer of the Cervix

76. 2. Although other positions may be used, the preferred position for a vaginal examination is the lithotomy position. This position offers the best visualization. If the client is elderly and frail, staff members may need to support the client's flexed legs while the examiner conducts the examination and obtains the Papanicolaou smear. Positioning the client in the other positions will make visualization more difficult and may not be as comfortable for the client.

CN: Health promotion and maintenance; CL: Apply

77. 4. The Pap smear identifies atypical cervical cells that may be present for various reasons. Cancer is the most common possible cause, but not the only one. The Pap smear does not show abnormal viral cells unless specific

gene typing is done for human papillomavirus. An adequate smear provides accurate diagnostic data; the false-positive rate is only about 5%.

CN: Health promotion and maintenance; CL: Apply

78. 4. Young age at first pregnancy is a risk factor for cervical cancer. Other risk factors include a family history of the disease, sexual experience with multiple partners, and a history of sexually transmitted disease (e.g., syphilis, human papillomavirus infection, gonorrhea). Cigarette smoking, promiscuous male partner, human immunodeficiency virus infection or other immunosuppression, and low socioeconomic status are other risk factors. Sexual relations with one partner, sedentary lifestyle, and obesity are not risk factors for cervical cancer.

CN: Health promotion and maintenance; CL: Apply

79. 4. In its early stages, cancer of the cervix is usually asymptomatic, which underscores the importance of regular Pap smears. A light bleeding or serosanguineous discharge may be apparent as the first noticeable symptom. Pain, leg edema, urinary and rectal symptoms, and weight loss are late signs of cervical cancer.

CN: Physiological adaptation; CL: Apply

80. 4. The vagina naturally cleans itself, and douching is not recommended unless it is prescribed by a **healthcare provider (HCP)**  for a medical condition. Daily douching could destroy normal flora. Perfumed douches could trigger allergenic responses. Douching should be avoided during menses.

CN: Reduction of risk potential; CL: Synthesize

81. 1,2,3,4. The social worker is part of the comprehensive, holistic healthcare team. Because the client is now unemployed and is a single parent, the social worker can provide information about sources of financial support. The needs of the client and the family members are included in the treatment plan. The social worker cannot authorize temporary funds.

CN: Management of care; CL: Apply

82. 1. When cervical cancer is detected early and treated aggressively, the

cure rate approaches 100%. The incidence of cervical cancer has increased among women of African descent, Native American and Aboriginal people, and Latinas, and these women often have a poorer prognosis because the cancer is not identified early. Papanicolaou smears and colposcopy have the potential to decrease mortality from invasive carcinoma when these screening and treatment programs are utilized by women.

CN: Physiological adaptation; CL: Synthesize

83. 2. The client should be informed that her next two or three periods could be heavy and prolonged. The client is instructed to report any excessive bleeding. The nurse should reinforce the necessity for the follow-up check and the review of the biopsy results with the client. The client's periods will not be normal for 2 to 3 months.

CN: Reduction of risk potential; CL: Synthesize

84. 2. Dislodged radioactive materials should not be touched with bare or gloved hands. Forceps are used to place the material in the lead-lined container, which shields the radiation. Exposure to radiation can occur only by direct exposure to the encased radioactive substance; it cannot result from contact with emesis or urine or from touching the client. Disposal of eating utensils cannot lead to radiation exposure. Radioactive dose materials are kept only in the radiation department.

CN: Safety and infection control; CL: Apply

85. 3. The three factors related to radiation safety are time, distance, and shielding. Nurses on radiation oncology units work with radiation frequently and so must limit their contact. Nurses are physically closer to clients than are visitors, who are often asked to sit 6 feet (182.9 cm) away from the client. Touching the client does not increase the amount of radiation exposure. Aseptic technique and isolation prevent the spread of infection. Age is a risk factor for people in their reproductive years.

CN: Safety and infection control; CL: Apply

86. 2. HPV infection, or genital warts, can lead to dysplastic changes of the cervix, referred to as cervical intraepithelial neoplasia. The development of cervical cancer remains the largest threat of all condyloma-associated

neoplasias. Infertility, pelvic inflammatory disease, and rectal cancer are not complications of genital warts.

CN: Health promotion and maintenance; CL: Apply

87. 4. Bowel movements can be difficult with the radium applicator in place. The purpose of the low-residue diet is to decrease bowel movements. The bowel is cleaned before therapy, and the woman is maintained on a low-residue diet during treatment to prevent bowel distention and defecation. To prevent dislodgment of the applicator, the client is maintained on strict bed rest and allowed only to turn from side to side. Perineal care is omitted during radium implant therapy, although any vaginal discharge should be reported to the **healthcare provider (HCP)** . It is rare for the applicator to extrude, so this does not need to be checked every hour.

CN: Basic care and comfort; CL: Synthesize

88. 4. Nausea, vomiting, and a foul vaginal discharge are common adverse effects of internal radiation therapy for cervical cancer. A foul-smelling discharge may develop from the destruction and sloughing of cells. Vaginal discharge may persist for some time. General signs and symptoms of radiation syndrome include nausea, vomiting, anorexia, and malaise. Vaginal itching, confusion, and high fever are not typical adverse effects of radiation therapy for cervical cancer.

CN: Safety and infection control; CL: Apply

The Client with Cancer of the Ovaries

89. 2,4. Client teaching emphasizes the importance of regular gynecologic examinations. If a pelvic mass is found, completely explain the procedures for diagnosis. Explain presurgical and postsurgical instructions, and explain the terminology particular to staging and grading of cancer, when appropriate. Refer all questions about the prognosis to the **healthcare provider (HCP)** . Routine colonoscopies are typically begun at age 50 unless family history warrants otherwise. Ovarian tumors are commonly occult until symptoms of advanced disease are present.

CN: Health promotion and maintenance; CL: Create

90. 2,4. Ovarian cancer is a malignant tumor of the ovary. Ovarian cancer is the fourth most common gynecologic cancer, but the most lethal. It is usually found in advanced stages because it is asymptomatic in early stages. Interdisciplinary management may involve chemotherapy, radiation therapy, surgery, and supportive services. Chemotherapy may be used to achieve remission of the disease; it is not, however, curative. Surgery is the treatment of choice, usually involving total hysterectomy with bilateral salpingo-oophorectomy and removal of the omentum. Radiation therapy may be performed for palliative purposes only. The nurse should provide referral to home health services, financial assistance, psychological counseling, clergy, and other social services, as appropriate. Nutrition therapy for parenteral lipids is not part of management of ovarian cancer.

CN: Health promotion and maintenance; CL: Create

91. 4. A definitive cause of carcinoma of the ovary is unknown, and the disease is multifactorial. The risk of developing ovarian cancer is related to environmental, endocrine, and genetic factors. The highest incidence is in industrialized Western countries. Endocrine risk factors for ovarian cancer include women who are nulliparous. Use of oral contraceptives does not increase the risk for developing ovarian cancer but may actually be protective.

CN: Health promotion and maintenance; CL: Apply

92. 1. Ovarian cancer is rarely diagnosed early. Methods for mass screening and early detection have not been successful. Signs and symptoms are often vague until late in development. Ovarian cancer should be considered in any woman older than 40 years of age who has vague abdominal and/or pelvic discomfort or enlargement, a sense of bloating, or flatulence. Enlargement of the abdomen due to the accumulation of fluid is the most common sign.

CN: Health promotion and maintenance; CL: Synthesize

The Client with Testicular Disease

93. 2. Epididymitis causes acute tenderness and pronounced swelling of the scrotum. Gradual onset of unilateral scrotal pain, urethral discharge, and

fever are other key signs. Epididymitis is occasionally, but not routinely, associated with urinary tract infection. Burning and pain on urination and foul-smelling ejaculate or urine are not classic symptoms of epididymitis.

CN: Physiological adaptation; CL: Analyze

94. 3. Among men younger than age 35, epididymitis is most frequently caused by a sexually transmitted infection. Causative organisms are usually chlamydia or *Neisseria gonorrhoeae*. The other major form of epididymitis is bacterial, caused by the *Escherichia coli* or *Pseudomonas* organisms. The nurse should always include safe sex teaching for a client with epididymitis. The client should also be advised against anogenital intercourse because this is a mode of transmission of gram-negative rods to the epididymis.

CN: Reduction of risk potential; CL: Apply

95. 3. After a warm bath or shower, the testes hang lower and are both relaxed and in the ideal position for manual evaluation and palpation. The testes are not relaxed or in the best position after intercourse, at the end of the day, or after exercise.

CN: Health promotion and maintenance; CL: Apply

96. 2. Normal testes feel smooth, egg-shaped, and firm to the touch, without lumps. The surface should feel smooth and rubbery. The testes should not be soft or spongy to the touch. Testicular malignancies are usually nontender, nonpainful hard lumps. Lumps, swelling, nodules, or signs of inflammation should be reported to the **healthcare provider (HCP)** 📖.

CN: Health promotion and maintenance; CL: Analyze

97. 4. AFP and hCG are considered markers that indicate the presence of testicular disease. Elevated AFP and hCG and decreased testosterone are markers for testicular disease. Measurements of AFP, hCG, and testosterone are also obtained throughout the course of therapy to help measure the effectiveness of treatment.

CN: Physiological adaptation; CL: Apply

98. 1. Cryptorchidism (undescended testes) carries a greatly increased risk for testicular cancer. Undescended testes occur in about 3% of male infants,

with an increased incidence in premature infants. Other possible causes of malignancy include chemical carcinogens, trauma, orchitis, and environmental factors. Testicular cancer is not associated with early sexual relations in men, even though cervical cancer is associated with early sexual relations in women. Testicular cancer is not associated with seminal vesiculitis or epididymitis.

CN: Health promotion and maintenance; CL: Apply

99. 2. The incidence of testicular cancer is higher in men who live in rural rather than suburban areas. Testicular cancer is more common in white than black men. Men with higher socioeconomic status seem to have a greater incidence of testicular cancer. The exact cause of testicular cancer is unknown. Cancer of the testes is the leading cause of death from cancer in the 15- to 35-year-old age group.

CN: Health promotion and maintenance; CL: Analyze

100. 3. Because of the location of the incision in the high inguinal area, pain is a major problem during the immediate postoperative period. The incisional area and discomfort caused by movement contribute to increased pain. Bladder spasms and elimination problems are more commonly associated with prostate surgery. Nausea is not a priority problem.

CN: Physiological adaptation; CL: Synthesize

101. 2. Unilateral orchiectomy alone does not result in impotence if the other testis is normal. The other testis should produce enough testosterone to maintain normal sexual drive, functioning, and characteristics. Sperm banking before treatment is commonly recommended because radiation or chemotherapy can affect fertility.

CN: Psychosocial adaptation; CL: Synthesize

102. 2. When diagnosed early and treated aggressively, testicular cancer has a cure rate of about 90%. Treatment of testicular cancer is based on tumor type, and seminoma cancer has the best prognosis. Modes of treatment include combinations of orchiectomy, radiation therapy, and chemotherapy. The chemotherapeutic regimen used currently is responsible for the successful treatment of testicular cancer. The nurse should not indicate to the

client that the cancer will be cured, even though cure rates are high.

CN: Physiological adaptation; CL: Apply

The Client with Cancer of the Prostate

103. 2. Most cases of prostate cancer are adenocarcinomas. An adenocarcinoma is palpable on rectal examination because it arises from the posterior portion of the gland. Although the prostate-specific antigen (PSA) is not a perfect screening test, the American Cancer Society and the Canadian Cancer Society recommend an annual rectal examination and blood PSA level for all men age 50 years and older, or starting at age 40 years if the client is of African descent, or if there is family history of prostate cancer. Avoiding heavy lifting does not prevent cancer, nor does having regular sexual activity.

CN: Health promotion and maintenance; CL: Synthesize

104. 4. Bilateral orchiectomy (removal of testes) results in reduction of the major circulating androgen, testosterone, as a palliative measure to reduce symptoms and progression of prostate cancer. A radical prostatectomy (removal of entire prostate gland, prostatic capsule, and seminal vesicles) may include pelvic lymphadenectomy. Complications include urinary incontinence, impotence, and rectal injury with the radical prostatectomy. Cryosurgery freezes prostate tissue, killing tumor cells without prostatectomy.

CN: Health promotion and maintenance; CL: Apply

105. 1,2,3. Cancer of the prostate gland is the second leading cause of cancer death among American and Canadian men and is the most common carcinoma in men older than age 65. Incidence of prostate cancer is higher in men of African descent, and onset is earlier. Most prostate cancers are adenocarcinoma. Prostate cancer is usually multifocal and slow growing and can spread by local extension, by lymphatics, or through the bloodstream. - Prostate-specific antigen (PSA) >4 ng/mg is diagnostic; a free PSA level can help stratify the risk of elevated PSA levels. Metastatic workup may include skeletal x-ray, bone scan, and computed tomography or magnetic resonance imaging to detect local extension, bone, and lymph node involvement. The urine does not have prostate cancer cells.

CN: Health promotion and maintenance; CL: Create

106. 3,4. Hormone manipulation deprives tumor cells of androgens or their by-products and, thereby, alleviates symptoms and retards disease progression. Complications of hormonal manipulation include hot flashes, nausea and vomiting, gynecomastia, and sexual dysfunction. As part of supportive care, provide explanations of diagnostic tests and treatment options and help the client gain some feeling of control over his disease and decisions related to it. To help achieve optimal sexual function, give the client the opportunity to communicate his concerns and sexual needs. Inform the client that decreased libido is expected after hormonal manipulation therapy and that impotence may result from some surgical procedures and radiation. A psychiatrist is not needed.

CN: Psychosocial adaptation; CL: Synthesize

107. 3. Manipulation of the prostate during the digital rectal examination may falsely increase the PSA levels. The PSA determination and the digital rectal examination are no longer recommended as screening tools for prostate cancer. Prostate cancer is the most common cancer in men and the second leading killer from cancer among men in the United States and Canada. Incidence increases sharply with age, and the disease is predominant in the 60- to 70-year-old age group.

 CN: Health promotion and maintenance; CL: Apply

108. 1. On digital rectal examination, key signs of prostate cancer are a hard prostate, induration of the prostate, and an irregular, hard nodule. Accompanying symptoms of prostate cancer can include constipation, weight loss, and lymphadenopathy. Abdominal pain usually does not accompany prostate cancer. A boggy, tender prostate is found with infection (e.g., acute or chronic prostatitis).

 CN: Health promotion and maintenance; CL: Analyze

109. 2. Loss of the prostate gland interrupts the flow of semen, so there will be no ejaculation fluid. The sensations of orgasm remain intact. The client needs to be advised that return of erectile capability is often disrupted after surgery, but within 1 year, 95% of men have returned to normal erectile function with sexual intercourse.

 CN: Physiological adaptation; CL: Synthesize

110. 1. Clients who have stage IA or IIB prostate cancer have an excellent survival rate. Prostate cancer is usually slow growing, and many men who have prostate cancer do not die from it. A stage I or II tumor is confined to the prostate gland and has not spread to the extrapelvic region or bone.

 CN: Physiological adaptation; CL: Synthesize

111. 2. Goserelin is used to decrease testosterone production in men to slow or stop the production of cancer cells. A common side effect is flushing or hot flashes. Changes in blood pressure, tenderness of the scrotum, and dramatic changes in secondary sexual characteristics should not occur.

 CN: Pharmacological and parenteral therapies; CL: Apply

The Client with Erectile Dysfunction

112. 2. The client should notify his HCP  promptly if he experiences sudden or decreased vision loss in one or both eyes. Sildenafil should not be taken more than once per day. Sildenafil offers no protection against sexually transmitted diseases. Sildenafil has no effect in the absence of sexual stimulation.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

113. 2. Antihypertensives, especially beta-blockers such as propranolol, can cause impotence. When a male client has impotence, the nurse should always examine his medication regimen as a potential contributing factor. Aspirin, nonsteroidal anti-inflammatory drugs, and anticoagulants do not cause erectile dysfunction.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

114. 2. ED is multifactorial in origin, and more than 50% of the cases can be attributed to organic causes, which include alteration in vascular supply, hormonal changes, neurologic dysfunction, medications, and associated systemic diseases, such as diabetes mellitus or alcoholism. The presence of nocturnal erections is the first evaluation to differentiate between organic and psychogenic causes. ED is a common problem among men older than age 65.

 CN: Psychosocial adaptation; CL: Apply

115. 1. Avoidance of alcohol can improve the outcome of therapy. Alcohol and smoking can affect a man's ability to have and maintain an erection. The client should be encouraged to follow a healthy diet, but no specific diet is associated with improvement of sexual function. The client should cease smoking, not just decrease smoking. Increasing attempts at intercourse without treatment will not facilitate improvement. The client should be reassured that ED is a common problem and that help is available.

 CN: Reduction of risk potential; CL: Synthesize

Managing Care, Quality, and Safety of Clients with Reproductive Health Problems

116. 4. The **registered nurse (RN)**  is responsible for monitoring the surgical site for condition of the dressing, status of the incision, and signs and symptoms of complications. **UAP**  who have been trained to report abnormalities to the RN supervising the care may take vital signs, record intake and output, and give perineal care.

 CN: Management of care; CL: Synthesize

117. 4. To determine the cause of this problem, a quality improvement study should be conducted. Before implementing solutions to a problem, the precise issues in the hospital system must be observed and documented. Consulting with the evening nurses may result in biased observations because the evening nurses are not conducting care under the same environment as the night nurses. Including a medication nurse is not the first step in understanding the problem and may be an unrealistic or expensive solution. The supervisor is not directly involved with the problem and should only be consulted if the problem cannot be solved by those involved.

CN: Management of care; CL: Synthesize

118. 3. The nurse must clarify this prescription with the admitting **HCP**  to ensure medication accuracy and client safety. In healthcare settings without computerized medical records or computer prescribing, misinterpretation of handwriting remains a leading cause of medication errors. It is not safe practice to question the client regarding a diagnosis and assume the medication is correctly prescribed. The pharmacist will need clarification of the prescription as well. It is not the role of the pharmacist to interpret the prescription.

CN: Pharmacological and parenteral therapies; CL: Synthesize

119. 2. The surgeon should be notified when a client who has had an abdominal hysterectomy develops vaginal bleeding that saturates a blue pad in 1 hour, and care should be managed so that other personnel can obtain vital signs while the nurse contacts the surgeon. The client may need to have IV fluids increased, but the surgeon needs to be notified first. Waiting 15 minutes while the client is having bright red bleeding is an unsafe nursing action; the client may lose a large amount of blood.

CN: Management of care; CL: Synthesize

120. 3. The nurse should follow the line of authority or chain of command by reporting the observation immediately to the nursing supervisor. The nurse should not confront the person or the medication nurse because the line of authority for reporting incidents should be followed. The RT supervisor may subsequently be involved in the incident, but the nursing supervisor should initiate and follow the policy and procedure.

 CN: Management of care; CL: Synthesize

The Client with Neurologic Health Problems

- The Client with a Head Injury
- The Client with Seizures
- The Client with a Stroke
- The Client with Parkinson's Disease
- The Client with Multiple Sclerosis
- The Client with Myasthenia Gravis
- The Unconscious Client
- The Client in Pain
- Managing Care, Quality, and Safety of Clients with Neurologic Health Problems
- Answers, Rationales, and Test-Taking Strategies

The Client with a Head Injury

1. The nurse has established a goal to maintain intracranial pressure (ICP) within the normal range for a client who had a craniotomy 12 hours ago. What should the nurse do? Select all that apply.

- ☐ **1.** Encourage the client to cough to expectorate secretions.
- ☐ **2.** Elevate the head of the bed 15 to 20 degrees.
- ☐ **3.** Contact the healthcare provider (HCP) if ICP is >15 mm Hg.
- ☐ **4.** Monitor neurologic status using the Glasgow Coma Scale.
- ☐ **5.** Stimulate the client with active range-of-motion exercises.

2. The nurse is monitoring a client with increased intracranial pressure (ICP). What indicators are the **most** critical for the nurse to monitor? Select all that apply.

- ☐ 1. systolic blood pressure
- ☐ 2. urine output
- ☐ 3. breath sounds
- ☐ 4. cerebral perfusion pressure
- ☐ 5. level of pain

3. A nurse is assessing a client with increasing intracranial pressure. What is a client's mean arterial pressure (MAP) in mm Hg when blood pressure (BP) is 120/60 mm Hg?
mm Hg.

4. A client with a contusion has been admitted for observation following a motor vehicle accident when he was driving his pregnant wife to the hospital. The next morning, instead of asking about his wife and baby, he asked to see the football game on television that he thinks is starting in 5 minutes. He is agitated because the nurse will not turn on the television. What should the nurse do **next**? Select all that apply.

- ☐ 1. Find a television so the client can view the football game.
- ☐ 2. Determine if the client's pupils are equal and react to light.
- ☐ 3. Ask the client if he has a headache.
- ☐ 4. Arrange for the client to be with his wife and baby.
- ☐ 5. Administer a sedative.

5. The nurse is assessing the level of consciousness in a client with a head injury who has been unresponsive for the last 8 hours. Using the Glasgow Coma Scale, the nurse notes that the client opens the eyes only as a response to pain, responds with sounds that are not understandable, and has abnormal extension of the extremities. What should the nurse do?

Glasgow Coma Scale

Parameter	Finding	Score
Eye opening	Spontaneously	4
	To speech	3
	To pain	2
	Do not open	1
Best verbal response	Oriented	5
	Confused	4
	Inappropriate speech	3
	Incomprehensible sounds	2
	No verbalization	1
Best motor response	Obeys command	6
	Localizes pain	5
	Withdraws from pain	4
	Abnormal flexio	3
	Abnormal extension	2
	No motor response	1
Interpretation: Best score = 15; worst score = 3; 7 or less generally indicates coma; changes from baseline are most important.		

- ☐ 1. Attempt to arouse the client.
- ☐ 2. Reposition the client with the extremities in normal alignment.
- ☐ 3. Chart the client's level of consciousness as coma.
- ☐ 4. Notify the healthcare provider (HCP).

6. An unconscious client with multiple injuries to the head and neck arrives in the emergency department. What should the nurse do **first**?

- ☐ 1. Establish an airway.
- ☐ 2. Determine the identity of the client.
- ☐ 3. Stop bleeding from open wounds.
- ☐ 4. Check for a neck fracture.

7. A client has delirium following a head injury. The client is disoriented and agitated. In which order from first to last should the nurse initiate care for this client? All options must be used.

1. Request a prescription for haloperidol.

2. Maintain a quiet environment.

3. Assure the client's safety.

4. Approach the client using short sentences.

8. A client is at risk for increased intracranial pressure (ICP). Which finding is the **priority** for the nurse to monitor?

- ☐ 1. unequal pupil size
- ☐ 2. decreasing systolic blood pressure
- ☐ 3. tachycardia
- ☐ 4. decreasing body temperature

9. What should the nurse do **first** when a client with a head injury begins to have clear drainage from the nose?

- ☐ 1. Compress the nares.
- ☐ 2. Tilt the head back.
- ☐ 3. Collect the drainage.
- ☐ 4. Administer an antihistamine for postnasal drip.

10. Which respiratory pattern indicates increasing intracranial pressure in the brain stem?

- ☐ 1. slow, irregular respirations
- ☐ 2. rapid, shallow respirations
- ☐ 3. asymmetric chest excursion
- ☐ 4. nasal flaring

11. A client has an increased intracranial pressure (ICP) of 20 mm Hg. The nurse should:

- ☐ 1. give the client a warming blanket.
- ☐ 2. administer low-dose barbiturates.
- ☐ 3. encourage the client to take deep breaths to hyperventilate.
- ☐ 4. restrict fluids.

12. The nurse is assessing a client with increasing intracranial pressure (ICP). The nurse should notify the healthcare provider (HCP) about which early change in the client's condition?

- ☐ 1. widening pulse pressure
- ☐ 2. decrease in the pulse rate
- ☐ 3. dilated, fixed pupils
- ☐ 4. decrease in level of consciousness (LOC)

13. The client has a sustained increased intracranial pressure (ICP) of 20 mm Hg. Which client position would be **most** appropriate?

- ☐ 1. the head of the bed elevated 15 to 20 degrees
- ☐ 2. Trendelenburg's position
- ☐ 3. left Sims' position
- ☐ 4. the head elevated on two pillows

14. The nurse administers mannitol to the client with increased intracranial pressure. Which parameter requires close monitoring?

- ☐ 1. muscle relaxation
- ☐ 2. intake and output
- ☐ 3. widening of the pulse pressure
- ☐ 4. pupil dilation

15. The nurse is assessing a client for movement after halo traction placement for a C8 fracture. The nurse should document that:

- ☐ 1. the client's shoulders shrug against downward pressure of the examiner's hands.
- ☐ 2. the client's arm pulls up from a resting position against resistance.
- ☐ 3. the client's arm straightens out from a flexed position against resistance.
- ☐ 4. the client's hand-grasp strength is equal.

16. A client who is regaining consciousness after a craniotomy becomes restless and attempts to pull out the IV line. Which nursing intervention protects the client without increasing the intracranial pressure (ICP)?

- ☐ 1. Place the client in a jacket restraint.
- ☐ 2. Wrap the hands in soft "mitten" restraints.
- ☐ 3. Tuck the arms and hands under the sheet.
- ☐ 4. Apply a wrist restraint to each arm.

17. Which activity should the nurse encourage the client to avoid when there is a risk for increased intracranial pressure (ICP)?

- ☐ 1. deep breathing
- ☐ 2. turning
- ☐ 3. coughing
- ☐ 4. passive range-of-motion (ROM) exercises

18. A client who had a serious head injury with increased intracranial pressure is to be discharged to a rehabilitation facility. Which outcome of rehabilitation would be appropriate for the client? The client will:

- ☐ 1. exhibit no further episodes of short-term memory loss.
- ☐ 2. be able to return to his construction job in 3 weeks.
- ☐ 3. actively participate in the rehabilitation process as appropriate.
- ☐ 4. be emotionally stable and display preinjury personality traits.

19. The nurse is assessing a client for decerebrate posturing. The nurse should assess the client for:

- ☐ 1. internal rotation and adduction of arms with flexion of elbows, wrists, and fingers.
- ☐ 2. back hunched over and rigid flexion of all four extremities with supination of arms and plantar flexion of feet.
- ☐ 3. supination of arms and dorsiflexion of the feet.
- ☐ 4. back arched and rigid extension of all four extremities.

20. A client receiving continuous mandatory ventilation begins to experience cluster breathing after recent intracranial occipital bleeding. What should the nurse do?

- ☐ 1. Count the rate to be sure that ventilations are deep enough to be sufficient.
- ☐ 2. Notify the healthcare provider (HCP) of the client's breathing pattern.
- ☐ 3. Increase the rate of ventilations.
- ☐ 4. Increase the tidal volume on the ventilator.

21. The nurse is planning the care for a client who has had a posterior fossa (infratentorial) craniotomy. What should the nurse **avoid** when positioning the client?

- ☐ 1. keeping the client flat on one side or the other
- ☐ 2. elevating the head of the bed to 30 degrees
- ☐ 3. logrolling or turning as a unit when turning
- ☐ 4. keeping the neck in a neutral position

22. A young adult is admitted to the hospital with a head injury and possible temporal skull fracture sustained in a motorcycle accident. On

admission, the client was conscious but lethargic; vital signs included temperature 99°F (37°C), pulse 100 bpm, respirations 18 breaths/min, and BP 140/70 mm Hg. The nurse should report which changes should they occur to the healthcare provider (HCP)? Select all that apply.

- ☐ 1. decreasing urinary output
- ☐ 2. decreasing systolic BP
- ☐ 3. bradycardia
- ☐ 4. widening pulse pressure
- ☐ 5. tachycardia
- ☐ 6. increasing diastolic BP

23. A client with a head injury regains consciousness after several days. When the client **first** awakes, what should the nurse say to the client?

- ☐ 1. “I will get your family.”
- ☐ 2. “Can you tell me your name and where you live?”
- ☐ 3. “I will bet you are a little confused right now.”
- ☐ 4. “You are in the hospital. You were in an accident and unconscious.”

The Client with Seizures

24. The nurse sees a client walking in the hallway who begins to have a seizure. What should the nurse do in order of priority from first to last? All options must be used.

1. Maintain a patent airway.

2. Record the seizure activity observed.

3. Ease the client to the floor.

4. Obtain vital signs.

25. Which finding will the nurse observe in the client in the ictal phase of a generalized tonic-clonic seizure?

- ☐ 1. jerking in one extremity that spreads gradually to adjacent areas
- ☐ 2. vacant staring and abruptly ceasing all activity
- ☐ 3. facial grimaces, patting motions, and lip smacking
- ☐ 4. loss of consciousness, body stiffening, and violent muscle contractions

26. It is the night before a client is to have a computed tomography (CT) scan of the head without contrast. The nurse should tell the client:

- ☐ 1. "You must shampoo your hair tonight to remove all oil and dirt."
- ☐ 2. "You may drink fluids until midnight, but after that, drink nothing until the scan is completed."
- ☐ 3. "You will have some hair shaved to attach the small electrode to your scalp."
- ☐ 4. "You will need to hold your head very still during the examination."

27. The client will have an electroencephalogram (EEG) in the morning. The nurse should instruct the client to have which foods/fluids for breakfast?

- ☐ 1. no food or fluids
- ☐ 2. only coffee or tea if needed
- ☐ 3. a full breakfast as desired without coffee, tea, or energy drinks
- ☐ 4. a liquid breakfast of fruit juice, oatmeal, or smoothie

28. The client is scheduled to receive phenytoin through a nasogastric tube (NGT) and has a tube-feeding supplement running continuously. The head of the bed is elevated to 30 degrees. Prior to administering the medication, the nurse should:

- ☐ 1. elevate the head of the bed to 60 degrees.
- ☐ 2. draw blood to determine the phenytoin level after giving the morning dose in order to determine if the client has toxic blood level.

- ☐ 3. stop the tube feeding 1 hour before giving phenytoin and hold tube feeding for 1 hour after giving the medication.
- ☐ 4. flush the NGT with 150 mL of water before and after giving the phenytoin.

29. Which instruction should the nurse include in the teaching plan for a client with seizures who is going home with a prescription for gabapentin?

- ☐ 1. Take all the medication until it is gone.
- ☐ 2. Notify the healthcare provider (HCP) if vision changes occur.
- ☐ 3. Store gabapentin in the refrigerator.
- ☐ 4. Take gabapentin with an antacid to protect against ulcers.

30. What is the **priority** nursing intervention in the postictal phase of a seizure?

- ☐ 1. Reorient the client to time, person, and place.
- ☐ 2. Determine the client's level of sleepiness.
- ☐ 3. Assess the client's breathing pattern.
- ☐ 4. Position the client comfortably.

31. Which intervention is **most** effective in minimizing the risk of seizure activity in a client who is undergoing diagnostic studies after having experienced several episodes of seizures?

- ☐ 1. Maintain the client on bed rest.
- ☐ 2. Administer butabarbital sodium 30 mg PO, three times per day.
- ☐ 3. Close the door to the room to minimize stimulation.
- ☐ 4. Administer carbamazepine 200 mg PO, twice per day.

32. What nursing assessments should be documented at the beginning of the ictal phase of a seizure?

- ☐ 1. heart rate, respirations, pulse oximeter, and blood pressure
- ☐ 2. last dose of anticonvulsant and circumstances at the time
- ☐ 3. type of visual, auditory, and olfactory aura the client experienced
- ☐ 4. movement of the head and eyes and muscle rigidity

33. The nurse is assessing a client in the postictal phase of generalized tonic-clonic seizure. The nurse should determine if the client has:

- ☐ 1. drowsiness.
- ☐ 2. inability to move.
- ☐ 3. paresthesia.
- ☐ 4. hypotension.

34. When preparing to teach a client about phenytoin sodium therapy, the nurse should urge the client not to stop the drug suddenly because:

- ☐ 1. physical dependency on the drug develops over time.
- ☐ 2. status epilepticus may develop.
- ☐ 3. a hypoglycemic reaction develops.
- ☐ 4. heart block is likely to develop.

35. The nurse is teaching a client to recognize an aura. The nurse should instruct the client to note:

- ☐ 1. a postictal state of amnesia.
- ☐ 2. a hallucination that occurs during a seizure.
- ☐ 3. a symptom that occurs just before a seizure.
- ☐ 4. a feeling of relaxation as the seizure begins to subside.

36. Which statement by a client with a seizure disorder who has been prescribed topiramate indicates the client has understood the nurse's instruction about this drug?

- ☐ 1. "I will take the medicine before going to bed."
- ☐ 2. "I will drink six to eight glasses of water a day."
- ☐ 3. "I will eat plenty of fresh fruits."
- ☐ 4. "I will take the medicine with a meal or snack."

37. Which clinical manifestation is a typical reaction to long-term phenytoin sodium therapy?

- ☐ 1. weight gain
- ☐ 2. insomnia
- ☐ 3. excessive growth of gum tissue
- ☐ 4. deteriorating eyesight

38. A 21-year-old female client takes clonazepam. What should the nurse ask this client about? Select all that apply.

- ☐ 1. seizure activity
- ☐ 2. pregnancy status
- ☐ 3. alcohol use
- ☐ 4. cigarette smoking
- ☐ 5. intake of caffeine and sugary drinks

The Client with a Stroke

39. Which outcomes indicate effective management of a conscious client who is being treated with recombinant tissue plasminogen therapy during the initial phase of an ischemic cerebral vascular accident (CVA)? Select all that apply.

- ☐ 1. headache reduced
- ☐ 2. dysphagia improved
- ☐ 3. visual disturbances improved
- ☐ 4. responds to comfort measures
- ☐ 5. no signs or symptoms of bleeding

40. Following a stroke, a client has dysphagia and left-sided facial paralysis. Which feeding technique will be **most** helpful at this time?

- ☐ 1. Encourage sipping diluted liquid meal supplements from a straw.
- ☐ 2. Position the client with the bed at a 30-degree angle.
- ☐ 3. Offer solid foods from the unaffected side of the mouth.
- ☐ 4. Feed the client a soft diet from a spoon into the left side of the mouth.

41. A client is being monitored for transient ischemic attacks. The client is oriented, can open the eyes spontaneously, and follows commands. What is the Glasgow Coma Scale score?

_____ points.

42. The nurse is teaching a client about taking prophylactic warfarin sodium. Which statement indicates that the client understands how to take the drug? Select all that apply.

- ☐ 1. "The drug's action peaks in 2 hours."
- ☐ 2. "Maximum dosage is not achieved until 3 to 4 days after starting the medication."

- ☐ 3. “Effects of the drug continue for 4 to 5 days after discontinuing the medication.”
- ☐ 4. “Protamine sulfate is the antidote for warfarin.”
- ☐ 5. “I should have my blood levels tested periodically.”

43. Which action is **not** appropriate when providing oral hygiene for a client who has had a stroke?

- ☐ 1. placing the client on the back with a small pillow under the head
- ☐ 2. keeping portable suctioning equipment at the bedside
- ☐ 3. opening the client’s mouth with a padded tongue blade
- ☐ 4. cleaning the client’s mouth and teeth with a toothbrush

44. A client arrives in the emergency department with an ischemic stroke. Because the healthcare team is considering administering tissue plasminogen activator (t-PA) administration, the nurse should **first**:

- ☐ 1. ask what medications the client is taking.
- ☐ 2. complete a history and health assessment.
- ☐ 3. identify the time of onset of the stroke.
- ☐ 4. determine if the client is scheduled for any surgical procedures.

45. During the **first** 24 hours after thrombolytic treatment for an ischemic stroke, the **primary** goal is to control the client’s:

- ☐ 1. pulse.
- ☐ 2. respirations.
- ☐ 3. blood pressure.
- ☐ 4. temperature.

46. What is a **priority** nursing assessment in the **first** 24 hours after admission of the client with a thrombotic stroke?

- ☐ 1. cholesterol level
- ☐ 2. pupil size and pupillary response
- ☐ 3. bowel sounds
- ☐ 4. echocardiogram

47. A client with a hemorrhagic stroke is slightly agitated, heart rate is 118 bpm, respirations are 22 breaths/min, bilateral rhonchi are auscultated, SpO₂

is 94%, blood pressure is 144/88 mm Hg, and oral secretions are noted. What order of interventions from first to last should the nurse follow when suctioning the client to prevent increased intracranial pressure (ICP) and maintain adequate cerebral perfusion? All options must be used.

1. Suction the airway.

2. Hyperoxygenate.

3. Suction the mouth.

4. Provide sedation.

48. In planning care for the client who has had a stroke, the nurse should obtain a history of the client's functional status before the stroke because:

- ☐ 1. the rehabilitation plan will be guided by it.
- ☐ 2. functional status before the stroke will help predict outcomes.
- ☐ 3. it will help the client recognize physical limitations.
- ☐ 4. the client can be expected to regain most functional status.

49. Which positioning technique is **not** appropriate when the nurse changes a client's position in bed if the client has hemiparalysis?

- ☐ 1. rolling the client onto the side
- ☐ 2. sliding the client to move up in bed
- ☐ 3. lifting the client when moving the client up in bed
- ☐ 4. having the client help lift off the bed using a trapeze

50. The nurse is caring for a client who is paraplegic as the result of a stroke. At home, the client uses a wheelchair for mobility and can transfer independently. The client is now being treated with IV antibiotics for a sacral wound via a peripherally inserted central catheter. The client is alert and oriented and has no previous history of falling. Using the Morse Fall Scale (see exhibit), what is this client's total score?

Morse Fall Risk/Scale

Item	Scale	Scoring
1. History of falling; immediate or within 3 months	No 0 Yes 25	
2. Secondary diagnosis	No 0 Yes 15	
3. Ambulatory aid Bed rest/nurse assist Crutches/cane/walker Furniture	0 15 30	
4. IV/Heparin Lock	No 0 Yes 20	
5. Gait/Transferring Normal/bedrest/ immobile Weak Impaired	0 10 20	
6. Mental status Oriented to own ability Forgets limitations	0 15	

fall risk score.

51. Which is the **most** effective means of preventing plantar flexion in a

client who has had a stroke with residual paralysis?

- ☐ 1. Place the client's feet against a firm footboard.
- ☐ 2. Reposition the client every 2 hours.
- ☐ 3. Have the client wear ankle-high tennis shoes at intervals throughout the day.
- ☐ 4. Massage the client's feet and ankles regularly.

52. The nurse is planning the care of a hemiplegic client to prevent joint deformities of the arm and hand. Which position is appropriate? Select all that apply.

- ☐ 1. placing a pillow in the axilla so the arm is away from the body
- ☐ 2. inserting a pillow under the slightly flexed arm so the hand is higher than the elbow
- ☐ 3. immobilizing the extremity in a sling
- ☐ 4. positioning a hand cone in the hand so the fingers are barely flexed
- ☐ 5. keeping the arm at the side using a pillow

53. For the client who is experiencing expressive aphasia, which nursing intervention is **most** helpful in promoting communication?

- ☐ 1. speaking loudly and slowly
- ☐ 2. using a "picture board" for the client to point to pictures
- ☐ 3. writing directions so the client can read them
- ☐ 4. speaking in short sentences

54. The nurse is teaching the family of a client with dysphagia about decreasing the risk of aspiration while eating. Which strategies should the nurse include in the teaching plan? Select all that apply.

- ☐ 1. maintaining an upright position while eating
- ☐ 2. restricting the diet to liquids until swallowing improves
- ☐ 3. introducing foods on the unaffected side of the mouth
- ☐ 4. keeping distractions to a minimum
- ☐ 5. cutting food into large pieces of finger food

55. The nurse is assisting a client with a stroke who has homonymous hemianopia. The nurse should understand that the client will:

- ☐ 1. have a preference for foods high in salt.
- ☐ 2. eat food on only half of the plate.
- ☐ 3. forget the names of foods.
- ☐ 4. not be able to swallow liquids.

56. A nurse is teaching a client who had a stroke about ways to adapt to a visual disability. Which does the nurse identify as the **primary** safety precaution to use?

- ☐ 1. Wear a patch over one eye.
- ☐ 2. Place personal items on the sighted side.
- ☐ 3. Lie in bed with the unaffected side toward the door.
- ☐ 4. Turn the head from side to side when walking.

57. A client is experiencing mood swings after a stroke and often has episodes of tearfulness that are distressing to the family. Which is the **best** technique for the nurse to instruct family members to try when the client experiences a crying episode?

- ☐ 1. Sit quietly with the client until the episode is over.
- ☐ 2. Ignore the behavior.
- ☐ 3. Attempt to divert the client's attention.
- ☐ 4. Tell the client that this behavior is unacceptable.

58. When communicating with a client who has aphasia, which approaches are helpful? Select all that apply.

- ☐ 1. Present one thought at a time.
- ☐ 2. Avoid writing messages.
- ☐ 3. Speak with normal volume.
- ☐ 4. Make use of gestures.
- ☐ 5. Encourage pointing to the needed object.

59. What is the expected outcome of thrombolytic drug therapy for stroke?

- ☐ 1. increased vascular permeability
- ☐ 2. vasoconstriction
- ☐ 3. dissolved emboli
- ☐ 4. prevention of hemorrhage

The Client with Parkinson's Disease

60. Which nursing approach is **most** helpful to a client with Parkinson's disease who is experiencing a freezing of gait with difficulty initiating movement?

- ☐ 1. Pull the client forward to initiate walking.
- ☐ 2. Instruct the client to use a wheelchair.
- ☐ 3. Have the client remain still.
- ☐ 4. Tell the client to march in place.

61. A healthcare provider (HCP) has prescribed carbidopa-levodopa four times per day for a client with Parkinson's disease. The client wants "to end it all now that the Parkinson's disease has progressed." What should the nurse do? Select all that apply.

- ☐ 1. Explain that the new prescription for carbidopa-levodopa will treat the depression.
- ☐ 2. Encourage the client to discuss feelings as the carbidopa-levodopa is being administered.
- ☐ 3. Contact the HCP before administering the carbidopa-levodopa.
- ☐ 4. Determine if the client is on antidepressants or monoamine oxidase (MAO) inhibitors.
- ☐ 5. Determine if the client is at risk for suicide.

62. Which is an initial sign of Parkinson's disease?

- ☐ 1. rigidity
- ☐ 2. tremor
- ☐ 3. bradykinesia
- ☐ 4. akinesia

63. The nurse develops a teaching plan for a client newly diagnosed with Parkinson's disease. Which topic is **most** important to include in the plan?

- ☐ 1. maintaining a balanced nutritional diet
- ☐ 2. enhancing the immune system
- ☐ 3. maintaining a safe environment
- ☐ 4. engaging in diversional activity

64. The nurse observes that when a client with Parkinson's disease unbuttons the shirt, the upper arm tremors disappear. Which statement **best** guides the nurse's analysis of this observation about the client's tremors?

- ☐ 1. The tremors are probably psychological and can be controlled at will.
- ☐ 2. The tremors sometimes disappear with purposeful and voluntary movements.
- ☐ 3. The tremors disappear when the client's attention is diverted by some activity.
- ☐ 4. There is no explanation for the observation; it is a chance occurrence.

65. At what time of day should the nurse encourage a client with Parkinson's disease to schedule the most demanding physical activities to minimize the effects of hypokinesia?

- ☐ 1. early in the morning, when the client's energy level is high
- ☐ 2. to coincide with the peak action of drug therapy
- ☐ 3. immediately after a rest period
- ☐ 4. when family members will be available

66. Which goal is the **most** realistic for a client diagnosed with Parkinson's disease?

- ☐ 1. to cure the disease
- ☐ 2. to stop progression of the disease
- ☐ 3. to begin preparations for terminal care
- ☐ 4. to maintain optimal body function

67. Which of the goals is collaboratively established by the client with Parkinson's disease, nurse, and physical therapist?

- ☐ 1. to maintain joint flexibility
- ☐ 2. to build muscle strength
- ☐ 3. to improve muscle endurance
- ☐ 4. to reduce ataxia

68. A client with Parkinson's disease is prescribed levodopa (l-dopa) therapy. Improvement in which area indicates effective therapy?

- ☐ 1. mood

- ☐ 2. muscle rigidity
- ☐ 3. appetite
- ☐ 4. alertness

69. A client is being switched from levodopa (l-dopa) to carbidopa-levodopa. The nurse should monitor for which possible complication during medication changes and dosage adjustment?

- ☐ 1. euphoria
- ☐ 2. jaundice
- ☐ 3. vital sign fluctuation
- ☐ 4. signs and symptoms of diabetes

70. A client with Parkinson's disease needs a long time to complete morning care but becomes annoyed when the nurse offers assistance and refuses all help. Which action is the nurse's **best** initial response in this situation?

- ☐ 1. Tell the client firmly that he or she needs assistance and help with the morning care.
- ☐ 2. Praise the client for the desire to be independent and give extra time and encouragement.
- ☐ 3. Tell the client that he or she is being unrealistic about the abilities and must accept the fact that he or she needs help.
- ☐ 4. Suggest to the client to at least modify the morning care routine if he or she insists on self-care.

71. Which is an expected outcome for a client with Parkinson's disease who has had a pallidotomy?

- ☐ 1. improved functional ability
- ☐ 2. reduced emotional stress
- ☐ 3. increased alertness
- ☐ 4. better appetite

The Client with Multiple Sclerosis

72. When assessing the client with multiple sclerosis for potential complications of the disease, the nurse should assess the client for which of

the following? Select all that apply.

- ☐ 1. dehydration
- ☐ 2. falls
- ☐ 3. seizures
- ☐ 4. skin breakdown
- ☐ 5. fatigue

73. The nurse is teaching a client with bladder dysfunction from multiple sclerosis (MS) about bladder training at home. Which instructions should the nurse include in the teaching plan? Select all that apply.

- ☐ 1. Restrict fluids to 1,000 mL/24 hours.
- ☐ 2. Drink 400 to 500 mL with each meal.
- ☐ 3. Drink fluids midmorning, midafternoon, and late afternoon.
- ☐ 4. Attempt to void at least every 2 hours.
- ☐ 5. Use intermittent catheterization as needed.

74. Which is **not** a typical clinical manifestation of multiple sclerosis (MS)?

- ☐ 1. double vision
- ☐ 2. sudden bursts of energy
- ☐ 3. weakness in the extremities
- ☐ 4. muscle tremors

75. A client with multiple sclerosis (MS) is receiving baclofen. The nurse determines that the drug is effective when it:

- ☐ 1. induces sleep.
- ☐ 2. stimulates the client's appetite.
- ☐ 3. relieves muscular spasticity.
- ☐ 4. reduces the urine bacterial count.

76. A client has had multiple sclerosis (MS) for 15 years and has received various drug therapies. What is the **primary** reason why the nurse has found it difficult to evaluate the effectiveness of the drugs that the client has used?

- ☐ 1. The client exhibits intolerance to many drugs.
- ☐ 2. The client experiences spontaneous remissions from time to time.

- ☐ 3. The client requires multiple drugs simultaneously.
- ☐ 4. The client endures long periods of exacerbation before the illness responds to a particular drug.

77. When the nurse talks with a client with multiple sclerosis who has slurred speech, which nursing intervention is **contraindicated**?

- ☐ 1. encouraging the client to speak slowly
- ☐ 2. encouraging the client to speak distinctly
- ☐ 3. asking the client to repeat indistinguishable words
- ☐ 4. asking the client to speak louder when tired

78. The right hand of a client with multiple sclerosis trembles severely whenever she attempts a voluntary action. She spills her coffee twice at lunch and cannot get her dress fastened securely. Which is the **best** legal documentation in nurses' notes of the medical record for this client - assessment?

- ☐ 1. "Has an intention tremor of the right hand."
- ☐ 2. "Right-hand tremor worsens with purposeful acts."
- ☐ 3. "Needs assistance with dressing and eating due to severe trembling and clumsiness."
- ☐ 4. "Slight shaking of right hand increases to severe tremor when client tries to button her clothes or drink from a cup."

79. A client with multiple sclerosis (MS) is experiencing bowel incontinence and is starting a bowel retraining program. Which strategy is **not** appropriate?

- ☐ 1. eating a diet high in fiber
- ☐ 2. setting a regular time for elimination
- ☐ 3. using an elevated toilet seat
- ☐ 4. limiting fluid intake to 1,000 mL/day

80. Which outcome is **not** realistic to establish with a client who has multiple sclerosis (MS)? The client will develop:

- ☐ 1. increased joint mobility.
- ☐ 2. improved muscle strength.
- ☐ 3. clearer thinking.

- ☐ 4. mood elevation.

81. The nurse is preparing a client with multiple sclerosis (MS) for discharge from the hospital to home. The nurse should tell the client:

- ☐ 1. “You will need to accept the necessity for a quiet and inactive lifestyle.”
- ☐ 2. “Keep active, use stress reduction strategies, and avoid fatigue.”
- ☐ 3. “Follow good health habits to change the course of the disease.”
- ☐ 4. “Practice using the mechanical aids that you will need when future disabilities arise.”

82. Which information should the nurse include in the discharge plan for a client with multiple sclerosis who has an impaired peripheral sensation? Select all that apply.

- ☐ 1. Carefully test the temperature of bath water.
- ☐ 2. Avoid kitchen activities because of the risk of injury.
- ☐ 3. Avoid hot water bottles and heating pads.
- ☐ 4. Inspect the skin daily for injury or pressure points.
- ☐ 5. Wear warm clothing when outside in cold temperatures.

83. Which intervention should the nurse suggest to help a client with multiple sclerosis avoid episodes of urinary incontinence?

- ☐ 1. Limit fluid intake to 1,000 mL/day.
- ☐ 2. Insert an indwelling urinary catheter.
- ☐ 3. Establish a regular voiding schedule.
- ☐ 4. Administer prophylactic antibiotics, as prescribed.

84. A client with multiple sclerosis (MS) lives with her daughter and 3-year-old granddaughter. The daughter asks the nurse what she can do at home to help her mother. Which measure would be **most** beneficial?

- ☐ 1. psychotherapy
- ☐ 2. regular exercise
- ☐ 3. day care for the granddaughter
- ☐ 4. weekly visits by another person with MS

The Client with Myasthenia Gravis

85. When planning care for a client with myasthenia gravis, the nurse understands that the client is at highest risk for:

- ☐ 1. aspiration.
- ☐ 2. bladder dysfunction.
- ☐ 3. hypertension.
- ☐ 4. sensory loss.

86. The nurse is discussing discharge instructions with a client with myasthenia gravis who is taking pyridostigmine. The nurse should tell the client to:

- ☐ 1. administer artificial tears.
- ☐ 2. avoid contact with crowds.
- ☐ 3. take pyridostigmine in the afternoon.
- ☐ 4. decrease protein in the diet.

87. After teaching a client about myasthenia gravis, the nurse would judge that the client has formed a realistic concept of her health problem when she says that by taking her medication and pacing her activities:

- ☐ 1. she will live longer, but ultimately the disease will cause her death.
- ☐ 2. her symptoms will be controlled, and eventually the disease will be cured.
- ☐ 3. she should be able to control the disease and enjoy a healthy lifestyle.
- ☐ 4. her fatigue will be relieved, but she should expect occasional periods of muscle weakness.

The Unconscious Client

88. A client is brought to the emergency department unconscious. An empty bottle of aspirin was found in the car, and a drug overdose is suspected. Which medication should the nurse have available for further emergency treatment?

- ☐ 1. vitamin K
- ☐ 2. dextrose 50%
- ☐ 3. activated charcoal powder
- ☐ 4. sodium thiosulfate

89. Which clinical manifestations should the nurse expect to assess in a client diagnosed with an overdose of a cholinergic agent? Select all that apply.

- ☐ 1. dry mucous membranes
- ☐ 2. urinary incontinence
- ☐ 3. central nervous system (CNS) depression
- ☐ 4. seizures
- ☐ 5. skin rash

90. The nurse is caring for a client who is unconscious following an attempted suicide by drug overdose. When speaking with the client's distraught wife, what should the nurse do **first**?

- ☐ 1. Explain that because the client was found on hospital property, he was probably asking for help and did not intentionally overdose.
- ☐ 2. Ask the wife if she would like to speak to a member of the clergy.
- ☐ 3. Encourage the wife to express her feelings and concerns, and listen carefully.
- ☐ 4. Allow the wife to help care for the client by rubbing his back when he is turned.

91. Which nursing action is a **priority** during the **first** 24 hours of hospitalization for a comatose client with suspected drug overdose?

- ☐ 1. Educate regarding drug abuse.
- ☐ 2. Minimize pain.
- ☐ 3. Maintain intact skin.
- ☐ 4. Increase caloric intake.

92. The nurse is caring for an unconscious intubated client with normal intracranial pressure. The nurse should:

- ☐ 1. monitor the oral temperature, keep the room temperature at 70° F (21.1° C), and place the client on a cooling blanket if the client's temperature is higher than 101° F (38.3° C).
- ☐ 2. clean the mouth carefully, apply a thin coat of a water-based lubricant, and move the endotracheal tube to the opposite side daily.
- ☐ 3. position the client in the supine position with the head to the side and

slightly elevated on two pillows.

- ☐ 4. turn the client with a drawsheet, and place a pillow behind the back and one between the legs.

93. The unconscious client is to be placed in a right side-lying position. The nurse should intervene when observing a client in which position?

- ☐ 1. The head is placed on a small pillow.
- ☐ 2. The right leg is extended without pillow support.
- ☐ 3. The left arm is rested on the mattress with the elbow flexed.
- ☐ 4. The left leg is supported on a pillow with the knee flexed.

94. Which indicates that performing passive range-of-motion (ROM) exercises on an unconscious client has been successful?

- ☐ 1. preservation of muscle mass
- ☐ 2. prevention of bone demineralization
- ☐ 3. increase in muscle tone
- ☐ 4. maintenance of joint mobility

95. When the nurse performs oral hygiene for an unconscious client, which nursing intervention is the **priority**?

- ☐ 1. Keep a suction machine available.
- ☐ 2. Place the client in a prone position.
- ☐ 3. Wear sterile gloves while brushing the client's teeth.
- ☐ 4. Use gauze wrapped around the fingers to clean the client's gums.

96. The nurse observes that the right eye of an unconscious client does not close completely. Which nursing intervention is **most** appropriate?

- ☐ 1. Have the client wear eyeglasses at all times.
- ☐ 2. Lightly tape the eyelid shut.
- ☐ 3. Instill artificial tears once every shift.
- ☐ 4. Clean the eyelid with a washcloth every shift.

97. Which sign is an early indicator of hypoxia in the unconscious client?

- ☐ 1. cyanosis
- ☐ 2. decreased respirations
- ☐ 3. restlessness

- ☐ 4. hypotension

98. When administering intermittent enteral feeding to an unconscious client, the nurse should:

- ☐ 1. heat the formula in a microwave.
- ☐ 2. place the client in a semi-Fowler's position.
- ☐ 3. obtain a sterile gavage bag and tubing.
- ☐ 4. weigh the client before administering the feeding.

99. The unconscious client is to receive 200 mL of tube feeding every 4 hours. The nurse checks for the client's gastric residual before administering the next scheduled feeding and obtains 40 mL of gastric residual. The nurse should:

- ☐ 1. withhold the tube feeding and notify the healthcare provider (HCP).
- ☐ 2. dispose of the residual and continue with the feeding.
- ☐ 3. delay feeding the client for 1 hour and then recheck the residual.
- ☐ 4. readminister the residual to the client and continue with the feeding.

The Client in Pain

100. The healthcare provider (HCP) prescribes morphine sulfate 2 to 4 mg IV push every 2 hours PRN pain for a client who has postoperative pain following abdominal surgery. Prior to performing an abdominal dressing change with packing at 1000, the nurse assesses the client's pain level as 1 on a scale of 0 = no pain to 10 = the worst pain. The client is awake and oriented, and vital signs are within normal limits. The nurse reviews the pain medication record (see chart). What should the nurse do?

Medication Record

Time	Pain Level	Intervention
0700	8	Morphine 4 mg IV
0900	4	Morphine 2 mg IV
1000	1	

- ☐ 1. Perform the dressing change.
- ☐ 2. Administer morphine 2 mg IV before the dressing change.
- ☐ 3. Administer morphine 4 mg IV after the dressing change.
- ☐ 4. Call the HCP for a new medication prescription.

101. The nurse finds it difficult to relieve a client's pain satisfactorily. Which measure should the nurse take **next** when continuing efforts to promote comfort?

- ☐ 1. Increase the client's confidence in the nurse.
- ☐ 2. Enlist the help of the client's family.
- ☐ 3. Allow the client additional time to work through his or her own responses to pain.
- ☐ 4. Arrange to have the client share a room with a client who has little pain.

102. The client's healthcare provider (HCP) changes the analgesia medication from meperidine hydrochloride 75 mg IM every 4 hours as needed to meperidine hydrochloride by the oral route. What dosage of oral meperidine is required to provide an equivalent analgesic dose?

- ☐ 1. 25 to 50 mg
- ☐ 2. 75 to 100 mg
- ☐ 3. 125 to 150 mg
- ☐ 4. 250 to 300 mg

103. After administering meperidine hydrochloride, the nurse determines its effectiveness as an analgesic was related to its ability to:

- ☐ 1. reduce the perception of pain.
- ☐ 2. decrease the sensitivity of pain receptors.
- ☐ 3. interfere with pain impulses traveling along sensory nerve fibers.
- ☐ 4. block the conduction of pain impulses along the central nervous system.

104. A client is arousing from a coma and keeps saying, “Just stop the pain.” The nurse responds based on the knowledge that the client’s **first** response to pain will be to:

- ☐ 1. tolerate the pain.
- ☐ 2. decrease the perception of pain.
- ☐ 3. escape the source of pain.
- ☐ 4. divert attention from the source of pain.

105. Ergotamine tartrate is prescribed for a client’s migraine headaches. Which is an expected outcome of the use of this drug?

- ☐ 1. prevention of the migraine
- ☐ 2. aborting of the developing migraine
- ☐ 3. relief from the sleeplessness experienced in the past after a migraine
- ☐ 4. relief from the vision problems experienced in the past after a migraine

106. The purpose of biofeedback is to enable a client to exert control over physiologic processes by:

- ☐ 1. regulating the body processes through electrical control.
- ☐ 2. shocking the client when an undesirable response is elicited.
- ☐ 3. monitoring the body processes for the therapist to interpret.
- ☐ 4. translating the signals of body processes into observable forms.

107. The nurse explains to the client that the **main** reason a back rub is used as therapy to relieve pain is because the massage:

- ☐ 1. blocks pain impulses from the spinal cord to the brain.
- ☐ 2. blocks pain impulses from the brain to the spinal cord.
- ☐ 3. stimulates the release of endorphins.

- ☐ 4. distracts the client's focus on the source of the pain.

108. Nursing responsibilities for the client with a patient-controlled analgesia (PCA) system include:

- ☐ 1. reassuring the client that pain will be relieved.
- ☐ 2. documenting the client's response to pain medication.
- ☐ 3. instructing the client to continue pressing the system's button whenever pain occurs.
- ☐ 4. titrating the client's pain medication until the client is free from pain.

109. A client has a patient-controlled analgesia (PCA) infusion to manage postoperative pain. In spite of receiving a dose of pain medication, the client rates the pain at 8 on a 0 to 10 pain scale. What should the nurse do **first**?

- ☐ 1. Check the patient-controlled analgesia (PCA) pump function.
- ☐ 2. Inspect the infusion site.
- ☐ 3. Assess vital signs.
- ☐ 4. Notify the healthcare provider (HCP).

110. The nurse using healing touch affects a client's pain **primarily** through:

- ☐ 1. directing the flow of energy fields.
- ☐ 2. lightly touching the client skin.
- ☐ 3. massaging the client's muscles.
- ☐ 4. increasing endorphin production.

111. When a nurse is assessing a client for pain, what finding is **most** significant? The client:

- ☐ 1. protects a specific area of the body.
- ☐ 2. tells the nurse about experiencing pain.
- ☐ 3. has a change in vital signs.
- ☐ 4. appears to be uncomfortable.

112. A client who is 89 years of age is in traction for a broken hip. At 1100 on 3/26, the client is experiencing pain. Prescriptions include morphine sulfate 2 to 4 mg intravenous push every 2 to 4 hours for pain. The client rates the pain as an 8 on the visual analog scale (0 to 10). Prior to intervening

to manage the pain, the nurse reviews the progress notes (see exhibit).

Nurse Progress Notes

Date	Time	Progress Notes
3/26	0900	Client is alert and oriented. Vital signs: pulse 80, respirations 14, BP 100/80, and oxygen saturation by pulse oximeter 9.2%. Received Morphine Sulfate 2 mg by intravenous push (IVP). Fred Lewis, RN
3/26	1000	Client has pain of 4 on the Visual Analog Scale (0-10). Respirations are 10. Fred Lewis, RN

At 1100 on 3/26, the nurse should:

- ☐ 1. reposition the client for comfort and administer pain medication in another 2 hours.
- ☐ 2. administer 2 mg morphine sulfate IVP now and reassess in 10 to 15 minutes.
- ☐ 3. call the healthcare provider (HCP) for supplemental medication to relax the client and promote sedation.
- ☐ 4. administer 2 mg morphine sulfate IVP in 2 hours if the respirations are above 12 breaths per minute.

Managing Care, Quality, and Safety of Clients with Neurologic Health Problems

113. When caring for a client with Guillain-Barre syndrome, the nurse can delegate which activity to the unlicensed assistive personnel (UAP)?

- ☐ 1. Assess weakness with range-of-motion exercises.
- ☐ 2. Reposition client every 2 hours.
- ☐ 3. Suction the endotracheal tube.
- ☐ 4. Show the client how to do deep-breathing exercises.

114. An unlicensed assistive personnel (UAP) is providing care to a client with left-sided paralysis. Which action by the UAP requires the nurse to provide further instruction?

- ☐ 1. providing passive range-of-motion exercises to the left extremities during the bed bath
- ☐ 2. elevating the foot of the bed to reduce edema
- ☐ 3. pulling up the client under the left shoulder when getting the client out of bed to a chair
- ☐ 4. putting high top tennis shoes on the client after bathing

115. The nurse notices that a client with Parkinson's disease is coughing frequently when eating. Which intervention should the nurse consider?

- ☐ 1. Have the client hyperextend the neck when swallowing.
- ☐ 2. Tell the client to place the chin firmly against the chest when eating.
- ☐ 3. Thicken all liquids before offering to the client.
- ☐ 4. Place the client on a clear liquid diet.

116. After receiving a change-of-shift report at 0700, the nurse should assess which client **first**?

- ☐ 1. a 23-year-old with a migraine headache who has severe nausea associated with retching
- ☐ 2. a 45-year-old who is scheduled for a craniotomy in 30 minutes and needs preoperative teaching
- ☐ 3. a 59-year-old with Parkinson's disease who will need a swallowing assessment before breakfast
- ☐ 4. a 63-year-old with multiple sclerosis who has an oral temperature of 101.8° F (38.8° C) and flank pain.

117. The nurse has asked the unlicensed assistive personnel (UAP) to

ambulate a client with Parkinson's disease. The nurse observes the UAP pulling on the client's arms to get the client to walk forward. The nurse should:

- ☐ 1. have the UAP keep a steady pull on the client to promote forward ambulation.
- ☐ 2. explain how to overcome a freezing gait by telling the client to march in place.
- ☐ 3. assist the UAP with getting the client back in bed.
- ☐ 4. give the client a muscle relaxant.

118. Which pressure point areas should the nurse monitor for an unconscious client positioned on the left side? (See figure.) Select all that apply.

- ☐ 1. ankles
- ☐ 2. ear
- ☐ 3. greater trochanter
- ☐ 4. heels

- ☐ 5. occiput
- ☐ 6. sacrum
- ☐ 7. shoulder

119. The nurse ascertains that there is a discrepancy in the records of use of a controlled substance for a client who is taking large doses of narcotic pain medication. What should the nurse do **next**?

- ☐ 1. Notify the police.
- ☐ 2. Contact the hospital's administration or legal department.
- ☐ 3. Notify the pharmacy technician who delivered the controlled substance.
- ☐ 4. Notify the nursing supervisor of the clinical unit.

120. The nurse is caring for a client who is confused about time and place. The client has intravenous fluid infusing. The nurse attempts to reorient the client, but the client remains unable to demonstrate appropriate use of the call light. In order to maintain client safety, what should the nurse do **first**?

- ☐ 1. Ask the family to stay with the client.
- ☐ 2. Contact the healthcare provider (HCP), and request a prescription for soft wrist restraints.
- ☐ 3. Increase the frequency of client observation.
- ☐ 4. Administer a sedative.

121. The nurse finds a confused client with soft wrist restraints in place (see figure). The nurse should **first**:

- ☐ 1. assess and document the condition of the client's skin beneath the restraint.
- ☐ 2. untie the restraint and resecure to the bed frame using a quick-release knot.
- ☐ 3. release the restraint and perform passive range of motion.
- ☐ 4. ask if the client needs to use the restroom.

Answers, Rationales, and Test-Taking Strategies

*The answers and rationales for each question follow below, along with keys (🔑) to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon (📖) highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in Part 1 of this book.*

The Client with a Head Injury

1. 2,3,4. The nurse should maintain ICP by elevating the head of the bed 15 to 20 degrees and monitoring neurologic status. An ICP >15 mm Hg with 20 to 25 mm Hg as upper limits of normal indicates increased ICP, and the nurse should notify the **HCP** 📖. Coughing and range-of-motion exercises will increase ICP and should be avoided in the early postoperative stage.

🔑 CN: Physiological adaptation; CL: Synthesize

2. 1,4. The nurse must monitor the systolic and diastolic blood pressure to obtain the mean arterial pressure (MAP), which represents the pressure needed for each cardiac cycle to perfuse the brain. The nurse must also monitor the cerebral perfusion pressure (CPP), which is obtained from the ICP and the MAP. The nurse should also monitor urine output, respirations, and pain; however, crucial measurements needed to maintain CPP are ICP and MAP. When ICP equals MAP, there is no CPP.

🔑 CN: Management of care; CL: Analyze

3. 80 mm Hg

To obtain the MAP, use this formula:

🔑 CN: Management of care; CL: Apply

4. 2,3. The nurse should determine if the client's pupils are equal and react to light, and ask the client if he has a headache. Confusion, agitation, and restlessness are subtle clinical manifestations of increased intracranial pressure (ICP). At this time, it is not appropriate for the nurse to find a television or arrange for the client to see his wife and baby. Administering a sedative at this time will obscure assessment of increased ICP.

🔑 CN: Management of care; CL: Synthesize

5. 3. The client has a score of 6 (eye opening to pain = 2; verbal response, incomprehensible sounds = 2; best motor response, abnormal extension = 2); a score <7 is indicative of coma. While the nurse should continue to speak to the client, at this time the client will not be able to be aroused. The nurse should continue to provide skin care and appropriate alignment, but the client will continue to have a motor response of limb extension. It is not necessary

to notify the **HCP**  as this assessment does not represent a significant change in neurological status.

 CN: Physiological adaptation; CL: Analyze

6. 1. The highest priority for a client with multiple head and neck injuries is to establish an open airway for effective ventilation and oxygenation. Unless the client has a patent airway, other care measures will be futile. Determining the client's identity, blood loss, stopping bleeding from open wounds, and checking for a neck fracture are important nursing interventions to be completed after the airway and ventilation are established.

 CN: Safety and infection control; CL: Synthesize

7. 4,3,2,1. The first step in providing care for a client with delirium is to approach the client calmly, introduce oneself, and use short sentences when explaining the care given. The nurse should also assure the client's safety by protecting the client from injury. Maintaining a quiet and calm environment by removing extraneous noises will prevent overstimulation. Pharmacologic intervention is used only when other plans for care are not effective. When the underlying problems related to the head injury are resolved, the delirium likely will improve.

 CN: Physiological adaptation; CL: Synthesize

8. 1. Increasing ICP causes unequal pupils as a result of pressure on the third cranial nerve. Increasing ICP causes an increase in the systolic pressure, which reflects the additional pressure needed to perfuse the brain. It increases the pressure on the vagus nerve, which produces bradycardia, and it causes an increase in body temperature from hypothalamic damage.

 CN: Reduction of risk potential; CL: Analyze

9. 3. The clear drainage must be analyzed to determine whether it is nasal drainage or cerebrospinal fluid (CSF). The nurse should not give the client tissues because it is important to know how much leakage of CSF is occurring. Compressing the nares will obstruct the drainage flow. It is inappropriate to tilt the head back, which would allow the fluid to drain down the throat and not be collected for a sample. It is inappropriate to administer an antihistamine because the drainage may not be from postnasal drip.

 CN: Reduction of risk potential; CL: Synthesize

10. 1. Neural control of respiration takes place in the brain stem. Deterioration and pressure produce slow and irregular respirations. Rapid and shallow respirations, asymmetric chest movements, and nasal flaring are more characteristic of respiratory distress or hypoxia.

 CN: Physiological adaptation; CL: Apply

11. 3. Normal ICP is 15 mm Hg or less for 15 to 30 seconds or longer. Hyperventilation causes vasoconstriction, which reduces cerebrospinal fluid and blood volume, two important factors for reducing a sustained ICP of 20 mm Hg. A cooling blanket is used to control the elevation of temperature because a fever increases the metabolic rate, which in turn increases ICP. High doses of barbiturates may be used to reduce the increased cellular metabolic demands. Fluid volume and inotropic drugs are used to maintain cerebral perfusion by supporting the cardiac output and keeping the cerebral perfusion pressure >80 mm Hg.

 CN: Physiological adaptation; CL: Synthesize

12. 4. A decrease in the client's LOC is an early indicator of deterioration of the client's neurologic status. Changes in LOC, such as restlessness and irritability, may be subtle. Widening of the pulse pressure, decrease in the pulse rate, and dilated, fixed pupils occur later if the increased ICP is not treated.

 CN: Physiological adaptation; CL: Analyze

13. 1. The client's ICP is elevated, and the client should be positioned to avoid extreme neck flexion or extension. The head of the bed is usually elevated 15 to 20 degrees to drain the venous sinuses and thus decrease the ICP. Trendelenburg's position places the client's head lower than the body, which would increase ICP. Sims' position (side lying) and elevating the head on two pillows may extend or flex the neck, which increases ICP.

 CN: Reduction of risk potential; CL: Synthesize

14. 2. After administering mannitol, the nurse closely monitors intake and output because mannitol promotes diuresis and is given primarily to pull

water from the extracellular fluid of the edematous brain. Mannitol can cause hypokalemia and may lead to muscle contractions, not muscle relaxation. Signs and symptoms, such as widening pulse pressure and pupil dilation, should not occur because mannitol serves to decrease ICP.

CN: Pharmacological and parenteral therapies; CL: Analyze

15. 4. The correct motor function test for C8 is a hand-grasp check. The motor function check for C4 to C5 is shoulders shrugging against downward pressure of the examiner's hands. The motor function check for C5 to C6 is an arm pulling up from a resting position against resistance. The motor function check for C7 is an arm straightening out from a flexed position against resistance.

CN: Management of care; CL: Analyze

16. 2. It is best for the client to wear mitts, which help prevent the client from pulling on the IV without causing additional agitation. Using a jacket or wrist restraint or tucking the client's arms and hands under the sheet restricts movement and adds to feelings of being confined, all of which would add to the agitation and increase ICP.

CN: Physiological adaptation; CL: Synthesize

17. 3. Coughing is contraindicated for a client at risk for increased ICP because coughing increases ICP. Deep breathing can be continued. Turning and passive ROM exercises can be continued with care not to extend or flex the neck.

CN: Reduction of risk potential; CL: Synthesize

18. 3. Recovery from a serious head injury is a long-term process that may continue for months or years. Depending on the extent of the injury, clients who are transferred to rehabilitation facilities most likely will continue to exhibit cognitive and mobility impairments as well as behavior and personality changes. The client would be expected to participate in the rehabilitation efforts to the extent he is capable. Family members and significant others will need long-term support to help them cope with the changes that have occurred in the client.

CN: Physiological adaptation; CL: Evaluate

19. 4. Decerebrate posturing occurs in clients with damage to the upper brain stem, midbrain, or pons and is demonstrated clinically by arching of the back, rigid extension of the extremities, pronation of the arms, and plantar flexion of the feet. Internal rotation and adduction of arms with flexion of elbows, wrists, and fingers describes decorticate posturing, which indicates damage to corticospinal tracts and cerebral hemispheres.

CN: Physiological adaptation; CL: Apply

20. 2. Cluster breathing consists of clusters of irregular breaths followed by periods of apnea on an irregular basis. A lesion in the upper medulla or lower pons is usually the cause of cluster breathing. Because the client had a bleed in the occipital lobe, which is just superior and posterior to the pons and medulla, clinical manifestations that indicate a new lesion are monitored very closely in case another bleed ensues. The nurse should notify the **HCP** immediately so that treatment can begin before respirations cease. The client is not obtaining sufficient oxygen, and the depth of breathing is assisted by the ventilator. The HCP will determine changes in the ventilator settings.

CN: Physiological adaptation; CL: Synthesize

21. 2. Elevating the head of the bed to 30 degrees is contraindicated for infratentorial craniotomies because it could cause herniation of the brain down onto the brain stem and spinal cord, resulting in sudden death. Elevation of the head of the bed to 30 degrees with the head turned to the side opposite the incision, if not contraindicated by the increased intracranial pressure, is used for supratentorial craniotomies.

CN: Physiological adaptation; CL: Synthesize

22. 3,4. The nurse should immediately report changes that indicate increasing intracranial pressure (ICP): bradycardia, increasing systolic pressure, and widening pulse pressure. As ICP increases and the brain becomes more compressed, respirations become rapid, BP decreases, and the pulse slows further; these are very ominous signs. Decreased arterial BP and tachycardia can indicate bleeding elsewhere in the body. Decreasing urinary output indicates decreased tissue perfusion. The nurse monitors changes and notifies the **HCP**  if trends continue.

CN: Physiological adaptation; CL: Synthesize

23. 4. It is important to first explain where a client is to orient him or her to time, person, and place. Offering to get the family and asking questions to determine orientation are important, but the first comments should let the client know where he or she is and what has happened. It is useful to be empathetic to the client, but making a comment such as “I will bet you are a little confused” is not helpful and may cause anxiety.

CN: Psychosocial adaptation; CL: Synthesize

The Client with Seizures

24. 3,1,4,2. To protect the client from falling, the nurse first should ease the client to the floor. It is important to protect the head and maintain a patent airway since altered breathing and excessive salivation can occur. The assessment of the postictal period should include level of consciousness and vital signs. The nurse should record details of the seizure once the client is stable. The events preceding the seizure, timing with descriptions of each phase, body parts affected and sequence of involvement, and autonomic signs should be recorded.

CN: Safety and infection control; CL: Synthesize

25. 4. A generalized tonic-clonic seizure involves both a tonic phase and a clonic phase. The tonic phase consists of loss of consciousness, dilated pupils, and muscular stiffening or contraction, which lasts about 20 to 30 seconds. The clonic phase involves repetitive movements. The seizure ends with confusion, drowsiness, and resumption of respiration. A partial seizure starts in one region of the cortex and may stay focused or spread (e.g., jerking in the extremity spreading to other areas of the body). An absence seizure usually occurs in children and involves a vacant stare with a brief loss of consciousness that often goes unnoticed. A complex partial seizure involves facial grimacing with patting and smacking.

CN: Physiological adaptation; CL: Analyze

26. 4. The client will be asked to hold the head very still during the examination, which lasts about 30 to 60 minutes. In some instances, food and

fluids may be withheld for 4 to 6 hours before the procedure if a contrast medium is used because the radiopaque substance sometimes causes nausea. There is no special preparation for a CT scan, so a shampoo the night before is not required. The client may drink fluids until 4 hours before the scan is scheduled. Electrodes are not used for a CT scan, nor is the head shaved.

CN: Physiological adaptation; CL: Synthesize

27. 3. Beverages containing caffeine, such as coffee, tea, cola, and energy drinks, are withheld before an EEG because of the stimulating effects of the caffeine on the brain waves. A meal should not be omitted before an EEG because low blood sugar could alter brain wave patterns; the client can have the entire meal except for the coffee. The client does not need to be on a liquid diet or NPO.

CN: Physiological adaptation; CL: Synthesize

28. 3. In order for phenytoin to be properly absorbed and provide maximum benefit to the client, nutritional supplements must be stopped before and after delivery. The head of the bed is elevated 30 degrees since this client has a tube feeding infusing; it is not necessary to elevate the bed any further. Blood levels are usually drawn before giving a dose of phenytoin, not after. It is not necessary to flush with such a large amount of water (150 mL) before and after administering phenytoin.

CN: Pharmacological and parenteral therapies; CL: Synthesize

29. 2. Gabapentin may impair vision. Changes in vision, concentration, or coordination should be reported to the **HCP** . Gabapentin should not be stopped abruptly because of the potential for status epilepticus; this is a medication that must be tapered off. Gabapentin is to be stored at room temperature and out of direct light. It should not be taken with antacids.

CN: Pharmacological and parenteral therapies; CL: Synthesize

30. 3. A priority for the client in the postictal phase (after a seizure) is to assess the client's breathing pattern for effective rate, rhythm, and depth. The nurse should apply oxygen and ventilation to the client as appropriate. Other interventions, to be completed after the airway has been established, include reorientation of the client to time, person, and place. Determining the client's

level of sleepiness is useful, but it is not a priority. Positioning the client comfortably promotes rest but is of less importance than ascertaining that the airway is patent.

CN: Reduction of risk potential; CL: Synthesize

31. 4. Carbamazepine is an anticonvulsant that helps prevent further seizures and is the most effective intervention for preventing seizure risk while the client is undergoing diagnostic tests for seizures. Bed rest, sedation (phenobarbital), and providing privacy do not minimize the risk of seizures.

CN: Pharmacological and parenteral therapies; CL: Synthesize

32. 4. During a seizure, the nurse should note movement of the client's head and eyes and muscle rigidity, especially when the seizure first begins, to obtain clues about the location of the trigger focus in the brain. Other important assessments would include noting the progression and duration of the seizure, respiratory status, loss of consciousness, pupil size, and incontinence of urine and stool. It is typically not possible to assess the client's pulse and blood pressure during a tonic-clonic seizure because the muscle contractions make assessment difficult to impossible. The last dose of anticonvulsant medication can be evaluated later. The nurse should focus on maintaining an open airway, preventing injury to the client, and assessing the onset and progression of the seizure to determine the type of brain activity involved. The type of aura should be assessed in the preictal phase of the seizure.

CN: Physiological adaptation; CL: Analyze

33. 1. The nurse should expect a client in the postictal phase to experience drowsiness to somnolence because exhaustion results from the abnormal spontaneous neuron firing and tonic-clonic motor response. An inability to move a muscle part is not expected after a tonic-clonic seizure because a lack of motor function would be related to a complication, such as a lesion, tumor, or stroke, in the correlating brain tissue. A change in sensation would not be expected because this would indicate a complication such as an injury to the peripheral nerve pathway to the corresponding part from the central nervous system. Hypotension is not typically a problem after a seizure.

CN: Physiological adaptation; CL: Analyze

34. 2. Anticonvulsant drug therapy should never be stopped suddenly; doing so can lead to life-threatening status epilepticus. Phenytoin sodium does not carry a risk of physical dependency or lead to hypoglycemia. Phenytoin has antiarrhythmic properties, and discontinuation does not cause heart block.

CN: Pharmacological and parenteral therapies; CL: Apply

35. 3. An aura is a premonition of an impending seizure. Auras usually are of a sensory nature (e.g., an olfactory, visual, gustatory, or auditory sensation); some may be of a psychic nature. Evaluating an aura may help identify the area of the brain from which the seizure originates. Auras occur before a seizure, not during or after (postictal). They are not similar to hallucinations or amnesia or related to relaxation.

CN: Physiological adaptation; CL: Synthesize

36. 2. Toxic effects of topiramate include nephrolithiasis, and clients are encouraged to drink six to eight glasses of water a day to dilute the urine and flush the renal tubules to avoid stone formation. Topiramate is taken in divided doses because it produces drowsiness. Although eating fresh fruits is desirable from a nutritional standpoint, this is not related to the topiramate. The drug does not have to be taken with meals.

CN: Pharmacological and parenteral therapies; CL: Evaluate

37. 3. A common adverse effect of long-term phenytoin therapy is an overgrowth of gingival tissues. Problems may be minimized with good oral hygiene, but in some cases, overgrown tissues must be removed surgically. Phenytoin does not cause weight gain, insomnia, or deteriorating eyesight.

CN: Pharmacological and parenteral therapies; CL: Evaluate

38. 1,2,3. The nurse should assess the number and type of seizures the client has experienced since starting clonazepam monotherapy for seizure control. The nurse should also determine if the client might be pregnant because clonazepam crosses the placental barrier. The nurse should also ask about the client's use of alcohol because alcohol potentiates the action of clonazepam. Although the nurse may want to check on the client's diet or use of cigarettes for health maintenance and promotion, such information is not

specifically related to clonazepam therapy.

CN: Pharmacological and parenteral therapies; CL: Evaluate

The Client with a Stroke

39. 1,4,5. A headache (which is treated with analgesics) is commonly associated with an ischemic CVA. A conscious client responds to comfort measures. Bleeding is a side effect of recombinant tissue plasminogen (t-PA) therapy to dissolve the clots; absence of bleeding is a desired outcome. Reduction of dysphagia and visual disturbances is unpredictable and less likely to occur during this phase.

CN: Pharmacological and parenteral therapies; CL: Evaluate

40. 3. Following a stroke, it is easiest for clients with dysphagia (difficulty swallowing) to swallow solid foods; the nurse introduces foods on the unaffected side. Liquid foods are difficult to swallow, and the client with facial paralysis will have difficulty sipping using a straw. The head of the bed is elevated to 90 degrees, or the client is instructed to sit up, if possible, while eating to prevent choking and aspiration.

CN: Physiological adaptation; CL: Apply

41. 15 points

The Glasgow Coma Scale provides three objective neurologic assessments: spontaneity of eye opening, best motor response, and best verbal response on a scale of 3 to 15. The client who scores the best on all three assessments scores 15 points.

CN: Management of care; CL: Apply

42. 2,3,5. The maximum dosage of warfarin sodium is not achieved until 3 to 4 days after starting the medication, and the effects of the drug continue for 4 to 5 days after discontinuing the medication. The client should have blood levels tested periodically to make sure that the desired level is maintained. Warfarin has a peak action of 9 hours. Vitamin K is the antidote for warfarin; protamine sulfate is the antidote for heparin.

CN: Pharmacological and parenteral therapies; CL: Evaluate

43. 1. A helpless client should be positioned on the side, not on the back, with the head on a small pillow. A lateral position helps secretions escape from the throat and mouth, minimizing the risk of aspiration. It may be necessary to suction the client if he aspirates. Suction equipment should be nearby. It is safe to use a padded tongue blade, and the client should receive oral care, including brushing with a toothbrush.

CN: Reduction of risk potential; CL: Synthesize

44. 3. Studies show that clients who receive recombinant t-PA treatment within 3 hours after the onset of a stroke have better outcomes. The time from the onset of a stroke to t-PA treatment is critical. A complete health assessment and history is not possible when a client is receiving emergency care. Upcoming surgical procedures may need to be delayed because of the administration of t-PA, which is a priority in the immediate treatment of the current stroke. While the nurse should identify which medications the client is taking, it is more important to know the time of the onset of the stroke to determine the course of action for administering t-PA.

CN: Pharmacological and parenteral therapies; CL: Synthesize

45. 3. Control of blood pressure is critical during the first 24 hours after treatment because an intracerebral hemorrhage is the major adverse effect of thrombolytic therapy. Vital signs are monitored, and blood pressure is maintained as identified by the **healthcare provider (HCP)**  and specific to the client's ischemic tissue needs and risk of bleeding from treatment. The other vital signs are important, but the priority is to monitor blood pressure.

CN: Reduction of risk potential; CL: Synthesize

46. 2. It is crucial to monitor the pupil size and pupillary response to indicate changes around the cranial nerves. The cholesterol level is not a priority assessment, although it may be an assessment to be addressed for long-term healthy lifestyle rehabilitation. Bowel sounds need to be assessed because an ileus or constipation can develop, but this is not a priority in the first 24 hours, when the primary concerns are cerebral hemorrhage and increased intracranial pressure. An echocardiogram is not needed for the client with a thrombotic stroke without heart problems.

 CN: Physiological adaptation; CL: Analyze

47. 4,2,1,3. Increased agitation with suctioning will increase ICP; therefore, sedation should be provided first. The client should be hyperoxygenated before and after suctioning to prevent hypoxia since hypoxia causes vasodilation of the cerebral vessels and increases ICP. The airway should then be suctioned for no more than 10 seconds. The mouth can be suctioned once the airway is clear to remove oral secretions. Once the mouth is suctioned, the suction catheter should be discarded.

 CN: Physiological adaptation; CL: Synthesize

48. 1. The primary reason for the nursing assessment of a client's functional status before and after a stroke is to guide the plan. The assessment does not help to predict how far the rehabilitation team can help the client to recover from the residual effects of the stroke, only what plans can help a client who has moved from one functional level to another. The nursing assessment of the client's functional status is not a motivating factor.

 CN: Physiological adaptation; CL: Apply

49. 2. Sliding a client on a sheet causes friction and is to be avoided. Friction injures skin and predisposes to pressure ulcer formation. Rolling the client is an acceptable method to use when changing positions as long as the client is maintained in anatomically neutral positions and the limbs are properly supported. The client may be lifted as long as the nurse has assistance and uses proper body mechanics to avoid injury to himself or herself or the client. Having the client help lift off the bed with a trapeze is an acceptable means to move a client without causing friction burns or skin breakdown.

 CN: Reduction of risk potential; CL: Synthesize

50. 35. This client has a fall risk score of 35 and is at medium fall risk due to the client's secondary diagnosis (15) and IV access (20). Though paraplegic, this does not affect the client's fall risk assessment as the client will be either in bed or in a wheelchair; the client therefore is not assessed points on the fall risk for "ambulatory aid" or "gait."

 CN: Safety and infection control; CL: Evaluate

51. 3. The use of ankle-high tennis shoes has been found to be most effective in preventing plantar flexion (footdrop) because they add support to the foot and keep it in the correct anatomic position. Footboards stimulate spasms and are not routinely recommended. Regular repositioning and range-of-motion exercises are important interventions, but the client's foot needs to be in the correct anatomic position to prevent overextension of the muscle and tendon. Massaging does not prevent plantar flexion and, if rigorous, could release emboli.

CN: Reduction of risk potential; CL: Synthesize

52. 1,2,4. Placing a pillow in the axilla so the arm is away from the body keeps the arm abducted and prevents skin from touching skin to avoid skin breakdown. Placing a pillow under the slightly flexed arm so the hand is higher than the elbow prevents dependent edema. Positioning a hand cone (not a rolled washcloth) in the hand prevents hand contractures. Immobilization of the extremity may cause a painful shoulder-hand syndrome. Flexion contractures of the hand, wrist, and elbow can result from immobility of the weak or paralyzed extremity. It is better to extend the arms to prevent contractures.

CN: Reduction of risk potential; CL: Synthesize

53. 2. Expressive aphasia is a condition in which the client understands what is heard or written but cannot say what he or she wants to say. A communication or picture board helps the client communicate with others in that the client can point to objects or activities that he or she desires. Receptive aphasia is a condition in which the client does not comprehend what is being said. For this client it is helpful to speak clearly using short sentences or writing out directions.

CN: Physiological adaptation; CL: Synthesize

54. 1,3,4. A client with dysphagia (difficulty swallowing) commonly has the most difficulty ingesting thin liquids, which are easily aspirated. Liquids should be thickened to avoid aspiration. Maintaining an upright position while eating is appropriate because it minimizes the risk of aspiration. Introducing foods on the unaffected side allows the client to have better control over the food bolus. The client should concentrate on chewing and

swallowing; therefore, distractions should be avoided. Large pieces of food could cause choking; the food should be cut into bite-sized pieces.

CN: Safety and infection control; CL: Synthesize

55. 2. Homonymous hemianopia is blindness in half of the visual field; therefore, the client would see only half of the plate. Eating only the food on half of the plate results from an inability to coordinate visual images and spatial relationships. There may be an increased preference for foods high in salt after a stroke, but this would not be related to homonymous hemianopia. Forgetting the names of foods is a sign of aphasia, which involves a cerebral cortex lesion. Being unable to swallow liquids is dysphagia, which involves motor pathways of cranial nerves IX and X, including the lower brain stem.

CN: Physiological adaptation; CL: Analyze

56. 4. To expand the visual field, the partially sighted client should be taught to turn the head from side to side when walking. Neglecting to do so may result in accidents. This technique helps maximize the use of remaining sight. Covering an eye with a patch will limit the field of vision. Personal items can be placed within sight and reach, but most accidents occur from tripping over items that cannot be seen. It may help the client to see the door, but walking presents the primary safety hazard.

CN: Reduction of risk potential; CL: Synthesize

57. 3. A client who has brain damage may be emotionally labile and may cry or laugh for no explainable reason. Crying is best dealt with by attempting to divert the client's attention. Ignoring the behavior will not affect the mood swing or the crying and may increase the client's sense of isolation. Telling the client to stop is inappropriate.

CN: Psychosocial adaptation; CL: Synthesize

58. 1,3,4,5. The goal of communicating with a client with aphasia is to minimize frustration and exhaustion. The nurse should encourage the client to write messages or use alternative forms of communication to avoid frustration. Presenting one thought at a time decreases stimuli that may distract the client, as does speaking in a normal volume and tone. The nurse should ask the client to point to objects and encourage the use of gestures to

assist in communicating.

CN: Psychosocial adaptation; CL: Synthesize

59. 3. Thrombolytic enzyme agents are used for clients with a thrombotic stroke to dissolve emboli, thus reestablishing cerebral perfusion. They do not increase vascular permeability, cause vasoconstriction, or prevent further hemorrhage.

CN: Pharmacological and parenteral therapies; CL: Evaluate

The Client with Parkinson's Disease

60. 4. When a freezing gait occurs, having the client march in place or step over actual lines, imaginary lines, or objects on the floor can promote walking. Instructing the client to take one step backward and two steps forward may also stimulate walking. Pulling the client forward can cause imbalance. The nurse does not instruct the client to use a wheelchair. The client obtains much exercise as possible; having the client remain still does not help the client obtain the momentum needed to walk.

CN: Physiological adaptation; CL: Apply

61. 3,4,5. The nurse should contact the **HCP**  before administering carbidopa-levodopa because this medication can cause further symptoms of depression. Suicide threats in clients with chronic illness should be taken seriously. The nurse should also determine if the client is on an MAO inhibitor because concurrent use with carbidopa-levodopa can cause a hypertensive crisis. Carbidopa-levodopa is not a treatment for depression. Having the client discuss feelings is appropriate when the prescription is finalized.

CN: Pharmacological and parenteral therapies; CL: Synthesize

62. 2. The first sign of Parkinson's disease is usually tremors. The client commonly is the first to notice this sign because the tremors may be minimal at first. Rigidity is the second sign, and bradykinesia is the third sign. Akinesia is a later stage of bradykinesia.

CN: Physiological adaptation; CL: Analyze

63. 3. The primary focus is on maintaining a safe environment because the client with Parkinson's disease usually has a propulsive gait, characterized by a tendency to take increasingly quicker steps while walking. This type of gait commonly causes the client to fall or to have trouble stopping. The client should maintain a balanced diet, enhance the immune system, and enjoy diversional activities; however, safety is the primary concern.

CN: Reduction of risk potential; CL: Synthesize

64. 2. Voluntary and purposeful movements often temporarily decrease or stop the tremors associated with Parkinson's disease. In some clients, however, tremors may increase with voluntary effort. Tremors associated with Parkinson's disease are not psychogenic but are related to an imbalance between dopamine and acetylcholine. Tremors cannot be reduced by distracting the client.

CN: Physiological adaptation; CL: Analyze

65. 2. Demanding physical activity should be performed during the peak action of drug therapy. Clients should be encouraged to maintain independence in self-care activities to the greatest extent possible. Although some clients may have more energy in the morning or after rest, tremors are managed with drug therapy.

CN: Physiological adaptation; CL: Synthesize

66. 4. Helping the client function at his or her best is most appropriate and realistic. There is no known cure for Parkinson's disease. Parkinson's disease progresses in severity, and there is no known way to stop its progression. However, many clients live for years with the disease, and it would not be appropriate to start planning terminal care at this time.

CN: Physiological adaptation; CL: Synthesize

67. 1. The primary goal of physical therapy and nursing interventions is to maintain joint flexibility and muscle strength. Parkinson's disease involves a degeneration of dopamine-producing neurons; therefore, it would be an unrealistic goal to attempt to build muscles or increase endurance. The decrease in dopamine neurotransmitters results in ataxia secondary to extrapyramidal motor system effects. Attempts to reduce ataxia through

physical therapy would not be effective.

CN: Physiological adaptation; CL: Synthesize

68. 2. Levodopa is prescribed to decrease severe muscle rigidity.

Levodopa does not improve mood, appetite, or alertness in a client with Parkinson's disease.

CN: Pharmacological and parenteral therapies; CL: Evaluate

69. 3. Vital signs should be monitored, especially during periods of adjustment. Changes, such as orthostatic hypotension, cardiac irregularities, palpitations, and light-headedness, should be reported immediately. The client may actually experience suicidal or paranoid ideation instead of euphoria. The nurse should monitor the client for elevated liver enzyme levels, such as lactate dehydrogenase, aspartate aminotransferase, alanine aminotransferase, blood urea nitrogen, and alkaline phosphatase, but the client should not be jaundiced. The client should not experience signs and symptoms of diabetes or a low serum glucose level, but the nurse should check the hemoglobin and hematocrit levels.

CN: Pharmacological and parenteral therapies; CL: Analyze

70. 2. Ongoing self-care is a major focus for clients with Parkinson's disease. The client should be given additional time as needed and praised for efforts to remain independent. Firmly telling the client that he or she needs assistance will undermine self-esteem and defeat efforts to be independent. Telling the client that perception of the situation is unrealistic does not foster hope in the ability to perform self-care measures. Suggesting that the client modify the morning routine seems to put the hospital or the nurse's time schedule before the client's needs. This will only decrease the client's self-esteem and the desire to try to continue self-care, which is obviously important to the client.

CN: Psychosocial adaptation; CL: Synthesize

71. 1. The goal of a pallidotomy is to improve functional ability for the client with Parkinson's disease. This is a priority. The pallidotomy creates lesions in the globus pallidus to control extrapyramidal disorders that affect control of movement and gait. If functional ability is improved by the

pallidotomy, the client may experience a secondary response of an improved emotional response, but this is not the primary goal of the surgical procedure. The procedure will not improve alertness or appetite.

 CN: Basic care and comfort; CL: Apply

The Client with Multiple Sclerosis

72. 2,4,5. The client with multiple sclerosis is at risk for falls due to muscle weakness, skin breakdown due to bowel and bladder incontinence, and fatigue. The client is not at risk for dehydration; seizures are not associated with myelin destruction.

 CN: Physiological integrity; CL: Analyze

73. 2,3,4,5. Maintaining urinary function in a client with neurogenic bladder dysfunction from MS is an important goal. The client should ideally drink 400 to 500 mL with each meal; drink 200 mL midmorning, midafternoon, and late afternoon; and attempt to void at least every 2 hours to prevent infection and stone formation. The client may need to catheterize herself to drain residual urine in the bladder. Restricting fluids during the day will not produce sufficient urine. However, in bladder training for nighttime continence, the client may restrict fluids for 1 to 2 hours before going to bed. The client should drink at least 2,000 mL every 24 hours.

 CN: Physiological adaptation; CL: Create

74. 2. With MS, hyperexcitability and euphoria may occur, but because of muscle weakness, sudden bursts of energy are unlikely. Visual disturbances, weakness in the extremities, and loss of muscle tone and tremors are common symptoms of MS.

 CN: Physiological adaptation; CL: Analyze

75. 3. Baclofen is a centrally acting skeletal muscle relaxant that helps relieve the muscle spasms common in MS. Drowsiness is an adverse effect, and driving should be avoided if the medication produces a sedative effect. Baclofen does not stimulate the appetite or reduce bacteria in the urine.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

76. 2. Evaluating drug effectiveness is difficult because a high percentage of clients with MS exhibit unpredictable episodes of remission, exacerbation, and steady progress without apparent cause. Clients with MS do not necessarily have increased intolerance to drugs, nor do they endure long periods of exacerbation before the illness responds to a particular drug. Multiple drug use is not what makes evaluation of drug effectiveness difficult.

CN: Physiological adaptation; CL: Analyze

77. 4. Asking a client to speak louder even when tired may aggravate the problem. Asking the client to speak slowly and distinctly and to repeat hard-to-understand words helps the client to communicate effectively.

CN: Psychosocial adaptation; CL: Synthesize

78. 4. The nurses' notes should be concise, objective, clearly stated, and relevant. This client trembles when she attempts voluntary actions, such as drinking a beverage or fastening clothing. This activity should be described exactly as it occurs so that others reading the note will have no doubt about the nurse's observation of the client's behavior. Identifying the "intentional" activity of daily living will help the interdisciplinary team individualize the client's plan of care. Clarifying what is meant by "worsening" with a purposeful act will facilitate the interrater reliability of the team. It is better to state what the client did than to give vague nursing orders in the nurses' notes.

CN: Management of care; CL: Apply

79. 4. Limiting fluid intake is likely to aggravate rather than relieve symptoms when a bowel retraining program is being implemented. Furthermore, water imbalance, as well as electrolyte imbalance, tends to aggravate the signs and symptoms of MS. A diet high in fiber helps keep bowel movements regular. Setting a regular time each day for elimination helps train the body to maintain a schedule. Using an elevated toilet seat facilitates transfer of the client from the wheelchair to the toilet or from a standing to a sitting position.

CN: Physiological adaptation; CL: Synthesize

80. 3. MS is a progressive, chronic neurologic disease characterized by patchy demyelination throughout the central nervous system. This interferes with the transmission of electrical impulses from one nerve cell to the next. MS affects speech, coordination, and vision, but not cognition. Care for the client with MS is directed toward maintaining joint mobility, preventing deformities, maintaining muscle strength, rehabilitation, preventing and treating depression, and providing client motivation.

CN: Reduction of risk potential; CL: Synthesize

81. 2. The nurse's most positive approach is to encourage a client with MS to keep active, use stress reduction strategies, and avoid fatigue because it is important to support the immune system while remaining active. A quiet, inactive lifestyle is not necessarily indicated. Good health habits are not likely to alter the course of the disease, although they may help minimize complications. Practicing using aids that will be needed for future disabilities may be helpful but also can be discouraging.

CN: Physiological adaptation; CL: Synthesize

82. 1,3,4,5. A client with impaired peripheral sensation does not feel pain as readily as does someone whose sensation is unimpaired; therefore, water temperatures should be tested carefully. The client should be advised to avoid using hot water bottles or heating pads and to protect against cold temperatures. Because the client cannot rely on minor pain as an indicator of damaged skin or sore spots, the client should carefully inspect the skin daily to visualize any injuries that he or she cannot feel. The client should not be instructed to avoid kitchen activities out of fear of injury; independence and self-care are also important. However, the client should meet with an occupational therapist to learn about assistive devices and techniques that can reduce injuries, such as burns and cuts that are common in kitchen activities.

CN: Reduction of risk potential; CL: Create

83. 3. Maintaining a regular voiding pattern is the most appropriate measure to help the client avoid urinary incontinence. Fluid intake is not related to incontinence. Incontinence is related to the strength of the detrusor and urethral sphincter muscles. Inserting an indwelling catheter would be a treatment of last resort because of the increased risk of infection. If

catheterization is required, intermittent self-catheterization is preferred because of its lower risk of infection. Antibiotics do not influence urinary incontinence.

CN: Physiological adaptation; CL: Synthesize

84. 2. An individualized regular exercise program helps the client to relieve muscle spasms. The client can be trained to use unaffected muscles to promote coordination because MS is a progressive, debilitating condition. The data do not indicate that the client needs psychotherapy, day care for the granddaughter, or visits from other clients.

CN: Physiological adaptation; CL: Synthesize

The Client with Myasthenia Gravis

85. 1. Loss of motor function to the face and throat can cause dysphagia and places the client at risk for aspiration. Bladder dysfunction and hypertension are not associated with myasthenia gravis. Myasthenia affects nerve impulses at the neuromuscular junction, causing loss of motor function; there is no sensory deficit.

CN: Reduction of risk potential; CL: Synthesize

86. 1. The nurse instructs the client regarding use of artificial tears because eyelid and extraocular muscles are frequently affected by myasthenia gravis and there is a risk of corneal abrasion if the eyelids do not close completely. The client is encouraged to maintain social contacts and prevent social isolation by staying at home. Medication is taken in the morning, prior to activities, so the client is able to complete them. A nutritious diet is encouraged, and there is no indication to limit protein.

CN: Reduction of risk potential; CL: Synthesize

87. 3. With a well-managed regimen, a client with myasthenia gravis should be able to control symptoms, maintain a normal lifestyle, and achieve a normal life expectancy. Myasthenia gravis can be controlled and need not be a fatal disease. Myasthenia gravis can be controlled, not cured. Episodes of increased muscle weakness should not occur if treatment is well managed.

CN: Physiological adaptation; CL: Evaluate

The Unconscious Client

88. 3. Activated charcoal powder is administered to absorb remaining particles of salicylate. Vitamin K is an antidote for warfarin sodium. Dextrose 50% is used to treat hypoglycemia. Sodium thiosulfate is an antidote for cyanide.

CN: Pharmacological and parenteral therapies; CL: Synthesize

89. 2,3,4. An excess of cholinergic agents produces urinary and fecal incontinence, increased salivation, diarrhea, and diaphoresis. In a severe overdose, CNS depression, seizures and muscle fasciculations, bradycardia or tachycardia, weakness, and respiratory arrest due to respiratory muscle paralysis occur. Anticholinergics produce dry mucous membranes. Skin rash is not a sign of overdose with a cholinergic agent.

CN: Pharmacological and parenteral therapies; CL: Analyze

90. 3. The wife's initial response to this crisis is high anxiety. Anxiety must dissipate before a person can deal with the actual situation. Allowing the wife to express her feelings can help diffuse their anxiety. The reasons for the client's actions are unknown; assumptions must be validated before they become facts. The nurse should first listen to the wife's needs before recommending meeting with clergy. Asking the wife to help with the client's care is appropriate at a later time.

CN: Psychosocial adaptation; CL: Synthesize

91. 3. Maintaining intact skin is a priority for the unconscious client. Unconscious clients need to be turned every hour to prevent complications of immobility, which include pressure ulcers and stasis pneumonia. The unconscious client cannot be educated at this time. Pain is not a concern. During the first 24 hours, the unconscious client will mostly likely be on nothing-by-mouth status.

CN: Reduction of risk potential; CL: Synthesize

92. 2. The nurse must clean the unconscious client's mouth carefully, apply a thin coat of petroleum jelly, and move the endotracheal tube to the opposite side daily to prevent dryness, crusting, inflammation, and parotiditis.

The unconscious client's temperature should be monitored by a route other than the oral (e.g., rectal, tympanic) because oral temperatures will be inaccurate. The client should be positioned in a lateral or semiprone position, not a supine position, to allow for drainage of secretions and for the jaw and tongue to fall forward. The client should not be dragged when turned, as may happen when a drawsheet is used. Care should be taken to lift the client's heels, buttocks, arms, and head off of the sheets when turning. Trochanter rolls, splints, foam boot aids, specialty beds, and so on—not just two pillows—should be used to keep the client in correct body position and to decrease pressure on bony prominences.

CN: Reduction of risk potential; CL: Synthesize

93. 3. The client is not in proper body alignment if, when in the right side-lying position, the client's left arm rests on the mattress with the elbow flexed. This positioning of the arm pulls the left shoulder out of good alignment, restricting respiratory movements. The arm should be supported on a pillow. The client's head also should be placed on a small pillow to keep it in alignment with the body. The right leg should be extended on the mattress without a pillow to avoid hyperrotation of the hip. A pillow should be placed between the left and right legs with the left knee flexed so that no parts of the legs is skin touching skin.

CN: Physiological adaptation; CL: Synthesize

94. 4. The goal of performing passive ROM exercises is to maintain joint mobility. Active exercise is needed to preserve bone and muscle mass. Passive ROM movements do not prevent bone demineralization or have a positive effect on the client's muscle tone.

CN: Physiological adaptation; CL: Evaluate

95. 1. Maintaining a patent airway is the priority. Therefore, the nurse should keep suction equipment available to remove secretions. The client should be placed in a side-lying, not prone, position. Performing oral hygiene is a clean procedure; therefore, the nurse wears clean gloves, not sterile gloves. The nurse should never place any fingers in an unconscious client's mouth; the client may bite down. Padded tongue blades, swabs, or a toothbrush should be used instead; but maintaining the airway is the priority.

 CN: Physiological adaptation; CL: Synthesize

96. 2. When the blink reflex is absent or the eyes do not close completely, the cornea may become dry and irritated. Corneal abrasion can occur. Taping the eye closed will prevent injury. Having the client wear eyeglasses or cleaning the eyelid will not protect the cornea from dryness or irritation. Artificial tears instilled once per shift are not frequent enough for preventing dryness.

 CN: Reduction of risk potential; CL: Synthesize

97. 3. Restlessness is an early indicator of hypoxia. The nurse should suspect hypoxia in the unconscious client who becomes restless. The most accurate method for determining the presence of hypoxia is to evaluate the pulse oximeter value or arterial blood gas values. Cyanosis and decreased respirations are late indicators of hypoxia. Hypertension, not hypotension, is a sign of hypoxia.

 CN: Physiological adaptation; CL: Apply

98. 2. The client should be placed in a semi-Fowler's position to reduce the risk of aspiration. The formula should be at room temperature, not heated. Administering enteral tube feedings is a clean procedure, not a sterile one; therefore, sterile supplies are not required. Clients receiving enteral feedings should be weighed regularly, but not necessarily before each feeding.

 CN: Reduction of risk potential; CL: Synthesize

99. 4. Gastric residuals are checked before administration of enteral feedings to determine whether gastric emptying is delayed. A residual of <50% of the previous feeding volume is usually considered acceptable. In this case, the amount is not excessive and the nurse should reinsert the aspirate through the tube and then administer the feeding. If the amount of gastric residual is excessive, the nurse should notify the **HCP**  and withhold the feeding. Disposing of the residual can cause electrolyte and fluid losses.

 CN: Reduction of risk potential; CL: Synthesize

The Client in Pain

100. 2. Morphine 2 mg was given 1 hour ago, and the client can have up to 4 mg every 2 hours. Although the pain level is at 1, the nurse should give medication prior to the dressing change with packing that is likely to cause discomfort. A 4-mg dose of morphine would exceed the 2-hour limit and, if given after the dressing change, would not manage pain during the procedure. The client has been responding to the pain medication dosing, and a new prescription is not required at this time.

CN: Management of care; CL: Synthesize

101. 1. Experience has demonstrated that clients who feel confidence in the persons who are caring for them do not require as much therapy for pain relief as do those who have less confidence. Without the client's confidence, developed in an effective nurse-client relationship, other interventions may be less effective. The client's family can be an important source of support, but it is the nurse who plans strategies for pain relief. The client may require time to adjust to the pain, but the nurse and client can collaborate to try to evaluate a variety of pain relief strategies. Arranging for the client to share a room with another client who has little pain may have negative effects on the client who has pain that is difficult to relieve.

CN: Basic care and comfort; CL: Synthesize

102. 4. Although meperidine hydrochloride can be given orally, it is more effective when given intramuscularly. The equianalgesic dose of oral meperidine is up to four times the IM dose ($75 \times 4 = 300$).

CN: Pharmacological and parenteral therapies; CL: Apply

103. 1. Opioid analgesics relieve pain by reducing or altering the perception of pain. Meperidine hydrochloride does not decrease the sensitivity of pain receptors, interfere with pain impulses traveling along sensory nerve fibers, or block the conduction of pain impulses in the central nervous system.

CN: Pharmacological and parenteral therapies; CL: Evaluate

104. 3. The client's innate responses to pain are directed initially toward escaping from the source of pain. Variations in tolerance and perception of pain are apparent only in conscious clients, and only conscious clients can

employ distraction to help relieve pain.

 CN: Physiological adaptation; CL: Apply

105. 2. Ergotamine tartrate is used to help abort a migraine attack. It should be taken as soon as prodromal symptoms appear. Reduced migraine severity and relief from sleeplessness and vision problems address symptoms that occur after the migraine has occurred and are not effects of ergotamine.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

106. 4. Biofeedback translates body processes into observable signs so that the client can develop some control over certain body processes. Biofeedback does not involve electrical stimulation. Use of unpleasant stimuli such as electrical shock is a form of aversion therapy. Biofeedback does not involve monitoring body processes for the therapist to interpret; rather, it is a self-directed, self-care activity that reinforces learning because the client can see the results of his or her actions.

 CN: Psychosocial adaptation; CL: Apply

107. 1. A back rub stimulates the large-diameter cutaneous fibers, which block transmission of pain impulses from the spinal cord to the brain. It does not block the transmission of pain impulses or stimulate the release of endorphins. A back rub may distract the client, but the physiologic process of fiber stimulation is the main reason a back rub is used as therapy for pain relief.

 CN: Basic care and comfort; CL: Apply

108. 2. It is essential that the nurse document the client's response to pain medication on a routine, systematic basis. Reassuring the client that pain will be relieved is often not realistic. A client who continually presses the PCA button may not be getting adequate pain relief, but through careful assessment and documentation, the effectiveness of pain relief interventions can be evaluated and modified. Pain medication is not titrated until the client is free from pain but rather until an acceptable level of pain management is reached.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

109. 2. The nurse should first check the infusion site to be sure the site has not infiltrated. Next, the nurse should check the PCA pump to determine if it is functioning properly. Assessing vital signs would be important to provide additional data about the possible cause of pain, but is not the first action at this time. It is not necessary to notify the **healthcare provider (HCP)**  unless the infusion site or pump is malfunctioning and other methods of managing the pain are required.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

110. 1. The nurse using healing touch affects a client's pain primarily through assessing and directing the flow of energy fields. Healing touch removes energy congestion so energy channels can facilitate integration of the body, mind, and soul to promote healing. Healing touch can involve touching, but it does not have to involve body contact. Massage is not involved with healing touch. The goal of healing touch is not to increase the production of endorphins.

 CN: Physiological adaptation; CL: Apply

111. 2. Pain is whatever the client perceives it is; using a pain scale is the best way to have the client quantify the amount of pain. The fact that the client is protecting an area of the body, the client's vital signs, and the client's appearance of discomfort are objective rather than subjective findings; the nurse should confirm the meaning of these changes before assuming the client has pain.

 CN: Basic care and comfort; CL Analyze

112. 2. The nurse administers between 2 and 4 mg of morphine sulfate IVP every 2 to 4 hours according to the prescription for pain management. Even though the client received pain medication 2 hours ago, the client is still experiencing pain of the intensity of 8 on a scale of 0 to 10. Elderly clients may have slowed pain perception, but not diminished pain intensity. The nurse starts out conservatively, administering 2 mg of morphine sulfate IVP and reassessing in 15 minutes to determine the effectiveness of pain management and respiratory effort. If pain is still not relieved, the titration of morphine sulfate upward to 4 mg is optional. The single provision of nonpharmacologic interventions such as repositioning is not sufficient pain

management when a client rates pain at 8 on a scale of 0 to 10. Requesting a prescription for sedation only causes the client to be unable to express her pain and does not treat the pain. Although the nurse continues to monitor the client's respirations, the respirations are not dangerously depressed, and waiting another 2 hours to administer pain medication does not address the client's need for pain relief.

CN: Pharmacological parenteral therapies; CL: Synthesize

Managing Care, Quality, and Safety of Clients with Neurologic Health Problems

113. 2. Assessments, teaching, and suctioning are roles of the nurse. Basic care with frequent positioning is the most appropriate to delegate to the **UAP**

CN: Management of care; CL: Apply

114. 3. Pulling the client up under the arm can cause shoulder displacement. A belt around the waist should be used to move the client. Passive range-of-motion exercises prevent contractures and atrophy. Raising the foot of the bed assists in venous return to reduce edema. High top tennis shoes are used to prevent foot drop.

CN: Management of care; CL: Synthesize

115. 3. Clients with Parkinson's disease can experience dysphagia. Thickening liquids assists with swallowing, preventing aspiration. Hyperextending the neck opens the airway and can increase risk of aspiration. Pressing the chin firmly on the chest makes swallowing more difficult. The chin should be slightly tucked to promote swallowing. The nurse should suggest a speech therapy consult for evaluation of the client's ability to swallow.

CN: Safety and infection control; CL: Synthesize

116. 4. Urinary tract infections are a frequent complication in clients with multiple sclerosis because of the effect on bladder function; therefore, that client should be seen first by the nurse. The elevated temperature and flank pain suggest that this client may have pyelonephritis. The client should be

notified immediately so that antibiotic therapy can be started quickly. The other clients should be assessed soon but do not have needs as urgent as this client.

CN: Management of care; CL: Synthesize

117. 2. Clients with Parkinson's disease may experience a freezing gait when they are unable to move forward. Instructing the client to march in place, step over lines in the flooring, or visualize stepping over a log allows them to move forward. It is important to ambulate the client and not keep him or her on bed rest. A muscle relaxant is not indicated.

CN: Management of care; CL: Synthesize

118. 1,2,3,7. Pressure points in the side-lying position include the ears, shoulders, ribs, greater trochanter, medial or lateral condyles, and ankles. The sacrum, occiput, and heels are pressure point areas affected in the supine position.

CN: Safety and infection control; CL: Analyze

119. 4. All healthcare facilities in which controlled medications are stored for dispensing and/or administration to clients are required to follow procedures for the proper maintenance of narcotic inventory. Narcotic inventory maintenance includes, but is not limited to, thorough and appropriate documentation of any discrepancy with accompanying reasons (i.e., tablet/amp/vial breakage, additional medication volume, etc.), timely resolution of inventory discrepancies, and timely notification of persons in oversight areas (i.e., pharmacy, security, nursing house supervisor). In the event of a significant incident, the proper external authorities will be notified by the Quality and Risk Management/Legal Department.

CN: Pharmacological and parenteral therapies; CL: Synthesize

120. 3. The first intervention for a confused client is to increase the frequency of observation, moving the client closer to the nurses' station if possible and/or delegating the **unlicensed assistive personnel (UAP)**  to check on the client more frequently. If the family is able to stay with the client, that is an option, but it is the nurse's responsibility, not the family's, to keep the client safe. Wrist restraints are not used simply because a client is

confused; there is no mention of this client pulling at intravenous lines, which is one of the main reasons to use wrist restraints. Administering a sedative simply because a client is confused is not appropriate nursing care and may actually potentiate the problem.

CN: Safety and infection control; CL: Synthesize

121. 2. To ensure the client's safety when using restraints, the restraint must be secured to the bed frame (not the side rail) using a quick-release slip knot (not a square knot). Assessing and documenting skin should be done regularly when restraints are in use, but safety is first priority. Regularly releasing restraints and performing range of motion is essential but not priority in this case. Providing for the client's basic needs while in restraints (i.e., toileting) is important but not first priority.

CN: Safety and infection control; CL: Synthesize

The Client with Musculoskeletal Health Problems

- The Client with Rheumatoid Arthritis
- The Client with Osteoarthritis
- The Client with a Hip Fracture
- The Client Having Hip Replacement Surgery
- The Client Having Knee Replacement Surgery
- The Client with a Herniated Disk
- The Client with an Amputation due to Peripheral Vascular Disease
- The Client with Fractures
- The Client with a Femoral Fracture
- The Client with a Spinal Cord Injury
- Managing Care, Quality, and Safety of Clients with Musculoskeletal Health Problems
- Answers, Rationales, and Test-Taking Strategies

The Client with Rheumatoid Arthritis

1. On a visit to the clinic, a client reports the onset of early symptoms of rheumatoid arthritis. The nurse should conduct a focused assessment for:

- ☐ **1.** limited motion of joints.
- ☐ **2.** deformed joints of the hands.
- ☐ **3.** early morning stiffness.
- ☐ **4.** rheumatoid nodules.

2. A client with rheumatoid arthritis states, “I cannot do my household chores without becoming tired. My knees hurt whenever I walk.” Which goal for this client should take **priority**?

- ☐ 1. Conserve energy.
- ☐ 2. Adapt self-care skills.
- ☐ 3. Develop coping skills.
- ☐ 4. Employ a housekeeping service.

3. Of the clients listed below, who is at risk for developing rheumatoid arthritis (RA)? Select all that apply.

- ☐ 1. adults between the ages of 20 and 50 years
- ☐ 2. adults who have had an infectious disease with the Epstein-Barr virus
- ☐ 3. adults who are of the male gender
- ☐ 4. adults who possess the genetic link, specifically HLA-DR4
- ☐ 5. adults who also have osteoarthritis

4. A client is in the acute phase of rheumatoid arthritis. In which order of priority from first to last should the nurse establish the goals? All options must be used.

1. Relieve pain.

2. Preserve joint function.

3. Maintain usual ways of accomplishing tasks.

4. Prevent joint deformity.

5. The nurse teaches a client about heat and cold treatments to manage

arthritis pain. Which statement indicates that the client still has a knowledge deficit?

- ☐ 1. "I can use heat and cold as often as I want."
- ☐ 2. "With heat, I should apply it for no longer than 20 minutes at a time."
- ☐ 3. "Heat-producing liniments can be used with other heat devices."
- ☐ 4. "Ten to fifteen minutes per application is the maximum time for cold applications."

6. The client with rheumatoid arthritis tells the nurse, "I have a friend who took gold shots and had a wonderful response. Why did my healthcare provider not let me try that?" Which response by the nurse would be **most** appropriate?

- ☐ 1. "It is the healthcare provider's prerogative to decide how to treat you. The healthcare provider has chosen what is best for your situation."
- ☐ 2. "Tell me more about your friend's arthritic condition. Maybe I can answer that question for you."
- ☐ 3. "That drug is used for cases that are more advanced than yours. You are not eligible for this treatment now."
- ☐ 4. "Every person is different. What works for one client may not always be effective for another."

7. The teaching plan for the client with rheumatoid arthritis includes rest promotion. What position of the involved joints should the nurse tell the client to **avoid** when at rest?

- ☐ 1. keeping all joints aligned
- ☐ 2. elevating the affected joints
- ☐ 3. lying in a prone position
- ☐ 4. maintaining the joints in a flexed position

8. After teaching the client with rheumatoid arthritis about measures to conserve energy in activities of daily living involving the small joints, which activity observed by the nurse indicates the need for additional teaching?

- ☐ 1. pushing with palms when rising from a chair
- ☐ 2. holding packages close to the body
- ☐ 3. sliding objects

- ☐ 4. carrying a laundry basket with clinched fingers and fists

9. After teaching the client with severe rheumatoid arthritis about prescribed methotrexate, which statement indicates the need for further teaching?

- ☐ 1. "I will take my vitamins while I am on this drug."
- ☐ 2. "I must not drink any alcohol while I am taking this drug."
- ☐ 3. "I should brush my teeth after every meal."
- ☐ 4. "I will continue taking my birth control pills."

10. A 25-year-old client taking hydroxychloroquine for rheumatoid arthritis reports difficulty seeing out of the left eye. What does this finding indicate?

- ☐ 1. development of a cataract
- ☐ 2. possible retinal degeneration
- ☐ 3. part of the disease process
- ☐ 4. a coincidental occurrence

11. A client with rheumatoid arthritis is taking high doses of nonsteroidal anti-inflammatory medications. The nurse should instruct the client to:

- ☐ 1. take prescribed medication with food to lessen the likelihood of an upset stomach.
- ☐ 2. not stop taking the medication suddenly; the dose needs to be decreased gradually.
- ☐ 3. use mouthwash to rinse the mouth after taking this medication.
- ☐ 4. not drive if dizziness occurs.

12. A client with rheumatoid arthritis tells the nurse, "I know it is important to exercise my joints so that I will not lose mobility, but my joints are so stiff and painful that exercising is difficult." Which response by the nurse would be **most** appropriate?

- ☐ 1. "You are probably exercising too much. Decrease your exercise to every other day."
- ☐ 2. "Tell the healthcare provider about your symptoms. Maybe your analgesic medication can be increased."
- ☐ 3. "Stiffness and pain are part of the disease. Learn to cope by focusing

on activities you enjoy.”

☐ 4. “Take a warm tub bath or shower before exercising. This may help with your discomfort.”

13. Which information should the nurse include in the teaching session when preparing a client for arthrocentesis? Select all that apply.

☐ 1. “A local anesthetic agent may be injected into the joint site for your comfort.”

☐ 2. “A syringe and needle will be used to withdraw fluid from your joint.”

☐ 3. “The procedure, although not painful, will provide immediate relief.”

☐ 4. “We will want you to keep your joint active after the procedure to increase blood flow.”

☐ 5. “You will need to wear a compression bandage for several days after the procedure.”

The Client with Osteoarthritis

14. A client with osteoarthritis will undergo an arthrocentesis on a painful, edematous knee. What information should be included in the nursing plan of care? Select all that apply.

☐ 1. Explain the procedure.

☐ 2. Administer preoperative medication 1 hour before surgery.

☐ 3. Instruct the client to immobilize the knee for 2 days after the surgery.

☐ 4. Assess the site for bleeding.

☐ 5. Offer pain medication.

15. A postmenopausal client is scheduled for a bone density scan. The nurse should instruct the client to:

☐ 1. remove all metal objects on the day of the scan.

☐ 2. consume foods and beverages with a high content of calcium for 2 days before the test.

☐ 3. ingest 600 mg of calcium gluconate by mouth for 2 weeks before the test.

☐ 4. report any significant pain to the healthcare provider (HCP) at least 2 days before the test.

16. A healthcare provider (HCP) prescribes a lengthy x-ray examination for a client with osteoarthritis. Which action by the nurse would demonstrate client advocacy?

- ☐ 1. Contact the x-ray department, and ask the technician if the lengthy session can be divided into shorter sessions.
- ☐ 2. Contact the HCP to determine if an alternative examination could be scheduled.
- ☐ 3. Request a prescription for acetaminophen prior to the examination.
- ☐ 4. Request padding for the hard x-ray table.

17. Which condition should the nurse assess when completing the history and physical examination of a client diagnosed with osteoarthritis?

- ☐ 1. anemia
- ☐ 2. osteoporosis
- ☐ 3. weight loss
- ☐ 4. local joint pain

18. Which information should be included in the teaching plan for a client with osteoporosis? Select all that apply.

- ☐ 1. Maintain a diet with adequate amounts of vitamin D, as found in fortified milk and cereals.
- ☐ 2. Choose good calcium sources, such as figs, broccoli, and almonds.
- ☐ 3. Use alcohol in moderation because a moderate intake has no known negative effects.
- ☐ 4. Try swimming as a good exercise to maintain bone mass.
- ☐ 5. Avoid high-fat foods, such as avocados, salad dressings, and fried foods.

19. Which statement indicates that the client with osteoarthritis understands the effects of capsaicin cream?

- ☐ 1. "I always wash my hands right after I apply the cream."
- ☐ 2. "After I apply the cream, I wrap my knee with an elastic bandage."
- ☐ 3. "I keep the cream in the cabinet above the stove in the kitchen."
- ☐ 4. "I also use the same cream when I get a cut or a burn."

20. At which time should the nurse instruct the client to take ibuprofen, prescribed for left hip pain secondary to osteoarthritis, to minimize gastric mucosal irritation?

- ☐ 1. at bedtime
- ☐ 2. on arising
- ☐ 3. immediately after a meal
- ☐ 4. on an empty stomach

21. The client diagnosed with osteoarthritis tells the nurse, “My friend takes steroid pills for her rheumatoid arthritis. Should I be taking steroids, too?” What should the nurse explain to the client?

- ☐ 1. Intra-articular corticosteroid injections are used to treat osteoarthritis.
- ☐ 2. Oral corticosteroids can be used in osteoarthritis.
- ☐ 3. A systemic effect is needed in osteoarthritis.
- ☐ 4. Rheumatoid arthritis and osteoarthritis are two similar diseases.

22. After teaching a client with osteoarthritis about the importance of regular exercise, which statement indicates the client has understood the teaching?

- ☐ 1. “Performing range-of-motion exercises will increase my joint mobility.”
- ☐ 2. “Exercise helps to drive synovial fluid through the cartilage.”
- ☐ 3. “Joint swelling should determine when to stop exercising.”
- ☐ 4. “Exercising in the outdoors year-round promotes joint relaxation.”

The Client with a Hip Fracture

23. A client in a double hip spica cast is constipated. The surgeon cuts a window into the front of the cast. Which outcome is intended?

- ☐ 1. The window will allow the nurse to palpate the superior mesenteric artery.
- ☐ 2. The window will allow the surgeon to manipulate the fracture site.
- ☐ 3. The window will allow the nurses to reposition the client.
- ☐ 4. The window will provide some relief from pressure due to abdominal distention as a result of constipation.

24. A client has an intracapsular hip fracture. The nurse should conduct a focused assessment to detect:

- ☐ 1. internal rotation.
- ☐ 2. muscle flaccidity.
- ☐ 3. shortening of the affected leg.
- ☐ 4. absence of pain in the fracture area.

25. When teaching a client with an extracapsular hip fracture scheduled for surgical internal fixation with the insertion of a pin, the nurse bases the teaching on the understanding that this surgical repair is the treatment of choice because:

- ☐ 1. hemorrhage at the fracture site is prevented.
- ☐ 2. neurovascular impairment risk is decreased.
- ☐ 3. the risk of infection at the site is lessened.
- ☐ 4. the client is able to be mobilized sooner.

26. A client with an extracapsular hip fracture returns to the nursing unit after internal fixation and pin insertion with a drainage tube at the incision site. Her husband asks, “Why does she have this tube inserted in her hip?” Which response would be **best**?

- ☐ 1. “The tube helps us to detect a wound infection early on.”
- ☐ 2. “This way we will not have to irrigate the wound.”
- ☐ 3. “Fluid will not be allowed to accumulate at the site.”
- ☐ 4. “We have a way to administer antibiotics into the wound.”

27. A client with a hip fracture has undergone surgery for insertion of a femoral head prosthesis. Which activity should the nurse instruct the client to avoid?

- ☐ 1. crossing the legs while sitting down
- ☐ 2. sitting on a raised commode seat
- ☐ 3. using an abductor splint while lying on the side
- ☐ 4. rising straight from a chair to a standing position

28. The nurse is caring for an older adult male who had open reduction internal fixation (ORIF) of the right hip 24 hours ago. The client is now experiencing shortness of breath and reports having “tightness in my chest.”

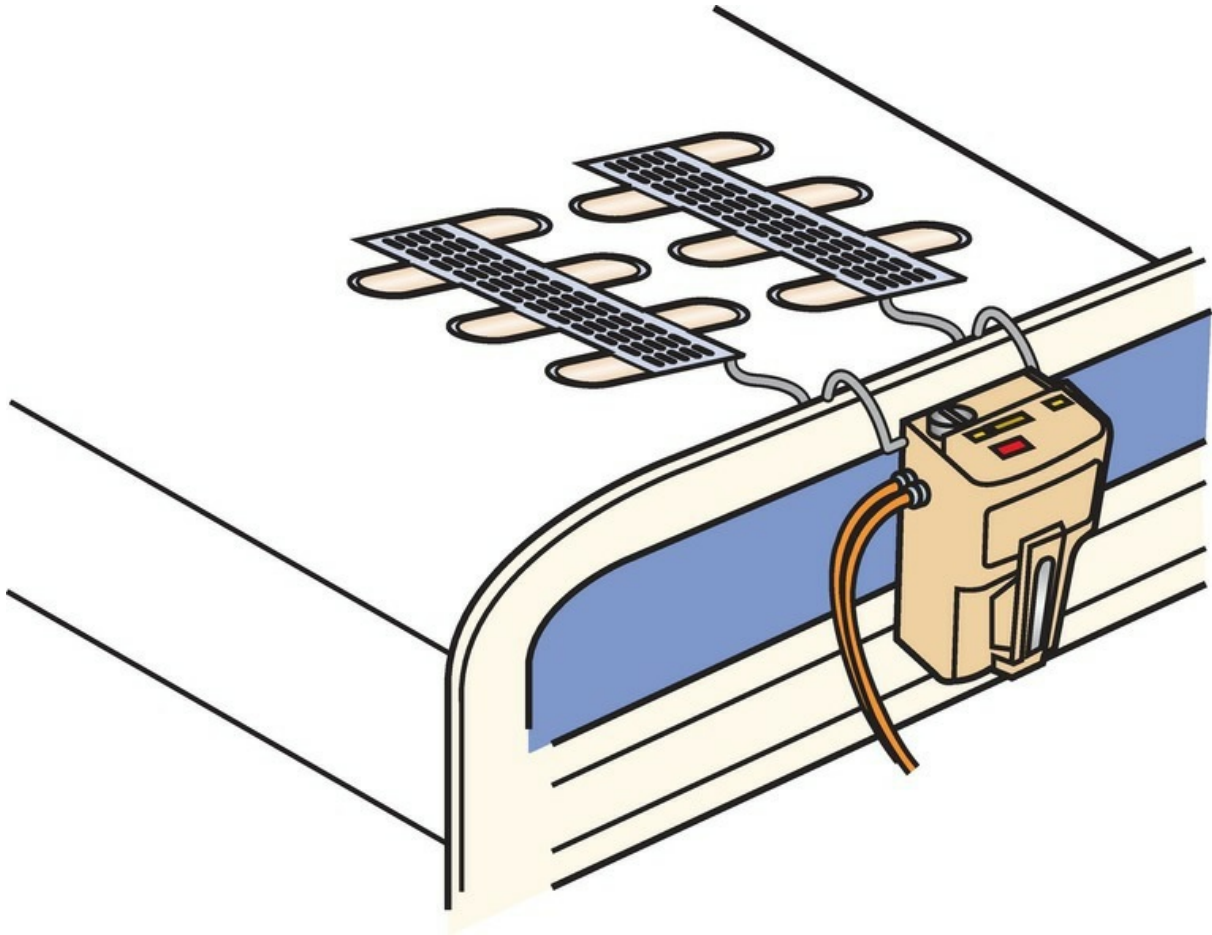

The nurse reviews the recent lab results. The nurse should report which lab results to the healthcare provider (HCP)?

- ☐ 1. hematocrit (Hct): 40% (0.4)
- ☐ 2. serum glucose: 120 mg/dL (6.7 mmol/L)
- ☐ 3. troponin: 1.4 mcg/L (1.4 µg/L)
- ☐ 4. erythrocyte sedimentation rate (ESR): 22 mm/h

29. The nurse advises the client who has had a femoral head prosthesis placement on the type of chair to sit in during the first 6 to 8 weeks after surgery. Which chair would be the correct type to recommend?

- ☐ 1. a desk-type swivel chair
- ☐ 2. a padded upholstered chair
- ☐ 3. a high-backed chair with armrests
- ☐ 4. a recliner with an attached footrest

30. The nurse is to apply a sequential compression device (intermittent pneumatic compression). Identify the area of the compression device that is placed on the client's calf.

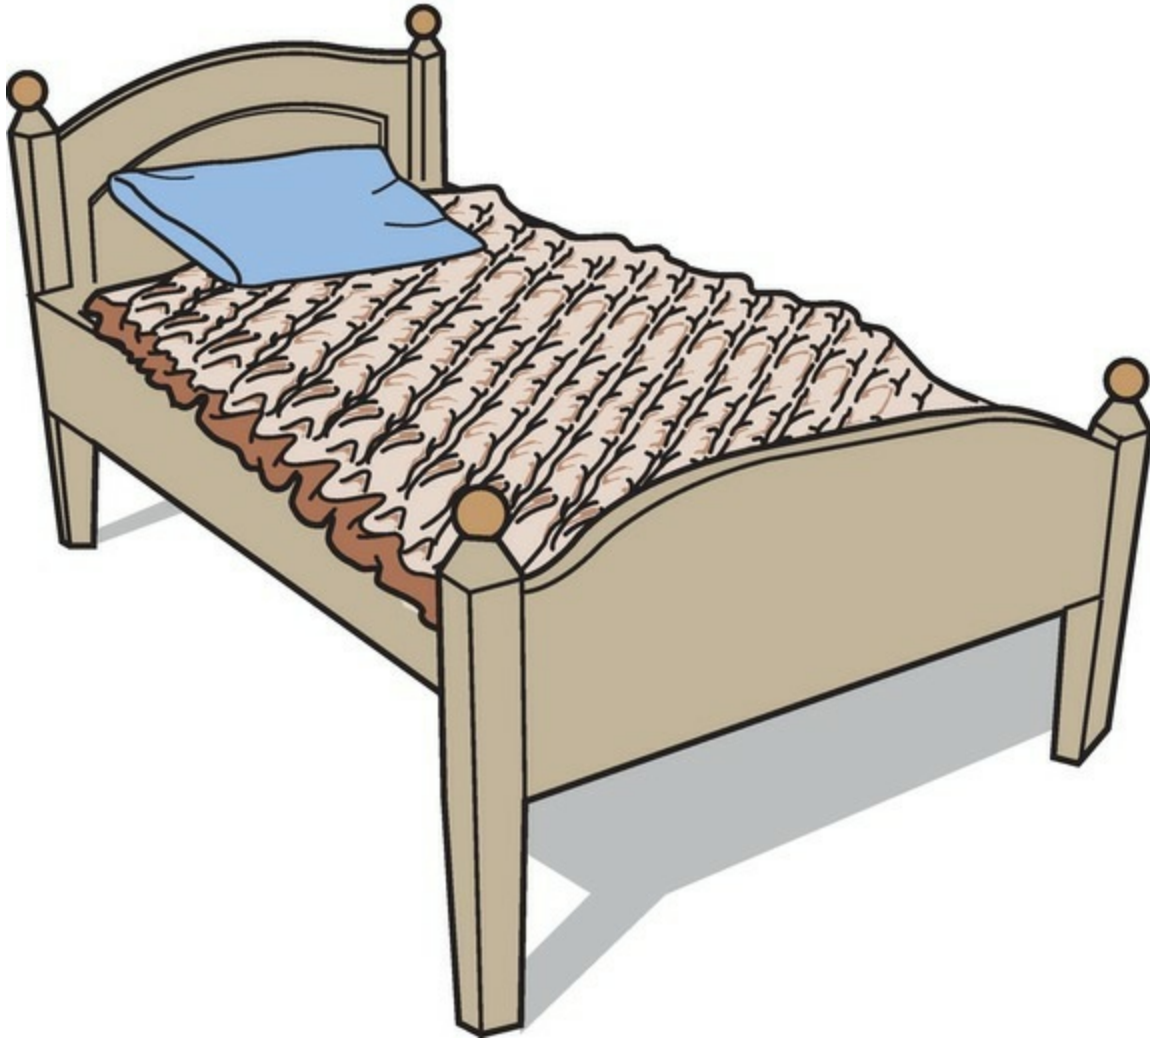

31. The nurse is assessing the home environment of an elderly client who is using crutches during the postoperative recovery phase after hip pinning. Which poses the **greatest** hazard to the client as a risk for falling at home?

- ☐ 1. a 4-year-old cocker spaniel
- ☐ 2. scatter rugs
- ☐ 3. snack tables
- ☐ 4. rocking chairs

The Client Having Hip Replacement Surgery

32. A frail elderly client with a hip fracture is to use an alternating air pressure mattress at home to prevent pressure ulcers while recovering from surgery. The nurse is assisting the client's family to place the mattress (see below). What should the nurse instruct the family to do?

- ☐ 1. Turn the mattress over so the air cells face the mattress of the bed, and cover the mattress with a bedsheet.
- ☐ 2. Put a thick pad over the pressure mattress to prevent soiling, and place the bedsheet on top of the pad.
- ☐ 3. Make the bed with the bedsheet on top of the pressure mattress.
- ☐ 4. Make the bed, and then remove the pillow to allow full use of the mattress on the neck.

33. A client had a posterolateral total hip replacement 2 days ago. What information should the nurse include in the client's plan of care? Select all that apply.

- ☐ 1. When using a walker, encourage the client to keep the toes pointing inward.
- ☐ 2. Position a pillow between the legs to maintain abduction.

- ☐ 3. Allow the client to be in the supine position or in the lateral position on the unoperated side.
- ☐ 4. Do not allow the client to bend down to tie or slip on shoes.
- ☐ 5. Place ice on the incision after physical therapy.

34. Which information should the nurse include when performing discharge teaching with a client who had an anterolateral approach for a total hip replacement? Select all that apply.

- ☐ 1. Avoid turning the toes or knee outward.
- ☐ 2. Use an abduction pillow between the legs when in bed.
- ☐ 3. Use an elevated toilet seat and shower chair.
- ☐ 4. Do not extend the operative leg backward.
- ☐ 5. Restrict motion for 2 weeks after surgery.

35. The nurse is assessing a client for neurologic impairment after a total hip replacement. Which finding indicates impairment in the affected - extremity?

- ☐ 1. decreased distal pulse
- ☐ 2. inability to move
- ☐ 3. diminished capillary refill
- ☐ 4. coolness to the touch

36. The nurse is instructing a client who will have a total hip replacement tomorrow. Which information is **most** important to include in the teaching plan at this time?

- ☐ 1. Teach how to prevent hip flexion.
- ☐ 2. Demonstrate coughing and deep-breathing techniques.
- ☐ 3. Show the client what an actual hip prosthesis looks like.
- ☐ 4. Assess the client's fears about the procedure.

37. After surgery and insertion of a total hip prosthesis, a client develops severe sudden pain and an inability to move the extremity. The nurse interprets these findings as indicating:

- ☐ 1. a developing infection.
- ☐ 2. bleeding in the operative site.
- ☐ 3. joint dislocation.

- ☐ 4. glue seepage into soft tissue.

38. A client who had a total hip replacement 2 days ago has developed an infection with a fever and profuse diaphoresis. The nurse establishes a goal to reduce the fluid deficit. Which outcome is the **most** appropriate?

- ☐ 1. The client drinks 2,000 mL of fluid per day.
- ☐ 2. The client understands how to manage the incision.
- ☐ 3. The client's bed linens are changed as needed.
- ☐ 4. The client's skin remains cool throughout hospitalization.

39. Following a total hip replacement, the nurse should position the client by:

- ☐ 1. placing weights alongside the affected extremity to keep the extremity from rotating.
- ☐ 2. elevating both feet on two pillows.
- ☐ 3. keeping the lower extremities adducted by use of an immobilization binder around both legs.
- ☐ 4. maintaining the extremity in slight abduction using an abduction splint or pillows placed between the thighs.

40. Following a client's total hip replacement, what should the nurse do? Select all that apply.

- ☐ 1. With the aid of a coworker, turn the client from the supine to the prone position every 2 hours.
- ☐ 2. Encourage the client to use the overhead trapeze to assist with position changes.
- ☐ 3. For meals, elevate the head of the bed to 90 degrees.
- ☐ 4. Use a fracture bedpan when needed by the client.
- ☐ 5. When the client is in bed, prevent thromboembolism by encouraging the client to do toe-pointing exercises.

41. A client is to have a total hip replacement. What nursing actions should the preoperative plan include? Select all that apply.

- ☐ 1. Administer antibiotics as prescribed to ensure therapeutic blood levels.
- ☐ 2. Apply leg compression device.
- ☐ 3. Request a trapeze be added to the bed.

- ☐ 4. Teach isometric exercises of quadriceps and gluteal muscles.
- ☐ 5. Demonstrate crutch walking with a three-point gait.
- ☐ 6. Place Buck's traction on the bed.

42. The nurse is teaching the client to administer enoxaparin following a total hip replacement. What should the nurse instruct the client to do? Select all that apply.

- ☐ 1. Report promptly any difficulty breathing, rash, or itching.
- ☐ 2. Notify the healthcare provider (HCP) of unusual bruising.
- ☐ 3. Avoid all aspirin-containing medications.
- ☐ 4. Wear or carry medical identification.
- ☐ 5. Expel the air bubble from the syringe before the injection.
- ☐ 6. Remove the needle immediately after the medication is injected.

43. A client who had a total hip replacement 4 days ago is worried about dislocation of the prosthesis. The nurse should respond by saying:

- ☐ 1. "Do not worry. Your new hip is very strong."
- ☐ 2. "Use of a cushioned toilet seat helps to prevent dislocation."
- ☐ 3. "Activities that tend to cause adduction of the hip tend to cause dislocation, so try to avoid them."
- ☐ 4. "Decreasing use of the abductor pillow will strengthen the muscles to prevent dislocation."

44. The nurse is assessing a client who had a left hip replacement 36 hours ago. Which findings indicate the prosthesis is dislocated? Select all that apply.

- ☐ 1. The client reported a "popping" sensation in the hip.
- ☐ 2. The left leg is shorter than the right leg.
- ☐ 3. The client has sharp pain in the groin.
- ☐ 4. The client cannot move the right leg.
- ☐ 5. The client cannot wiggle the toes on the left leg.

45. A client who has had a total hip replacement has a dislocated hip prosthesis. The nurse should **first**:

- ☐ 1. stabilize the leg with Buck's traction.

- ☐ 2. apply an ice pack to the affected hip.
- ☐ 3. position the client toward the opposite side of the hip.
- ☐ 4. notify the orthopedic surgeon.

46. The nurse has established a goal with a client to improve mobility following hip replacement. Which outcome is realistic at the time of discharge from the surgical unit?

- ☐ 1. The client can walk throughout the entire hospital with a walker.
- ☐ 2. The client can walk the length of a hospital hallway with minimal pain.
- ☐ 3. The client has increased independence in transfers from bed to chair.
- ☐ 4. The client can raise the affected leg 6 inches (15.2 cm) with assistance.

47. Following a total joint replacement, which complication has the **greatest** likelihood of occurring?

- ☐ 1. deep vein thrombosis (DVT)
- ☐ 2. polyuria
- ☐ 3. displacement of the new joint
- ☐ 4. wound evisceration

The Client Having Knee Replacement Surgery

48. In preparation for total knee surgery, a 200-lb (90.7-kg) client with osteoarthritis must lose weight. Which exercise should the nurse recommend as **best** if the client has no contraindications?

- ☐ 1. weight lifting
- ☐ 2. walking
- ☐ 3. aquatic exercise
- ☐ 4. tai chi exercise

49. The client has just had a total knee replacement for severe osteoarthritis. When assessing the client, which finding should lead the nurse to suspect possible nerve damage?

- ☐ 1. numbness
- ☐ 2. bleeding
- ☐ 3. dislocation

- ☐ 4. pinkness

50. After knee arthroplasty, the client has a sequential compression device (SCD). What should the nurse do?

- ☐ 1. Elevate the SCD on two pillows.
- ☐ 2. Change the settings on the SCD to make the client more comfortable.
- ☐ 3. Stop the SCD to remove dressings, and bathe the leg.
- ☐ 4. Discontinue the SCD when the client is ambulatory.

51. A client returns from the first session of scheduled physical therapy following total knee replacement surgery. The nurse assesses that the client's knee is swollen, slightly erythematous, and painful. The client rates the pain as 7 out of 10 and has not had any scheduled or PRN pain medication today. What should the nurse do? Select all that apply.

- ☐ 1. Gently massage the area to increase circulation to reduce pain.
- ☐ 2. Administer pain medication as prescribed.
- ☐ 3. Elevate the leg and apply a cold pack.
- ☐ 4. Notify the healthcare provider (HCP).
- ☐ 5. Call physical therapy to cancel the next treatment.

52. The nurse is preparing a client who has had a knee replacement with a metal joint to go home. What should the nurse instruct the client to do? Select all that apply.

- ☐ 1. Notify healthcare provider (HCP) about the joint prior to invasive procedures.
- ☐ 2. Inform healthcare provider (HCP) prior to having magnetic resonance imaging (MRI) scans.
- ☐ 3. Notify airport security that the joint may set off alarms on metal detectors.
- ☐ 4. Refrain from carrying items weighing more than 5 lb (2.3 kg).
- ☐ 5. Limit fluid intake to 1,000 mL/day.

53. The laboratory notifies the nurse that a client who had a total knee replacement 3 days ago and is receiving heparin has an activated partial thromboplastin time (aPTT) of 95 seconds. After verifying the values, the nurse calls the healthcare provider (HCP). The nurse should discuss with the

HCP giving the client a prescription for:

- ☐ 1. protamine sulfate.
- ☐ 2. vitamin K.
- ☐ 3. warfarin.
- ☐ 4. packed red blood cells.

54. The nurse is assessing a client's left leg for neurovascular changes following a total left knee replacement. Which are expected normal findings? Select all that apply.

- ☐ 1. moderate edema of the left knee
- ☐ 2. skin warm to touch
- ☐ 3. capillary refill response of <3 seconds
- ☐ 4. moves toes
- ☐ 5. pain absent
- ☐ 6. pulse on left leg weaker than right leg

55. On the evening of surgery for total knee replacement, a client wants to get out of bed. To safely assist the client, the nurse should:

- ☐ 1. encourage the client to apply full weight bearing.
- ☐ 2. prescribe a walker for the client.
- ☐ 3. place a straight-backed chair at the foot of the bed.
- ☐ 4. apply a knee immobilizer.

56. When preparing a client for discharge from the hospital after a total knee replacement, the nurse should include which information in the discharge plan? Select all that apply.

- ☐ 1. Report signs of infection to healthcare provider (HCP).
- ☐ 2. Keep the affected leg and foot on the floor when sitting in a chair.
- ☐ 3. Remove antiembolism stockings when sleeping.
- ☐ 4. The physical therapist will encourage progressive ambulation with use of assistive devices.
- ☐ 5. Change the dressing daily.

The Client with a Herniated Disk

57. The nurse is observing a client who is recovering from back strain lift a box as shown below. What should the nurse do?

- ☐ 1. Praise the client for using correct body mechanics.
- ☐ 2. Suggest to the client to put both knees on the floor before attempting to lift the box.
- ☐ 3. Advise the client to bend from the waist rather than stretching the back in this position.
- ☐ 4. Instruct the client to keep the back straight by squatting with both knees parallel.

58. The nurse should instruct the client with low back pain to **avoid**:

- ☐ 1. keeping light objects below the level of the elbows when lifting.

- ☐ 2. leaning forward while bending the knees.
- ☐ 3. exceeding the prescribed exercise program.
- ☐ 4. sleeping on the side with legs flexed.

59. A client is discharged with the following prescription for severe back pain from a herniated intravertebral disc: hydrocodone 5 mg, acetaminophen 500 mg, one-half to one tablet by mouth each 8 to 12 hours as needed. The nurse should instruct the client to:

- ☐ 1. start with one-half tablet and take one every 12 hours.
- ☐ 2. start with one-half tablet and take one every 8 hours.
- ☐ 3. start with one tablet and then take one tablet every 8 hours.
- ☐ 4. start with one tablet and then take one tablet every 12 hours.

60. A client attempting to get out of bed stops midway because of low back pain radiating down to the right heel and lateral foot. What should the nurse do in order of priority from first to last? All options must be used.

1. Apply a warm compress to the client's back.

2. Notify the healthcare provider (HCP).

3. Assist the client to lie down.

4. Administer the prescribed celecoxib.

61. A client with a ruptured intervertebral disc at L4–L5 stands with a

flattened spine slightly tilted forward and slightly flexed to the affected side. The nurse interprets this finding as indicating:

- ☐ 1. motor changes.
- ☐ 2. postural deformity.
- ☐ 3. alteration of reflexes.
- ☐ 4. sensory changes.

62. Which position would be **most** comfortable for a client with a ruptured disc at L5–S1 right?

- ☐ 1. prone
- ☐ 2. supine with the legs flexed
- ☐ 3. high Fowler's
- ☐ 4. right Sims'

63. Which action would **not** be appropriate to include when preparing a client for magnetic resonance imaging (MRI) to evaluate a ruptured disc?

- ☐ 1. informing the client that the procedure is painless
- ☐ 2. taking a thorough history of past surgeries
- ☐ 3. checking for previous claustrophobia
- ☐ 4. starting an IV line at keep-open rate

64. A client tells the nurse about having numbness from the back of the left buttock to the dorsum of the foot and big toe. The client is scheduled to undergo a laminectomy, and the operative consent form states “a left lumbar laminectomy of L3–L4.” What should the nurse do **next**?

- ☐ 1. Have the client sign the consent form.
- ☐ 2. Call the surgeon.
- ☐ 3. Change the consent form.
- ☐ 4. Review the client's history.

65. Immediately after a lumbar laminectomy, the nurse administers ondansetron hydrochloride to the client as prescribed. The nurse determines that the drug is effective when which sign is controlled?

- ☐ 1. muscle spasms
- ☐ 2. nausea

- ☐ 3. shivering
- ☐ 4. dry mouth

66. After a laminectomy, the client states, “The doctor said that I can do anything I want to.” Which activity that the client intends to do indicates the need for further teaching?

- ☐ 1. drying the dishes
- ☐ 2. sitting outside on firm cushions
- ☐ 3. making the bed walking from side to side
- ☐ 4. sweeping the front porch

67. The nurse is developing the discharge teaching plan for a client after a lumbar laminectomy L4–L5. What action should the nurse encourage the client to **avoid** when returning to work in 6 weeks?

- ☐ 1. placing one foot on a step stool during prolonged standing
- ☐ 2. sleeping on the back with support under the knees
- ☐ 3. maintaining average body weight for height
- ☐ 4. sitting whenever possible

68. A male client underwent a lumbar spinal fusion yesterday. Which nursing assessment should alert the nurse to the development of a possible complication?

- ☐ 1. lateral rotation of the head and neck
- ☐ 2. clear yellowish fluid on the dressing
- ☐ 3. use of the standing position to void
- ☐ 4. nonproductive cough

69. After the nurse teaches a client about wearing a back brace after a spinal fusion, which statement indicates effective teaching?

- ☐ 1. “I will apply lotion before putting on the brace.”
- ☐ 2. “I will be sure to pad the area around my iliac crest.”
- ☐ 3. “I can use baby powder under the brace to absorb perspiration.”
- ☐ 4. “I should wear a thin cotton undershirt under the brace.”

70. The nurse develops a teaching plan for a client scheduled for a spinal fusion. What should the nurse tell the client?

- ☐ 1. The client will typically experience more pain at the donor site than at the fusion site.
- ☐ 2. The surgeon will apply a simple gauze dressing to the donor site.
- ☐ 3. Neurovascular checks are unnecessary if the fibula is the donor site.
- ☐ 4. The client's level of activity restriction is determined by the amount of pain.

71. A client who has had a lumbar laminectomy with a spinal fusion is sitting in a chair. Which is the correct position for this client?

- ☐ 1. with the feet flat on the floor
- ☐ 2. on a low footstool
- ☐ 3. in any comfortable position with legs uncrossed
- ☐ 4. on a high footstool so the feet are level with the chair seat

72. The nurse develops a plan of care for a client in the initial postoperative period following a lumbar laminectomy. Which activity is **contraindicated**?

- ☐ 1. assisting with daily hygiene activities
- ☐ 2. lying flat in bed
- ☐ 3. walking in the hall
- ☐ 4. sitting all afternoon in her room

73. Which exercise should the nurse advise the client to **avoid** after a lumbar laminectomy?

- ☐ 1. knee-to-chest lifts
- ☐ 2. hip tilts
- ☐ 3. sit-ups
- ☐ 4. pelvic tilts

The Client with an Amputation due to Peripheral Vascular Disease

74. Which factor contributes to a risk for amputation in a client with peripheral vascular disease? Select all that apply.

- ☐ 1. uncontrolled diabetes mellitus for 15 years

- ☐ 2. a 20-pack-year history of cigarette smoking
- ☐ 3. current age of 39 years
- ☐ 4. a serum cholesterol concentration of 275 mg/dL (15.3 mmol/L)
- ☐ 5. work that requires prolonged standing

75. A client has severe arterial occlusive disease and gangrene of the left great toe. Which finding is expected?

- ☐ 1. edema around the ankle
- ☐ 2. loss of hair on the lower leg
- ☐ 3. thin, soft toenails
- ☐ 4. warmth in the foot

76. A client with absent peripheral pulses and pain at rest is scheduled for an arterial Doppler study of the affected extremity. When preparing the client for this test, the nurse should:

- ☐ 1. have the client sign an informed consent form for the procedure.
- ☐ 2. administer a pretest sedative as appropriate.
- ☐ 3. keep the client tobacco free for 30 minutes before the test.
- ☐ 4. wrap the client's affected foot with a blanket.

77. Which action is **most** helpful to promote circulation for the client with peripheral arterial disease?

- ☐ 1. resting with the legs elevated above the level of the heart
- ☐ 2. walking slowly but steadily for 30 minutes twice a day
- ☐ 3. minimizing activity as much and as often as possible
- ☐ 4. wearing antiembolism stockings at all times when out of bed

78. What information should the nurse include in the teaching plan for a client with arterial insufficiency to the feet that is being managed - conservatively?

- ☐ 1. Lubricate the feet daily.
- ☐ 2. Soak the feet in warm water.
- ☐ 3. Apply antiembolism stockings.
- ☐ 4. Wear firm, supportive leather shoes.

79. A client says, "I hate the idea of being an invalid after they cut off my

leg.” Which response by the nurse would be the **most** therapeutic?

- ☐ 1. “At least you will still have one good leg to use.”
- ☐ 2. “Tell me more about how you are feeling.”
- ☐ 3. “Let us finish the preoperative teaching.”
- ☐ 4. “You are lucky to have a wife to care for you.”

80. The client asks the nurse, “Why will the healthcare provider not tell me exactly how much of my leg he is going to take off? Do you not think I should know that?” On which information should the nurse base the response?

- ☐ 1. the need to remove as much of the leg as possible
- ☐ 2. the adequacy of the blood supply to the tissues
- ☐ 3. the ease with which a prosthesis can be fitted
- ☐ 4. the client’s ability to walk with a prosthesis

81. A client who has had an above-the-knee amputation develops a dime-sized bright red spot on the dressing after 45 minutes in the postanesthesia recovery unit. The nurse should **first**:

- ☐ 1. elevate the stump.
- ☐ 2. reinforce the dressing.
- ☐ 3. call the surgeon.
- ☐ 4. draw a mark around the site.

82. A client in the postanesthesia care unit with a left below-the-knee amputation has pain in the left big toe. What should the nurse do **first**?

- ☐ 1. Tell the client it is impossible to feel the pain.
- ☐ 2. Show the client that the toes are not there.
- ☐ 3. Explain to the client that the pain is real.
- ☐ 4. Give the client the prescribed opioid analgesic.

83. The client with an above-the-knee amputation is to use crutches while the prosthesis is being adjusted. Which exercises will **best** prepare the client for using crutches?

- ☐ 1. abdominal exercises
- ☐ 2. isometric shoulder exercises

- ☐ 3. quadriceps setting exercises
- ☐ 4. triceps strengthening exercises

84. The nurse teaches a client about using crutches, instructing the client to support the weight **primarily** on the:

- ☐ 1. axillae.
- ☐ 2. elbows.
- ☐ 3. upper arms.
- ☐ 4. hands.

85. The client is to be discharged on a low-fat, low-cholesterol, low-sodium diet. When coaching the client about the diet, the nurse should **first**:

- ☐ 1. determine the client's knowledge level about cholesterol.
- ☐ 2. ask the client to name foods that are high in fat, cholesterol, and salt.
- ☐ 3. explain the importance of complying with the diet.
- ☐ 4. assess the client's and family's typical food preferences.

The Client with Fractures

86. A client has a leg immobilized in traction. Which observation by the nurse indicates that the client understands actions to take to prevent muscle atrophy?

- ☐ 1. The client adducts the affected leg every 2 hours.
- ☐ 2. The client rolls the affected leg away from the body's midline twice per day.
- ☐ 3. The client performs isometric exercises to the affected extremity three times per day.
- ☐ 4. The client asks the nurse to add a 5-lb (2.3-kg) weight to the traction for 30 min/day.

87. The client with a fractured tibia has been taking methocarbamol. Which finding indicates that the drug is having the intended effect?

- ☐ 1. lack of infection
- ☐ 2. reduction in itching
- ☐ 3. relief of muscle spasms

- ☐ 4. decrease in nervousness

88. When developing a teaching plan for a client who is prescribed acetaminophen for muscle pain, which information should the nurse expect to include? Select all that apply.

- ☐ 1. The drug can be used if the person is allergic to aspirin.
- ☐ 2. Acetaminophen does not affect platelet aggregation.
- ☐ 3. This drug causes little or no gastric distress.
- ☐ 4. Acetaminophen exerts a strong anti-inflammatory effect.
- ☐ 5. The client should have the international normalized ratio (INR) checked regularly.

89. A client who has been taking hydrocodone with acetaminophen at home for 6 weeks following a fractured tibia is admitted with a blood pressure of 80/50 mm Hg, a pulse rate of 115 bpm, and respirations of 8 breaths/min and shallow. The nurse interprets these findings as indicating:

- ☐ 1. expected common adverse effects of the hydrocodone.
- ☐ 2. hypersensitivity reaction to the acetaminophen.
- ☐ 3. possible habituating effect of the long-term drug use.
- ☐ 4. hemorrhage from gastrointestinal irritation associated with the pain medication.

90. The nurse is caring for a client who is 30 years of age with a fracture of the right femur and left tibia. Both legs have casts. The nurse assesses the following: respirations are 30 per minute and are rapid and shallow; there is presence of faint expiratory wheeze; and coughing produces thin pink sputum. The client is yelling at the nurse and wants to be released from the hospital; this is behavior unlike that previously reported. The last pain medication was administered 3 hours ago. The nurse should **first**:

- ☐ 1. cut slits in the top of the casts.
- ☐ 2. administer pain medication.
- ☐ 3. notify the healthcare provider (HCP).
- ☐ 4. obtain a chest x-ray.

91. A client is being discharged following an open reduction and internal fixation of the left ankle and is to wear a non-weight-bearing cast for 2

weeks. What should the nurse teach the client to do when using crutches?

- ☐ 1. Use a four-point gait.
- ☐ 2. Maintain two to three finger widths between the axillary fold and underarm piece grip.
- ☐ 3. Keep leg dependent when sitting.
- ☐ 4. Maintain balance by supporting body's weight on the axillae.

92. The nurse is caring for an adult with a grade III compound fracture of the right femur; the client has been placed in skeletal traction. The intended outcome of the traction is to:

- ☐ 1. prevent skin breakdown.
- ☐ 2. prevent movement in the bed.
- ☐ 3. preserve normal length of the leg.
- ☐ 4. reduce and immobilize the fracture.

93. An older adult is admitted with a fracture of the femur. The nurse should **first** assess:

- ☐ 1. ability to change positions.
- ☐ 2. type of pain.
- ☐ 3. mechanism of injury.
- ☐ 4. extent of anxiety.

94. When admitting a client with a fractured extremity, the nurse should **first** assess:

- ☐ 1. the area proximal to the fracture.
- ☐ 2. the actual fracture site.
- ☐ 3. the area distal to the fracture.
- ☐ 4. the opposite extremity for baseline comparison.

95. Which client statement identifies a knowledge deficit about cast care?

- ☐ 1. "I will elevate the cast above my heart initially."
- ☐ 2. "I will exercise my joints above and below the cast."
- ☐ 3. "I can pull out cast padding to scratch inside the cast."
- ☐ 4. "I will apply ice for 10 minutes to control edema for the first 24 hours."

96. Which nursing action would be **least** appropriate for a client who is in

a double hip spica cast?

- ☐ 1. encouraging the intake of cranberry juice
- ☐ 2. advising the client to eat large amounts of cheese
- ☐ 3. establishing regular times for elimination
- ☐ 4. having the client dangle at the bedside

97. The nurse is preparing a teaching plan for a client about crutch walking using a two-point gait pattern. What information should the nurse include?

- ☐ 1. Advance a crutch on one side, and then advance the opposite foot; repeat on the opposite side.
- ☐ 2. Advance a crutch on one side, and simultaneously advance and bear weight on the opposite foot; repeat on the opposite side.
- ☐ 3. Advance both crutches together, and then follow by lifting both lower extremities to the level of the crutches.
- ☐ 4. Advance both crutches together, and then follow by lifting both lower extremities past the level of the crutches.

98. A client returned from surgery with a debrided open tibial fracture and has a three-way drainage system. The client's vital signs are within normal limits. What should the nurse do **next**?

- ☐ 1. Review the results of culture and sensitivity testing of the wound.
- ☐ 2. Look for the presence of a pressure dressing over the wound.
- ☐ 3. Determine if the client has increased pain from exposed nerve endings.
- ☐ 4. Check laboratory results for electrolyte imbalances.

99. A client has a left tibial fracture that required casting. Approximately 5 hours later, the client has increasing pain distal to the fracture despite the morphine injection administered 30 minutes previously. Which area should be the nurse's **next** assessment?

- ☐ 1. distal pulses
- ☐ 2. pain with a pain rating scale
- ☐ 3. vital sign changes
- ☐ 4. potential for drug tolerance

100. A client with a fracture develops compartment syndrome. Which sign

should alert the nurse to impending organ failure?

- ☐ 1. crackles
- ☐ 2. jaundice
- ☐ 3. generalized edema
- ☐ 4. dark, scanty urine

The Client with a Femoral Fracture

101. A client with a fractured right femur has not had any immunizations since childhood. Which biologic products should the nurse administer to provide the client with passive immunity for tetanus?

- ☐ 1. tetanus toxoid
- ☐ 2. tetanus antigen
- ☐ 3. tetanus vaccine
- ☐ 4. tetanus antitoxin

102. After teaching the client about the use of skeletal traction which statement about the purpose of the traction indicates the client needs additional teaching?

- ☐ 1. to align injured bones.
- ☐ 2. to provide long-term pull.
- ☐ 3. to apply 25 lb (11.3 kg) of traction.
- ☐ 4. to pull weight with a boot.

103. The nurse is planning care for the client with a femoral fracture who is in balanced suspension traction. Which nursing action is **least** likely to be included in the plan of care?

- ☐ 1. use of a fracture bedpan
- ☐ 2. checks for redness over the ischial tuberosity
- ☐ 3. elevation of the head of bed no more than 25 degrees
- ☐ 4. personal hygiene with a complete bed bath

104. The client in balanced suspension traction is transported to surgery for closed reduction and internal fixation of a fractured femur. What should the nurse do when transporting the client to the operating room?

- ☐ 1. Transfer the client to a cart with manually suspended traction.
- ☐ 2. Call the surgeon to request a prescription to temporarily remove the traction.
- ☐ 3. Send the client on the bed with extra help to stabilize the traction.
- ☐ 4. Remove the traction and send the client on a cart.

105. A client has a Pearson attachment on the traction setup. What is the purpose of this attachment?

- ☐ 1. to support the lower portion of the leg
- ☐ 2. to support the thigh and upper leg
- ☐ 3. to allow attachment of the skeletal pin
- ☐ 4. to prevent flexion deformities in the ankle and foot

106. Which sign indicates that a client with a fracture of the right femur may be developing a fat embolus?

- ☐ 1. acute respiratory distress syndrome
- ☐ 2. migraine-like headaches
- ☐ 3. numbness in the right leg
- ☐ 4. muscle spasms in the right thigh

107. Which goal is the **priority** for a client with a fractured femur who is in traction at this time?

- ☐ 1. Prevent effects of immobility while in traction.
- ☐ 2. Develop skills to cope with prolonged immobility.
- ☐ 3. Choose appropriate diversional activities during the prolonged recovery.
- ☐ 4. Adapt to inactivity from the impaired mobility.

108. The client in traction for a fractured femur is having difficulty managing self-care activities. Which outcome indicates a successful completion of a goal of promoting independence for this client?

- ☐ 1. The client assists as much as possible in care, demonstrating increased participation over time.
- ☐ 2. The client allows the nurse to complete care in an efficient manner without interfering.
- ☐ 3. The client allows the spouse to assume total responsibility for care.

- ☐ 4. The client accepts that self-care is not possible while in traction.

109. The client with an open femoral fracture was discharged to home and reports having a fever, night sweats, chills, restlessness, and restrictive movement of the fractured leg. The nurse should interpret these findings as the client may be experiencing:

- ☐ 1. a pulmonary embolus.
- ☐ 2. osteomyelitis.
- ☐ 3. a fat embolus.
- ☐ 4. a urinary tract infection.

110. The nurse is planning care for a client with osteomyelitis. The client is taking an antibiotic, but the infection has not resolved. The nurse should advise the client to:

- ☐ 1. use herbal supplements.
- ☐ 2. eat a diet high in protein and vitamins C and D.
- ☐ 3. ask the healthcare provider (HCP) for a change of antibiotics.
- ☐ 4. encourage frequent passive range of motion to the affected extremity.

The Client with a Spinal Cord Injury

111. When planning to move a person with a possible spinal cord injury, the nurse should direct the team to:

- ☐ 1. limit movement of the arms by wrapping them next to the body.
- ☐ 2. move the person gently to help reduce pain.
- ☐ 3. immobilize the head and neck to prevent further injury.
- ☐ 4. cushion the back with pillows to ensure comfort.

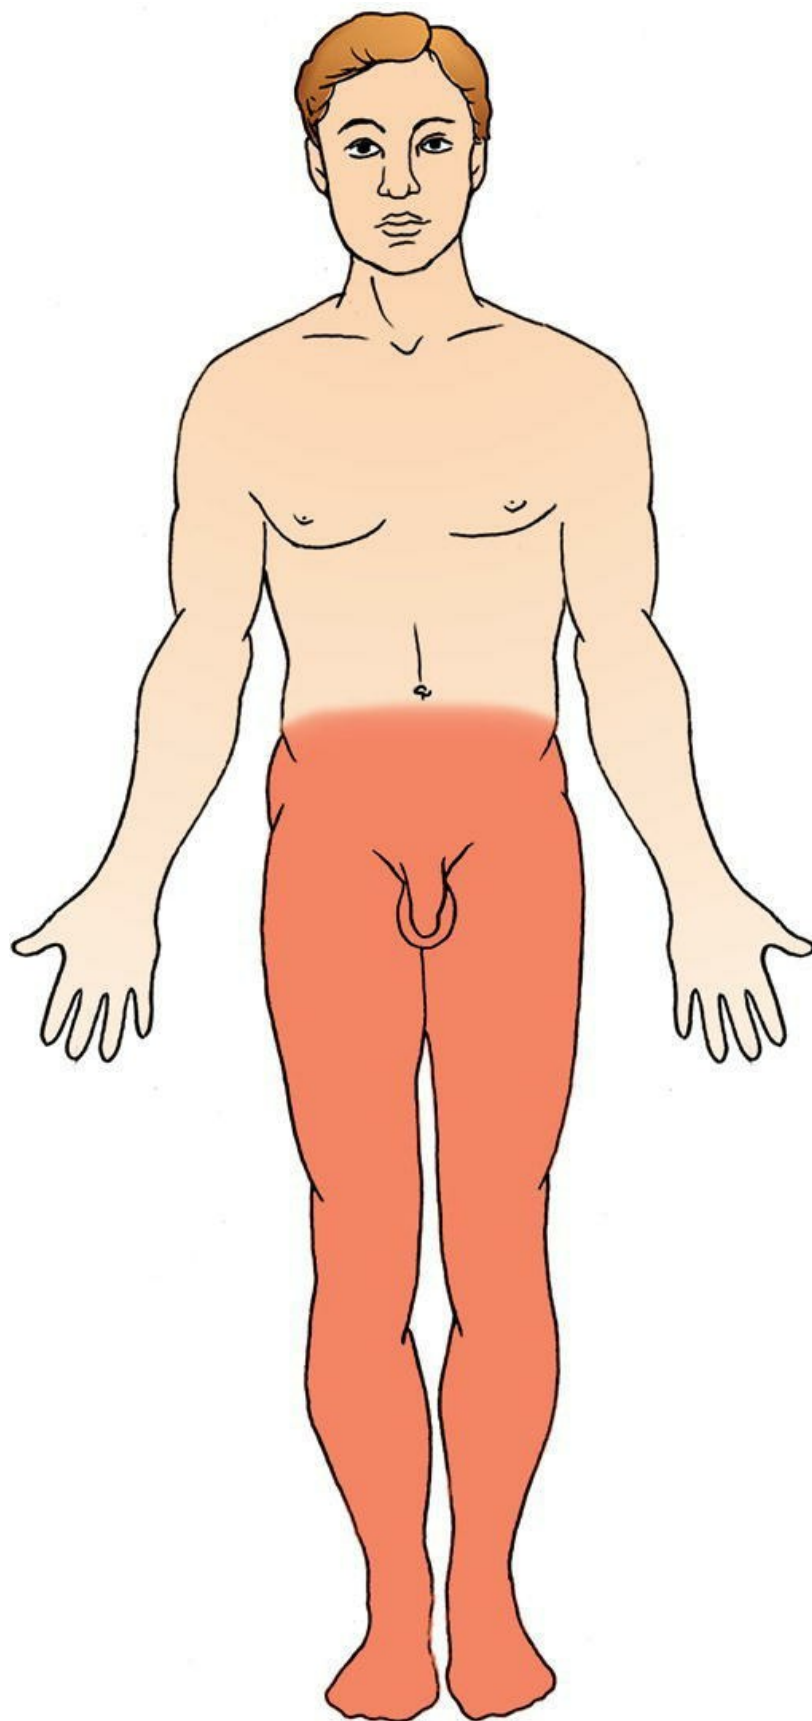

112. The nurse is caring for a client with a spinal cord injury. The client is experiencing blurred vision and has a blood pressure of 204/102 mm Hg. What should the nurse do **first**?

- ☐ 1. Position the client on the left side.
- ☐ 2. Control the environment by turning the lights off and decreasing stimulation for the client.
- ☐ 3. Check the client's bladder for distention.

- ☐ 4. Administer pain medications.

113. The nurse is taking care of a client with a spinal cord injury. The extent of the client's injury is shown below. Which finding is expected when assessing this client?

- ☐ 1. inability to move the arms
- ☐ 2. loss of sensation in the hands and fingers
- ☐ 3. dysfunction of bowel and bladder
- ☐ 4. difficulty breathing

114. When the client has a cord transection at T4, the nurse should focus the assessment on:

- ☐ 1. renal status.
- ☐ 2. vascular status.
- ☐ 3. gastrointestinal function.
- ☐ 4. biliary function.

115. When assessing the client with a cord transection above T5 for possible complications, which complication is **least** likely to occur?

- ☐ 1. diarrhea
- ☐ 2. paralytic ileus
- ☐ 3. stress ulcers
- ☐ 4. intra-abdominal bleeding

116. Which is the **best** method to assess for the development of deep vein thrombosis in a client with a spinal cord injury?

- ☐ 1. Homans' sign
- ☐ 2. pain
- ☐ 3. tenderness
- ☐ 4. leg girth

117. During the period of spinal shock, the nurse should expect the client's bladder function to be:

- ☐ 1. spastic.
- ☐ 2. normal.
- ☐ 3. atonic.
- ☐ 4. uncontrolled.

118. After 1 month of therapy, the client in spinal shock begins to experience muscle spasms in the legs and calls the nurse in excitement to report the leg movement. Which response by the nurse would be the **most** accurate?

- ☐ 1. "These movements indicate that the damaged nerves are healing."
- ☐ 2. "This is a good sign. Keep trying to move all the affected muscles."
- ☐ 3. "The return of movement means that eventually you should be able to

walk again.”

- ☐ 4. “The movements occur from muscle reflexes that cannot be initiated or controlled by the brain.”

119. The client with a spinal cord injury asks the nurse why the dietitian has recommended to decrease the total daily intake of calcium. Which response by the nurse would provide the **most** accurate information?

- ☐ 1. “Excessive intake of dairy products makes constipation more common.”
- ☐ 2. “Immobility increases calcium absorption from the intestine.”
- ☐ 3. “Lack of weight bearing causes demineralization of the long bones.”
- ☐ 4. “Dairy products likely will contribute to weight gain.”

120. As a first step in teaching a woman with a spinal cord injury and quadriplegia about her sexual health, the nurse assesses her understanding of her current sexual functioning. Which statement by the client indicates she understands her current ability?

- ☐ 1. “I will not be able to have sexual intercourse until the urinary catheter is removed.”
- ☐ 2. “I can participate in sexual activity but might not experience orgasm.”
- ☐ 3. “I cannot have sexual intercourse because it causes hypertension, but other sexual activity is okay.”
- ☐ 4. “I should be able to participate in sexual activity, but I will be infertile.”

121. A client with a spinal cord injury who has been active in sports and outdoor activities talks almost obsessively about his past activities. In tears, one day he asks the nurse, “Why am I unable to stop talking about these things? I know those days are gone forever.” Which response by the nurse conveys the **best** understanding of the client’s behavior?

- ☐ 1. “Be patient. It takes time to adjust to such a massive loss.”
- ☐ 2. “Talking about the past is a form of denial. We have to help you focus on today.”
- ☐ 3. “Reviewing your losses is a way to help you work through your grief and loss.”
- ☐ 4. “It is a simple escape mechanism to go back and live again in happier

times.”

Managing Care, Quality, and Safety of Clients with Musculoskeletal Health Problems

122. The nurse should assess which clients for risk for falling? Select all that apply.

- ☐ 1. client who is 45 years of age, in hospice with terminal cancer, and receiving morphine every 2 hours
- ☐ 2. client who is 70 years of age, hospitalized for lung biopsy, and receiving no medications
- ☐ 3. client who is 62 years of age, recovering from breast biopsy in outpatient surgery, and has a fear of falling
- ☐ 4. client who is 80 years of age and in a locked facility for clients with cognitive impairment
- ☐ 5. client who is 75 years of age and recovering at home from hip replacement surgery on the left hip

123. Four days after surgery for internal fixation of a C3–C4 fracture, a nurse is moving a client from the bed to the wheelchair. The nurse is checking the wheelchair for correct features for this client. Which features of the wheelchair are appropriate for the needs of this client? Select all that apply.

- ☐ 1. back at the level of the client’s scapula
- ☐ 2. back and head that are high
- ☐ 3. seat that is lower than normal
- ☐ 4. seat with firm cushions
- ☐ 5. chair controlled by the client’s breath

124. The nurse is planning care for a group of clients who have had total hip replacement. Of the clients listed below, who is at **highest** risk for infection and should be assessed **first**?

- ☐ 1. a 55-year-old client who is 6 feet (180 cm) tall and weighs 180 lb (81.7 kg)
- ☐ 2. a 90-year-old who lives alone

- ☐ 3. a 74-year-old who has periodontal disease with periodontitis
- ☐ 4. a 75-year-old who has asthma and uses an inhaler

125. The nurse is documenting care of a client who is restrained in bed with bilateral wrist restraints. Following assessment of the restraints, what should the nurse's documentation include? Select all that apply.

- ☐ 1. nutrition and hydration needs
- ☐ 2. capillary refill
- ☐ 3. continued need for restraints
- ☐ 4. need for medication
- ☐ 5. skin integrity

126. The nurse is instituting a falls prevention program. Which personnel should be involved in the program? Select all that apply.

- ☐ 1. registered nurses (RNs)
- ☐ 2. insurance providers
- ☐ 3. unlicensed assistive personnel (UAP)
- ☐ 4. housekeeping services
- ☐ 5. family members
- ☐ 6. client

127. The nurse unit manager is making rounds on a team of clients and notices a client who is wearing red slipper socks and a color-coded armband that indicates the client is at risk for falling walking down the hall unassisted. The client is already at the end of the hallway farthest from the client's room, but is not tired. What should the nurse do **first**?

- ☐ 1. Obtain a wheel chair, and take the client back to the room.
- ☐ 2. Walk with the client back to the room, and assist the client to get in bed.
- ☐ 3. Locate an unlicensed nursing personnel (UAP) to walk with the client back to the room.
- ☐ 4. Instruct the client to walk only in the room at this time.

128. The healthcare provider has prescribed 5 mg warfarin orally for a hospitalized client. In planning care for this client, the nurse should verify that which services have been contacted? Check all that apply.

- ☐ 1. pharmacy
- ☐ 2. dietary
- ☐ 3. laboratory
- ☐ 4. discharge planning
- ☐ 5. chaplain

129. Unlicensed assistive personnel (UAP) are helping a client who has had knee surgery 2 days ago get into bed. As the nurse makes rounds, which information requires the nurse to intervene?

- ☐ 1. The call light is pinned to the head of the bed in the client's reach.
- ☐ 2. The night light is dimmed, giving low-level lighting to the room.
- ☐ 3. There is a clear path to the bathroom.
- ☐ 4. The side rails on the head and foot of the bed are in the up position.

130. The nurse on the orthopedic unit is going to lunch and is conducting a "hand-off" to the charge nurse. The goal of the "hand-off" communication is:

- ☐ 1. to ensure the charge nurse understands that the nurse is going to lunch.
- ☐ 2. to be sure the charge nurse assigns someone else to take care of the client.
- ☐ 3. to provide accurate information about client's care to the next caregiver.
- ☐ 4. to provide in-depth information about the client's history.

131. The client has been diagnosed with septic arthritis in a hip joint. Which outcomes are desired from a client-focused teaching plan? Select all that apply.

- ☐ 1. Report pain that is severe enough to limit activities.
- ☐ 2. Discuss how to take prescribed medications.
- ☐ 3. Describe how the application of a heating pad set on "high" readily resolves edema.
- ☐ 4. Describe the septic arthritis physiologic process.
- ☐ 5. Explain the importance of supporting the affected joint.
- ☐ 6. Describe how to use ambulatory aids and assistive devices.

132. The nurse should perform passive range-of-motion (ROM) exercises

on which clients? Select all that apply.

- ☐ 1. a client who has septic joints
- ☐ 2. a client who has temporary loss of sensation
- ☐ 3. a client who is unconsciousness
- ☐ 4. a client who has plantar flexion of the foot
- ☐ 5. a client who has supination of the hand

Answers, Rationales, and Test-Taking Strategies

*The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in part 1 of this book.*

The Client with Rheumatoid Arthritis

1. 3. Initially, most clients with early symptoms of rheumatoid arthritis report early morning stiffness or stiffness after sitting still for a while. Later symptoms of rheumatoid arthritis include limited joint range of motion; deformed joints, especially of the hand; and rheumatoid nodules.

 CN: Physiological adaptation; CL: Analyze

2. 1. Based on the information from the client, the nurse should develop a plan with the client that will conserve energy and decrease episodes of fatigue. Although the client may develop a self-care deficit related to the increasing joint pain, the client is voicing concerns about household chores and difficulty around the house and yard, not self-care issues. Over time, the client may have difficulty coping, but that is not the current concern. Employing cleaning services may not be within the client's budget, and the client should first try a plan that balances rest and activity.

 CN: Basic care and comfort; CL: Analyze

3. 1,2,4. RA affects women three times more often than men between the ages of 20 and 55 years. Research has determined that RA occurs in clients who have had infectious disease, such as the Epstein-Barr virus. The genetic link, specifically HLA-DR4, has been found in 65% of clients with RA. People with osteoarthritis are not necessarily at risk for developing RA.

 CN: Reduction of risk potential; CL: Analyze

4. 1,2,4,3. Pain relief is the highest priority during the acute phase because pain is typically severe and interferes with the client's ability to function. Preserving joint function is the next goal to set, followed by preventing joint deformity during the acute phase to promote an optimal level of functioning and reduce the risk of contractures. Maintaining usual ways of accomplishing tasks is the goal with the lowest priority during the acute phase. Rather, the focus is on developing less stressful ways of accomplishing routine tasks.

 CN: Physiological adaptation; CL: Synthesize

5. 3. Heat-producing liniment can produce a burn if used with other heat devices that could intensify the response to the heat. Heat and cold can be used as often as the client desires. However, each application of heat should not exceed 20 minutes, and each application of cold should not exceed 10 to 15 minutes. Application for longer periods results in the opposite of the intended effect: vasoconstriction instead of vasodilation with heat, and vasodilation instead of vasoconstriction with cold.

 CN: Reduction of risk potential; CL: Evaluate

6. 4. The nurse's most appropriate response is one that is therapeutic. The basic principle of therapeutic communication and a therapeutic relationship is honesty. Therefore, the nurse needs to explain truthfully that each client is different and that there are various forms of arthritis and arthritis treatment. To state that it is the **HCP's**  prerogative to decide how to treat the client implies that the client is not a member of his or her own healthcare team and is not a participant in his or her care. The statement also is defensive, which serves to block any further communication or questions. Asking the client to tell more about the friend presumes that the client knows correct and

complete information, which is not a valid assumption to make. The nurse does not know about the client's friend and should not make statements about another client's condition. Stating that the drug is for advanced disease demonstrates that the nurse is making assumptions that are not necessarily valid or appropriate. Also, telling the client that he or she is not eligible for the drug now is not within the scope of the nurse's practice.

CN: Psychosocial adaptation; CL: Synthesize

7. 4. Positions of flexion should be avoided to prevent loss of functional ability of affected joints. Proper body alignment during rest periods is encouraged to maintain correct muscle and joint placement. Lying in the prone position is encouraged to avoid further curvature of the spine and internal rotation of the shoulders.

CN: Physiological adaptation; CL: Synthesize

8. 4. Carrying a laundry basket with clinched fingers and fists is not an example of conserving energy of small joints. The laundry basket should be held with both hands opened as wide as possible and with outstretched arms so that pressure is not placed on the small joints of the fingers. When rising from a chair, the palms should be used instead of the fingers so as to distribute weight over the larger area of the palms. Holding packages close to the body provides greater support to the shoulder, elbow, and wrist joints because muscles of the arms and hands are used to stabilize the weight against the body. This decreases the stress and weight or pull on small joints such as the fingers. Objects can be slid with the palm of the hand, which distributes weight over the larger area of the palms instead of stressing the small joints of the fingers to pick up the weight of the object to move it to another place.

CN: Basic care and comfort; CL: Evaluate

9. 1. Because some over-the-counter vitamin supplements contain folic acid, the client should avoid self-medication with vitamins while taking methotrexate, a folic acid antagonist. Because methotrexate is hepatotoxic, the client should avoid the intake of alcohol, which could increase the risk for hepatotoxicity. Methotrexate can cause bone marrow depression, placing the client at risk for infection. Therefore, meticulous mouth care is essential to

minimize the risk of infection. Contraception should be used during methotrexate therapy and for 8 weeks after the therapy has been discontinued because of its effect on mitosis. Methotrexate is considered teratogenic.

CN: Pharmacological and parenteral therapies; CL: Evaluate

10. 2. Difficulty seeing out of one eye, when evaluated in conjunction with the client's medication therapy regimen, leads to the suspicion of possible retinal degeneration. The possibility of an irreversible retinal degeneration caused by deposits of hydroxychloroquine in the layers of the retina requires an ophthalmologic examination before therapy is begun and at 6-month intervals. Although cataracts may develop in young adults, they are less likely, and damage from the hydroxychloroquine is the most obvious at-risk factor. Eyesight is not affected by the disease process of rheumatoid arthritis.

CN: Pharmacological and parenteral therapies; CL: Analyze

11. 1. Gastric upset is a side effect of nonsteroidal anti-inflammatory medications; taking medication with food minimizes this effect. Corticosteroids affect adrenal gland function and are discontinued by lowering the dose gradually, but this is not true of nonsteroidal anti-inflammatory medications. It is not necessary to rinse the mouth, as stomatitis is not a usual side effect. Dizziness is not an effect of this drug.

CN: Pharmacological and parenteral therapies; CL: Synthesize

12. 4. Superficial heat applications, such as tub baths, showers, and warm compresses, can be helpful in relieving pain and stiffness. Exercises can be performed more comfortably and more effectively after heat applications. The client with rheumatoid arthritis must balance rest with exercise every day, not every other day. Typically, large doses of analgesics, which can lead to hepatotoxic effects, are not necessary. Learning to cope with the pain by refocusing is inappropriate.

CN: Basic care and comfort; CL: Synthesize

13. 1,2,5. An arthrocentesis is performed to aspirate excess synovial fluid, pus, or blood from a joint cavity to relieve pain or to diagnose inflammatory diseases such as rheumatoid arthritis. A local agent may be used to decrease the pain of the needle insertion through the skin and into the joint cavity.

Aspiration of the fluid into the syringe can be very painful because of the size and inflammation of the joint. Usually, a steroid medication is injected locally to alleviate the inflammation; a compression bandage is applied to help decrease swelling; and the client is asked to rest the joint for up to 24 hours afterward to help relieve the pain and promote rest to the inflamed joint. The client may experience pain during this time until the inflammation begins to resolve and swelling decreases.

CN: Reduction of risk potential; CL: Create

The Client with Osteoarthritis

14. 1,4,5. To prepare a client for an arthrocentesis, the nurse should tell the client that a local anesthetic administered by the **healthcare provider (HCP)**  will decrease discomfort. There may be bleeding after the procedure, so the nurse should check the dressing. The client may experience pain. The nurse should offer pain medication and evaluate outcomes for pain relief. Because a local anesthetic is used, the client will not require preoperative medication. The client will rest the knee for 24 hours and then should begin range-of-motion and muscle-strengthening exercises.

CN: Management of care; CL: Create

15. 1. Metal will interfere with the test. Metallic objects within the examination field, such as jewelry, earrings, and dental amalgams, may inhibit organ visualization and can produce unclear images. Ingesting foods and beverages days before the test will not affect bone mineral status. Short-term calcium gluconate intake will also not influence bone mineral status. The client may already have had chronic pain as a result of a bone fracture or from osteoporosis.

CN: Management of care; CL: Synthesize

16. 1. Shorter sessions will allow the client to rest between the sessions. Changing the **HCP's**  prescription to a different examination will not provide the information needed for this client's treatment. Acetaminophen is a nonopioid analgesic and an antipyretic, not an anti-inflammatory agent; thus, it would not help this client avoid the adverse effects of a lengthy x-ray examination. Although the x-ray table is hard, it is not possible to provide

padding and obtain the needed diagnostic x-rays.

CN: Management of care; CL: Synthesize

17. 4. Osteoarthritis is a degenerative joint disease with local manifestations such as local joint pain. Rheumatoid arthritis has systemic manifestation such as anemia and osteoporosis. Weight loss occurs in rheumatoid arthritis, whereas most clients with osteoarthritis are overweight.

CN: Physiological adaptation; CL: Analyze

18. 1,2,3. A diet with adequate amounts of vitamin D aids in the regulation, absorption, and subsequent utilization of calcium and phosphorus, which are necessary for the normal calcification of bone. Figs, broccoli, and almonds are very good sources of calcium. Moderate intake of alcohol has no known negative effects on bone density, but excessive alcohol intake does reduce bone density. Swimming, biking, and other non-weight-bearing exercises do not maintain bone mass. Walking and running, which are weight-bearing exercises, do maintain bone mass. The client should eat a balanced diet but does not need to avoid high-fat foods.

CN: Reduction of risk potential; CL: Create

19. 1. Capsaicin cream, which produces analgesia by preventing the reaccumulation of substance P in the peripheral sensory neurons, is made from the active ingredients of hot peppers. Therefore, clients should wash their hands immediately after applying capsaicin cream if they do not wear gloves, to avoid possible contact between the cream and mucous membranes. Clients are instructed to avoid wearing tight bandages over areas where capsaicin cream has been applied because swelling may occur from inflammation of the arthritis in the joint and lead to constriction on the peripheral neurovascular system. Capsaicin cream should be stored in areas between 59°F and 86°F (15°C and 30°C). The cabinet over the stove in the kitchen would be too warm. Capsaicin cream should not come in contact with irritated and broken skin, mucous membranes, or eyes. Therefore, it should not be used on cuts or burns.

CN: Pharmacological and parenteral therapies; CL: Evaluate

20. 3. Drugs that cause gastric irritation, such as ibuprofen, are best taken

after or with a meal, when stomach contents help minimize the local irritation. Taking the medication on an empty stomach at any time during the day will lead to gastric irritation. Taking the drug at bedtime with food may cause the client to gain weight, possibly aggravating the osteoarthritis. When the client arises, he or she is stiff from immobility and should use warmth and stretching until he or she gets food in the stomach.

CN: Pharmacological and parenteral therapies; CL: Synthesize

21. 1. Corticosteroids are used for clients with osteoarthritis to obtain a local effect. Therefore, they are given only via intra-articular injection. Oral corticosteroids are avoided because they can cause an acceleration of osteoarthritis. Rheumatoid arthritis and osteoarthritis are two different diseases.

CN: Pharmacological and parenteral therapies; CL: Synthesize

22. 2. Weight-bearing exercise plays a very important role in stimulating regeneration of cartilage, which lacks blood vessels, by driving synovial fluid through the joint cartilage. Joint mobility is increased by weight-bearing exercises, not range-of-motion exercises, because surrounding muscles, ligaments, and tendons are strengthened. Pain is an early sign of degenerative joint bone problems. Swelling may not occur for some time after pain, if at all. Osteoarthritic pain is worsened in cold, damp weather; therefore, exercising outdoors is not recommended year round in all settings.

CN: Health promotion and maintenance; CL: Evaluate

The Client with a Hip Fracture

23. 4. The hip spica cast is used for treatment of femoral fractures; it immobilizes the affected extremity and the trunk securely. It extends from above the nipple line to the base of the foot of both extremities in a double hip spica. Constipation, possible due to lack of mobility, can cause abdominal distention or bloating. When the spica cast becomes too tight due to distention, the cast will compress the superior mesenteric artery against the duodenum. The compression produces abdominal pain, abdominal pressure, nausea, and vomiting. To relieve the compression, the surgeon can cut a “window” in the cast. The nurse should assess the abdomen for decreased

bowel sounds, not the superior mesenteric artery. The surgeon cannot manipulate a fracture through a small window in a double hip spica cast. The nurse cannot use the window to aid in repositioning because the window opening can break and negate the effect of the cast.

CN: Reduction of risk potential; CL: Evaluate

24. 3. With an intracapsular hip fracture, the affected leg is shorter than the unaffected leg because of the muscle spasms and external rotation. The client also experiences severe pain in the region of the fracture.

CN: Physiological adaptation; CL: Analyze

25. 4. Insertion of a pin for the internal fixation of an extracapsular fractured hip provides good fixation of the fracture. The fracture site is stabilized, and fractured bone ends are well approximated. As a result, the client is able to be mobilized sooner, thus reducing the risks of complications related to immobility. Internal fixation with a pin insertion does not prevent hemorrhage or decrease the risk of neurovascular impairment, which are potential complications associated with any joint or bone surgery. It does not lessen the client's risk of infection at the site.

CN: Reduction of risk potential; CL: Apply

26. 3. The primary purpose of the drainage tube is to prevent fluid accumulation in the wound. Fluid, when it accumulates, creates dead space. Elimination of the dead space by keeping the wound free of fluid greatly enhances wound healing and helps prevent abscess formation. Although the characteristics of the drainage from the tube, such as a change in color or appearance, may suggest a possible infection, this is not the tube's primary purpose. The drainage tube does not eliminate the need for wound irrigation or provide a way to instill antibiotics into the wound.

CN: Reduction of risk potential; CL: Apply

27. 1. Any activity or position that causes flexion, adduction, or internal rotation of >90 degrees should be avoided until the soft tissue surrounding the prosthesis has stabilized, at approximately 6 weeks. Crossing the legs while sitting down causes internal rotation and can lead to dislocation of the femoral head from the hip socket. Sitting on a raised commode seat prevents

hip flexion and adduction. Using an abductor splint while side-lying keeps the hip joint in abduction, thus preventing adduction and possible dislocation. Rising straight from a chair to a standing position is acceptable for this client because this action avoids hip flexion, adduction, and internal rotation of >90 degrees.

CN: Reduction of risk potential; CL: Synthesize

28. 3. Troponin is a cardiac biomarker and is normally almost undetectable in the blood. A level of 1.4 means there has likely been some damage to the heart muscle. Though serum glucose (normal 60 to 100 mg/dL [3.3 to 5.5 mmol/L]) and ESR (normal is <20 for males >50 years old) are slightly elevated, this could be explained by normal stress and inflammatory response to surgery. The hematocrit is low (normal 40 to 45 [0.4 to 0.5] for men) but also not unexpected for a client following surgery.

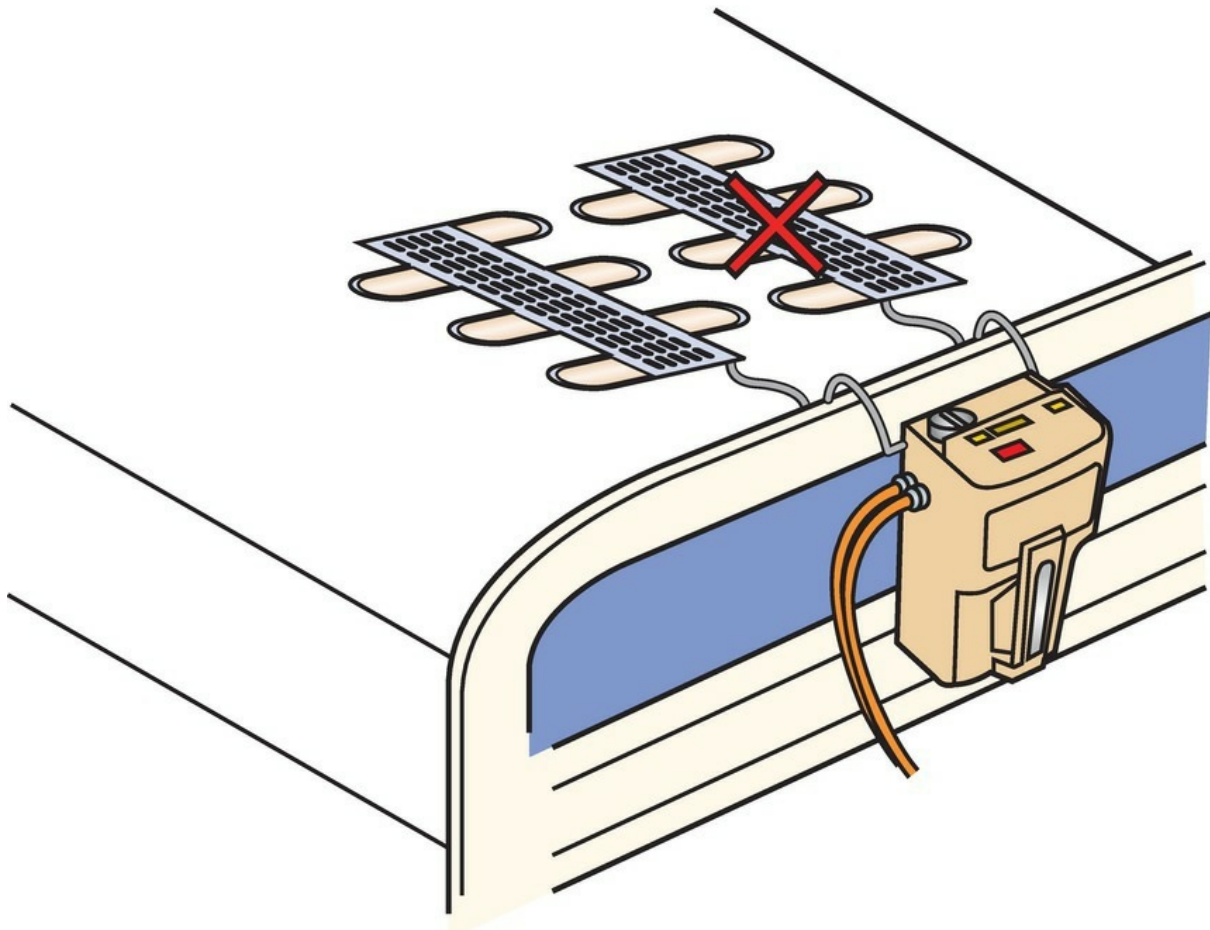

CN: Physiological adaption; CL: Synthesize

29. 3. A high-backed straight chair with armrests is recommended to help keep the client in the best possible alignment after surgery for a femoral head prosthesis placement. Use of this type of chair helps to prevent dislocation of the prosthesis from the socket. A desk-type swivel chair, padded upholstered chair, or recliner should be avoided because it does not provide for good body alignment and can cause the overly flexed femoral head to dislocate.

CN: Reduction of risk potential; CL: Synthesize

30. The air cell should be centered on the back of the client's calf.

 CN: Safety and infection control; CL: Apply

31. 2. Although pets and furniture, such as snack tables and rocking chairs, may pose a problem, scatter rugs are the single greatest hazard in the home, especially for elderly people who are unsure and unsteady with walking. Falls have been found to account for almost half the accidental deaths that occur in the home. The risk of falls is further compounded by the client's need for crutches.

 CN: Safety and infection control; CL: Synthesize

The Client Having Hip Replacement Surgery

32. 3. To obtain best results, one sheet should be used to cover the mattress. The air cells should be facing up as shown. Thick pads should not be used; if the client is incontinent, a “breathable” incontinent pad can be added. The client can use a pillow as needed.

33. 2,3,4,5. A client who has had a posterolateral total hip replacement should not adduct the hip joint, which would lead to dislocation of the ball out of the socket; therefore, the client should be encouraged to keep the toes pointed slightly outward when using a walker. An abduction pillow should be kept between the legs to keep the hip joint in an abducted position. The client should rotate between lying supine and lateral on the unoperated side, but not on the operated side. Ice is used to reduce swelling on the operative side. The client should not flex the operated hip beyond a 90-degree angle, such as when bending down to tie or slip on shoes. Doing so could lead to joint dislocation.

CN: Reduction of risk potential; CL: Create

34. 1,3,4. A client who has had a total hip replacement via an anterolateral approach has almost the opposite precautions as those for a client who has had a total hip replacement through the posterolateral approach. The hip joint should not be actively abducted. The client should avoid turning the toes or knee outward. The client should keep the legs side by side without a pillow or wedge. The client should use an elevated toilet seat and shower chair and should not extend the operative leg backward. The client should perform range-of-motion exercises as directed by the physical therapist.

CN: Reduction of risk potential; CL: Create

35. 2. Being unable to move the affected leg suggests neurologic impairment. A decrease in the distal pulse, diminished capillary refill, and coolness to touch of the affected extremity suggest vascular compromise.

CN: Reduction of risk potential; CL: Analyze

36. 4. The nurse should first identify and discuss the client's fears about the procedure. Only then can the client begin to hear what the nurse has to share about the individualized teaching plan designed to meet the client's needs. In the preoperative period, the client needs to learn how to correctly prevent hip flexion and to demonstrate coughing and deep breathing. However, this teaching can be effective only after the client's fears have been assessed and addressed. Although the client may appreciate seeing what a hip prosthesis looks like, so as to understand the new body part, this is not a necessity.

CN: Psychosocial adaptation; CL: Synthesize

37. 3. The joint has dislocated when the client with a total joint prosthesis develops severe sudden pain and an inability to move the extremity. Clinical manifestations of an infection would include inflammation, redness, erythema, and possibly drainage and separation of the wound. Bleeding could be external (e.g., blood visible from the wound or on the dressing) or internal and manifested by signs of shock (e.g., pallor, coolness, hypotension, tachycardia). The seepage of glue into soft tissue would have occurred in the operating room, when the glue is still in the liquid form. The glue dries into the hard, fixed form before the wound is closed.

CN: Reduction of risk potential; CL: Analyze

38. 1. An average adult requires approximately 1,100 to 1,400 mL of fluids per day. In some instances, such as when a person has an increase in body temperature or has increased perspiration, additional water may be necessary. With an increase in body temperature, there is also an increase in insensible fluid loss. The increased loss of fluid causes an increased need for fluid replacement. If the loss is significant and/or goes untreated, an individual's intake will not be balanced with output. Managing the incision, changing the bed linens, or keeping the client's skin cool are not outcomes indicative of resolution of a fluid volume deficit.

CN: Physiological adaptation; CL: Synthesize

39. 4. After total hip replacement, proper positioning by the nurse prevents dislocation of the prosthesis. The nurse should place the client in a supine position and keep the affected extremity in slight abduction using an abduction splint or pillows or Buck's extension traction. The client must not abduct or flex the operated hip because this may produce dislocation.

CN: Reduction of risk potential; CL: Synthesize

40. 2,4,5. Following total hip replacement, the client should use the overhead trapeze to assist with position changes. The head of the bed should not be elevated more than 45 degrees; any height >45 degrees puts a strain on the hip joint and may cause dislocation. To use a fracture bedpan, instruct the client to flex the unoperated hip and knee to lift the buttocks onto the pan.

Toe-pointing exercises stimulate circulation in the lower extremities to prevent the formation of thrombi and potential emboli. The prone position is avoided shortly after a total hip replacement.

CN: Reduction of risk potential; CL: Synthesize

41. 1,3,4. Administration of antibiotics as prescribed will aid in the acquisition of therapeutic blood levels during and immediately after surgery to prevent osteomyelitis. The nurse can request that a trapeze be added to the bed so the client can assist with lifting and turning. The nurse should also demonstrate and have the client practice isometric exercises (muscle setting) of quadriceps and gluteal muscles. The client will not use crutches after surgery; a physical therapy assistant will initially assist the client with walking by using a walker. The client will not use Buck's traction. The client will require antiembolism stockings and use of a leg compression device to minimize the risk of thrombus formation and potential emboli; the leg compression device is applied during surgery and maintained per prescription.

CN: Physiological adaptation; CL: Create

42. 1,2,3,4. Client/family teaching should include advising the client to report any symptoms of unusual bleeding or bruising, dizziness, itching, rash, fever, swelling, or difficulty breathing to **HCP**  immediately. Instruct the client not to take aspirin or nonsteroidal anti-inflammatory drugs without consulting the HCP while on therapy. A low-molecular-weight heparin is considered to be a high-risk medication, and the client should wear or carry medical identification. The air bubble should not be expelled from the syringe because the bubble ensures the client receives the full dose of the medication. The client should allow 5 seconds to pass before withdrawing the needle to prevent seepage of the medication out of the site.

CN: Pharmacological and parenteral therapies; CL: Create

43. 3. Dislocation precautions include the following: avoid extremes of internal rotation, adduction, and 90-degree flexion of affected hip for at least 4 to 6 weeks after the procedure. Use of an abduction pillow prevents adduction. Decreasing use of the abductor pillow does not strengthen the muscles to prevent dislocation. Informing a client to “not worry” is not

therapeutic. A cushioned toilet seat does not prevent hip dislocation.

CN: Psychosocial adaptation; CL: Synthesize

44. 1,2,3. Dislocation of a hip prosthesis may occur with positioning that exceeds the limits of the prosthesis. The nurse must recognize dislocation of the prosthesis. Signs of prosthesis dislocation include acute groin pain in the affected hip, shortening of the affected leg, restricted ability or inability to move the affected leg, and reported “popping” sensation in the hip. Toe wiggling is not a test for potential hip dislocation.

CN: Reduction of risk potential; CL: Analyze

45. 4. If a prosthesis becomes dislocated, the nurse should immediately notify the surgeon. This is done so the hip can be reduced and stabilized promptly to prevent nerve damage and to maintain circulation. After closed reduction, the hip may be stabilized with Buck’s traction or a brace to prevent recurrent dislocation. If prescribed by the surgeon, an ice pack may be applied postreduction to limit edema, although caution must be utilized due to potential muscle spasms. Some orthopedic surgeons may prescribe the client be turned toward the side of the reduced hip, but that is not the nurse’s first response.

CN: Reduction of risk potential; CL: Synthesize

46. 3. Expected outcomes at the time of discharge from the surgical unit after a hip replacement include the following: increased independence in transfers, participates in progressive ambulation without pain or assistance, and raises the affected leg without assistance. The client will not be able to walk throughout the hospital, walk for a distance without some postoperative pain, or raise the affected leg more than several inches. The client may be referred to a rehabilitation unit in order to achieve the additional independence, strength, and pain relief.

CN: Physiological adaptation; CL: Evaluate

47. 1. DVT is a complication of total joint replacement and may occur during hospitalization or develop later when the client is home. Clients who are obese or have previous history of a deep vein thrombosis or pulmonary embolism are at high risk. Immobility produces venous stasis, increasing the

client's chance to develop a venous thromboembolism. Signs of a DVT include unilateral calf tenderness, warmth, redness, and edema (increased calf circumference). Findings should be reported promptly to the **healthcare provider (HCP)** 📖 for definitive evaluation and therapy. Polyuria may be indicative of diabetes mellitus. Displacement of the new joint is unlikely. Wound evisceration is more likely to occur after abdominal surgeries.

🔑 CN: Reduction of risk potential; CL: Analyze

The Client Having Knee Replacement Surgery

48. 3. When combined with a weight loss program, aquatic exercise would be best because it cushions the joints and allows the client to burn off calories. Aquatic exercise promotes circulation, muscle toning, and lung expansion, which promote healthy preoperative conditioning. Weight lifting and walking are too stressful to the joints, possibly exacerbating the client's osteoarthritis. Although tai chi exercise is designed for stretching and coordination, it would not be the best exercise for this client to help with weight loss.

🔑 CN: Physiological adaptation; CL: Synthesize

49. 1. The nurse should suspect nerve damage if numbness is present. However, whether the damage is short term and related to edema or long term and related to permanent nerve damage would not be clear at this point. The nurse needs to continue to assess the client's neurovascular status, including pain, pallor, pulselessness, paresthesia, and paralysis (the five Ps). Bleeding would suggest vascular damage or hemorrhage. Dislocation would suggest malalignment. Pink color would suggest adequate circulation to the area. Numbness would suggest neurologic damage.

🔑 CN: Reduction of risk potential; CL: Analyze

50. 4. After knee arthroplasty, the knee will be extended and immobilized with a firm compression dressing and an adjustable soft extension splint in place. An SCD will be applied. The SCD can be discontinued when the client is ambulatory, but while the client is in bed the SCD needs to be maintained to prevent thromboembolism. The SCD should be positioned on the bed, but not on two pillows. Settings for the SCD are prescribed by the orthopedic

surgeon. Initial dressing changes are completed by the orthopedic surgeon and changed as needed per prescription.

CN: Reduction of risk potential; CL: Synthesize

51. 2,3. It is anticipated that there might be some swelling, redness, and discomfort immediately after activity, including physical therapy. Ideally, pain medication could be offered or given prior to therapy to reduce posttreatment pain but should be administered now. Elevation and cold packs can also reduce swelling and decrease pain. It is not appropriate to notify the **HCP**  as pain and swelling are normal after therapy. It is also not appropriate to massage the area. This will increase circulation and therefore increase swelling and pain.

CN: Management of care; CL: Synthesize

52. 1,2,3. The nurse should instruct the client to notify the dentist and other **HCPs**  of the need to take prophylactic antibiotics if undergoing any procedure (e.g., tooth extraction) due to the potential of bacteremia. The nurse should also advise the client that the metal components of the joint may set off the metal-detector alarms in airports. The client should also report having the metal joint prior to having MRI studies because, depending on the type of joint replacement, the implanted metal components could be pulled toward the large magnet core of the MRI. Any weight bearing that is permitted is prescribed by the orthopedic surgeon and is usually not limited to 5 lb (2.3 kg). Postsurgery, the client can resume a normal diet with regular fluid intake.

CN: Health promotion and maintenance; CL: Create

53. 1. The aPTT is at a critical value, and the client should receive protamine sulfate as the antidote for heparin. Vitamin K is the antidote for warfarin. Packed red blood cells are administered to increase the hematocrit.

CN: Pharmacological and parenteral therapies; CL: Apply

54. 1,2,3,4. Postoperatively, the knee in a total knee replacement is dressed with a compression bandage, and ice may be applied to control edema and bleeding. Recurrent assessment by the nurse for neurovascular changes can prevent loss of limb. Normal neurovascular findings include color normal,

extremity warm, capillary refill <3 seconds, moderate edema, tissue not palpably tense, pain controllable, normal sensations, no paresthesia, normal motor abilities, no paresis or paralysis, and pulses strong and equal.

CN: Reduction of risk potential; CL: Analyze

55. 4. The knee is usually protected with a knee immobilizer (splint, cast, or brace) and is elevated when the client sits in a chair. Pre- and postsurgery, the **healthcare provider (HCP)**  prescribes weight-bearing limits and use of assistive devices for progressive ambulation. Positioning a straight-backed chair at the foot of the bed is not an action conducive to getting the client out of bed on the evening of surgery for a total knee replacement.

CN: Reduction of risk potential; CL: Synthesize

56. 1,4. After a total knee replacement, efforts are directed at preventing complications, such as thromboembolism, infection, limited range of motion, and peroneal nerve palsy. The nurse should instruct the client to report signs of infection, such as an increased temperature. To prevent edema, the affected leg must remain elevated when the client sits in a chair. The client will wear antiembolism stockings at all times, including when sleeping. After discharge, the client may undergo physical therapy on an outpatient basis per **HCP**  prescription. The client should leave the dressing in place until the follow-up visit with the surgeon.

CN: Reduction of risk potential; CL: Create

The Client with a Herniated Disk

57. 1. The client is using correct body mechanics for lifting because she is keeping her back as straight as possible and is holding the box close to her body. She is using her large leg muscles to lift the box. She is using a broad base of support by placing her feet as wide apart as possible. The other suggestions would cause the client to put a strain on her back.

CN: Reduction of risk potential; CL: Synthesize

58. 3. The client with low back pain should not exceed the prescribed exercises even though the client may think, “If this will make me well, double will make me well quicker.” When exceeding prescribed exercise

programs, the client's muscle may be unconditioned and easily tired, leading to injury and increased pain. To use proper body mechanics when lifting light objects, the client should bring the item close to the center of gravity, which occurs when the object is kept below the level of the elbows. Leaning forward while bending the knees allows for the muscles of the thigh to be used instead of those of the lower back. Sleeping on the side with the legs flexed is appropriate because the spine is kept in a neutral position without twisting or pulling on muscles.

CN: Reduction of risk potential; CL: Synthesize

59. 1. The nurse instructs the client to start the prescription by taking the least amount of the medication. The client is advised to monitor pain level and adjust the dosage according to the amount of pain relief.

CN: Pharmacological and parenteral therapies; CL: Synthesize

60. 3,4,1,2. When the client is not entirely able to get out of bed, the nurse should first assist the client to lie down for comfort/safety before administering the prescribed celecoxib. Applying a warm compress will further promote relaxation of skeletal muscles. The **HCP**  should be kept informed of the client's status and nursing actions already taken.

CN: Basic care and comfort; CL: Synthesize

61. 2. Standing with a flattened spine slightly tilted forward and slightly flexed to the affected side indicates a postural deformity. Motor changes would include findings such as hypotonia or muscle weakness. Absent or diminished reflexes related to the level of herniation would indicate alteration in reflexes. Sensory changes would include findings such as paresthesia and numbness related to the specific tract of the herniation.

CN: Physiological adaptation; CL: Analyze

62. 2. A supine position with the client's legs flexed is the most comfortable position because it allows for the disc to recess off of the nerve, thus alleviating the pressure and pain. The prone position causes hyperextension of the spine and increased pressure of the disc on the nerve root on the right. A ruptured disc at L5–S1 right identifies a ruptured disc compressing the right nerve root exiting the L5–S1 spinous process; terms

such as this are commonly used in the analysis of a magnetic resonance image, myelogram, or history and physical examination. If the ruptured area of the disc were in the central area of the spinous process, the prone position and hyperextension might relieve the disc pressure on the nerve. A high Fowler's or sitting position increases the pressure of the disc on the nerve root because of gravity, as does a right Sims' position.

CN: Physiological adaptation; CL: Synthesize

63. 4. An IV line is not required for an MRI. If a client has an IV line, it is usually converted to an intermittent infusion device, such as a saline lock, to avoid infiltration during transport of the client and completion of the procedure. When a contrast agent is used, the client is moved out of the cylinder, the contrast material is injected, and the client is moved back in. An MRI scan is painless. Typically, the staff positions the client with pillows, blankets, earplugs, and music, to ensure client comfort, before the procedure is started. A history of past surgeries is important, especially if the surgery involved implantation of any metallic devices (e.g., implants, clips, pacemakers). Additionally, the nurse needs to assess for hearing aids, electronic devices, shrapnel, bra hooks, necklaces, jewelry, credit cards, zippers, or any type of metal that the magnet of the MRI unit would attract. Although open MRI units are now available, they are not in widespread use. Therefore, the nurse needs to determine whether the client is claustrophobic because the unit is a closed cylinder in which the client hears pops of noise. A number of clients develop claustrophobia that causes the procedure to be canceled. If the client is claustrophobic, the procedure may need to be rescheduled after an open MRI unit is located or made available.

CN: Reduction of risk potential; CL: Synthesize

64. 2. Based on the client's comments, the nurse should call the surgeon to verify the location of the surgery. The client's comments indicate radiculopathy of L4–L5, but the **informed consent**  form states L3–L4. Radiculopathy of L3–L4 involves pain radiating from the back to the buttocks to the posterior thigh to the inner calf. The nurse must act as a client advocate and not ask the client to sign the consent until the correct procedure is identified and confirmed on the consent. The nurse has no legal authority or responsibility to change the consent. The history is a source of

information, but when the client is coherent and the history is contradictory, the **healthcare provider (HCP)**  should be contacted to clarify the situation. Ultimately, it is the surgeon's responsibility to identify the site of surgery specified on the surgical consent form.

 CN: Management of care; CL: Synthesize

65. 2. Ondansetron hydrochloride is a selective serotonin receptor antagonist that acts centrally to control the client's nausea in the postoperative phase. It does not control muscle spasms, shivering, or dry mouth.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

66. 4. Sweeping causes a twisting motion, which should be avoided because twisting can cause undue stress on the recently ruptured disc site, muscle spasms, and a potential recurrent disc rupture. Although the client should not bend at the waist, such as when washing dishes at the sink, the client can dry dishes because no bending is necessary. The client can sit in a firm chair that keeps the back anatomically aligned. The client should not twist and pull, so when making the bed, the client should pull the covers up on one side and then walk around to the other side before trying to pull the covers up there.

 CN: Physiological adaptation; CL: Evaluate

67. 4. After a lumbar laminectomy L4–L5, a client who is returning to work should avoid sitting whenever possible. If the client must sit, he or she should sit only in chairs that allow the knees to be higher than the hips and support the arms to maintain correct body alignment and reduce undue stress on the spine. Maintaining good body postures is most important after a lumbar laminectomy L4–L5. By 6 weeks after the surgery, the client should have regained stamina. To maintain correct body posture, the client should also place one foot on a step stool during prolonged standing. Sleeping on the back with a support under the knees is effective in maintaining correct body posture. Maintaining an average weight for height is important in maintaining a healthy back because carrying extra weight causes undue stress on back muscles.

CN: Physiological adaptation; CL: Synthesize

68. 2. Clear yellowish fluid on the dressing may be cerebrospinal fluid (CSF). This fluid must be tested for glucose to determine whether it is CSF. If so, the client is at great risk for an infection of the central nervous system, which has a high mortality rate. The client should be able to laterally rotate the head and neck, which is above the surgical site in the spinal column. During the nursing postoperative neuromuscular-vascular assessment of movement of the head and neck, the nurse should find results consistent with the preoperative baseline status. Using the standing position to void is normal for a male client. Coughing is the body's defense mechanism to help clear the lungs of the anesthetic agents and to ventilate the lungs in response to a sustained deep inspiration for ventilation of the lower lobes of the lungs. A frequent cough could place a strain on the incision site and should be avoided. Also, a productive cough of thick, yellow sputum would indicate the complication of a respiratory infection.

CN: Reduction of risk potential; CL: Analyze

69. 4. The client should wear a thin cotton undershirt under the brace to prevent the brace from abrading directly against the skin. The cotton material also aids in absorbing any moisture, such as perspiration, that could lead to skin irritation and breakdown. Applying lotion is not recommended before applying the brace because further skin breakdown can result (related to the collection of moisture where microorganisms can grow). Applying extra padding (e.g., to the iliac crests) is not recommended because the padding can become wrinkled, producing more pressure sites and skin breakdown. Use of baby or talcum powder and lotion is not recommended because they can cause irritation and skin breakdown.

CN: Reduction of risk potential; CL: Evaluate

70. 1. Typically, the donor site causes more pain than the fused site does because inflammation, swelling, and venous oozing around the nerve endings in the donor site, where the subcutaneous tissue was removed, occur during the first 24 to 48 hours postoperatively. After surgery, the surgeon applies a pressure dressing to the donor site to compress the veins that were transected for the removal of subcutaneous tissue but that did not stop oozing blood

after surgical cauterization. Pressure on a transected vein, which is low pressure, stops the oozing and loss of blood from the venous site. When the donor site is the fibula, neurovascular checks must be performed every hour to ensure adequate neurologic function of and circulation to the area. The surgeon, not the degree or amount of pain, specifies activity restrictions.

CN: Physiological adaptation; CL: Synthesize

71. 1. A client who has had back surgery should place his feet flat on the floor to avoid strain on the incision. Placing the feet on a low or high footstool or in any other position of comfort with the legs uncrossed increases the pressure on the suture line and increases the inflammation around the involved nerve root, thereby increasing the risk of possible rerupture of the disc site.

CN: Reduction of risk potential; CL: Evaluate

72. 4. After a lumbar laminectomy, a client should not sit for prolonged periods in a chair because of the increased pressure against the nerve root and incision site. Assisting with daily hygiene is an appropriate activity during the initial postoperative period because, as with any surgical procedure, the client needs to return to an optimal level of functioning as soon as possible. There is no limitation on the client's participation in daily hygiene activities except for individual responses of pain, nausea, vomiting, or weakness. Lying flat in bed is appropriate because it does not cause stress on the spinal column where the laminectomy was performed and the disc tissue was removed. Positions that should be avoided are those that would cause twisting and flexion of the spine. Walking in the hall is an acceptable activity. It promotes good postoperative ventilation, circulation, and return of peristalsis, which are needed for all surgical clients. In addition, walking provides the postoperative lumbar laminectomy client an opportunity to build up endurance and muscle strength and to promote circulation to the operative and incision sites for healing without twisting or stressing them.

CN: Physiological adaptation; CL: Synthesize

73. 3. Sit-ups are not recommended for the client who has had a lumbar laminectomy because these exercises place too great a stress on the back. Knee-to-chest lifts, hip tilts, and pelvic tilt exercises are recommended to

strengthen back and abdominal muscles.

CN: Reduction of risk potential; CL: Synthesize

The Client with an Amputation due to Peripheral Vascular Disease

74. 1,2,4. Uncontrolled diabetes mellitus is considered a risk factor for peripheral vascular disease because of the macroangiopathic and microangiopathic changes that result from poor blood glucose control. Cigarette smoking is a known risk factor for peripheral vascular disease; nicotine is a potent vasoconstrictor. Serum cholesterol levels >200 mg/dL (11.1 mmol/L) are considered a risk factor for peripheral vascular disease. Typically, peripheral vascular disease is considered to be a disorder affecting older adults. Therefore, an age of 39 years would not be considered as a risk factor contributing to the development of peripheral vascular disease. Prolonged standing is a risk factor for venous stasis and varicose veins.

CN: Health promotion and maintenance; CL: Analyze

75. 2. The client with severe arterial occlusive disease and gangrene of the left great toe would have lost the hair on the leg due to decreased circulation to the skin. Edema around the ankle and lower leg would indicate venous insufficiency of the lower extremity. Thin, soft toenails (i.e., not thickened and brittle) are a normal finding. Warmth in the foot indicates adequate circulation to the extremity. Typically, the foot would be cool to cold if a severe arterial occlusion were present.

CN: Physiological adaptation; CL: Analyze

76. 3. The client should be tobacco free for 30 minutes before the test to avoid false readings related to the vasoconstrictive effects of smoking on the arteries. Because this test is noninvasive, the client does not need to sign an **informed consent**  form. The client should receive an opioid analgesic, not a sedative, to control the pain as the blood pressure cuffs are inflated during the Doppler studies to determine the ankle-to-brachial pressure index. The client's ankle should not be covered with a blanket because the weight of the blanket on the ischemic foot will cause pain. A bed cradle should be used to keep even the weight of a sheet off the affected foot.

CN: Reduction of risk potential; CL: Synthesize

77. 2. Slow, steady walking is a recommended activity for the client with peripheral arterial disease because it stimulates the development of collateral circulation needed to ensure adequate tissue oxygenation. The client with peripheral arterial disease should not minimize activity. Activity is necessary to foster the development of collateral circulation. Elevating the legs above the heart is an appropriate strategy for reducing venous congestion. Wearing antiembolism stockings promotes the return of venous circulation, which is important for clients with venous insufficiency. However, their use in clients with peripheral arterial disease may cause the disease to worsen.

CN: Physiological adaptation; CL: Evaluate

78. 1. Daily lubrication, inspection, cleaning, and patting dry of the feet should be performed to prevent cracking of the skin and possible infection. Soaking the feet in warm water should be avoided because soaking can lead to maceration and subsequent skin breakdown. Additionally, the client with arterial insufficiency typically experiences sensory changes, so the client may be unable to detect water that is too warm, thus placing the client at risk for burns. Antiembolism stockings, appropriate for clients with venous insufficiency, are inappropriate for clients with arterial insufficiency and could lead to a worsening of the condition. Footwear should be roomy, soft, and protective and allow air to circulate. Therefore, firm, supportive leather shoes would be inappropriate.

CN: Reduction of risk potential; CL: Synthesize

79. 2. Encouraging the client who will be undergoing amputation to verbalize his feelings is the most therapeutic response. Asking the client to tell more about how he is feeling helps to elicit information, providing insight into his view of the situation and also providing the nurse with ideas to help him cope. The nurse should avoid value-laden responses, such as, “At least you will still have one good leg to use,” that may make the client feel guilty or hostile, thereby blocking further communication. Furthermore, stating that the client still has one good leg ignores his expressed concerns. The client has verbalized feelings of helplessness by using the term “invalid.” The nurse needs to focus on this concern and not try to complete the teaching first

before discussing what is on the client's mind. The client's needs, not the nurse's needs, must be met first. It is inappropriate for the nurse to assume to know the relationship between the client and his wife or the roles they now must assume as dependent client and caregiver. Additionally, the response about the client's wife caring for him may reinforce the client's feelings of helplessness as an invalid.

CN: Psychosocial adaptation; CL: Synthesize

80. 2. The level of amputation often cannot be accurately determined until during surgery, when the surgeon can directly assess the adequacy of the circulation of the residual limb. From a moral, ethical, and legal viewpoint, the surgeon attempts to remove as little of the leg as possible. Although a longer residual limb facilitates prosthesis fitting, unless the stump is receiving a good blood supply, the prosthesis will not function properly because tissue necrosis will occur. Although the client's ability to walk with a prosthesis is important, it is not a determining factor in the decision about the level of amputation required. Blood supply to the tissue is the primary determinant.

CN: Physiological adaptation; CL: Synthesize

81. 4. The priority action is to draw a mark around the site of bleeding to determine the rate of bleeding. Once the area is marked, the nurse can determine whether the bleeding is increasing or decreasing by the size of the area marked. Because the spot is bright red, the bleeding is most likely arterial in origin. Once the rate and source of bleeding are identified, the surgeon should be notified. The stump is not elevated because adhesions may occur, interfering with the ability to fit a prosthesis. The dressing would be reinforced if the bleeding is determined to be of venous origin, characterized by slow oozing of darker blood that ceases with the application of a pressure dressing. Typically, operative dressings are not changed for 24 hours. Therefore, the dressing is reinforced to prevent organisms from penetrating through the blood-soaked areas of the initial postoperative dressing.

CN: Physiological adaptation; CL: Synthesize

82. 4. The nurse's first action should be to administer the prescribed opioid analgesic to the client because this phenomenon is phantom sensation and interventions should be provided to relieve it. Pain relief is the priority.

Phantom sensation is a real sensation. It is incorrect and inappropriate to tell a client that it is impossible to feel the pain. Although it does relieve the client's apprehensions to be told that phantom sensations are a real phenomenon, the client needs prompt treatment to relieve the pain sensation. Usually, phantom sensation will go away. However, showing the client that the toes are not there does nothing to provide the client with relief.

CN: Physiological adaptation; CL: Synthesize

83. 4. Use of crutches requires significant strength from the triceps muscles. Therefore, efforts are focused on strengthening these muscles in anticipation of crutch walking. Bed and wheelchair push-ups are excellent exercises targeted at the triceps muscles. Abdominal exercises, range-of-motion and isometric exercises of the shoulders, and quadriceps and gluteal setting exercises are not helpful in preparing for crutch walking.

CN: Reduction of risk potential; CL: Synthesize

84. 4. When using crutches, the client is taught to support weight primarily on the hands. Supporting body weight on the axillae, elbows, or upper arms must be avoided to prevent nerve damage from excessive pressure.

CN: Reduction of risk potential; CL: Synthesize

85. 4. Before beginning dietary instructions and interventions, the nurse must first assess the client's and family's food preferences, such as pattern of food intake, lifestyle, food preferences, and ethnic, cultural, and financial influences. Once this information is obtained, the nurse can begin teaching based on the client's current knowledge level and then building on this knowledge base.

CN: Physiological adaptation; CL: Synthesize

The Client with Fractures

86. 3. Isometric contractions increase the tension within a muscle but do not produce movement. Repeated isometric contractions make muscles grow larger and stronger. Adduction of the leg puts work onto the hip joint as well as altering the pull of traction. Rolling the leg, or *external rotation*, alters the pull of traction. Additional weight should not be added to traction unless

prescribed by the **healthcare provider (HCP)** ; it will not prevent muscle atrophy.

 CN: Reduction of risk potential; CL: Evaluate

87. 3. Methocarbamol is a muscle relaxant and acts primarily to relieve muscle spasms. It has no effect on microorganisms, does not reduce itching, and has no effect on nervousness.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

88. 1,2,3. Acetaminophen is an alternative for a client who is allergic to aspirin. It does not affect platelet aggregation, and the client does not need to have coagulation studies (such as INR). Acetaminophen causes little or no gastric distress. Acetaminophen exerts no anti-inflammatory effects.

 CN: Pharmacological and parenteral therapies; CL: Create

89. 3. Hypotension and depressed respirations are signs of high levels of ingestion of hydrocodone, and the client may be developing a habit of taking this drug for a prolonged period. Expected common adverse effects of hydrocodone and acetaminophen would include drowsiness, confusion, blurred vision, and constipation. Hemorrhage from gastrointestinal irritation is not associated with this drug. Hypersensitivity reactions would be manifested by pruritus and rashes.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

90. 3. The nurse's first action is to notify the **HCP**  because the client is likely experiencing a fat embolus. Fat emboli are associated with embolization of marrow or tissue fat or platelets and free fatty acids to the pulmonary capillaries, producing rapid onset of symptoms. Multiple fractures and fractures of the long bones or pelvis increase a client's risk for developing a fat embolus; in addition, young adults between 20 and 30 years of age are at a higher risk for fat emboli with fractures. When fat emboli do occur, hypoxia results; therefore, it is most important the nurse assess changes in level of consciousness and observe changes in behavior such as restlessness and irritability. The nurse does not cut the cast; there is no indication that the casts are obstructing circulation. ABGs are used to confirm the diagnosis, not a chest x-ray. The client's behavior is a result of

hypoxemia, not pain.

CN: Reduction of risk potential; CL: Synthesize

91. 2. The nurse instructs the client to maintain two finger widths between the axillary fold and the underarm piece grip of the crutches to prevent pressure on the brachial plexus. The client is advised to use the three-point gait; in the four-point and two-point gait, there is partial weight bearing of both feet. The client is also advised to keep the affected leg elevated when sitting to prevent swelling and to use the arms, not the axillae, to maintain balance and support.

CN: Reduction of risk potential; CL: Apply

92. 4. Skeletal traction is often used to regain normal length of the bone, but in this situation, the main purpose of the traction is to reduce and immobilize the fracture. This type of traction allows the client to move in bed without dislocating the fracture. This client has an open fracture, but skeletal traction will not prevent further skin breakdown.

CN: Physiological adaptation; CL: Evaluate

93. 3. The nurse first assesses the mechanism of injury to help determine related injuries, tests needed, and potential treatment options. The next step is to assess the location, type, quality, and intensity of the pain. Neurovascular stasis of the injured site is assessed after pain; therefore, the nurse checks for functional ability or changing positions. Although the nurse can also determine the extent of anxiety while assessing the injury and can use communication strategies to minimize anxiety, it is not the first priority for assessing this client.

CN: Physiological adaptation; CL: Synthesize

94. 3. The nursing assessment is first focused on the region distal to the fracture for neurovascular injury or compromise. When a nerve or blood vessel is severed or obstructed at the actual fracture site, innervation to the nerve or blood flow to the vessel is disrupted below the site; therefore, the area distal to the fracture site is the area of compromised neurologic input or vascular flow and return, not the area above the fracture site or the fracture site itself. The nurse may assess the opposite extremity at the area proximal to

the fracture site for a baseline comparison of pulse quality, color, temperature, size, and so on, but the comparison would be made after the initial neurovascular assessment.

CN: Physiological adaptation; CL: Analyze

95. 3. Clients should not pull out cast padding to scratch inside the cast because of the hazard of skin breakdown and subsequent potential for infection. Clients are encouraged to elevate the casted extremity above the level of the heart to reduce edema and to exercise or move the joints above and below the cast to promote and maintain flexibility and muscle strength. Applying ice for 10 minutes during the first 24 hours helps to reduce edema.

CN: Reduction of risk potential; CL: Evaluate

96. 2. The client in a double hip spica cast should avoid eating foods that can be constipating, such as cheese. Rather, fresh fruits and vegetables should be encouraged, and the client should be encouraged to drink at least 2,500 mL/day. Drinking cranberry juice, which helps keep urine acidic, thereby avoiding the development of renal calculi, is encouraged. The client should be encouraged to establish regular times for elimination to promote regularity in bowel and bladder habits. The client will develop orthostatic hypotension unless the circulatory system is reconditioned slowly through dangling and standing exercises.

CN: Physiological adaptation; CL: Synthesize

97. 2. A two-point gait involves partial weight bearing on each foot, with each crutch advancing simultaneously with the opposing leg. Advancing a crutch on one side and then advancing the opposite foot, and repeating on the opposite side, illustrates the four-point gait. When the client advances both crutches together and follows by lifting both lower extremities to the same level as the crutches, the gait is called a “swing-to” gait. When the client advances both crutches together and follows by lifting both lower extremities past the level of the crutches, the gait is called a “swing-through” gait. The “swing-through” gait is often used by paraplegic clients because it allows them to place weight on their legs while the crutches are moved one stride ahead.

CN: Reduction of risk potential; CL: Synthesize

98. 1. The wound was left open with a three-way drainage system in place to irrigate the debrided wound with normal saline or an antibiotic. Before the debridement, a sample of the wound would be taken for culture and sensitivity testing so that an organism-specific antibiotic could be administered to prevent possible serious sequelae of osteomyelitis. Therefore, the nurse should review the results of the culture and sensitivity report before initiating care. A pressure dressing would not be applied to an open wound. Rather, a wet-to-dry dressing most likely would be used. There should not be increased pain related to the exposure of nerve endings in the subcutaneous tissue of the wound that was left open to the environment. The first priority is to determine if there is an infection as this is the biggest risk to the client; the nurse can check other lab values later.

CN: Physiological adaptation; CL: Synthesize

99. 1. The nurse should assess the client's ability to move the toes and for the presence of distal pulses, including a neurovascular assessment of the area below the cast. Increasing pain unrelieved by usual analgesics and occurring 4 to 12 hours after the onset of casting or trauma may be the first sign of compartment syndrome, which can lead to permanent damage to nerves and muscles. Although the nurse can use a pain rating scale or assess for changes in vital signs to objectively assess the client's pain, the client's comments suggest early and important signs of compartment syndrome requiring immediate intervention. The nurse should not confuse these signs with the potential for drug tolerance. This assessment might be appropriate once the suspicion of compartment syndrome has been ruled out.

CN: Physiological adaptation; CL: Analyze

100. 4. The client with compartment syndrome may release myoglobin from damaged muscle cells into the circulation. This becomes trapped in the renal tubules, resulting in dark, scanty urine, possibly leading to acute renal failure. Crackles may suggest respiratory complications; jaundice suggests liver failure; and generalized edema may suggest heart failure. However, these are not associated with compartment syndrome.

CN: Reduction of risk potential; CL: Analyze

The Client with a Femoral Fracture

101. 4. Passive immunity for tetanus is provided in the form of tetanus antitoxin or tetanus immune globulin. An antitoxin is an antibody to the toxin of an organism. Administering tetanus toxoid, antigen, or vaccine would provide active immunity by stimulating the body to produce its own antibodies.

CN: Pharmacological and parenteral therapies; CL: Apply

102. 4. Skeletal traction is NOT used to pull weight with a boot, and the nurse should explain to the client that skeletal traction involves the insertion of a wire or a pin into the bone to maintain a pull of 5 to 45 lb (2.3 to 20.4 kg) on the area which will align the injured bones by providing a long-term pull to realign the fracture.

CN: Reduction of risk potential; CL: Evaluate

103. 4. The client with a femoral fracture in balanced suspension traction should not be given a complete bed bath. Rather, the client is encouraged to participate in self-care and movement in bed, such as with a trapeze triangle. Use of a fracture bedpan is appropriate. A fracture bedpan is lower, and it is easier for the client to move on and off the bedpan without altering the line of traction. Checking for areas of redness or pressure over all areas in contact with the traction or bed, including the ischial tuberosity, is important to prevent possible skin breakdown. The client should be positioned so that the feet do not press against the footboard. Therefore, elevating the head of the bed no more than 25 degrees is recommended to keep the client from moving down in the bed.

CN: Reduction of risk potential; CL: Synthesize

104. 3. The nurse should send the client to the operating room on the bed with extra help to keep the traction from moving to maintain the femur in the proper alignment before surgery. Transferring the client to a cart with manually suspended traction is inappropriate because doing so places the client at risk for additional trauma to the surrounding neurovascular and soft tissues, as would removing the traction. The surgeon need not be called because the decision about transferring the client is an independent nursing

action.

CN: Reduction of risk potential; CL: Synthesize

105. 1. The Pearson attachment supports the lower leg and provides increased stability in the overall traction setup. It also makes it easier to maintain correct alignment. It does not support the thigh and the upper leg or prevent flexion deformities in the ankle and foot. It is not attached to the skeletal pin.

CN: Reduction of risk potential; CL: Apply

106. 1. Fat emboli usually result in symptoms of acute respiratory distress syndrome, such as apprehension, chest pain, cyanosis, dyspnea, tachypnea, tachycardia, and decreased partial pressure of arterial oxygen resulting from poor oxygen exchange. Migraine-like headaches are not a symptom of a fat embolism, but mental confusion, memory loss, and a headache from poor oxygen exchange may be seen with central nervous system involvement. Numbness in the right leg is a peripheral neurovascular response that most likely is related to the femoral fracture. Muscle spasms in the right thigh are a symptom of a neuromuscular response affecting the local muscle around the femoral fracture site.

CN: Reduction of risk potential; CL: Analyze

107. 1. The priority for this client is to prevent the effects of prolonged immobility, such as by preventing skin breakdown and encouraging the client to take deep breaths, and use active range-of-motion exercises for the joints that are not immobilized. Although not the priority, the nurse also should seek ways to help the client adjust to and cope with the present state of immobility. Emphasis should be placed on what the client can do, such as participating in daily care and exercises to maintain muscle strength. Finding diversional activities is not a **priority** at this moment. Although the client must adapt to the inactivity, helping the client develop coping skills is the priority at this time.

CN: Psychosocial adaptation; CL: Analyze

108. 1. The client's assisting as much as possible in self-care and increasing participation over time indicate that the client has accomplished

self-care by gaining a sense of control. If the client lets the nurse complete the care without interfering, the behavior would indicate passivity, possibly from denial or depression. If the client allows the spouse to assume total responsibility, a successful outcome has not been reached. The client is able to accomplish self-care activities within the limits of immobilization from the traction.

CN: Basic care and comfort; CL: Evaluate

109. 2. Fever, night sweats, chills, restlessness, and restrictive movement of the fractured leg are clinical manifestations of osteomyelitis, which is a pyogenic bone infection caused by bacteria (usually staphylococci), a virus, or a fungus. The bone is inaccessible to macrophages and antibodies for protection against infections, so an infection in this site can become serious quickly. The client with a pulmonary or fat embolus would develop symptoms of pulmonary compromise, such as shortness of breath, chest pain, angina, and mental confusion. Signs and symptoms of urinary tract infection would include pain over the suprapubic, groin, or back region with fever and chills, with no restrictive movement of the leg.

CN: Reduction of risk potential; CL: Analyze

110. 2. The goal of care for this client is healing and tissue growth while the client continues on long-term antibiotic therapy to clear the infection. A diet high in protein and vitamins C and D promotes healing. Herbal supplements may potentiate bleeding (e.g., ginkgo, ginger, tumeric, chamomile, kelp, horse chestnut, garlic, and dong quai) and have not been proven through research to promote healing. Frequent passive motion will increase circulation but may also aggravate localized bone pain. It is not appropriate to advise the client to change antibiotics as treatment may take time.

CN: Physiological adaptation; CL: Synthesize

The Client with a Spinal Cord Injury

111. 3. The priority concern is to immobilize the head and neck to prevent further trauma when a fractured vertebra is unstable and easily displaced. Although wrapping and supporting the extremities is important, it does not

take priority over immobilizing the head and neck. Pain usually is not a significant consideration with this type of injury. Cushioning is contraindicated. The neck should be kept in a neutral position and immobilized. Flexion of the neck is avoided.

 CN: Safety and infection control; CL: Synthesize

112. 3. The client is experiencing autonomic dysreflexia, which is a medical emergency. The nurse should immediately evaluate the client for bladder distention and be prepared to catheterize the client. Positioning the client on the left side, reducing environmental stimuli, and administering pain medications are not used to treat autonomic hyperreflexia.

 CN: Physiological adaptation; CL: Synthesize

113. 3. This client has a spinal cord injury of the sacral region of the spinal cord and will have bladder and bowel dysfunction, as well as loss of sensation and muscle control below the injury. The other options are true of a client who has quadriplegia.

 CN: Physiological adaptation; CL: Analyze

114. 2. Although assessment of renal status, gastrointestinal function, and biliary function is important, with the spinal cord transection at T4 the client's vascular status is the primary focus of the nursing assessment because the sympathetic feedback system is lost and the client is at risk for hypotension and bradycardia.

 CN: Physiological adaptation; CL: Analyze

115. 1. The client with a spinal cord transection above T5 is least likely to develop diarrhea. Rather, constipation due to atonia would be possible. The client with a spinal cord transection above T5 is at risk for development of a paralytic ileus because the sympathetic nerve innervation to the vagus nerve, which dominates all the vessels and organs below T5 (e.g., the intestinal tract), has been disrupted and, therefore, so has movement or peristalsis. The client is at risk for development of stress ulcers because the sympathetic nerve innervation to the stomach has been disrupted, which results in an excessive release of hydrochloric acid in the stomach, allowing contact of hydrochloric acid with the stomach mucosa. The client does not feel

subjective signs of stress ulcers (e.g., pain, guarding, tenderness) and therefore is at increased risk for bleeding because complications of an ulcer can develop before early diagnosis.

 CN: Reduction of risk potential; CL: Synthesize

116. 4. Measuring the leg girth is the most appropriate method because the usual signs, such as a positive Homans' sign, pain, and tenderness, are not present. Other means of assessing for deep vein thrombosis in a client with a spinal cord injury are through a Doppler examination and impedance plethysmography.

 CN: Reduction of risk potential; CL: Analyze

117. 3. During the period of spinal shock, the bladder is completely atonic and will continue to fill passively unless the client is catheterized. The bladder will not go into spasms or cause uncontrolled urination. Bladder function will not be normal during the period of spinal shock.

 CN: Reduction of risk potential; CL: Analyze

118. 4. The movements occur from muscle reflexes and cannot be initiated or controlled by the brain. After the period of spinal shock, the muscles gradually become spastic owing to an increased sensitivity of the lower motor neurons. It is an expected occurrence and does not indicate that healing is taking place or that the client will walk again. The movement is not voluntary and cannot be brought under voluntary control.

 CN: Physiological adaptation; CL: Synthesize

119. 3. Long-bone demineralization is a serious consequence of the loss of weight bearing. An excessive calcium load is brought to the kidneys, and precipitation may occur, predisposing to stone formation. Excessive intake of dairy products may promote constipation. However, this is not the most accurate reason for decreasing calcium intake. Immobility does not increase calcium absorption from the intestine. Dairy products do not necessarily contribute to weight gain.

 CN: Basic care and comfort; CL: Synthesize

120. 2. The woman with spinal cord injury can participate in sexual

activity but might not experience orgasm. Cessation in the nerve pathway may occur in spinal cord injury, but this does not negate the client's mental and emotional needs to creatively participate with her partner in a sexual relationship and to reach orgasm. An indwelling urinary catheter may be left in place during intercourse and need not be removed because the indwelling urinary catheter is placed in the urethra, which is not the channel used for sexual intercourse. There are no contraindications, such as hypertension, to sexual activity in a woman with spinal cord injury. Sexual intercourse is allowed, and hypertension should be manageable. Because a spinal cord injury does not affect fertility, the client should have access to family planning information so that an unplanned pregnancy can be avoided.

CN: Basic care and comfort; CL: Evaluate

121. 3. Spinal cord injury represents a physical loss; grief is the normal response to this loss. Working through grief entails reviewing memories and eventually letting go of them. The process may take as long as 2 years. Telling the client to be patient and that adjustment takes time is a clichéd type of response, one that is not empathetic or responsive to the client's needs. Telling the client to focus on today does not allow time for the grief process, which is necessary for the client to work through and adjust to the loss. The client is not escaping but is reminiscing on what is lost, to work through the grieving process.

CN: Psychosocial adaptation; CL: Synthesize

Managing Care, Quality, and Safety of Clients with Musculoskeletal Health Problems

122. 1,3,4,5. Clients who are at risk for falling include the client taking narcotics, the client with a known fear of falling, the client with cognitive impairment, and the client with gait problems. Age and setting are not necessarily risks for fallings.

CN: Management of care; CL: Synthesize

123. 2,3,5. The client with a C3–C4 fracture has neck control but may tire easily using sore muscles around the incision area to hold up the head. Therefore, the head and neck of the wheelchair should be high. The seat of

the wheelchair should be lower than normal to facilitate transfer from the bed to the wheelchair. When a client can use the hands and arms to move the wheelchair, the placement of the back to the client's scapula is necessary. This client cannot use the arms and will need an electric chair with breath, chin, or voice control to manipulate movement of the chair. A firm or hard cushion adds pressure to bony prominences; the cushion should instead be padded to reduce the risk of pressure ulcers.

CN: Basic care and comfort; CL: Synthesize

124. 3. Infection is a serious complication of total hip replacement and may necessitate removal of the implant. Clients who are obese, poorly nourished, or elderly and those who have poorly controlled diabetes, rheumatoid arthritis, or concurrent infections (e.g., dental, urinary tract) are at high risk for infection. Clients who are of normal weight and have well-controlled chronic diseases are not at risk for infection. Living alone is not a risk factor for infection.

CN: Reduction of risk potential; CL: Synthesize

125. 1,2,3,5. A restraint is a method of involuntary physical restriction of a client's freedom of movement, physical activity, or normal access to his/her body. The nurse must monitor and provide care to optimize the physical and psychological well-being of the client including, but not limited to, respiratory and circulatory status, skin integrity, and vital signs. With each assessment, the nurse needs to ascertain that restraints are still required for client safety. The least restrictive intervention based on an individualized assessment of the client's medical or behavioral status or condition is needed.

CN: Safety and infection control; CL: Analyze

126. 1,3,4,5,6. Client safety is a priority for the client, the client's family, and all of the personnel working on this unit. All of these persons must be engaged in using strategies to prevent falls. The insurance provider does not need to be involved in developing a falls program.

CN: Safety and infection control; CL: Create

127. 2. The client is identified as being at risk for falling, and a staff member or family member should accompany the client when walking. The

nurse should first accompany the client back the room. Because the client is not fatigued, the client does not need a wheelchair, but must have assistance. The nurse can delegate the task of ambulating the client to the **UAP** 📖, but it may take a while to locate one that is available at this time. Walking only in the room will not provide an opportunity for the client to gain strength and improve ambulation, but the nurse should remind the client to have assistance.

🔑 CN: Reduction of risk potential; CL: Synthesize

128. 1,2,3. To assure client safety when using anticoagulants, the nurse should coordinate care at this time with the pharmacist, dietitian, and laboratory. The pharmacist will collaborate in teaching the client about using the drug; dietary services will plan a diet that limits foods that have high amounts of vitamin K (spinach, cabbage, blueberries) that will interfere with anticoagulation; and the laboratory will draw daily INR levels to assure accurate dosing. Although the nurse coordinates discharge planning at the time of admission to the hospital, at this point it is too soon for discharge planning services to be involved because it is not known if the client will continue to take the warfarin when discharged. There is no indication a chaplain is needed at this time.

🔑 CN: Management of care; CL: Synthesize

129. 4. Side rails are considered restraints and are not used at both the head and foot of the bed. Using side rails at the head of the bed will aid the client in sitting up and are safe, but using side rails at both the head and the foot of the bed presents risks for a client who might become wedged between the rail and the bed or attempt to climb over them. The nurse discusses side rail use with the **UAP** 📖 and lowers the side rail at the foot of the bed. The nurse assures the bed is placed in low position. The accessible call light, dim lighting, and clear path to the bathroom are factors that contribute to fall prevention.

🔑 CN: Management of care; CL: Synthesize

130. 3. Hand-off communication is an interactive communication allowing the opportunity for questioning between the giver and receiver of client information, including up-to-date information regarding the client's care,

treatment, and services, as well as the client's current condition and any recent or anticipated changes. "Hand-off" communication does occur when a nurse is leaving the nursing unit, but the purpose is not to let the charge nurse know that the nurse is going to lunch or to have someone else assigned to care for the client. "Hand-off" communication focuses on current information, not the client's history.

CN: Management of care; CL: Synthesize

131. 1,2,4,5,6. The nurse should determine that a client with rheumatoid arthritis can describe the septic arthritis physiologic process and knows how to relieve pain using pharmacologic and nonpharmacologic interventions. Prolonged immobility and limited activity may promote formation of a deep vein thrombosis and possibly subsequent pulmonary emboli. The client should also understand the importance of supporting the affected joint, weight-bearing and activity restrictions, and how to use ambulatory aids and assistive devices safely to promote recovery of normal function. The local application of heat and cold to an injured body part can provide therapeutic benefits; however, "high" heat may cause a thermal injury and further promote edema formation. The client should inform the **healthcare provider (HCP)**  about pain that is not relieved by the current management plan.

CN: Management of care; CL: Evaluate

132. 2,3. Passive ROM exercises are used to move the client's joints through as full a ROM as possible. Passive ROM exercises improve or maintain joint mobility and help prevent contractures. These exercises are indicated for the client with temporary or permanent loss of mobility, sensation, or consciousness. Exercises help with joint mobility, strength, and endurance. Plantar flexion of the foot and supination of the hand may be normal joint movements if the client can do active ROM. Septic joints have infection that may be spread either hematogenously or through trauma.

CN: Reduction of risk potential; CL: Apply

The Client with Cancer

- The Client at Risk for Cancer
- The Client with Pain
- The Client Who Is Receiving Chemotherapy
- The Client Who Is Receiving Radiation Therapy
- The Client Who Requires Symptom Management
- The Client Who Is Coping with Loss, Grief, Bereavement, and Spiritual Distress
- The Client Who Is Experiencing Problems with Sexuality
- Ethical and Legal Issues Related to Clients with Cancer
- End-of-Life Care
- Managing Care, Quality, and Safety of Clients with Cancer
- Answers, Rationales, and Test-Taking Strategies

The Client at Risk for Cancer

- 1.** Which client is at **highest** risk for colorectal cancer?
 - ☐ **1.** the client who smokes
 - ☐ **2.** the client who eats a vegetarian diet
 - ☐ **3.** the client who has been treated for Crohn's disease for 20 years
 - ☐ **4.** the client who has a family history of lung cancer
- 2.** A nurse is conducting a cancer risk screening program. Which client is at **greatest** risk for skin cancer?
 - ☐ **1.** a 45-year-old healthcare worker
 - ☐ **2.** a 15-year-old high school student
 - ☐ **3.** a 30-year-old butcher

- ☐ 4. a 60-year-old mountain biker

3. A client diagnosed with testicular cancer expresses concerns about fertility. The client and his spouse desire to eventually have a family, and the nurse discusses the option of sperm banking. The nurse should inform the couple that sperm banking would need to be performed:

- ☐ 1. before treatment is started.
- ☐ 2. once the client is tolerating the treatment.
- ☐ 3. upon completion of treatment.
- ☐ 4. when tumor markers drop to normal levels.

4. Cancer prevalence is defined as:

- ☐ 1. the likelihood cancer will occur in a lifetime.
- ☐ 2. the number of persons with cancer at a given point in time.
- ☐ 3. the number of new cancers in a year.
- ☐ 4. all cancer cases more than 5 years old.

5. A nurse is planning an educational program about cancer prevention and detection. Which group would benefit **most** from education regarding potential risk factors for melanoma?

- ☐ 1. adults older than age 35
- ☐ 2. senior citizens who have been repeatedly exposed to the effects of ultraviolet A and ultraviolet B rays
- ☐ 3. parents with children
- ☐ 4. employees of a chemical factory

6. A nurse is providing education in a community setting about general measures to avoid excessive sun exposure. Which recommendation is appropriate?

- ☐ 1. Apply sunscreen only after going into the water.
- ☐ 2. Avoid peak exposure hours from 0900 to 1300.
- ☐ 3. Wear loosely woven clothing for added ventilation.
- ☐ 4. Apply sunscreen with a sun protection factor (SPF) of 15 or more before sun exposure.

7. A 29-year-old woman is concerned about her personal risk factors for

malignant melanoma. She is upset because her 49-year-old sister was recently diagnosed with the disease. After gathering information about the client's history of sun exposure, the nurse's **best** response would be to explain that:

- ☐ 1. some melanomas have a familial component, and she should seek medical advice.
- ☐ 2. her personal risk is low because most melanomas occur at age 60 or later.
- ☐ 3. her personal risk is low because melanoma does not have a familial component.
- ☐ 4. she should not worry because she did not experience severe sunburn as a child.

8. A client with a family history of cancer asks the nurse what the single most important risk factor is for cancer. Which risk factor should the nurse discuss?

- ☐ 1. family history
- ☐ 2. lifestyle choices
- ☐ 3. age
- ☐ 4. menopause or hormonal events

9. A 42-year-old female highway construction worker is concerned about her cancer risks. She has been married for 18 years, has two children, smokes one pack of cigarettes per day, and occasionally drinks one to two beers. She is 30 lb (13.6 kg) overweight, eats fried fast food often, and rarely eats fresh fruits and vegetables. Her mother was diagnosed with breast cancer 2 years ago. Her father and an aunt both died of lung cancer. She had a basal cell carcinoma removed from her cheek 3 years earlier. What behavioral changes should the nurse coach this client to make to decrease her risk of cancer? Select all that apply.

- ☐ 1. Improve nutrition.
- ☐ 2. Decrease alcohol consumption.
- ☐ 3. Use sunscreen.
- ☐ 4. Stop smoking.
- ☐ 5. Lose weight.
- ☐ 6. Change her job to work inside.

10. The incidence and risk of cancer increase when smoking is combined with:

- ☐ 1. asbestos exposure and alcohol consumption.
- ☐ 2. ultraviolet radiation exposure and alcohol consumption.
- ☐ 3. asbestos exposure and ultraviolet radiation exposure.
- ☐ 4. alcohol consumption and human papillomavirus (HPV) infection.

11. The nurse is assessing a 60-year-old who has hoarseness and a chronic sore throat. What should the nurse determine while conducting a focused assessment? Select all that apply.

- ☐ 1. use of acetaminophen
- ☐ 2. exposure to sun
- ☐ 3. consumption of a high-fat diet
- ☐ 4. history of tobacco use
- ☐ 5. amount of alcohol consumption

12. A 42-year-old is interested in making dietary changes to reduce the risk of colon cancer. What dietary selections should the nurse suggest?

- ☐ 1. croissant, granola and peanut butter squares, whole milk
- ☐ 2. bran muffin, skim milk, stir-fried broccoli
- ☐ 3. granola, bagel with cream cheese, cauliflower salad
- ☐ 4. oatmeal raisin cookies, baked potato with sour cream, turkey sandwich

13. The nurse is conducting a cancer risk assessment for a middle-aged client. Which environmental factor increases the risk of cancer?

- ☐ 1. gender
- ☐ 2. nutrition
- ☐ 3. immunologic status
- ☐ 4. age

14. A client at risk for lung cancer asks about the reason for having a computed tomography (CT) scan as part of the initial exam. What is the nurse's **best** response? "A CT scan is:

- ☐ 1. far superior to magnetic resonance imaging for evaluating lymph node metastasis."

- ☐ 2. noninvasive and readily available.”
- ☐ 3. useful for distinguishing small differences in tissue density and detecting nodal involvement.”
- ☐ 4. used to distinguish a malignant from a nonmalignant adenopathy.”

15. Lifestyle influences that are considered risk factors for colorectal cancer include:

- ☐ 1. a diet low in vitamin C.
- ☐ 2. a high dietary intake of artificial sweeteners.
- ☐ 3. a high-fat, low-fiber diet.
- ☐ 4. multiple sex partners.

16. When planning a culturally sensitive health education program, the nurse should:

- ☐ 1. locate the program at a facility that will not charge for use.
- ☐ 2. integrate folk beliefs and traditions of the target population into the content.
- ☐ 3. prepare materials in the primary language of the program sponsor.
- ☐ 4. exclude community leaders from the dominant culture from initial planning efforts.

The Client with Pain

17. A client in a hospice program has increasing pain. The nurse and client collaborate to schedule analgesics to provide:

- ☐ 1. doses of analgesic when pain is a 5 on a scale of 1 to 10.
- ☐ 2. enough analgesia to keep the client semisomnolent.
- ☐ 3. an analgesia-free period so that the client can carry out daily hygienic activities.
- ☐ 4. around-the-clock routine administration of analgesics for continuous pain relief.

18. A client with pancreatic cancer has been receiving morphine via a subcutaneous pump for 2 weeks. The client is requiring an increased dose of the morphine to manage the pain. The nurse should document that the client is:

- ☐ 1. tolerating the medication well.
- ☐ 2. showing addiction to morphine.
- ☐ 3. developing a tolerance for the medication.
- ☐ 4. experiencing physical dependence.

19. A client with advanced ovarian cancer takes 150 mg of long-acting morphine orally every 12 hours for abdominal pain. When the client develops a small bowel obstruction, the healthcare provider (HCP) discontinues the oral morphine and prescribes morphine 6 mg/h IV. After calculating the equianalgesic conversion from oral to intravenous morphine, the nurse should:

- ☐ 1. continue the oral morphine for one more dose after the IV morphine is started.
- ☐ 2. contact the HCP to suggest a higher equianalgesic dose of IV morphine.
- ☐ 3. administer the morphine IV as prescribed.
- ☐ 4. clarify the prescription to recommend the initial morphine dose of 4 mg/h.

20. A client had a craniotomy for removal of a malignant brain tumor in the occipital region. The nurse should question a prescription for which of these drugs?

- ☐ 1. ibuprofen
- ☐ 2. naproxen
- ☐ 3. morphine sulfate
- ☐ 4. acetaminophen

21. A 62-year-old female is taking long-acting morphine 120 mg every 12 hours for pain from metastatic breast cancer. She can have 20 mg of immediate-release morphine every 3 to 4 hours as needed for breakthrough pain. The healthcare provider (HCP) should be notified if the client uses **more** than how many breakthrough doses of morphine in 24 hours?

- ☐ 1. seven
- ☐ 2. four
- ☐ 3. two

☐ 4. one

22. Assessment of a client taking a nonsteroidal anti-inflammatory drug (NSAID) for pain management should include specific questions regarding which body system?

- ☐ 1. gastrointestinal
- ☐ 2. renal
- ☐ 3. pulmonary
- ☐ 4. cardiac

23. The nurse is assessing a client with chronic pain. What findings are expected for a client in chronic pain? Select all that apply.

- ☐ 1. facial grimacing
- ☐ 2. normal vital signs
- ☐ 3. physical inactivity
- ☐ 4. moaning
- ☐ 5. depression

24. A client with lung cancer is being cared for by his wife at home. His pain is increasing in severity. The nurse recognizes that teaching has been effective when the wife: (Select all that apply.)

- ☐ 1. gives her husband a long-acting or sustained-release oral pain medication regularly around the clock.
- ☐ 2. uses an immediate-release medication (oxycodone) for breakthrough pain.
- ☐ 3. avoids long-acting opioids due to her concern about addiction.
- ☐ 4. uses music for distraction as well as heat or cold in combination with medications.
- ☐ 5. substitutes acetaminophen to avoid tolerance to the medications.
- ☐ 6. has her husband use a pain rating scale to measure the effectiveness at reaching his individual pain goal.

25. A 52-year-old male was discharged from the hospital for cancer-related pain. His pain appeared to be well controlled on the IV morphine. He was switched to oral morphine when discharged 2 days ago. He now reports his pain as an 8 on a 10-point scale and wants the IV morphine. Which

explanation is the **most** likely for the client's reports of inadequate pain control?

- ☐ 1. He is addicted to the IV morphine.
- ☐ 2. He is going through withdrawal from the IV opioid.
- ☐ 3. He is physically dependent on the IV morphine.
- ☐ 4. He is undermedicated on the oral opioid.

26. A nurse is assessing a client with bone cancer pain. Which part of a thorough pain assessment is **most** significant for this client?

- ☐ 1. intensity
- ☐ 2. cause
- ☐ 3. aggravating factors
- ☐ 4. location

27. A client with chronic cancer pain has been receiving opiates for 4 months. She rated the pain as an 8 on a 10-point scale before starting the opioid medication. Following a thorough examination, there is no new evidence of increased disease, yet the pain is close to 8 again. The **most** likely explanation for the increasing pain is:

- ☐ 1. development of an addiction to the opioids.
- ☐ 2. tolerance to the opioid.
- ☐ 3. withdrawal from the opioid.
- ☐ 4. placebo effect has decreased.

28. The nurse teaches the client with chronic cancer pain about optimal pain control. Which recommendation is **most** effective for pain control?

- ☐ 1. Get used to some pain, and use a little less medication than needed to keep from being addicted.
- ☐ 2. Take prescribed analgesics on an around-the-clock schedule to prevent recurrent pain.
- ☐ 3. Take analgesics only when pain returns.
- ☐ 4. Take enough analgesics around the clock so that you can sleep 12 to 16 hours a day to block the pain.

The Client Who Is Receiving Chemotherapy

29. When preparing to administer a chemotherapeutic agent to a client, the nurse should:

- ☐ 1. recap all needles used to prepare agents.
- ☐ 2. dispose of chemotherapy wastes in the client's bedside trash.
- ☐ 3. use gloves and disposable long-sleeved gowns when handling agents.
- ☐ 4. administer only prepackaged agents from the manufacturer.

30. A client who is receiving chemotherapy develops stomatitis. What should the nurse instruct the client to do?

- ☐ 1. Rinse the mouth with full-strength hydrogen peroxide every 4 hours.
- ☐ 2. Use a soft-bristled toothbrush after each meal.
- ☐ 3. Drink hot tea with honey to soothe the painful oral mucosa.
- ☐ 4. Avoid using dental floss until the stomatitis is resolved.

31. Doxorubicin is prescribed for a female client with breast cancer. The client is distressed about hair loss. What should the nurse do?

- ☐ 1. Have the client wash and massage the scalp daily to stimulate hair growth.
- ☐ 2. Explain that hair loss is temporary and will quickly grow back to its original appearance.
- ☐ 3. Provide resources for a wig selection before hair loss begins.
- ☐ 4. Recommend that the client limit social contacts until hair regrows.

32. A client is receiving chemotherapy for the diagnosis of brain cancer. When teaching the client about contamination from excretion of the chemotherapy drugs within 48 hours, the nurse should instruct the client that:

- ☐ 1. a bathroom can be shared with an adult who is not pregnant.
- ☐ 2. urinary and bowel excretions are not considered contaminated.
- ☐ 3. disposable plates and plastic utensils must be used during the entire course of chemotherapy.
- ☐ 4. any contaminated linens should be washed separately and then washed a second time, if necessary.

33. A client is receiving vincristine. Client teaching by the nurse should include instructions on:

- ☐ 1. use of loperamide.
- ☐ 2. fluid restriction.
- ☐ 3. low-fiber, bland diet.
- ☐ 4. bowel regimen.

34. The client who is receiving chemotherapy is not eating well but otherwise feels healthy. What should the nurse suggest the client eat?

- ☐ 1. cereal with milk and strawberries
- ☐ 2. toast, gelatin dessert, and cookies
- ☐ 3. broiled chicken, green beans, and cottage cheese
- ☐ 4. steak and french fries

35. A nurse is assessing a woman who is receiving the second administration of chemotherapy for breast cancer. When obtaining this client's health history, the nurse should ask the client which question?

- ☐ 1. "Has your hair been falling out in clumps?"
- ☐ 2. "Have you had nausea or vomiting?"
- ☐ 3. "Have you been sleeping at night?"
- ☐ 4. "Do you have your usual energy level?"

36. A client is receiving monthly doses of chemotherapy for treatment of stage III colon cancer. Which laboratory results should the nurse report to the oncologist before the **next** dose of chemotherapy is administered? Select all that apply.

- ☐ 1. hemoglobin of 14.5 g/dL (145 g/L)
- ☐ 2. platelet count of 40,000/mm³ ($40 \times 10^9/L$)
- ☐ 3. blood urea nitrogen (BUN) level of 12 mg/dL (4.3 mmol/L)
- ☐ 4. white blood cell count of 2,300/mm³ ($2.3 \times 10^9/L$)
- ☐ 5. temperature of 101.2°F (38.4°C)
- ☐ 6. urine specific gravity of 1.020

37. A nurse is checking the laboratory results of a client with colon cancer admitted for further chemotherapy. The client has lost 30 lb (13.6 kg) since initiation of the treatment. Which laboratory result should be reported to the healthcare provider (HCP)?

- ☐ 1. blood glucose level of 95 mg/dL (5.3 mmol/L)
- ☐ 2. total cholesterol level of 182 mg/dL (4.71 mmol/L)
- ☐ 3. hemoglobin level of 12.3 mg/dL (123 g/L)
- ☐ 4. albumin level of 2.8 g/dL (28 g/L)

38. The **most** reliable early indicator of infection in a client who is neutropenic is:

- ☐ 1. fever.
- ☐ 2. chills.
- ☐ 3. tachycardia.
- ☐ 4. dyspnea.

39. A nurse is caring for a client who is undergoing chemotherapy. Current laboratory values are noted on the medical record. Which action would be **most** appropriate for the nurse to implement?

Laboratory Results

Test	Result
Hemoglobin	12.0 g/dL (120 g/L)
Platelet count	108,000/mm ³ (108 × 10 ⁹ /L)
WBC count	1,600/mm ³ (1.6 × 10 ⁹ /L)
ANC	< 1,000/mm ³ (1 × 10 ⁹ /L)

- ☐ 1. wearing a protective gown and particulate respiratory mask when completing treatments
- ☐ 2. washing hands before and after entering the room
- ☐ 3. restricting visitors
- ☐ 4. contacting the healthcare provider (HCP) for a prescription for hematopoietic factors such as erythropoietin

40. A client is using an herbal therapy while receiving chemotherapy. The nurse should:

- ☐ **1.** determine what substances the client is using, and make sure that the healthcare provider (HCP) is aware of all therapies the client is using.
- ☐ **2.** guide the client in the decision-making process to select either Western or alternative medicine.
- ☐ **3.** encourage the client to seek alternative modalities that do not require the ingestion of substances.
- ☐ **4.** recommend that the client stop using the alternative medicines immediately.

41. A client diagnosed with cancer is receiving chemotherapy. The nurses should assess which diagnostic value while the client is receiving chemotherapy?

- ☐ **1.** bone marrow cells
- ☐ **2.** liver tissues
- ☐ **3.** heart tissues
- ☐ **4.** pancreatic enzymes

42. A client is receiving chemotherapy that has the potential to cause pulmonary toxicity. Which signs or symptoms indicate a toxic response to the chemotherapy?

- ☐ **1.** decrease in appetite
- ☐ **2.** drowsiness
- ☐ **3.** spasms of the diaphragm
- ☐ **4.** cough and shortness of breath

43. A client is to start chemotherapy to treat lung cancer. A venous access device has been placed to permit administration of chemotherapeutic medications. Three days later at the scheduled appointment to receive chemotherapy, the nurse assesses that the client is dyspneic and the skin is warm and pale. The vital signs are blood pressure 80/30 mm Hg, pulse 132 bpm, respirations 28 breaths/min, temperature 103°F (39.4°C), and oxygen saturation 84%. The central line insertion site is inflamed. After calling the rapid response team, what should the nurse do **next**?

- ☐ 1. Place cold, wet compresses on the client's head.
- ☐ 2. Obtain a portable ECG monitor.
- ☐ 3. Administer a prescribed antipyretic.
- ☐ 4. Insert a peripheral intravenous fluid line and infuse normal saline.

44. A client receiving chemotherapy for cancer has an elevated serum creatinine level. The nurse should **next**:

- ☐ 1. cancel the next scheduled chemotherapy.
- ☐ 2. administer the scheduled dose of chemotherapy.
- ☐ 3. notify the HCP.
- ☐ 4. obtain a urine specimen.

The Client Who Is Receiving Radiation Therapy

45. The nurse is instructing a client about skin care while receiving radiation therapy to the chest. What should the nurse instruct the client to do?

- ☐ 1. Apply lotion if the skin becomes dry.
- ☐ 2. Shave the chest to prevent contamination from chest hair.
- ☐ 3. Wash the area with tepid water and mild soap.
- ☐ 4. Keep the area covered with a nonadherent dressing between treatments.

46. A client with cancer who is receiving radiation therapy develops thrombocytopenia. The **priority** nursing goal is to prevent:

- ☐ 1. pain related to spontaneous bleeding episodes.
- ☐ 2. altered nutrition related to anemia.
- ☐ 3. injury related to the decreased platelet count.
- ☐ 4. skin breakdown related to decreased tissue perfusion.

47. A client is beginning external beam radiation therapy to the right axilla after a lumpectomy for breast cancer. Which information should the nurse include in client teaching?

- ☐ 1. Use a heating pad under the right arm.
- ☐ 2. Immobilize the right arm.
- ☐ 3. Place ice on the area after each treatment.
- ☐ 4. Apply deodorant only under the left arm.

48. A client receiving radiation therapy for lung cancer is having difficulty sleeping. The nurse should:

- ☐ 1. suggest the client stop watching television before bed.
- ☐ 2. assess the client's usual sleep patterns, amount of sleep, and bedtime rituals.
- ☐ 3. tell the client sleeplessness is expected with radiation therapy.
- ☐ 4. suggest that the client stop drinking coffee until the therapy is completed.

49. A 56-year-old female client is currently receiving radiation therapy to the chest wall for recurrent breast cancer. She has pain while swallowing and burning and tightness in her chest. The nurse should further assess the client for indications of:

- ☐ 1. hiatal hernia.
- ☐ 2. stomatitis.
- ☐ 3. radiation enteritis.
- ☐ 4. esophagitis.

50. A 36-year-old female is scheduled to receive external radiation therapy and a cesium implant for cancer of the cervix and is asking about the effects of the radiation on sexual relations. The nurse should inform the client about which potential effects of radiation therapy on sexuality?

- ☐ 1. "You can have sexual intercourse while the implant is in place."
- ☐ 2. "You may notice some vaginal dryness after treatment is completed."
- ☐ 3. "You may notice some vaginal relaxation after treatment is completed."
- ☐ 4. "You will continue to have normal menstrual periods during treatment."

51. The nurse caring for a client who is receiving external beam radiation therapy for treatment of lung cancer should assess the client for:

- ☐ 1. diarrhea.
- ☐ 2. improved energy level.
- ☐ 3. dysphagia.
- ☐ 4. normal white blood cell count.

The Client Who Requires Symptom Management

52. A client receiving radiation to the head and neck is experiencing stomatitis. The nurse should recommend:

- ☐ 1. evaluation by a dentist.
- ☐ 2. alcohol-based mouthwash rinses.
- ☐ 3. artificial saliva.
- ☐ 4. vigorous brushing of teeth after each meal.

53. A client undergoing chemotherapy has a white blood cell count of $2,300/\text{mm}^3$ ($2.3 \times 10^9/\text{L}$), hemoglobin of 9.8 g/dL (98 g/L), platelet count of $80,000/\text{mm}^3$ ($80 \times 10^9/\text{L}$), and potassium of 3.8. Which finding should take priority?

- ☐ 1. blood pressure 136/88 mm Hg
- ☐ 2. emesis of 90 mL
- ☐ 3. temperature 101°F (38.3°C)
- ☐ 4. urine output 40 mL/h

54. A client with bladder cancer has gross hematuria. The client's hemoglobin is 8.0 g/dL (80 g/L), and the healthcare provider (HCP) prescribes a unit of packed blood cells. The client has an existing intravenous infusion of normal saline using a 19-gauge needle. To administer the packed red blood cells, the nurse should:

- ☐ 1. attach the packed cells to the existing 19-gauge IV of normal saline solution using Y tubing.
- ☐ 2. start an additional 22-gauge IV site because the packed blood cells must be given in a separate line.
- ☐ 3. attach the packed blood cells to the existing 22-gauge IV of 5% dextrose using Y tubing.
- ☐ 4. start an additional IV access device with a 22-gauge intravenous cannulation device.

55. A nurse is caring for a client 24 hours after an abdominal-perineal resection for a bowel tumor. The client's wife asks if she can bring him some of his favorite home-cooked Italian minestrone soup. What should the nurse do **first**?

- ☐ 1. Auscultate for bowel sounds.
- ☐ 2. Ask the client if he feels hunger or gas pains.
- ☐ 3. Consult the dietician.
- ☐ 4. Encourage the wife to bring the soup.

56. Which nursing intervention would be **most** helpful in improving the respiratory effort of a client with metastatic lung cancer?

- ☐ 1. teaching the client diaphragmatic breathing techniques
- ☐ 2. administering cough suppressants as prescribed
- ☐ 3. teaching and encouraging pursed-lip breathing
- ☐ 4. placing the client in a low semi-Fowler's position

57. Which information should be included in the teaching plan for a client with cancer who is experiencing thrombocytopenia? Select all that apply.

- ☐ 1. Use an electric razor.
- ☐ 2. Use a soft-bristle toothbrush.
- ☐ 3. Avoid frequent flossing for oral care.
- ☐ 4. Include an over-the-counter nonsteroidal anti-inflammatory (NSAID) daily for pain control.
- ☐ 5. Monitor temperature daily.
- ☐ 6. Report bleeding, such as nosebleed, petechiae, or melena, to a healthcare provider (HCP).

58. A client with cancer is afraid of experiencing a febrile reaction associated with blood transfusions. The nurse should explain to the client that:

- ☐ 1. "Febrile reactions are caused when antibodies on the surface of blood cells in the transfusion are directed against antigens of the recipient."
- ☐ 2. "Febrile reactions can usually be prevented by administering antipyretics and antihistamines before the start of the transfusion."
- ☐ 3. "Febrile reactions are rarely immune-mediated reactions and can be a sign of hemolytic transfusion."
- ☐ 4. "Febrile reactions primarily occur within 15 minutes after initiation of the transfusion and can occur during the blood transfusion."

59. An adult who recently had a right pneumonectomy for lung cancer is

admitted to the oncology unit with dyspnea and fever. The nurse should:

- ☐ 1. place the client on the left side.
- ☐ 2. position the client for postural drainage.
- ☐ 3. provide education on deep-breathing exercises.
- ☐ 4. instruct the client to maintain bed rest with bathroom privileges.

60. A client undergoing chemotherapy tells the nurse, “I do not want to get out of bed in the morning, because I am so tired.” The nursing plan of care should include:

- ☐ 1. education on the use of filgrastim.
- ☐ 2. individually tailored exercise program.
- ☐ 3. weight lifting when not experiencing fatigue.
- ☐ 4. bed rest until chemotherapy is completed.

61. A nurse is reviewing the medical record of an adult male with cancer. The healthcare provider (HCP) has prescribed filgrastim 400 mcg, subcutaneously once daily. The nurse reviews the laboratory report and determines treatment has been effective when:

Laboratory Results

Hemoglobin: 16 g/dL (160 g/L)

White blood cell (WBC) count: 3,500/mm³ ($3.5 \times 10^9/L$)

Platelet count: 200,000/mm³ ($200 \times 10^9/L$)

Red blood cell (RBC) count: 4.3 million/mm³ ($4.3 \times 10^{12}/L$)

- ☐ 1. hemoglobin is 16 g/dL (160 g/L).
- ☐ 2. WBC count is 3,500/mm³ ($3.5 \times 10^9/L$).
- ☐ 3. platelet count is 200,000/mm³ ($200 \times 10^9/L$).
- ☐ 4. RBC count is 4.3 million/mm³ ($4.3 \times 10^{12}/L$).

62. The nurse is teaching the client who is receiving chemotherapy and the family how to manage possible nausea and vomiting at home. The nurse

should include information about:

- ☐ 1. eating frequent, small meals throughout the day.
- ☐ 2. eating three normal meals a day.
- ☐ 3. eating only cold foods with no odor.
- ☐ 4. limiting the amount of fluid intake.

63. A terminally ill client in hospice care is experiencing nausea and vomiting because of a partial bowel obstruction. To respect the client's wishes for palliative care, the nurse should recommend the use of:

- ☐ 1. a nasogastric (NG) suction tube.
- ☐ 2. IV antiemetics.
- ☐ 3. osmotic laxatives.
- ☐ 4. a clear liquid diet.

64. An adult is dying from metastatic lung cancer, and all treatments have been discontinued. The client's breathing pattern is labored, with gurgling sounds. The client's spouse asks the nurse, "Can you do something to help with the breathing?" Which is the nurse's **best** response in this situation?

- ☐ 1. Direct the unlicensed assistive personnel (UAP) to assess the client's vital signs and provide oral care.
- ☐ 2. Suction the client so that the client's spouse knows all interventions were performed.
- ☐ 3. Reposition the client, elevate the head of the bed, and provide a cool compress.
- ☐ 4. Explain to the spouse that it is standard practice not to suction clients when treatments have been discontinued.

65. A 65-year-old client with brown hair is concerned about losing the hair on the head as a result of chemotherapy. The nurse should tell the client:

- ☐ 1. "The new growth of hair will be gray."
- ☐ 2. "The hair loss is temporary."
- ☐ 3. "New hair growth will be the same texture and color as it was before chemotherapy."
- ☐ 4. "The client should avoid use of wigs when possible."

66. An adult with a history of chronic obstructive pulmonary disease

(COPD) and metastatic carcinoma of the lung has not responded to radiation therapy and is being admitted to the hospice program. The nurse should conduct a focused client assessment for:

- ☐ 1. ascites.
- ☐ 2. pleural friction rub.
- ☐ 3. dyspnea.
- ☐ 4. peripheral edema.

67. The nurse is planning with a client who has cancer to improve the client's independence in activities of daily living after radiation therapy. What should the nurse do?

- ☐ 1. Refer the client to a community support group after discharge from the rehabilitation unit.
- ☐ 2. Make certain that a family member is present for the rehabilitation sessions.
- ☐ 3. Provide positive reinforcement for skills achieved.
- ☐ 4. Inform the client of rehabilitation plans made by the rehabilitation team.

68. When teaching about prevention of infection to a client with a long-term venous catheter, the nurse determines that the client has understood discharge instructions when the client states:

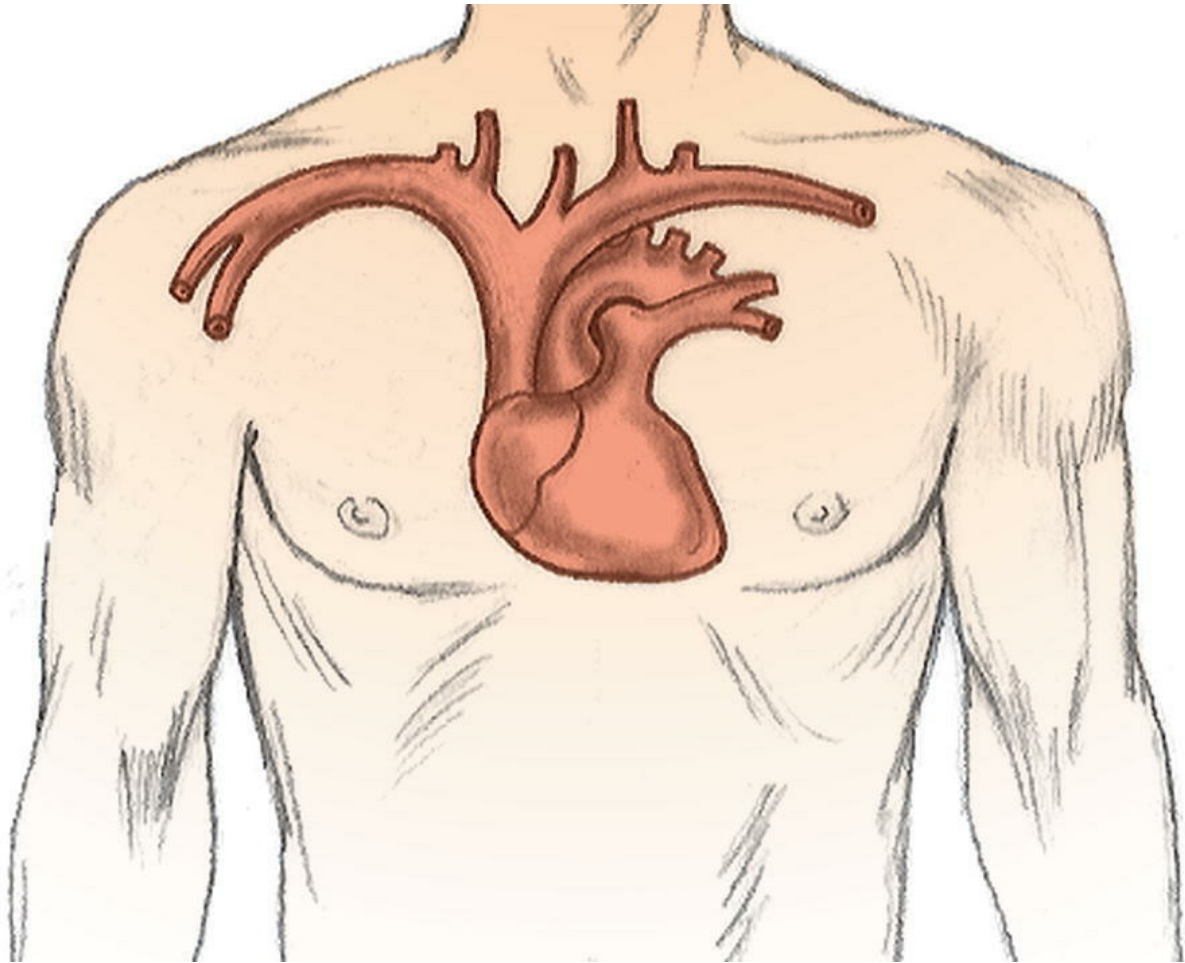

- ☐ 1. "I will not remove the dressing until I return to the clinic next week."
- ☐ 2. "My husband will change the dressing three times a week, using sterile technique."
- ☐ 3. "I will monitor my temperature every other day."
- ☐ 4. "I know it is very important to wash my hands after irrigating the catheter."

69. When caring for a client with a central venous line, which nursing actions should be implemented in the plan of care for chemotherapy administration? Select all that apply.

- ☐ 1. Verify patency of the line by the presence of a blood return at regular intervals.
- ☐ 2. Inspect the insertion site for swelling, erythema, or drainage.

- ☐ 3. Administer a cytotoxic agent to keep the regimen on schedule even if blood return is not present.
- ☐ 4. If unable to aspirate blood, reposition the client and encourage the client to cough.
- ☐ 5. Contact the healthcare provider (HCP) about verifying placement if the status is questionable.

70. Indicate on the illustration the area that correctly identifies the position of the distal tip of a central line that is inserted into the subclavian vein.

71. A client with pancreatic cancer, who has been bed-bound for 3 weeks, has just returned from having a left subclavian, long-term, tunneled catheter inserted for administration of analgesics. The nurse has not yet received radiographic results for confirmation of placement. The client becomes restless and dyspneic and has chest pain radiating to the middle of the back. Physical assessment reveals tachycardia and absent breath sounds in the left

lung. The nurse should further assess the client for:

- ☐ 1. an air embolus.
- ☐ 2. a pneumothorax.
- ☐ 3. a pulmonary embolus.
- ☐ 4. a myocardial infarction.

72. In setting goals for a client with advanced liver cancer who has poor nutrition, which is a desired outcome for the client? The client will:

- ☐ 1. have normalized albumin levels.
- ☐ 2. return to ideal body weight.
- ☐ 3. gain 1 lb (0.5 kg) every 2 weeks.
- ☐ 4. maintain current weight.

73. The nurse administers a bolus tube feeding to a client with cancer. To decrease the risk of aspiration, the nurse should:

- ☐ 1. place the client on bed rest with the head of the bed elevated to 60 degrees for 2 hours.
- ☐ 2. turn the client on the left side with the head of the bed at 45 degrees for 15 minutes.
- ☐ 3. assist the client out of bed to sit upright in a chair for 1 hour.
- ☐ 4. ask the client to rest in bed with the head of the bed elevated to 30 degrees for 20 minutes.

74. A client with colon cancer had a left hemicolectomy 3 weeks ago. The client is still having difficulty maintaining an adequate oral intake to meet metabolic needs for optimal healing. The nurse should recommend to the healthcare provider (HCP) which nutritional support to maintain the nutritional needs of the client?

- ☐ 1. total parenteral nutrition through a central catheter
- ☐ 2. IV infusion of dextrose
- ☐ 3. nasogastric feeding tube with protein supplement
- ☐ 4. jejunostomy for high-caloric feedings

75. A client with colon cancer undergoes surgical removal of a segment of colon and creation of a sigmoid colostomy. What assessments by the nurse indicate the client is developing complications within the first 24 hours?

Select all that apply.

- ☐ 1. coarse breath sounds auscultated bilaterally at the bases
- ☐ 2. dusky appearance of the stoma
- ☐ 3. no drainage in the ostomy appliance
- ☐ 4. temperature >101.2°F (38.4°C)
- ☐ 5. decreased bowel sounds

76. A client receiving chemotherapy for metastatic colon cancer is admitted to the hospital because of prolonged vomiting. Assessment findings include irregular pulse of 120 bpm, blood pressure of 88/48 mm Hg, respiratory rate of 14 breaths/min, serum potassium of 2.9 mEq/L (2.9 mmol/L), and arterial blood gas—pH 7.46, PCO₂ 45 mm Hg (6.0 kPa), PO₂ 95 mm Hg (12.6 kPa), and bicarbonate level 29 mEq/L (29 mmol/L). The nurse should implement which prescription **first**?

- ☐ 1. oxygen at 4 L per nasal cannula
- ☐ 2. repeat lab work in 4 hours
- ☐ 3. 5% dextrose in 0.45% normal saline with KCl 40 mEq/L at 125 mL/h
- ☐ 4. 12-lead ECG

77. One week after a left mastectomy, the client reports her appetite is still not good, she is not getting much sleep, and her husband is avoiding her. She is eager to get back to work. What should the nurse do **first**?

- ☐ 1. Call the healthcare provider (HCP) to discuss allowing the client to return to work earlier.
- ☐ 2. Suggest that the client learn relaxation techniques for help with insomnia.
- ☐ 3. Perform a nutritional assessment to assess for anorexia.
- ☐ 4. Ask open-ended questions about sexuality issues related to her mastectomy.

78. The nurse is making a follow-up telephone call to a 52-year-old client with lung cancer. The client now has a low-grade fever (100.6°F [38.1°C]), nonproductive cough, and increasing fatigue. The client completed the radiation therapy to the mass in the right lung and mediastinum 10 weeks ago and has a follow-up appointment to see the healthcare provider in 2 weeks.

The nurse should advise the client:

- ☐ 1. to take two acetaminophen tablets every 4 to 6 hours for 2 days and call the healthcare provider (HCP) if the temperature increases to 101°F (38.3°C) or greater.
- ☐ 2. that this is an expected side effect of the radiation therapy and to keep his appointment in 2 weeks.
- ☐ 3. to contact the healthcare provider (HCP) for an appointment today.
- ☐ 4. to go to the nearest emergency department.

79. A client with malignant pleural effusions has dyspnea and chest pain. In which order of priority from first to last should the nurse manage the client's care? All options must be used.

1. Administer morphine sulfate 2 mg IV.

2. Apply oxygen at 2 L via nasal cannula.

3. Educate the client in anticipation of a thoracentesis.

4. Coach the client on deep-breathing exercise.

80. What instructions should the nurse provide to a client who develops cellulitis in the right arm after a right modified radical mastectomy?

- ☐ 1. Antibiotics will need to be taken for 1 to 2 weeks.
- ☐ 2. Arm exercises will get rid of the cellulitis.
- ☐ 3. Ice packs should be applied to the affected area for 20-minute periods

to reduce swelling.

- ☐ 4. The right extremity should be lowered to improve blood flow to the forearm.

81. An adult has just had a sclerosing agent instilled after chest tube drainage of a pleural effusion. The nurse should instruct the client to:

- ☐ 1. lie still to prevent a pneumothorax.
- ☐ 2. sit upright with arms on an overhead table to promote lung expansion.
- ☐ 3. change position frequently to distribute the agent.
- ☐ 4. lie on the side where the thoracentesis was done to hold pressure on the chest tube site.

82. After surgery for head and neck cancer, a client has a permanent tracheostomy. Which is the **most** important point for the nurse to include in the teaching plan for the client and family?

- ☐ 1. providing tracheostomy site care
- ☐ 2. addressing the psychosocial issues related to tracheostomy
- ☐ 3. observing for early signs and symptoms of skin breakdown around the tracheostomy site
- ☐ 4. using humidifiers to prevent thick, tenacious secretions

83. A client has malignant pleural effusions. The nurse should conduct a focused assessment to determine if the client has which signs and symptoms? Select all that apply.

- ☐ 1. hiccups
- ☐ 2. weight gain
- ☐ 3. peripheral edema
- ☐ 4. chest pain
- ☐ 5. dyspnea
- ☐ 6. cough

84. A client with suspected lung cancer is undergoing a thoracentesis. Which outcomes of the procedure are expected? Select all that apply.

- ☐ 1. treatment of recurrent malignant effusion
- ☐ 2. diagnosis of underlying disease
- ☐ 3. palliation of symptoms

- ☐ 4. relief of acute respiratory distress
- ☐ 5. removal of the cancer cells

85. The nurse is assessing a client with anemia. In order to plan nursing care, the nurse should focus the assessment on which signs and symptoms?

- ☐ 1. decreased salivation
- ☐ 2. bradycardia
- ☐ 3. cold intolerance
- ☐ 4. nausea

86. A nurse is assessing an adult who has been receiving chemotherapy. The client has a platelet count of 22,000 cells/mm³ ($22 \times 10^9/L$) and has petechiae on the lower extremities. The nurse should advise the client to:

- ☐ 1. increase the amount of iron in the client's diet.
- ☐ 2. apply lotion to the lower extremities.
- ☐ 3. elevate the legs.
- ☐ 4. consult the healthcare provider (HCP).

87. A nurse is teaching an older adult who has had a left modified radical mastectomy with axillary node dissection about lymphedema. The nurse should tell the client that lymphedema occurs:

- ☐ 1. if all cancer cells are not removed.
- ☐ 2. in older women.
- ☐ 3. at any time after surgery.
- ☐ 4. only with radical mastectomy.

88. A middle-aged female with a history of breast-conserving surgery, axillary node dissection, and radiation therapy reports that her arm is red, warm to touch, and slightly swollen. Which action should the nurse suggest?

- ☐ 1. Apply warm compresses to the affected arm.
- ☐ 2. Elevate the arm on two pillows.
- ☐ 3. See the healthcare provider (HCP) immediately.
- ☐ 4. Schedule an appointment within 2 to 3 weeks.

89. The nurse is assessing a middle-aged client with cancer who has lost 1 lb (0.5 kg) in 4 weeks. The client is taking ondansetron for nausea and now

has a temperature of 101°F (38.3°C). The fever is indicative of:

- ☐ 1. inadequate nutrition.
- ☐ 2. new resistance to current antiemetic therapy.
- ☐ 3. expected response to chemotherapy treatment.
- ☐ 4. infection.

90. A nurse is assessing a client with lymphoma who reports distress 9 days after chemotherapy. Because of the risk for septic shock, the nurse should assess the client for which cluster of symptoms?

- ☐ 1. flushing, decreased oxygen saturation, mild hypotension
- ☐ 2. low-grade fever, chills, tachycardia
- ☐ 3. elevated temperature, oliguria, hypotension
- ☐ 4. high-grade fever, normal blood pressure, increased respirations

91. An appropriate nursing intervention for a client with fatigue related to cancer treatment includes teaching the client to:

- ☐ 1. increase fluid intake.
- ☐ 2. minimize naps or periods of rest during day.
- ☐ 3. conserve energy by prioritizing activities.
- ☐ 4. limit dietary intake of high-fiber foods.

92. The **most** common issue associated with sleep disturbances in the hospitalized client with cancer is:

- ☐ 1. social.
- ☐ 2. nutritional.
- ☐ 3. cultural.
- ☐ 4. psychological.

93. Which is the **most** appropriate nursing intervention for a hospitalized client with pruritus caused by medications used to treat cancer?

- ☐ 1. administration of antihistamines
- ☐ 2. steroids
- ☐ 3. silk sheets
- ☐ 4. medicated cool baths

94. A client receiving chemotherapy has pruritus. In order to develop a

care plan, the nurse should ask if the client has been:

- ☐ 1. wearing clothes made from 100% cotton.
- ☐ 2. sleeping in a cool, humidified room.
- ☐ 3. increasing fluid intake to at least 3,000 mL/day.
- ☐ 4. taking daily baths with a deodorant soap.

95. Which factor is **most** important to assess when determining the impact of the cancer diagnosis and treatment modalities on a long-term survivor's quality of life?

- ☐ 1. occupation and employability
- ☐ 2. functional status
- ☐ 3. evidence of disease
- ☐ 4. individual values and beliefs

96. A client with breast cancer has abdominal bloating and cramping with no bowel movement for 5 days. She says she usually has a bowel movement every day after her morning coffee. Bowel sounds are present in all four quadrants. She received 80 mg of doxorubicin hydrochloride 10 days ago. The nurse should contact the healthcare provider (HCP) to request a prescription for:

- ☐ 1. a ready-to-use enema to stimulate peristalsis.
- ☐ 2. a soapsuds enema until clear.
- ☐ 3. an oral cathartic until the client has a bowel movement; then evaluate the need for daily stool softeners.
- ☐ 4. a daily stool softener for constipation and a mild opioid for abdominal discomfort.

97. A client with cancer has diarrhea and inflamed areas of skin around the rectum. What actions should the nurse take? Select all that apply.

- ☐ 1. Use sitz baths.
- ☐ 2. Apply zinc oxide ointment to the rectal area after each bowel movement.
- ☐ 3. Apply a skin barrier dressing daily to the rectal area.
- ☐ 4. Clean the rectal area with unscented soap and water after each bowel movement, rinse well, and pat dry.

- ☐ 5. Increase fluid intake.

98. When explaining the long-term toxic effects of cancer treatments on the immune system, what should the nurse tell the client?

- ☐ 1. Clients with persistent immunologic abnormalities after treatment are at a much greater risk for infection than clients with a history of splenectomy.
- ☐ 2. The use of radiation and combination chemotherapy can result in more frequent and more severe immune system impairment.
- ☐ 3. Long-term immunologic effects have been studied only in clients with breast and lung cancer.
- ☐ 4. The helper T cells recover more rapidly than do the suppressor T cells, which results in positive helper cell balance that can last 5 years.

The Client Who Is Coping with Loss, Grief, Bereavement, and Spiritual Distress

99. A client is newly diagnosed with cancer and is beginning a treatment plan. Which action by the nurse will be **most** effective in helping the client cope?

- ☐ 1. Assume decision making for the client until treatment is completed.
- ☐ 2. Encourage the client to observe strict compliance with all treatment regimens.
- ☐ 3. Inform the client of all possible adverse treatment effects.
- ☐ 4. Identify available resources for the client and family.

100. A daughter is concerned that her mother is in denial because when they discuss the diagnosis of breast cancer, the mother says that breast cancer is not that serious and then changes the subject. The nurse can tell the daughter that denial can be a healthy defense mechanism if it is used:

- ☐ 1. to permit her mother to seek unconventional treatments.
- ☐ 2. when making decisions about her care.
- ☐ 3. alone and not in combination with other defense mechanisms.
- ☐ 4. to allow her mother to continue in her role as a mother.

101. A 45-year-old single mother of three teenaged boys has metastatic

breast cancer. Her parents live 750 miles (1,200 km) away and have only been able to visit twice since her initial diagnosis 14 months ago. The progression of her disease has forced the client to consider high-dose chemotherapy. She is concerned about her children's welfare during the treatment. When assessing the client's present support systems, the nurse will be **most** concerned about the potential problems with:

- ☐ 1. denial as a primary coping mechanism.
- ☐ 2. support systems and coping strategies.
- ☐ 3. decision-making abilities.
- ☐ 4. transportation and money for the boys.

102. Which characteristic displayed by the wife of a 36-year-old man with pancreatic cancer suggests that she may be at risk for negative bereavement outcomes?

- ☐ 1. She is preparing for her husband's death.
- ☐ 2. She has a high socioeconomic status.
- ☐ 3. She has strong family support.
- ☐ 4. She blames herself for her husband's cancer.

103. The nurse is counseling the family of an older adult who died today. Which factor facilitates attainment of a positive bereavement outcome?

- ☐ 1. being a teenager
- ☐ 2. having a history of anxiety
- ☐ 3. being a spouse
- ☐ 4. possessing adequate financial resources

104. Which nursing intervention will be **most** effective when caring for a client who is experiencing powerlessness?

- ☐ 1. Make certain that all staff members focus only on the client's capabilities.
- ☐ 2. Encourage family members to become more responsible for the client's care.
- ☐ 3. Request a referral to a psychologist.
- ☐ 4. Include the client in decision making whenever possible.

105. During the initial stage of adaptation to the diagnosis of cancer and

its treatment, the nurse can facilitate the client's adaptation by:

- ☐ 1. encouraging the client to maintain her usual role.
- ☐ 2. facilitating family-related disagreements and conflicts.
- ☐ 3. supporting the client in her use of denial as a coping strategy.
- ☐ 4. arranging transportation and child care on treatment days.

106. When explaining hospice care to a client, the nurse should tell the client:

- ☐ 1. "Hospice care uses a team approach to direct hospice activity."
- ☐ 2. "Clients and their families are the focus of care."
- ☐ 3. "Your healthcare provider coordinates all the care."
- ☐ 4. "All hospice clients will die at home."

107. A client's husband expresses concern that his dying wife keeps saying, "I have to go to the store." Which statement by the nurse will be **most** effective in assisting the husband to understand the dying process?

- ☐ 1. "Many dying clients are restless and can be treated with sedatives."
- ☐ 2. "The client may be fighting death, and you should leave her alone."
- ☐ 3. "Comments related to going somewhere or leaving on a trip are common in dying clients."
- ☐ 4. "You can tell your wife that you will take her to the store."

108. The wife of a terminally ill client asks the nurse, "Why is my husband having frequent bowel movements if he is not eating?" The nurse should tell the wife:

- ☐ 1. "I know he is having frequent loose stools and it is distressing for you, but that is just the way it is."
- ☐ 2. "I do not know when the bowels will shut down, but they will eventually."
- ☐ 3. "The pain medication will eventually help to slow the process of bowel function."
- ☐ 4. "The intestines still produce some waste products even when a person is not eating."

109. The client who is in end stages of cancer is requesting spiritual support. The nurse should:

- ☐ 1. inform the family and ask for their suggestions.
- ☐ 2. call a chaplain and set up an appointment for spiritual guidance.
- ☐ 3. help the client reflect on past accomplishments.
- ☐ 4. ask the client what spiritual activities would be most helpful.

110. An older adult with end-stage cancer needs assistance with arranging the finances for end-of-life home care. The nurse should refer the client to:

- ☐ 1. the business manager of the healthcare agency.
- ☐ 2. a social worker.
- ☐ 3. the healthcare provider (HCP).
- ☐ 4. the executor of the client's will.

111. The family members of a client who is near death from colon cancer ask the nurse what to expect if the client becomes dehydrated. What should the nurse tell them?

- ☐ 1. The healthcare provider (HCP) will make the decision regarding hydration therapy.
- ☐ 2. Dehydration may prolong the dying process.
- ☐ 3. Hydration is used only in extreme situations of dehydration.
- ☐ 4. Dehydration is expected during the dying process.

112. When caring for a client who is experiencing spiritual distress, what should the nurse do **first**?

- ☐ 1. Make a referral to a member of the clergy.
- ☐ 2. Explain the major beliefs of different religions.
- ☐ 3. Suggest reading material.
- ☐ 4. Help the client explore his or her own values and beliefs.

113. A nurse is caring for a client who is receiving hospice care at home. The client's neighbors have been calling the nurse to inquire about the client's condition. The nurse should tell the callers:

- ☐ 1. "Please call the oncologist."
- ☐ 2. "The client is in a coma now."
- ☐ 3. "Please call the client's sister."
- ☐ 4. "The client is not expected to live much longer."

114. A 42-year-old client with breast cancer is concerned that her husband is depressed by her diagnosis. Which change in her husband's behavior may confirm her fears?

- ☐ 1. increased decisiveness
- ☐ 2. problem-focused coping style
- ☐ 3. increase in social interactions
- ☐ 4. disturbance in his sleep patterns

115. The **most** cost-effective suggestion for bereavement support for the hospice nurse to give a woman whose husband died 3 months ago and her three young children would be to:

- ☐ 1. seek group counseling support for the three children.
- ☐ 2. request individual counseling and medication to manage depression.
- ☐ 3. remind her gently that bereavement care before death minimizes grieving.
- ☐ 4. continue bereavement support offered through hospice.

116. Which strategy will be **most** effective in improving transcultural communications with clients with cancer and their families?

- ☐ 1. Use touch to show concern and caring for the client.
- ☐ 2. Focus attention on verbal communication skills only.
- ☐ 3. Establish a rapport and listen to their concerns.
- ☐ 4. Maintain eye contact at all times.

117. Which outcome is expected of a nursing referral to a cancer support group? The client can:

- ☐ 1. choose the best treatment options.
- ☐ 2. find financial help.
- ☐ 3. obtain home health care.
- ☐ 4. cope with cancer.

118. A cancer survivor feels guilty when attending a cancer support group meeting. The nurse can help the client manage feelings of guilt by pointing out that:

- ☐ 1. these actually are feelings of anger at the terminally ill clients in the

group.

- ☐ 2. it is an unexpected response to volatile emotions.
- ☐ 3. this is a spiritual response to the client's own illness.
- ☐ 4. this is a normal reaction when surviving a life-threatening experience.

119. The 65-year-old widower whose only son is 500 miles (800 km) away is at higher risk for psychosocial distress because the client:

- ☐ 1. has been successful in dealing with stress all his life.
- ☐ 2. does not have to deal with other stressors right now.
- ☐ 3. is able to use denial as a coping mechanism.
- ☐ 4. perceives he has minimal social support.

120. A client with a diagnosis of cancer is frequently disruptive and challenges the nurse. This behavior may be caused by:

- ☐ 1. uncertainty and an underlying fear of recurrence.
- ☐ 2. the usual trajectory of a short-term illness.
- ☐ 3. a history of a behavioral illness.
- ☐ 4. the one-time crisis from learning of the diagnosis.

121. A 42-year-old husband and father of a 7-year-old girl and a 10-year-old boy is concerned about what he should tell his children regarding his wife's impending death from aggressive breast cancer. The nurse should **first**:

- ☐ 1. refer the family to pastoral care services.
- ☐ 2. encourage the husband to come to terms with his own grief.
- ☐ 3. suggest that the healthcare provider (HCP) tell the children about the seriousness of their mother's illness.
- ☐ 4. begin education about strategies for communication with his children.

122. While talking to her husband, who is caring for their children, a middle-aged woman who has stage 4 breast cancer slams the phone down. She begins to cry and states that she is feeling guilty for being hospitalized. Which nursing action will **best** support the client emotionally?

- ☐ 1. Ask the client if she would like to speak with a grief counselor.
- ☐ 2. Call the healthcare provider (HCP), and request an antidepressant.
- ☐ 3. Sit with the client, and help her acknowledge and discuss her feelings.

- ☐ 4. Suggest the client call her husband when she is calmer.

123. A middle-aged woman who is receiving radiation therapy tells the nurse that she feels inadequate as a wife and mother because she can no longer carry out her usual duties with the same energy as before. What recommendations should the nurse make to help the client cope with this situation?

- ☐ 1. Suggest that she reassign all household chores to other members of the family.
- ☐ 2. Suggest that she prioritize her activities and ask for help from friends and family.
- ☐ 3. Suggest that she ignore the household chores during the crisis period.
- ☐ 4. Tell her not to worry so much because everyone gets a little tired at this phase of the therapy.

124. An older adult woman who is usually meticulous about her appearance and dress arrives today for her 23rd day of radiation therapy. She appears disheveled and emotionally labile, and her responses to the usual questions are a little inappropriate. Her heart rate is 124 bpm, her respirations are 32 breaths/min, and her skin is cold and clammy. These findings would suggest that the nurse should further assess the client for:

- ☐ 1. schizophrenia.
- ☐ 2. panic disorder.
- ☐ 3. depression.
- ☐ 4. delirium.

125. The nurse is planning future care with a middle-aged woman who has undergone surgical resection for lung cancer. Which plan will **best** promote adaptation and rehabilitation?

- ☐ 1. arranging a visit from a client who has recovered from a similar surgery
- ☐ 2. planning a progressive activity regimen
- ☐ 3. teaching about dressing care
- ☐ 4. requesting house cleaning services for 3 months

126. Which activity indicates that the client with cancer is adapting well to

body image changes?

- ☐ 1. The client names his brother as the person to call if he is experiencing suicidal ideation.
- ☐ 2. The client continuously looks at the incision.
- ☐ 3. The client discusses a date to return to work.
- ☐ 4. The client serves as a volunteer in a client-to-client visitation program.

The Client Who Is Experiencing Problems with Sexuality

127. A 36-year-old female has increased vaginal dryness during sexual intercourse. She has received chemotherapy in the past and has menopausal symptoms due to ovarian suppression. The nurse should instruct the client on the use of:

- ☐ 1. vaginal dilators.
- ☐ 2. douching with a soothing solution.
- ☐ 3. water-soluble vaginal lubricants.
- ☐ 4. relaxation techniques.

128. A 49-year-old male with a tracheostomy tube confides to the nurse that he is beginning to avoid sexual activity because of the increased tracheostomy secretions. Which statement by the nurse will be **most** helpful to the client?

- ☐ 1. "Use a scopolamine patch to decrease secretions."
- ☐ 2. "Avoid fluid intake 2 hours before sexual activity."
- ☐ 3. "Place a thin piece of gauze over the tracheostomy."
- ☐ 4. "Wash the tracheostomy area with deodorizing antibacterial soap before sexual activity."

129. A 52-year-old client is scheduled for a total abdominal hysterectomy for cervical cancer. When discussing the potential impact of this procedure on the client's sexuality, the nurse should respond by saying:

- ☐ 1. "All women experience sexual problems with this surgical procedure. Do you have any questions?"
- ☐ 2. "When can I schedule an appointment with you and your partner to discuss any issues either of you may have regarding sexuality?"

- ☐ 3. “Do you anticipate any problems with sex related to your scheduled hysterectomy?”
- ☐ 4. “Most women have concerns about their sexuality after this type of surgery. Do you have any concerns or questions?”

130. A young man with early-stage testicular cancer is scheduled for a unilateral orchiectomy. The client confides to the nurse that he is concerned about what effects the surgery will have on his sexual performance. Which response by the nurse provides accurate information about sexual performance after an orchiectomy?

- ☐ 1. “Most impotence resolves in a couple of months.”
- ☐ 2. “You could have early ejaculation with this type of surgery.”
- ☐ 3. “We will refer you to a sex therapist because you will probably notice erectile dysfunction.”
- ☐ 4. “Because your surgery does not involve other organs or tissues, you will likely not notice much change in your sexual performance.”

131. A young female client is receiving chemotherapy and mentions to the nurse that she and her husband are using a diaphragm for birth control. Which information is **most** important for the nurse to discuss?

- ☐ 1. inconvenience of the diaphragm
- ☐ 2. transmission of sexually transmitted diseases
- ☐ 3. body changes related to hormones
- ☐ 4. infection control

132. To promote comfort and optimal respiratory expansion for a client with chronic obstructive pulmonary disease during sexual intimacy, the nurse can suggest that the couple:

- ☐ 1. use a foam mattress.
- ☐ 2. use pillows to raise the affected partner’s head and upper torso.
- ☐ 3. have the affected partner assume a dependent position.
- ☐ 4. limit the duration of the sexual activity.

Ethical and Legal Issues Related to Clients with Cancer

133. A hospitalized client with end-stage heart failure does not want to be

resuscitated. The healthcare provider (HCP) has written the do-not-resuscitate (DNR) prescription on the client's record. The client has a cardiac arrest, and the wife tells the nurse she wants the client to be resuscitated and asks the nurse to "do something." The nurse should:

- ☐ 1. begin CPR.
- ☐ 2. call a "code."
- ☐ 3. page the healthcare provider (HCP).
- ☐ 4. discuss the DNR prescription with the wife.

134. A registered nurse (RN) is assigning care on the oncology unit and assigns the client with Kaposi's sarcoma and human immunodeficiency virus (HIV) infection to the unlicensed assistive personnel (UAP). This person does not want to care for this client. How should the nurse respond?

- ☐ 1. "I will assign this client to another nurse."
- ☐ 2. "I will help you take care of this client so you are confident with the care."
- ☐ 3. "You seem worried about this assignment."
- ☐ 4. "I will review blood and body fluid precautions with you."

135. A woman employed full-time wants to request a leave of absence to care for her father who is being treated for colon cancer 300 miles (480 km) away. What should the nurse advise the client to do **first**?

- ☐ 1. Contact her employee resources department about policies guiding leaves of absence.
- ☐ 2. Make a plan to see how long she can be out of work without financial concerns.
- ☐ 3. Find someone to do her work while she is away.
- ☐ 4. Ask her father if he can afford a caregiver.

136. The nurse is developing a care plan for a client with cancer receiving hospice home care. Which would be the **most** appropriate action for managing the client's chronic pain?

- ☐ 1. Administer analgesics regularly and additionally as needed for breakthrough pain.
- ☐ 2. Sedate the client with tranquilizers.

- ☐ 3. Avoid intravenous pain medication until the client is terminal.
- ☐ 4. Administer analgesics when vital signs indicate increased pain severity.

137. A client and nurse have established a goal for the client to be more autonomous in decision making. Which situation indicates that the goal has been met?

- ☐ 1. The healthcare provider (HCP) directs the client's care.
- ☐ 2. The nurse provides the client with the facts and then allows the client to reach an unassisted decision.
- ☐ 3. The nurse respects a client's choice not to know particular information.
- ☐ 4. The healthcare team makes health and treatment decisions.

End-of-Life Care

138. A client who is near death is receiving hospice care to manage severe pain. The client is receiving a narcotic pain medication intravenously per a patient-controlled analgesia (PCA) pump. The client is lethargic and is sleeping much of the time, and has not had any pain for the last 12 hours. The nurse plans care based on the fact that the client:

- ☐ 1. Received too much medication through an overdose of medication administered through the PCA pump.
- ☐ 2. May be nearing death as specific dosages and time intervals for self-administration of the analgesic is programmed into the PCA pump to prevent overdose.
- ☐ 3. Has obtained sufficient pain relief because of not having pain in the last 12 hours.
- ☐ 4. Has an IV that has infiltrated and the analgesic has been injected into the subcutaneous tissues, thereby being absorbed faster than prescribed.

139. The family of a hospitalized client demonstrates understanding of the teaching about legal documents related to end-of-life care such as "advance directive" and "power of attorney" when they make which statements? Select all that apply.

- ☐ 1. "Advance directives give instructions about future medical care and treatment."
- ☐ 2. "If people are not capable of communicating their wishes, healthcare

providers and family together can agree on measures or actions that will be taken.”

☐ 3. “Ethics experts agree that the family is the sole deciding factor when the client is competent.”

☐ 4. “Medical power of attorney gives primarily financial access to the designee.”

☐ 5. “Medical power of attorney or durable power of attorney for health care is a document that lists who can make healthcare decisions should a person be unable to make an informed decision for himself or herself.”

☐ 6. “Advance directives give details about the client’s past medical history.”

140. The nurse can be an important advocate for the client who is considering an alternative method of cancer treatment. Which statement **best** demonstrates the nurse as client advocate? The nurse will:

☐ 1. provide the information about standard therapies.

☐ 2. monitor blood tests as indicated by the alternative therapy.

☐ 3. document the client’s desire to try an alternative therapy.

☐ 4. allow the client to make healthcare choices but will assist in ensuring the client is fully informed when making those decisions.

141. After completing the nursing assessment for a client and family entering the palliative care program, the nurse should develop a teaching plan that includes an understanding of which outcome? Select all that apply.

☐ 1. alteration in the family’s usual coping strategies

☐ 2. achievement of a dignified and respectful death

☐ 3. improvement in the client’s quality of life

☐ 4. provision of comfort during the dying process

☐ 5. provision of support for client and family

☐ 6. advocacy for prolonging life while curing the disease

142. When a client and family receive the initial diagnosis of colon cancer, the nurse can act as an advocate by:

☐ 1. helping them maintain a sense of optimism and hopefulness.

☐ 2. determining their understanding of the results of the diagnostic testing.

- ☐ 3. listening carefully to their perceptions of what their needs are.
- ☐ 4. providing them with written materials about the cancer site and its treatment.

143. A client who is dying of acquired immunodeficiency syndrome (AIDS) is admitted to the inpatient psychiatric unit because he attempted suicide. His close friend recently died of AIDS. The client begins to talk about his feelings related to his illness and the loss of his friend. He begins to cry. Which response by the nurse would be **most** appropriate?

- ☐ 1. Give the client some tissues, and tell him it is okay to cry.
- ☐ 2. Tell the client to stop crying and that everything will be okay.
- ☐ 3. Sort the client's mail to distract the client.
- ☐ 4. Change the subject.

144. The wife of an older adult who has been admitted to the hospital with kidney failure tells the nurse, "I know he does not want to die in a hospital, but it is so hard for me to take care of him at home. He said he does not want any more treatment, but I am not ready to let him go. We have so many arrangements to decide before he dies." Which statement by the nurse to the client's wife would be **most** appropriate? Select all that apply.

- ☐ 1. "He is not going to die that soon judging by his current symptoms."
- ☐ 2. "What are your fears about your husband dying?"
- ☐ 3. "I can imagine that it is hard for you to care for him at home."
- ☐ 4. "What do you and your husband know about advance directives?"
- ☐ 5. "We can discuss types of hospice and home care available."
- ☐ 6. "What kind of arrangements do you think need to be made before he dies?"

145. A terminally ill client's husband tells the nurse, "I wish we had taken that trip to Europe last year. We just kept putting it off, and now I am furious that we did not go." The nurse interprets the husband's statement as indicating which stage of adaptation to dying?

- ☐ 1. anger
- ☐ 2. denial
- ☐ 3. bargaining

- ☐ 4. depression

146. Which philosophy should the nurse integrate into the plan of care for a client and family to help them **best** cope during the final stages of the client's illness?

- ☐ 1. living each day as it comes as fully as possible
- ☐ 2. reliving the pleasant memories of days gone by
- ☐ 3. expecting the worst and being grateful when it does not happen
- ☐ 4. planning ahead for the remaining good times that will be spent together

147. A client who is in the end stages of cancer is increasingly upset about receiving chemotherapy. Which approach by the nurse would likely be **most** helpful in gaining the client's cooperation?

- ☐ 1. Tell the client how the treatment can be expected to help.
- ☐ 2. Describe the probable effect that missing a treatment would have.
- ☐ 3. Explain that being upset makes the treatment more difficult.
- ☐ 4. Suggest having a massage during the treatment.

148. A client suspects that he will not live. However, others talk about only pleasant matters with him and maintain a persistently cheerful facade around him. The nurse plans care for this client by recognizing that these behaviors will **most** likely cause the client to feel:

- ☐ 1. relief.
- ☐ 2. isolated.
- ☐ 3. hopeful.
- ☐ 4. independent.

149. The young sister of a young adult client with leukemia asks, "Can you check my blood? When my sister got pneumonia, so did I. And I think I have this, too." How should the nurse respond? Select all that apply.

- ☐ 1. Ask the client's healthcare provider (HCP) to take a sample of the sister's blood.
- ☐ 2. Explain to the sister that leukemia is not a communicable disease.
- ☐ 3. Discuss the sister's concern with her parents.
- ☐ 4. Tell the sister's parents about a group for siblings of clients with terminal illness.

- ☐ 5. Ask the sister about her concerns.

150. When talking with the nurse, the brother of a client with leukemia says, “We used to play pretty rough games together. Maybe some of the bruises he got when I tackled him caused this.” Which statement is the nurse’s **best** response?

- ☐ 1. “Do not feel guilty. You did not cause your brother’s illness.”
- ☐ 2. “I can see you are worried. Let us talk about how people get leukemia.”
- ☐ 3. “Here is some information about leukemia for you to read.”
- ☐ 4. “Lots of people worry about things like this. It is not your fault.”

Managing Care, Quality, and Safety of Clients with Cancer

151. A nurse is making follow-up phone calls to clients being treated for cancer. In which order of priority from first to last should the nurse return the calls? All options must be used.

1. the client receiving chemotherapy who has a loss of appetite

2. the client who underwent a mastectomy 2 weeks ago who called for information on the Reach for Recovery program

3. the client receiving spinal radiation for bone cancer metastases who has urinary incontinence

4. the client with colon cancer who has questions about a high-fiber diet

152. The nurse is making client rounds following shift report. Which client should the nurse assess **first**?

- ☐ 1. a 38-year-old woman receiving internal radiation therapy for cervical cancer
- ☐ 2. a 27-year-old man with leukemia hospitalized for induction of high-dose chemotherapy
- ☐ 3. a 75-year-old man with metastatic prostate cancer with a pathologic fracture of the femur who is in pain
- ☐ 4. a 23-year-old woman undergoing surgery for placement of a central venous catheter

153. The RN is administering intravenous chemotherapy to a client with cancer. Which precautions are necessary when administering chemotherapy? Select all that apply.

- ☐ 1. taping all IV tubing connections
- ☐ 2. wearing gloves when handling the client's urine
- ☐ 3. disposing of chemotherapy waste as hazardous material
- ☐ 4. wearing a long-sleeved gown when administering chemotherapy
- ☐ 5. disposing of sharps in a specifically labeled container.

154. During the intravenous administration of a chemotherapeutic vesicant drug, the nurse observes that there is a lack of blood return from the intravenous catheter. The nurse should **first**:

- ☐ 1. stop the administration of the drug.
- ☐ 2. reposition the client's arm and continue with administration of the drug.
- ☐ 3. irrigate the catheter with normal saline.
- ☐ 4. continue to administer the drug and assess for edema at the IV site.

155. The nurse is caring for a client with end-stage cancer whose health status is declining. A prescription is written by the attending healthcare provider (HCP) to withhold all fluid, but the healthcare team cannot locate a family member or guardian. The nurse requests an ethics consultation. Which information is true of an ethics consultation? Select all that apply.

- ☐ 1. Persons requesting an ethics consultation may do so without

intimidation or fear of reprisal.

- ☐ 2. Ethics consultations may prevent poor outcomes in cases involving ethical problems.
- ☐ 3. The recommendations of ethics consultants are advisory only.
- ☐ 4. Requests for ethics consultations may only be made by the HCP or nurse.
- ☐ 5. Ethics consultation is intended to provide legal advice on client care.

156. The nurse-manager on the oncology unit wants to address the issue of correct documentation of the effectiveness of analgesia medication within 30 minutes after administration. What should the nurse-manager do **first**?

- ☐ 1. Change the policy of documentation to 45 minutes.
- ☐ 2. Consult the pharmacist.
- ☐ 3. Consult the nurses on the evening shift where documentation of analgesia is the greatest problem.
- ☐ 4. Complete a brief quality improvement study and chart audit to document the rate of adherence to the policy and the pattern of documentation over shifts.

157. A registered nurse (RN) instructs the unlicensed assistive personnel (UAP) to check the urine intake and output (I&O) on clients on the oncology unit at the end of the 8-hour shift. It is important for the nurse to instruct the UAP to do what?

- ☐ 1. Ask the clients if they are thirsty when calculating the I&O.
- ☐ 2. Report back to the nurse immediately if any client has an output <240 mL.
- ☐ 3. Document the I&O results on the medical records.
- ☐ 4. Write the I&O results down for the nurse to give report to the next shift.

158. An alert and oriented older adult female with metastatic lung cancer is admitted to the medical-surgical unit for treatment of heart failure. She was given 80 mg of furosemide in the emergency department. Although the client is ambulatory, the unlicensed assistive personnel (UAP) are concerned about urinary incontinence because the client is frail and in a strange environment. The nurse should instruct the UAP to assist with implementing the nursing

plan of care by:

- ☐ 1. prescribing adult diapers for the client so she will not have to worry about incontinence.
- ☐ 2. requesting an indwelling urinary catheter to avoid incontinence.
- ☐ 3. padding the bed with extra absorbent linens.
- ☐ 4. placing a commode at the bedside and instructing the client in its use.

159. The nursing team on an oncology unit consists of a registered nurse (RN), a licensed practical/vocational nurse (LPN/VN), and one unlicensed assistive personnel (UAP). Which client should be assigned to the RN?

- ☐ 1. a 52-year-old client with lung cancer admitted for acute dyspnea
- ☐ 2. a 45-year-old client receiving tube feedings
- ☐ 3. a 28-year-old client being evaluated for a bone marrow transplant
- ☐ 4. a 65-year-old client diagnosed with endometrial cancer who underwent an abdominal hysterectomy 3 days ago

160. The nurse is to wear personal protective equipment (PPE) to administer a chemotherapeutic agent to the client. What guidelines should the nurse use for PPE use and care? Select all that apply.

- ☐ 1. Understand the proper use and limitations of PPE.
- ☐ 2. Use care in removing all items to reduce contamination.
- ☐ 3. Ensure that PPE is made of materials that allow for air ventilation.
- ☐ 4. Cleanse hands with alcohol-based solution before putting gloves on and after removing gloves.
- ☐ 5. Discard the PPE in containers for contaminated waste.

161. The nurse should ensure that which item is placed when the client is to receive intravascular therapy for more than 6 days?

- ☐ 1. short peripheral catheter
- ☐ 2. central venous access in the femoral vein
- ☐ 3. intravenous catheter insertion device
- ☐ 4. peripherally inserted central catheter (PICC)

Answers, Rationales, and Test-Taking Strategies

*The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in part 1 of this book.*

The Client at Risk for Cancer

1. 3. Clients over age 50 who have a history of inflammatory bowel disease are at risk for colon cancer. The client who smokes is at high risk for lung cancer. While the exact cause is not always known, other risk factors for colon cancer are a diet high in animal fats, including a large amount of red meat and fatty foods with low fiber, and the presence of colon cancer in a first-generation relative.

 CN: Reduction of risk potential; CL: Analyze

2. 4. Basal cell carcinoma occurs most commonly in sun-exposed areas of the body. The incidence of skin cancer is highest in older people who live in the mountains or spend outdoor leisure time at higher altitudes.

 CN: Health promotion and maintenance; CL: Analyze

3. 1. Because of the high risk of infertility with chemotherapy, pelvic irradiation, and retroperitoneal lymph node dissection that may follow an orchiectomy, cryopreservation of sperm is completed before treatment is started and should be discussed with the client.

 CN: Physiological adaptation; CL: Apply

4. 2. The word *prevalence* in a statistical setting is defined as the number of cases of a disease present in a specified population at a given time.

 CN: Health promotion and maintenance; CL: Apply

5. 3. Sun damage is a cumulative process. Parents should be taught to

apply sunscreen and teach their children to use sunscreen at an early age. Although preventive education is always valuable, serious sunburns in childhood are associated with an increased risk of melanoma. Adults and senior citizens have already been exposed to the harmful effects of the sun and, although they, too, should use sunscreen, they are not the group that will most benefit from intervention. Exposure to chemicals is not a risk factor for melanoma.

CN: Health promotion and maintenance; CL: Analyze

6. 4. A sunscreen with an SPF of 15 or higher should be worn on all sun-exposed skin surfaces. It should be applied before sun exposure and reapplied after being in the water. Peak sun exposure usually occurs from 0010 to 1400. Tightly woven clothing, protective hats, and sunglasses are recommended to decrease sun exposure. Sun tanning parlors should be avoided.

CN: Health promotion and maintenance; CL: Synthesize

7. 1. Malignant melanoma may have a familial basis, especially in families with dysplastic nevi syndrome. First-degree relatives should be monitored closely. Malignant melanoma occurs most often in the 20- to 45-year-old age group. Severe sunburn as a child does increase the risk; however, this client is at increased risk because of her family history.

CN: Health promotion and maintenance; CL: Apply

8. 3. Because more than 50% of the cancers occur in people who are older than age 65, the single most important factor in determining risk would be age.

CN: Health promotion and maintenance; CL: Apply

9. 1,3,4,5. The client is at increased risk for development of lung, skin, or breast cancer. Consequently, the client should improve nutrition (e.g., eating food with lower animal fat content, increasing fiber, adding fruits and vegetables to the diet), stop smoking, use sunscreen, and lose weight. The client's alcohol consumption is not excessive and not a risk. It is not necessary and would be difficult for the client to change jobs to work inside as long as the client uses protection from the sun.

CN: Health promotion and maintenance; CL: Synthesize

10. 1. Asbestos and alcohol, when combined with smoking, produce a synergistic effect and result in increased cancer risk and incidence. Ultraviolet radiation exposure is associated with skin cancer. HPV exposure is associated with cervical cancer. However, the risks of contracting these types of cancer are not markedly increased when combined with smoking.

CN: Health promotion and maintenance; CL: Apply

11. 4,5. Hoarseness and chronic sore throat are indicative of cancer of head and neck cancers, particularly cancer of the pharynx. Tobacco use and heavy consumption of alcohol are risk factors for these cancers and may have a synergistic effect. Heavy use of acetaminophen is not a risk factor for head and neck cancer, but is related to liver failure. Exposure to the sun increases the risk of skin cancers, but not cancers of the head and neck. Consuming a high-fat diet is not related to head and neck cancer, but may be a risk factor for other cancers and heart disease. Exposure to wood dust and other inhaled particles is associated with lung cancer.

CN: Health promotion and maintenance; CL: Analyze

12. 2. High-fiber, low-fat diets are recommended to reduce the risk of colon cancer. Stir-frying, poaching, steaming, and broiling are all low-fat methods to prepare foods. Croissants are made of refined flour. They are also high in fat, as are peanut butter squares and whole milk, granola, cream cheese, and sour cream.

CN: Health promotion and maintenance; CL: Apply

13. 2. Environmental factors include place of residence, nutrition, occupation, personal habits, iatrogenic factors, and physical environment. Gender, immunologic status, and age are individual factors.

CN: Health promotion and maintenance; CL: Apply

14. 3. CT scanning is the standard noninvasive method used in a workup for lung cancer because it can distinguish small differences in tissue density and can detect nodal involvement. CT is comparable to magnetic resonance imaging in evaluating lymph node metastasis. CT is noninvasive and usually available, but these are not the main reasons for its use. CT can distinguish malignancy in some situations only.

 CN: Physiological adaptation; CL: Synthesize

15. 3. A high-fat, low-fiber diet is a risk factor for colorectal cancer. A diet low in vitamin C, use of artificial sweeteners, and multiple sex partners are not considered risk factors for colorectal cancer.

 CN: Health promotion and maintenance; CL: Analyze

16. 2. Strategies to reach clients in all cultures should include incorporating the folk beliefs and traditions of the target population into the program. Identification of a centrally located building with available access by the target population, use of materials in the native or primary language of the target population, and involvement by all community leaders will also help the program succeed.

 CN: Health promotion and maintenance; CL: Synthesize

The Client with Pain

17. 4. The desired outcome for management of pain is that the client's or family's subjective report of pain is acceptable and documented using a pain scale; the goal is that behavioral and physiologic indicators of pain are absent around the clock. The nurse and client/family should develop a systematic approach to pain management using information gathered from history and a hierarchy of pain measurement. Pain should be assessed at frequent intervals. The client should not wait to receive medication until the pain is midpoint on the pain scale, nor should the client receive so much pain medication that he or she is not alert. Continuous pain relief is the goal, not just during particular periods during the day.

 CN: Basic care and comfort; CL: Synthesize

18. 3. Tolerance develops from taking opioids over an extended period. It is characterized by the need for an increased dose to achieve the same degree of analgesia. Addiction is characterized by a drive to take the medication for the psychic effect rather than the therapeutic effect. Physical dependence is a response to ongoing exposure to a medication manifested by withdrawal symptoms when discontinued abruptly.

 CN: Pharmacological and parenteral therapies; CL: Analyze

19. 4. The conversion ratio for morphine is 10 mg IV equals 30 mg oral, or 1:3. The client is receiving 300 mg orally per 24 hours, which is equivalent to 100 mg of IV morphine. Morphine 100 mg IV/24 hours = approximately 4 mg/h IV. The effect of the IV morphine is quick, and the oral morphine should be discontinued prior to starting the IV morphine. Administering too much morphine can cause untoward side effects.

CN: Pharmacological and parenteral therapies; CL: Synthesize

20. 3. Administration of morphine sulfate is contraindicated because morphine causes respiratory depression. It may also increase intracranial pressure if the client is not ventilating properly, which could result in an accumulation of CO₂, a potent vasodilator. Ibuprofen, naproxen, and acetaminophen are not likely to mask symptoms of increased intracranial pressure or impact respiratory status.

CN: Pharmacological and parenteral therapies; CL: Synthesize

21. 1. If the maximum dose specified by the prescription is required every 3 to 4 hours for breakthrough pain, the **HCP**  should be notified to increase the long-acting medication or rotate to another type of opioid. Around-the-clock dosing is mandatory to achieve a steady state of analgesia. The rescue dose for breakthrough pain is administered over and above the regularly scheduled medication. If three to four analgesic doses are required every 24 hours, the sustained-release around-the-clock dose should be increased to include the amount used for previous breakthrough pain while maintaining a dose for future breakthrough pain.

CN: Pharmacological and parenteral therapies; CL: Synthesize

22. 1. The most common toxicities from NSAIDs are gastrointestinal disorders (nausea, epigastric pain, ulcers, bleeding, diarrhea, and constipation). Renal dysfunction, pulmonary complications, and cardiovascular complications from NSAIDs are much less common.

CN: Pharmacological and parenteral therapies; CL: Analyze

23. 2,3. In the client with chronic pain, physiologic adaptation results in minimal changes in behavior and vital signs; clients have normal vital signs and are generally physically inactive. Clients with chronic pain are not

necessarily depressed. Elevated vital signs, grimacing, and moaning are characteristic responses to acute pain.

CN: Basic care and comfort; CL: Analyze

24. 1,2,4,6. Scheduled use of long-acting opioids and an around-the-clock dosing are necessary to achieve a steady level of analgesia. Whatever the route or frequency, a prescription should be available for “breakthrough” pain medication to be administered in addition to the regularly scheduled medication. Oral drug administration is the route of choice for economy, safety, and ease of use. Even severe pain requiring high doses of opioids can be managed orally as long as the client can swallow medication and has a functioning gastrointestinal system. Tolerance occurs due to the need for increasing doses to achieve the same pain relief and will not be avoided with the use of acetaminophen. Addiction is a complex condition in which the drug is used for psychological effect and not analgesia. Nurses need to educate families about the appropriate use of opioids and assure them that addiction is not a concern when managing cancer pain. Nonpharmacologic methods are useful as an adjunct to assist in pain control. Self-report is the best assessment of pain and is an individual response.

CN: Pharmacological and parenteral therapies; CL: Evaluate

25. 4. Most clients with cancer who are experiencing inadequate pain control while taking an oral opioid after being switched from IV administration have been undermedicated. Equianalgesic conversions should be made to provide estimates of the equivalent dose needed for the same level of relief as provided by the IV dose. There is research to suggest that cancer clients do not become addicted to opioids when dosed adequately. There is no evidence to suggest that the client is physically addicted or is having withdrawal symptoms.

CN: Pharmacological and parenteral therapies; CL: Analyze

26. 1. Intensity is indicative of the severity of pain and is important for evaluating the efficacy of pain management. The cause and location of the pain cannot be managed, but the intensity of the pain can be controlled. The nurse and client can collaborate to reduce aggravating factors; however, the goal will ultimately be to reduce the intensity of the pain.

 CN: Basic care and comfort; CL: Analyze

27. 2. Tolerance to an opioid occurs when a larger dose of the analgesic is needed to provide the same level of pain control. The risk of addiction is low with opioids to treat cancer pain. There are no data to support that this client is experiencing withdrawal. Although the client may have experienced a placebo effect at one time, placebo effects tend to diminish over time, especially in regard to chronic cancer pain.

 CN: Pharmacological and parenteral therapies; CL: Analyze

28. 2. The regular administration of analgesics provides a consistent serum level of medication, which can help prevent breakthrough pain. Therefore, taking the prescribed analgesics on a regular schedule is the best way to manage chronic cancer-related pain. There is little risk for the client with cancer-related pain to become addicted. Sleeping 12 to 16 hours a day would not allow the client to participate in usual daily activities or preferred activities.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

The Client Who Is Receiving Chemotherapy

29. 3. Chemotherapeutic agents are very toxic; therefore, precautions are taken such as the use of gloves and long-sleeved gowns when handling agents to prevent incidental contact with skin. Recapping needles is against universal precaution standards, and chemotherapy waste is disposed of in biohazard containers according to institution policy. Prepackaged agents can still be hazardous if not handled properly.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

30. 2. Stomatitis is an inflammation of the mucous membranes of the mouth resulting from chemotherapy. Using a soft-bristled toothbrush prevents further bleeding and irritation to the already irritated gums and mucous membranes. Hydrogen peroxide can further irritate the mouth. Fluids need to be lukewarm instead of hot; dental floss can be used if it is done gently.

 CN: Basic care and comfort; CL: Synthesize

31. 3. Resources should be provided for acquiring a wig since it is easier to match hairstyle and color before hair loss begins. The client has expressed negative feelings of self-image with hair loss. Excessive shampooing and manipulation of hair will increase hair loss. Hair usually grows back in 3 to 4 weeks after the chemotherapy is finished; however, new hair may have a new color or texture. A wig, hairpiece, hat, scarf, or turban can be used to conceal hair loss. Social isolation should be avoided, and the client should be encouraged to socialize with others.

CN: Pharmacological and parenteral therapies; CL: Synthesize

32. 4. The client may excrete the chemotherapeutic agent for 48 hours or more after administration. Blood, emesis, and excretions may be considered contaminated during this time, and the client should not share a bathroom with children or pregnant women. Any contaminated linens or clothing should be washed separately and then washed a second time, if necessary. All contaminated disposable items should be sealed in plastic bags and disposed of as hazardous waste.

CN: Physiological integrity; CL: Synthesize

33. 4. A side effect of vincristine is constipation, and a bowel protocol should be considered. Loperamide is used to treat diarrhea. Fluids should be encouraged, along with high-fiber foods to prevent constipation.

CN: Pharmacological and parenteral therapies; CL: Synthesize

34. 3. Carbohydrates are the first substance used by the body for energy. Proteins are needed to maintain muscle mass, repair tissue, and maintain osmotic pressure in the vascular system. Fats, in a small amount, are needed for energy production. Chicken, green beans, and cottage cheese are the best selection to provide a nutritionally well-balanced diet of carbohydrate, protein, and a small amount of fat. Cereal with milk and strawberries as well as toast, gelatin dessert, and cookies have a large amount of carbohydrates and not enough protein. Steak and french fries provide some carbohydrates and a good deal of protein; however, they also provide a large amount of fat.

CN: Health promotion and maintenance; CL: Synthesize

35. 2. Chemotherapy agents typically cause nausea and vomiting when not

controlled by antiemetic drugs. Antineoplastic drugs attack rapidly growing normal cells, such as in the gastrointestinal tract. These drugs also stimulate the vomiting center in the brain. Hair loss, loss of energy, and sleep are important aspects of the health history, but are not as critical as the potential for dehydration and electrolyte imbalance caused by nausea and vomiting.

CN: Pharmacological and parenteral therapies; CL: Analyze

36. 2,4,5. Chemotherapy causes bone marrow suppression and risk of infection. A platelet count of $40,000/\text{mm}^3$ ($40 \times 10^9/\text{L}$) and a white blood cell count of $2,300/\text{mm}^3$ ($2.3 \times 10^9/\text{L}$) are low. A temperature of 101.2°F (38.4°C) is high and could indicate an infection. Further assessment and examination should be performed to rule out infection. The BUN, hemoglobin, and specific gravity values are normal.

CN: Reduction of risk potential; CL: Analyze

37. 4. The nurse must recognize that an albumin level of 2.8 g/dL (28 g/L) indicates catabolism and potential for malnutrition. Normal albumin is 3.5 to 5.0 g/dL (35 to 50 g/L); <3.5 (35 g/L) indicates malnutrition. The other laboratory results are normal.

CN: Reduction of risk potential; CL: Analyze

38. 1. Fever is an early sign requiring clinical intervention to identify potential causes. Chills and dyspnea may or may not be observed. Tachycardia can be an indicator in a variety of clinical situations when associated with infection; it usually occurs in response to an elevated temperature or change in cardiac function.

CN: Reduction of risk potential; CL: Analyze

39. 2. Chemotherapy causes myelosuppression with a decrease in red blood cells (RBCs), WBCs, and platelets. This client's data demonstrate neutropenia, placing the client at risk for infection. An ANC of 500 to $1,000/\text{mm}^3$ (0.5 to $1 \times 10^9/\text{L}$) indicates a moderate risk of infection; $<500/\text{mm}^3$ ($0.5 \times 10^9/\text{L}$) indicates severe neutropenia and a high risk of infection. When the WBC count is low and immature WBCs are present, normal phagocytosis is impaired. Precautions to protect the client from life-threatening infections may be instituted when ANC is $<1,000/\text{mm}^3$ ($1 \times$

$10^9/L$). Handwashing is the best way to avoid the spread of infection. It is not necessary to wear a gown and mask to take care of this client. It is also not necessary to restrict visitors; however, visitors should be screened to avoid exposing the client to possible infections. Erythropoietin is used for stimulating RBCs, not WBCs. Granulocyte colony-stimulating factors or granulocyte macrophage colony-stimulating factors are useful for treating neutropenia.

CN: Safety and infection control; CL: Synthesize

40. 1. The role of the nurse is to assess what substances or medications the client is using and to document and inform other members of the healthcare team. It is very important to encourage the client to keep the **HCP**  informed of all therapeutic agents, medications, and supplements he or she is using, to avoid adverse interactions. It is not appropriate for the nurse to suggest that the client choose either Western or alternative therapies or to discourage the client's use of alternative therapies. The nurse should remain objective about the client's treatment choices and respect the client's autonomy.

CN: Reduction of risk potential; CL: Synthesize

41. 1. The fast-growing, normal cells most likely to be affected by certain cancer treatments are blood-forming cells in the bone marrow, as well as cells in the digestive track, reproductive system, and hair follicles. Fortunately, most normal cells recover quickly when treatment is over. Bone marrow suppression (a decreased ability of the bone marrow to manufacture blood cells) is a common side effect of chemotherapy. A low white blood cell count (neutropenia) increases the risk of infection during chemotherapy, but other blood cells made in the bone marrow can be affected as well. Most cancer agents do not affect tissues and organs, such as heart, liver, and pancreas.

CN: Physiologic adaptation; CL: Apply

42. 4. Cough and shortness of breath are significant symptoms because they may indicate decreasing pulmonary function secondary to drug toxicity. Decrease in appetite, difficulty in thinking clearly, and spasms of the diaphragm may occur as a result of chemotherapy; however, they are not indicative of pulmonary toxicity.

 CN: Physiological adaptation; CL: Evaluate

43. 4. The client is experiencing severe sepsis, and it is essential to increase circulating fluid volume to restore the blood pressure and cardiac output. The wet compress, administering the antipyretic, and monitoring the client's cardiac status may be beneficial for this client, but they are not the highest priority action at this time. These three interventions may require the nurse to leave the client, which is not advisable at this time.

 CN: Physiological adaptation; CL: Synthesize

44. 3. Nephrotoxicity caused by chemotherapy is assessed by monitoring serum creatinine. Creatinine is the most sensitive indicator of proper kidney function. In this case, the client is experiencing decreased kidney function, most likely due to the chemotherapy. The nurse consults the **HCP**  for guidance. Administering the next dose of chemotherapy could potentially cause further kidney damage. It is inappropriate to cancel the chemotherapy without checking with the HCP or to tell the client that the cancer is spreading. A urine specimen will not provide other helpful information.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

The Client Who Is Receiving Radiation Therapy

45. 3. Clients receiving radiation experience dryness or redness in the area of the radiation. The nurse instructs the client to wash the area with soap and water and keep the area dry. The client does not apply lotion, shave, or cover the area.

 CN: Basic care and comfort; CL: Apply

46. 3. This client is at high risk for bleeding because of the decreased platelet count. The priority nursing goal is to prevent injury to this client by preventing bleeding occurrences. Spontaneous bleeding may cause pain but is not the priority. The client has a low platelet count, but not a low hemoglobin count such as exists in anemia. Skin integrity is a risk but not a priority.

 CN: Reduction of risk potential; CL: Synthesize

47. 4. The nurse should instruct the client to avoid applying chemicals

(such as a deodorant) or heat or cold (such as with a heating pad or ice pack) to the area being treated. The client should be encouraged to use the extremity to prevent muscle atrophy and contractures.

CN: Health promotion and maintenance; CL: Synthesize

48. 2. Since sleeplessness is often an adverse effect of radiation therapy, the nurse should first assess the client's usual sleep patterns, hours of sleep required before treatment, and usual bedtime routine. Refraining from watching television before bedtime and avoiding caffeine intake are helpful suggestions. Determining the client's usual sleep pattern is essential before telling the client that sleeplessness is expected and making suggestions for improving sleep patterns.

CN: Health promotion and maintenance; CL: Synthesize

49. 4. Difficulty in swallowing, pain, and tightness in the chest are signs of esophagitis, which is a common complication of radiation therapy of the chest wall. Hiatal hernia is a herniation of a portion of the stomach into the esophagus. The client could experience burning and tightness in the chest secondary to a hiatal hernia, but not pain when swallowing. Also, hiatal hernia is not a complication of radiation therapy. Stomatitis is an inflammation of the oral cavity characterized by pain, burning, and ulcerations. The client with stomatitis may experience pain with swallowing, but not burning and tightness in the chest. Radiation enteritis is a disorder of the large and small bowel that occurs during or after radiation therapy to the abdomen, pelvis, or rectum. Nausea, vomiting, abdominal cramping, the frequent urge to have a bowel movement, and watery diarrhea are the signs and symptoms.

CN: Physiological adaptation; CL: Analyze

50. 2. Radiation fields that include the ovaries usually result in premature menopause. Vaginal dryness will occur without estrogen replacement. There should be no sexual intercourse while the implant is in place. Cesium is a radioactive isotope used for therapeutic irradiation of cancerous tissue. There is no documentation to support vaginal relaxation after treatment. Because the client will have premature menopause, she will not have normal menstrual periods.

CN: Physiological adaptation; CL: Synthesize

51. 3. Radiation-induced esophagitis with dysphagia is particularly common in clients who receive radiation to the chest. The anatomic location of the esophagus is posterior to the mediastinum and is within the field of primary treatment. Diarrhea may occur with radiation to the abdomen. Decreased energy level and decreased white blood cell count are potential complications of radiation therapy.

CN: Reduction of risk potential; CL: Analyze

The Client Who Requires Symptom Management

52. 3. Head and neck radiation can cause the complication of stomatitis and decreased salivary flow. A saliva substitute will assist with dryness, moistening food, and swallowing. Meticulous mouth care is needed; however, alcohol and vigorous brushing will increase irritation. Evaluation by a dentist to perform necessary dental work is done prior to initiation of therapy.

CN: Physiological adaptation; CL: Synthesize

53. 3. The client has a low white blood cell count from the chemotherapy and has a temperature. Signs and symptoms of infection may be diminished in a client receiving chemotherapy; therefore, the temperature elevation is significant. Early detection of the source of infection facilitates early intervention. Surveillance for bleeding is important with the low hemoglobin and platelet count; however, the high blood pressure does not indicate bleeding. Vomiting is a side effect of chemotherapy and should be treated. The urine output and potassium are within normal limits.

CN: Physiological adaptation; CL: Synthesize

54. 1. The packed cells should be administered using a central catheter or 19-gauge needle. Y tubing and the normal saline solution are used to keep the vein open when the blood transfusion is complete. Blood is not compatible with dextrose because dextrose may cause blood coagulation. Blood products should be given with normal saline solution. A blood filter must be used for all blood products to filter out sediment from stored blood products. It is not

necessary to add another IV access.

CN: Pharmacological and parenteral therapies; CL: Synthesize

55. 1. The nurse should perform a thorough assessment of the abdomen and auscultate for bowel sounds in all four quadrants. Clients who have gastrointestinal surgery may have decreased peristalsis for several days after surgery. The nurse should check the abdomen for distention and check with the client and the **medical record** regarding the passage of flatus or stool. Consulting a dietician would be inappropriate because the client must be kept on nothing-by-mouth status until bowel sounds are present. The nurse should explain to the wife that it is too soon after surgery for her husband to eat.

CN: Reduction of risk potential; CL: Synthesize

56. 3. For clients with obstructive versus restrictive disorders, extending exhalation through pursed-lip breathing will make the respiratory effort more efficient. The usual position of choice for this client is the upright position, leaning slightly forward to allow greater lung expansion. Teaching diaphragmatic breathing techniques will be more helpful to the client with a restrictive disorder. Administering cough suppressants will not help respiratory effort. A low semi-Fowler's position does not encourage lung expansion. Lung expansion is enhanced in the upright position.

CN: Basic care and comfort; CL: Synthesize

57. 1,2,3,6. Thrombocytopenia places the client at risk for bleeding. Therefore, electric razors will reduce the potential for skin nicks and bleeding. Oral hygiene should be provided with a soft toothbrush and with minimal friction to gently clean without trauma. Clients should be instructed to read labels on all over-the-counter medications and avoid medications such as aspirin or NSAIDs due to their effect on platelet adhesiveness. Clients should evaluate mucous membranes, skin, stools, or other sources of potential bleeding. Monitoring temperature may be an important part of assessment but is focused on neutropenia instead of the problem of thrombocytopenia.

CN: Reduction of risk potential; CL: Create

58. 2. The administration of antipyretics and antihistamines before initiation of the transfusion in the frequently transfused client can decrease

the incidence of febrile reactions. Febrile reactions are immune mediated and are caused by antibodies in the recipient that are directed against antigens present on the granulocytes, platelets, and lymphocytes in the transfused component. They are the most common transfusion reactions and may occur with onset, during transfusion, or hours after transfusion is completed.

CN: Pharmacological and parenteral therapies; CL: Synthesize

59. 3. The fever and dyspnea suggest a respiratory infection. Education on deep-breathing exercises or incentive spirometry, elevating the head of the bed, and getting out of bed to a chair are necessary to promote lung expansion. When in bed, positioning the client with good lung down should be avoided, since this impedes expansion of the only lung. Postural drainage positioning will lower the head of bed and increase dyspnea.

CN: Physiological adaptation; CL: Synthesize

60. 2. An individualized exercise program will increase stamina and endurance. Weight lifting may be too vigorous. Filgrastim is used to increase white blood cells and is not applicable in this situation. Decreased hemoglobin and hematocrit predisposes the client to fatigue due to decreased oxygen availability. Bed rest causes muscle atrophy, adding to fatigue, and can contribute to deep vein thrombosis (DVT).

CN: Health promotion and maintenance; CL: Synthesize

61. 1. Chemotherapy may cause suppression of the immune system, resulting in a reduction in the WBC count and placing the client at risk for infection. This client has a normal white blood cell count indicating that the filgrastim has been effective. Decreased hemoglobin (Hgb) indicates anemia. The Hgb is within normal limits for an adult male. A decreased platelet count would indicate thrombocytopenia, and platelets would be prescribed. The platelet count is within normal limits for an adult male. Epoetin alfa is used to treat low red blood cell counts (anemia) caused by chemotherapy.

CN: Pharmacologic and parenteral therapy; CL: Evaluate

62. 1. Dietary suggestions to reduce adverse effects of cancer and cancer therapies include a soft, bland diet low in fat and sugar. Frequent, small meals are usually better tolerated. It is not necessary to restrict the diet to cold

foods. Fluid intake should be encouraged to avoid dehydration.

CN: Basic care and comfort; CL: Synthesize

63. 4. The use of diet modification is a conservative approach to treat the terminally ill or hospice clients who have nausea and vomiting related to bowel obstruction. Osmotic laxatives would be harder for the client to tolerate. An NG tube is more aggressive and invasive. IV antiemetics are also invasive. The hospice philosophy involves comfort and palliative care for the terminally ill.

CN: Basic care and comfort; CL: Synthesize

64. 3. Repositioning the client, elevating the head of the bed, and providing a cool compress are comfort interventions consistent with the concept of palliative care of the dying. Directing the UAP to assess vital signs focuses on the dying process, not the client. Suctioning may not benefit the client and is considered invasive and uncomfortable. Telling the spouse an intervention is not needed discounts the spouse's judgment and concerns.

CN: Basic care and comfort; CL: Synthesize

65. 2. Alopecia from chemotherapy is temporary. The new hair will not be necessarily gray, but the texture and color of new hair growth may be different. Clients who will be receiving chemotherapy should be encouraged to purchase a wig while they still have hair so that they can match the color and texture of their hair. Loss of hair, or alopecia, is a serious threat to self-esteem and should be addressed quickly before treatment.

CN: Pharmacological and parenteral therapies; CL: Apply

66. 3. Dyspnea is a distressing symptom in clients with advanced cancer including metastatic carcinoma of the lung, previous radiation therapy, and coexisting COPD. Ascites does occur in clients with metastatic carcinoma; however, in the client with COPD and lung cancer, dyspnea is a more common finding. A pleural friction rub is usually associated with pneumonia, pleurisy, or pulmonary infarct.

CN: Physiological adaptation; CL: Analyze

67. 3. The positive reinforcement builds confidence and facilitates

achievement of rehabilitation goals. Community support may or may not be applicable after discharge. Although family support is an important component of rehabilitation, reinforcing the skills the client has acquired is of greater importance when regaining independence. Rehabilitation plans should include the client, family, or both.

CN: Psychosocial integrity; CL: Synthesize

68. 2. The most important intervention for infection control is to continue meticulous catheter site care. Dressings are to be changed two to three times per week depending on institutional policies. Temperature should be monitored at least once a day in someone with a vascular access device. Handwashing before and after irrigation or any manipulation of the site is a must for infection prevention.

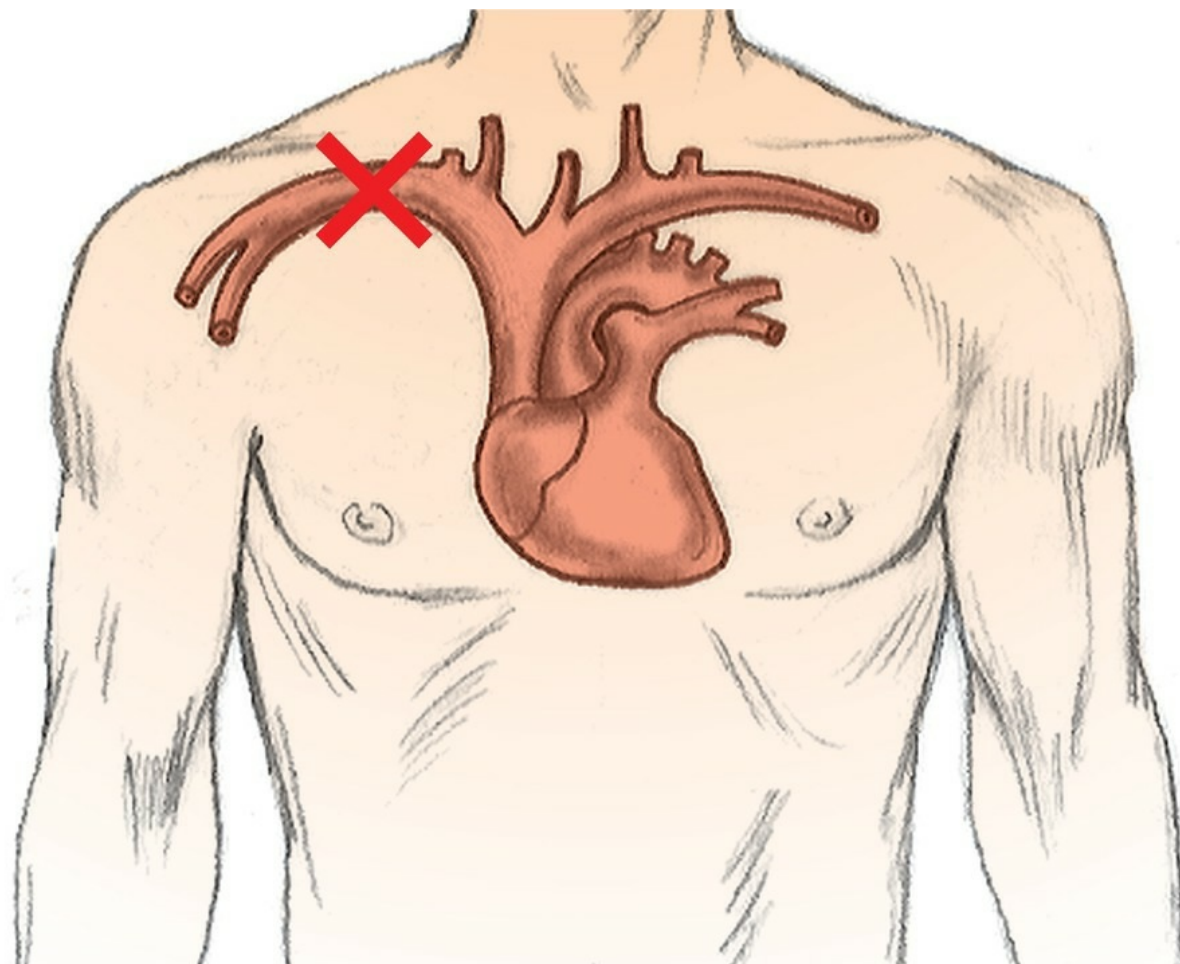

CN: Safety and infection control; CL: Evaluate

69. 1,2,4,5. A major concern with IV administration of cytotoxic agents is vessel irritation or extravasation. The Oncology Nursing Society and hospital guidelines require frequent reevaluation of blood return when administering vesicant or nonvesicant chemotherapy due to the risk of extravasation. These guidelines apply to peripheral and central venous lines. The nurse should also assess the insertion site for signs of infiltration, such as swelling and redness. In addition, central venous lines may be long-term venous access devices. Thus, difficulty drawing or aspirating blood may indicate the line is against the vessel wall or may indicate the line has occlusion. Having the client cough or move position may change the status of the line if it is temporarily against a vessel wall. Occlusion warrants more thorough evaluation via x-ray study to verify placement if the status is questionable and may require a declotting regimen. The nurse should not administer any drug if the IV line is not open or does not have an adequate blood return.

CN: Pharmacological and parenteral therapies; CL: Create

70. The distal tip of a central line should be placed in the subclavian vein.

 CN: Pharmacological and parenteral therapies; CL: Apply

71. 2. The client is exhibiting signs and symptoms of a pneumothorax from the insertion of the subclavian venous catheter. Although it is possible that the client suffered an air embolus during the procedure, and the client is at risk for pulmonary emboli because of his immobility, absent breath sounds immediately after insertion of a subclavian line are strongly suggestive of a pneumothorax. Unilateral absent breath sounds are not associated with a myocardial infarction.

 CN: Physiological adaptation; CL: Analyze

72. 4. An appropriate and realistic outcome would be for the client to maintain current weight or not lose weight. It is unrealistic to expect that the client with advanced liver cancer will have normal albumin levels or will be able to gain weight.

 CN: Basic care and comfort; CL: Synthesize

73. 3. As long as the client is able to get out of bed, the preferred position and time frame for preventing aspiration after a bolus tube feeding is sitting upright out of bed in a chair for 30 to 60 minutes. The client should have the head of the bed elevated more than 60 degrees; it is not necessary to remain in an upright position for more than an hour after the feeding. Placing the client on the right, not the left, side may facilitate gastric emptying, but this is not the preferred position. Elevating the bed 30 degrees decreases the risk of aspiration, but this elevation must be maintained for at least 45 to 60 minutes.

CN: Basic care and comfort; CL: Synthesize

74. 1. Total parenteral nutrition solutions supply the body with sufficient amounts of dextrose, amino acids, fats, vitamins, and minerals to meet metabolic needs. Clients who are unable to tolerate adequate quantities of foods and fluids and those who have had extensive bowel surgery may not be candidates for enteral feedings. The nurse would anticipate total parenteral nutrition via central catheter to promote wound healing. IV dextrose does not supply all the nutrients required to promote wound healing.

CN: Pharmacological and parenteral therapies; CL: Synthesize

75. 1,2,4. Elevated temperature in the first 24 hours along with coarse breath sounds may indicate a respiratory complication or the result of general anesthesia. Use of incentive spirometry and increasing activity would be key interventions. A healthy stoma will be beefy red. A dusky appearance of the stoma indicates decreased blood supply and is of concern. It is not uncommon to have decreased bowel sounds initially after gastrointestinal surgery. In addition, it usually will take time for the ostomy to function.

CN: Reduction of risk potential; CL: Analyze

76. 3. The vital signs suggest that the client is dehydrated from the vomiting, and the nurse should first infuse the IV fluids with the addition of potassium. There is no indication that the client needs oxygen at this time since the PO_2 is 95 (12.6 kPa). Although the client has a rapid and irregular pulse, the infusion of fluids may cause the heart rate to return to normal, and the 12-lead ECG can be prescribed after starting the intravenous fluids.

CN: Physiological adaptation; CL: Synthesize

77. 4. The content of the client's comments suggests that she is concerned about her husband avoiding her. Addressing sexuality issues is appropriate for a client who has undergone a mastectomy. Rushing her return to work may add to her exhaustion. Suggesting that she learn relaxation techniques for help with her insomnia is appropriate; however, the nurse must first address the psychosocial and sexual issues. A nutritional assessment may be useful, but there is no indication that she has anorexia.

CN: Psychosocial integrity; CL: Synthesize

78. 3. The client is exhibiting early symptoms of pulmonary toxicity as a result of the radiation therapy. These are not expected adverse effects of radiation. The client should be examined to differentiate between an infection and radiation pneumonitis. Suggesting that the client take acetaminophen and call back in 2 days is inappropriate. These signs and symptoms are not indicative of a true emergency, but the client should be seen by an **HCP**  before the next appointment.

CN: Reduction of risk potential; CL: Synthesize

79. 2,1,4,3. The client is short of breath. The head of the bed should be elevated to enable breathing, and oxygen should be applied. Morphine should be administered for pain prior to initiating deep-breathing exercises. Deep-breathing exercises improve lung expansion and decrease dyspnea. Education can be provided on the thoracentesis that is anticipated once the symptoms are managed.

CN: Physiological adaptation; CL: Synthesize

80. 1. Treatment for cellulitis includes oral or intravenous antibiotics for 1 to 2 weeks, elevation of the affected extremity, and application of warm, moist packs to the site. Arm exercises help to reduce swelling, but do not treat the infection.

CN: Physiological adaptation; CL: Synthesize

81. 3. Changing positions frequently aids in distributing the agent to the pleura for sealing. The majority of the pleural fluid is drained, and the lung should already be reexpanded before instillation of the sclerosing agent. A pressure dressing is applied to the chest tube exit site, and it is not necessary

to lie on that side to hold pressure on the area.

CN: Reduction of risk potential; CL: Synthesize

82. 4. Providing adequate humidification for the client with a tracheostomy is essential. The client no longer has the functions of the nose for warming, moistening, or filtering the air when breathing through the tracheostomy site. Providing tracheostomy site care, addressing the psychosocial issues, and observing for early signs and symptoms of skin breakdown around the tracheostomy site are also important; however, using humidifiers to prevent thick, tenacious secretions is the most important recommendation for long-term management and the prevention of pulmonary infection.

CN: Reduction of risk potential; CL: Synthesize

83. 4,5. A malignant pleural effusion is an accumulation of excessive fluid within the pleural space that occurs when cancer cells irritate the pleural membrane. Dyspnea can result from the increased pressure, which may contribute to increased anxiety and fear of suffocation. Pain is a consequence of the pleural irritation. Cough is related to the atelectasis of the bronchi and inability to clear the airways. Hiccups are usually associated with pericardial effusions. Weight gain and peripheral edema may occur with peritoneal effusion.

CN: Physiological adaptation; CL: Analyze

84. 2,3,4. Thoracentesis is usually successful for diagnosis of underlying disease, palliation of symptoms, and treating the acute respiratory distress; alleviation of the symptoms and distress is usually short term. The thoracentesis is not used as a treatment for recurrent pleural effusion because the fluid accumulates rapidly. Thoracentesis does not remove cancer cells.

CN: Reduction of risk potential; CL: Evaluate

85. 3. Cold intolerance may be associated with anemia because of the diminished oxygen supply to the peripheral circulation. Decreased salivation is not associated with anemia. Tachycardia may be expected in severe anemia. Clients with anemia are usually not nauseated.

CN: Physiological adaptation; CL: Analyze

86. 4. Petechiae are tiny, purplish, hemorrhagic spots visible under the skin. Petechiae usually appear when platelets are depleted. Bleeding gums or oozing of blood may accompany the petechiae, and the client should seek medical assistance immediately. Increasing iron in the diet will not improve the platelet count. Lotion will not treat the petechiae. Elevating the legs will not cause the petechiae to disappear.

CN: Physiological adaptation; CL: Synthesize

87. 3. Lymphedema after breast cancer surgery is the accumulation of lymph tissue in the tissues of the upper extremity extending down from the upper arm. It may occur at any time after surgery in women of any age. It is caused by the interruption or removal of lymph channels and nodes after axillary node dissection. Removal results in less efficient filtration of lymph fluid and a pooling of lymph fluid in the tissues on the affected side. Treatments or interventions should be instituted as soon as lymphedema is noted to prevent or reduce further progression. Range-of-motion exercises, elevation, and avoidance of injury in the affected arm are important when completing client teaching. The **healthcare provider (HCP)**  may also prescribe a compression sleeve. Lymphoma is not caused by failure to remove all cancer cells. Lymphedema can occur after any surgery that disrupts lymph flow, not just radical mastectomy.

CN: Reduction of risk potential; CL: Synthesize

88. 3. Redness, warmth, and swelling are all signs of infection. Treatment with antibiotics is usually indicated. Infection usually increases fluid accumulation and could worsen the lymphedema. Warm compresses could also increase fluid accumulation. Elevation will not treat the infection. It is critical that the client not delay treatment.

CN: Reduction of risk potential; CL: Synthesize

89. 4. Fever is most commonly related to infection. In a neutropenic client, fever frequently occurs in the absence of the usual clinical signs and symptoms of infection. Inadequate nutrition or antiemetic therapy resistance would not result in fever. Fever is not usually expected with most chemotherapy drugs.

 CN: Physiological adaptation; CL: Analyze

90. 2. Nine days after chemotherapy, it is expected for the client to be immunocompromised. The clinical signs and symptoms of shock reflect changes in cardiac function, vascular resistance, cellular metabolism, and capillary permeability. Low-grade fever, tachycardia, and chills may be early signs of shock. The client with signs and symptoms of impending septic shock may not have decreased oxygen saturation levels. Oliguria and hypotension are late signs of shock. Urine output can be initially normal or increased.

 CN: Pharmacological and parenteral therapies; CL: Analyze

91. 3. Prioritizing physical activities helps to conserve energy, which promotes adaptation to fatigue. The client should learn to take short naps or short rest periods during the day for additional energy conversation. Increased fluid intake is important but may interrupt rest periods by causing frequent urination. Limiting intake of high-fiber foods can add to constipation, which may be a problem because of inactivity in fatigued clients.

 CN: Basic care and comfort; CL: Synthesize

92. 4. Most hospitalized persons are at risk for sleep disturbances. Psychological issues (such as anxiety and depression) and pain are related to sleep deprivation. Social, nutritional, and cultural issues are not necessarily associated with sleep disturbances.

 CN: Psychosocial integrity; CL: Apply

93. 4. Nursing interventions to decrease the discomfort of pruritus include those that prevent vasodilation, decrease anxiety, and maintain skin integrity and hydration. Medicated baths with salicylic acid or colloidal oatmeal can be soothing as a temporary relief. The use of antihistamines or topical steroids depends on the cause of the pruritus, and these agents should be used with caution. Using silk sheets is not a practical intervention for the hospitalized client with pruritus.

 CN: Basic care and comfort; CL: Apply

94. 4. Use of deodorant or fragrant soaps is drying to the skin. Cotton clothing gives the least irritation to skin. A cool, humidified environment adds to the client's comfort as well as providing hydration for skin comfort. Fluid intake of 3,000 mL/day is recommended for adequate hydration.

CN: Basic care and comfort; CL: Analyze

95. 4. Individuals with cancer have various cultural values and beliefs that help them cope with the cancer experience. Quality of life cannot be evaluated solely by quantifiable factors such as employability, functional status, or evidence of disease. It must be evaluated by the survivors within the context of their subjective and individual values and beliefs.

CN: Psychosocial integrity; CL: Analyze

96. 3. Constipation lasting 3 days or longer is unusual in this client and warrants immediate action. However, because the client had chemotherapy with doxorubicin 10 days ago, she is susceptible to infection and should avoid rectal medications and treatments. Abdominal discomfort secondary to constipation will be relieved after the client has a bowel movement; an opioid would contribute to the constipation.

CN: Pharmacological and parenteral therapies; CL: Synthesize

97. 1,4,5. The rectal area needs to be cleaned and gently dried after each bowel movement to prevent skin breakdown and inhibit growth of bacteria. Sitz baths are appropriate because they promote comfort. The client should increase fluid consumption to prevent dehydration. Zinc oxide ointment does form a protective skin barrier, but it makes it difficult to thoroughly clean the perirectal area of feces and increases the risk of infection, as do skin barrier dressings.

CN: Safety and infection control; CL: Synthesize

98. 2. Studies of long-term immunologic effects in clients treated for leukemia, Hodgkin's disease, and breast cancer reveal that combination treatments of chemotherapy and radiation can cause overall bone marrow suppression, decreased leukocyte counts, and profound immunosuppression. Persistent and severe immunologic impairment may follow radiation and chemotherapy (especially multiagent therapy). There is no evidence of

greater risk of infection in clients with persistent immunologic abnormalities. Suppressor T cells recover more rapidly than do the helper T cells.

CN: Pharmacological and parenteral therapies; CL: Apply

The Client Who Is Coping with Loss, Grief, Bereavement, and Spiritual Distress

99. 4. Identifying available resources for the client and family represents a respectful effort to make options available and encourages the client to become involved in treatment decisions. Assuming decision making for the client may foster dependence. Encouraging strict compliance with all treatment regimens may increase anxiety and limit the client's options and treatment choices. Informing the client of all possible adverse treatment effects may increase anxiety and fear by focusing on adverse outcomes too soon.

CN: Psychosocial integrity; CL: Synthesize

100. 4. Denial is a defense mechanism used to shut out a situation that is too frightening or threatening to tolerate. In this case, denial allows the client to vacillate between acceptance of the illness and its treatment and denial of the actual or potential seriousness of the disease. This may allow the client more psychological freedom to maintain her current roles in the family and elsewhere. Denial can be harmful if the client ignores standard medical therapies in favor of unconventional treatments. Denial is not helpful when it interferes with a client's willingness to seek treatment or make decisions about care. Using any one defense mechanism exclusively usually reflects maladaptive coping. Other defense mechanisms that may be used include regression, humor, and sublimation.

CN: Psychosocial integrity; CL: Apply

101. 2. The client's resources for coping with the emotional and practical needs of herself and her family need to be assessed because usual coping strategies and support systems are often inadequate in especially stressful situations. The nurse may be concerned with the client's use of denial, - decision-making abilities, and ability to pay for transportation; however, the client's support systems will be of more importance in this situation.

 CN: Psychosocial integrity; CL: Analyze

102. 4. Variables that are most predictive of negative bereavement outcomes include anger and self-reproach, low socioeconomic status, lack of preparation for death, and lack of family support. Making preparations suggests that she is coping with her husband's approaching death.

 CN: Psychosocial integrity; CL: Analyze

103. 4. Having adequate financial resources facilitates bereavement. Younger people are at higher risk for negative bereavement outcomes. Having a history of depressive illness or anxiety is a risk factor for negative bereavement outcomes. Being a spouse does not make grieving easier.

 CN: Psychosocial integrity; CL: Analyze

104. 4. Focusing on the client's physical capabilities is important, but powerlessness reflects a perceived lack of control over the current situation and the belief that one's actions will not affect the outcome. Participation in decision making is key to getting the client involved and feeling more in control of his or her own care. Apathy and dependence on others are characteristics of powerlessness. Encouraging others to take responsibility for the client's care will increase the client's feelings of powerlessness. A referral to a psychologist is not necessarily indicated. The nurse should implement strategies to involve the client in decisions about the client's care and evaluate the response to this intervention before suggesting a referral.

 CN: Psychosocial integrity; CL: Synthesize

105. 1. Maintaining role function has been found to be a supportive source of normalcy and positive self-esteem for the client and family during the cancer experience. Facilitating family-related disagreements and conflicts is not the nurse's role. Supporting the client in her use of denial as a coping strategy will not help facilitate the client's adaptation to the diagnosis. Arranging transportation and child care on treatment days may be helpful but does not necessarily facilitate adaptation to the diagnosis.

 CN: Psychosocial integrity; CL: Synthesize

106. 2. The most important central component of hospice care is focus of

care on the client as well as the family or significant other. The team approach and the **HCP's** coordination of the hospice team are important, but they are not the focus. Not all hospice clients want to die at home.

 CN: Basic care and comfort; CL: Apply

107. 3. Mental changes and decreased level of consciousness are common in the dying process, and the client may talk about travel, trips, or going somewhere. Suggesting that the client be sedated ignores the husband's question about what his wife is experiencing. Suggesting that the client is fighting death and that the husband should leave her alone is inappropriate and denies the husband time to spend with his wife. The husband should not make misleading statements to his wife.

 CN: Psychosocial integrity; CL: Synthesize

108. 4. It is important to give factual information to answer a loved one's questions and concerns. Stating "That is just the way it is" is unprofessional and uncaring. Saying "I do not know when the bowels will shut down, but they will eventually" projects an uncaring attitude and does not address the wife's concern for her husband or her need for information. Although it may be true that the pain medication will slow bowel function, this does not provide the wife with the information she is seeking.

 CN: Psychosocial integrity; CL: Apply

109. 4. It is important to allow the client to choose his or her own form of spiritual support, and the nurse can begin by asking the client what would be most supportive now. The client must be consulted before referral to a chaplain is made. Reflection on past accomplishments may be comforting to the client, but it does not directly address spiritual concerns. The client is able to communicate with the nurse, and discussing the conversation with the family does not respect the client's right to privacy.

 CN: Psychosocial integrity; CL: Synthesize

110. 2. A social worker can provide information for supportive services and can help the client determine which resources are necessary at this time. The business office of the healthcare agency does not provide advice about managing finances. The **HCP**  will be part of the team, but will focus on

managing the client's health and end-of-life care. The client may or may not have a will; it is not the role of an executor to make financial decisions about health care.

CN: Psychosocial integrity; CL: Synthesize

111. 4. Dehydration is an expected event within the dying process. Hydration may be used in any situation of dehydration as long as it is within the client and family's wishes. Rehydrating the client may actually prolong the dying process. Decisions about treatment are made with the family.

CN: Basic care and comfort; CL: Apply

112. 4. The nurse must first allow the client to explore his or her own beliefs and values before making referrals, explaining various religious beliefs, or suggesting appropriate reading material.

CN: Psychosocial integrity; CL: Synthesize

113. 3. The family is in the best position to give the information they elect to disclose to friends and community members. The hospice nurse and the oncologist must maintain client confidentiality and follow privacy guidelines for release of confidential information. Therefore, disclosing any information about the client's condition would be inappropriate.

CN: Management of care; CL: Synthesize

114. 4. Depression can be a mixture of affective responses (feelings of worthlessness, hopelessness, sadness), behavioral responses (appetite changes, withdrawal, sleep disturbances, lethargy), and cognitive responses (decreased ability to concentrate, indecisiveness, suicidal ideation). Increased decisiveness, problem-solving ability, and increased social interactions are reflective of adaptive coping.

CN: Psychosocial integrity; CL: Analyze

115. 4. Bereavement support after death usually continues for about 1 year or as needed at little or no cost to the remaining family. Mutual support groups by nonprofessionals are usually free or inexpensive but are not necessarily appropriate for young children. Professional individual counseling and medication are expensive, and medication may not be

appropriate for young children. To remind someone of what she should have done before the death is not helpful at this time.

CN: Psychosocial integrity; CL: Synthesize

116. 3. It is important to establish rapport with the client and family by listening to verbal and nonverbal concern and showing respect for cultural differences. The use of touch or eye contact is culture-specific and cannot be generalized as an intervention for all individuals with cancer.

Miscommunication between individuals of different cultures is often caused by language differences, rules of communication, age, and gender.

CN: Psychosocial integrity; CL: Synthesize

117. 4. Support groups are designed to educate clients and their families experiencing cancer about the disease and methods of coping positively with it. These are self-help and support groups monitored by professionals and cancer survivors who have undergone a training course that helps them to facilitate small groups.

CN: Psychosocial integrity; CL: Apply

118. 4. Many cancer survivors question why they are doing so well and others are not. Often, they express feeling guilty when they hear that others are not doing well. Suggesting that the client does not know how to describe his own emotions is inappropriate and may discourage him from expressing his feelings. Although the client may be experiencing volatile emotions, this is not the likely source of his feelings of guilt. Guilt about doing well after cancer treatment is not a spiritual response to illness.

CN: Psychosocial integrity; CL: Synthesize

119. 4. The person who has minimal social support, has not been successful in dealing with stressors, and has multiple other stressors is at greater risk for psychosocial distress. Being successful in dealing with stress all his life would decrease the client's risk for psychosocial distress. Not having to deal with other stressors would be helpful in managing the current stressful situation. The denial coping mechanism, if used for short periods, can decrease the risk for psychosocial distress.

CN: Psychosocial integrity; CL: Analyze

120. 1. Clients with cancer report that the lifelong fear of recurrence is one of the most disruptive aspects of the disease. The trajectory of the disease is unpredictable and can be intertwined with many short- and long-term illnesses related to cancer and the treatment modalities. A diagnosis of cancer challenges the individual and the family with a series of crises rather than a time-limited episode. There are no data to indicate that the client has an underlying behavioral disorder.

CN: Psychosocial integrity; CL: Analyze

121. 4. Without clear, consistent communication, the parent-child relationship may become strained during the illness and subsequent death of a parent. A great number of parents do not know how to communicate with their children, especially about difficult emotional topics at a time when they are also under great emotional stress. The nurse should begin by providing information and developmentally appropriate books about the grieving process for children. Referral to pastoral care services may be appropriate; however, the nurse's direct intervention of beginning education about strategies for communication will be of immediate and long-term benefit. The grieving process cannot be rushed for the husband, nor should an opportunity for the father and children to communicate and grieve together be delayed. Excluding children from participating in the grieving ritual does not shield them from the sorrow and sadness, and having the HCP  tell the children does not promote healthy communication between the father and the children.

CN: Psychosocial integrity; CL: Synthesize

122. 3. Acknowledgment and discussion of the client's feelings begin the establishment of a therapeutic relationship between nurse and client. It also acknowledges the seriousness of the current situation and validates the client's feelings. Grief counseling antidepressant medication may be options if the depression is severe and prolonged. The client is not ready at this point to continue the conversation with her husband.

CN: Psychosocial integrity; CL: Synthesize

123. 2. Individuals who are experiencing fatigue need to prioritize their activities and ask for assistance from others. It is best not to take away all of the client's activities because her role as wife and mother is obviously

important to her and to her sense of self-worth. Suggesting that she ignore the household chores or telling her not to worry because everyone gets tired disregards the client's feelings and is not appropriate.

CN: Basic care and comfort; CL: Synthesize

124. 4. Tachycardia, tachypnea, moist or clammy skin, and disorientation are classic symptoms of delirium. Clients with panic disorder do not exhibit disorientation. Clients with depression exhibit a flat affect, apathy, and sleep disturbances. Clients with schizophrenia have thought disorders such as hallucinations or delusions.

CN: Physiological adaptation; CL: Analyze

125. 2. A progressive activity regimen may be prescribed to increase pulmonary function after surgical lung resection. Rehabilitation should include walking and some stair climbing as tolerated. It is not necessary at this point for the client to speak with someone who has had similar surgery. Depending on the surgeon's preference, there may not be a dressing to change. There is no indication that the client would not be able to manage cleaning the house as her energy increases.

CN: Psychosocial integrity; CL: Synthesize

126. 4. Serving as a volunteer in a client-to-client program represents reintegration with constructive channeling of energies, which indicates a higher level of adaptation than attention to safety, knowledge, or planned activity. Discussing suicide is an indication the client is not adapting to the changes in health status. Continuing to look at the incision indicates the client is still concerned about the changes to the body. While looking forward to returning to work is a positive sign, being able to help others demonstrates an integration of the experience into the client's life.

CN: Psychosocial integrity; CL: Evaluate

The Client Who Is Experiencing Problems with Sexuality

127. 3. Water-soluble lubricants used during sexual intercourse can augment reduced natural vaginal lubrication caused by ovarian dysfunction and decreased circulating estrogen related to chemotherapy. The use of

vaginal dilators, relaxation techniques, or nightly douches would not increase vaginal lubrication. Frequent douching can disrupt the normal vaginal environment.

CN: Health promotion and maintenance; CL: Synthesize

128. 3. Placing a thin piece of gauze over the tracheostomy during sexual activity will help to contain the secretions and yet allow ventilation. Although a scopolamine patch may depress the salivary and bronchial secretions, it is not recommended for long-term use and would not be indicated in this situation. Avoiding fluids before sexual activity is not recommended to decrease secretions. Washing the tracheostomy area with any deodorizing soap may cause skin irritation and place the client at risk for infection.

CN: Health promotion and maintenance; CL: Synthesize

129. 4. This question introduces some basic information and allows for support for the client who may be experiencing some sexuality concerns. Not all women experience sexual problems after undergoing a hysterectomy. Assuming that the client will want to schedule an appointment with her partner is inappropriate and may embarrass her. Simply asking the client whether she expects to have problems with sex is too abrupt and does not provide any information.

CN: Psychosocial integrity; CL: Synthesize

130. 4. Although there may not be a big change in sexual function with a unilateral orchiectomy, the loss of a gonad and testosterone may result in decreased libido and sterility. Sperm banking may be an option worth exploring if the number and motility of the sperm are adequate. The population most affected by testicular cancer is generally young men aged 15 to 34, and in this crucial stage of life, sexual anxieties may be a large concern. Since there will likely not be a big change in sexual function, it is not appropriate to tell the client he will experience impotence, have early ejaculation, or require a referral to a sex therapist.

CN: Psychosocial integrity; CL: Synthesize

131. 4. The risk of becoming neutropenic during chemotherapy is very high. Therefore, an inserted foreign object such as a diaphragm may be a

nidus for infection. Although the nurse may wish to inform the client about the ease with which various contraceptive modalities may be used, the focus of this discussion should be on preventing an infection, which can be fatal for the neutropenic client. There are no data to suggest the client is at risk for acquiring a sexually transmitted disease. The client will not be experiencing body changes directly related to hormonal changes.

 CN: Safety and infection control; CL: Synthesize

132. 2. Raising the upper torso for the affected partner facilitates respiratory function. The use of a foam mattress is not necessary and will not help promote respiratory expansion. A dependent position may compromise respiratory expansion, even though energy may be conserved. Duration of sexual activity is not necessarily related to exertion.

 CN: Health promotion and maintenance; CL: Synthesize

Ethical and Legal Issues Related to Clients with Cancer

133. 4. The nurse must respect the wishes of the client who has indicated that he does not wish to be resuscitated and not to initiate CPR. Nurses who resuscitate clients who have directed otherwise may be considered to be battering the client. In this situation, the **HCP**  has written the DNR prescription, and it is not necessary for the nurse to page the HCP. The nurse can be most helpful by explaining the client's decision to the wife and helping her manage her understand her husband's wishes and manage her own grief.

 CN: Management of care; CL: Synthesize

134. 3. The **RN** assigning care should first give the UAP the opportunity to explore concerns and fears about caring for a client with HIV infection. Reassigning care for this client, assisting with care, and reviewing precautions do not address the present concern or create an environment that will generate useful knowledge regarding future assignments for client care.

 CN: Management of care; CL: Synthesize

135. 1. The nurse should advise the client to check with her employer to determine the policies and legislation followed there regarding leaves of

absence. While the client can consider the other options, the first step is to obtain information from her employer.

 CN: Management of care; CL: Apply

136. 1. Maintaining a steady blood level of analgesics is beneficial for the client with chronic cancer pain. Administering analgesics regularly helps control pain more efficiently. Additional doses of medication may be necessary as ordered for breakthrough pain. Keeping the client overly sedated may not help to control pain. Intravenous analgesics are more effective than oral medications at controlling pain because their distribution is more predictable. Vital signs are not a reliable indicator of how much pain the client is experiencing.

 CN: Management of care; CL: Apply

137. 3. The goal of client autonomy is to respect the client's choice not to know particular information. The client's best interests should be determined by the client after he or she receives all the necessary information and in conjunction with other people of the client's choice, including family, **HCP**  , and other healthcare personnel. The client's best interests are not totally directed by the HCP or the healthcare team.

 CN: Management of care; CL: Evaluate

End-of-Life Care

138. 2. The client is likely becoming more comatose and is not self-administering the pain medication. The client is not receiving too much medication because the PCA pump has controls to prevent overdose. The client is likely having pain, but is not able to recognize it. There is no indication that the IV has infiltrated.

 CN: Pharmacological and parenteral therapies CL: Analyze

139. 1,2,5. Advance directives are written statements of person's wishes related to health care if they are unable to decide for themselves. Power of attorney is a written authorization to represent or act on another's behalf in private affairs, business, or some other legal matter. These documents relate to current or future health care and not past medical history. Competent

adults are responsible for their own healthcare decisions and their own right to accept or refuse treatment. Advance directives are used when the person cannot make the decision. Medical power of attorney is a term used to describe the person who makes healthcare decisions should someone be unable to make informed decisions for himself or herself. The focus is not primarily financial access.

CN: Management of care; CL: Evaluate

140. 4. The advocacy role of the nurse implies that the nurse will ensure that the client's wishes are being respected and the client is making informed decisions. Therefore, the nurse will assist in ensuring that the client is fully informed. The other interventions are appropriate for the nurse but are not related to client advocacy. The client may not understand or have all the necessary information for standard therapy. A client who is taking an alternative therapy should be monitored for adverse effects. If a client is taking an alternative therapy, it is essential for the **healthcare provider (HCP)** to know so that the therapy can be incorporated into the client's treatment plan and to ensure that there are no incompatibilities with other therapies or medications.

CN: Management of care; CL: Evaluate

141. 2,3,4,5. End-of-life care is the term currently used for issues related to death and dying. End-of-life care focuses on physical and psychosocial needs at the end of life for the client and client's family. Palliative care is health care aimed at symptom management rather than curative treatment for diseases. Goals would include providing comfort and support for the client and family and improving the client's quality of life. Grief counseling is a component, and efforts would be to enhance the coping of all involved and not to alter usual coping methods.

CN: Management of care; CL: Create

142. 3. The best nursing advocacy intervention is listening carefully to the client's and family's perceptions of their needs. Studies have demonstrated that these needs are not necessarily what the nurse thinks they are. Intervening without listening carefully may result in a lack of responsiveness to the real needs. Helping the client and family maintain a sense of optimism

and hopefulness is appropriate but is not necessarily advocacy. Determining the client's and family's understanding of the results of the diagnostic testing and providing written materials about the cancer site and its treatment are examples of the nurse's role as educator.

CN: Psychosocial integrity; CL: Synthesize

143. 1. The nurse would give the client a tissue and indicate that it is okay to cry to convey acceptance and empathy. He needs to know that it is natural to have tremendous feelings of loss and sadness. Telling the client to stop crying, busying oneself in the client's room, and changing the subject are not helpful to the client because they ignore his needs and inhibit the expression of emotion.

CN: Psychosocial integrity; CL: Synthesize

144. 2,3,4,5,6. With serious, chronic, and terminal illnesses, it is important to help clients and families address fears, difficulties with home care, advance directives, hospice and home care options, and final arrangements. Predicting the length of life for this client is not appropriate at admission.

CN: Psychosocial integrity; CL: Synthesize

145. 1. The client's husband is experiencing anger, much of which stems from feelings of guilt about not taking the trip. During the stage of denial, the husband is more likely to deny the client's diagnosis and prognosis. During the stage of bargaining, the husband would offer to do certain things in exchange for more time before the client dies. In the stage of depression, the husband is likely to make few or no comments and to act dejected.

CN: Psychosocial integrity; CL: Analyze

146. 1. When supporting the friends or family of a terminally ill client, it is best to focus on the present. This can be accomplished by living each day to its fullest. Friends and families also want to know what to expect and want someone to listen to them as they express grief over the approaching death. Focusing on the past can interfere with enjoying the present. Expecting the worst interferes with focusing on day-to-day positive experiences. Planning ahead is inappropriate because of uncertainty when the length of life is unknown.

 CN: Psychosocial integrity; CL: Synthesize

147. 1. The best course of action when the client has outbursts concerning treatments is to explain how the treatment is expected to help. Describing the effect if the client misses a treatment is a negative approach and may be threatening to the client. Explaining the effects of being upset does not deal with the client's feelings. Offering to arrange for a massage during the chemotherapy may be helpful, but does not deal with the client's immediate feelings.

 CN: Psychosocial integrity; CL: Synthesize

148. 2. Clients tend to experience isolation and loneliness when those around them are trying to hide or mask the truth. They are then left to face the realities of death alone. Clients do not experience relief or hopefulness when others are falsely cheerful. Independence is promoted by offering realistic choices about care at the end of life.

 CN: Health promotion and maintenance; CL: Analyze

149. 3,4,5. Taking a blood sample is an unnecessary, invasive procedure that would not directly address the sister's fear. Leukemia is not considered a communicable disease. The nurse should first determine the sister's concerns, and then alert the parents to the sister's concerns and also tell the parents about resources that are available to assist siblings to cope with a terminal illness in the family.

 CN: Psychosocial integrity; CL: Synthesize

150. 2. A response that acknowledges the brother's concern and provides him with information is most helpful. Therefore, telling the brother that the nurse sees that he is worried and then following this up with a discussion about leukemia is most appropriate. Providing reassurance or information without acknowledging the expressed concern is not as helpful as acknowledging the concern and providing the information. Although acknowledging his worry is appropriate, more importantly, the brother needs factual information about the disease.

 CN: Psychosocial integrity; CL: Synthesize

Managing Care, Quality, and Safety of Clients with Cancer

151. 3,1,4,2. Using Maslow's hierarchy of needs to set priorities, the nurse should first call the client with bone cancer metastases to the spine because this client is at risk for compression, damage, or severing of the spinal cord. The nurse should evaluate the client immediately for urinary incontinence, paralysis, difficulty ambulating, and possible weakness or loss of motor function. The nurse should next call the client with loss of appetite to assess weight loss and suggest ways to increase the appetite. The client with colon cancer requires assistance with diet planning, also a physiologic need, but this client is not at high risk for weight loss. Lastly, the nurse should obtain information on Reach to Recovery and return the call to the client with a mastectomy. The needs of this client are the least urgent.

CN: Reduction of risk potential; CL: Synthesize

152. 3. The nurse should first assess the 75-year-old man with prostate cancer because of the client's age, need for pain management, extended bed rest, and the potential for preexisting nutritional deficits. The nurse should plan to spend a focused but short time with the woman receiving internal radiation. The client who will receive chemotherapy will require more observation after receiving the medication. The nurse can assess the client who will have a central venous catheter after assuring the older client is comfortable.

CN: Management of care; CL: Synthesize

153. 2,3,4,5. Nurses preparing and administering chemotherapy wear gloves and a disposable, long-sleeved gown. Antineoplastic agents are disposed of as hazardous material, and gloves are always worn when handling the excretions of clients who have received chemotherapy. Sharps must be disposed of in a sharps container labeled "chemotherapy items". It is not appropriate to tape IV tubing connections; antineoplastic agents are administered using LuerLok fittings on all intravenous tubing to minimize the risk of exposure from needlestick injury.

CN: Pharmacological and parenteral therapies; CL: Synthesize

154. 1. An intravenous catheter with no blood return is most likely

occluded and not patent. A chemotherapeutic vesicant drug extravasates into the surrounding skin tissue and causes tissue necrosis. The nurse stops administration of the drug immediately. Repositioning the arm does not improve patency. Irrigating the catheter may cause the medication to enter tissue. It is inappropriate to wait and see if the arm becomes edematous because of the vesicant action of the drug.

CN: Pharmacological and parenteral therapies; CL: Synthesize

155. 1,2,3. Ethics consultation seeks to facilitate communication and shared decision making in client care. Ethics consultations also tend to increase knowledge of clinical ethics, improve client care, and prevent poor outcomes in cases involving ethical problems. Requests for ethics consultations can be made by any member of the healthcare team and by clients, family members, guardians, students, or others with a legitimate interest in the client. The recommendations of ethics consultants are advisory only; the ethics consultation process is intended to supplement and support existing departmental and institutional mechanisms for making decisions and resolving conflict in clinical practice. Clinicians are encouraged to seek an ethics consultation when the client is incapacitated and when no family member/s or guardian/s exist or can be found or when the client's family members disagree about the ethically appropriate action to be taken. Ethics consultation is not intended or authorized to provide legal advice on client care. Persons requesting an ethics consultation may do so without intimidation or fear of reprisal.

CN: Management of care; CL: Synthesize

156. 4. To determine the cause of this problem, a quality improvement study should be conducted along with a chart audit. Before implementing solutions to a problem, the precise issues in the hospital system must be observed and documented. Changing the time to chart from 30 to 45 minutes does not solve the problem. It is not the pharmacist's role to provide consultation about documentation of drugs administered by nurses. Consulting the evening nurses may be helpful, but this is a systems issue of the entire unit and involves every **registered nurse (RN)** administering analgesia.

 CN: Management of care; CL: Create

157. 2. The **RN** is responsible for describing to the **UAP**  when to report to the RN a result that indicates a potential client problem with dehydration. The RN must assess and interpret results, but must give concrete feedback to the UAP on what is an expected situation or a specific result to report back to the RN. Urine output should be at least 30 mL/h, or 240 mL, over the 8-hour shift. Dehydrated clients may be thirsty, and the UAP can ask if the client is thirsty and offer water if permitted. However, because urine output is the critical indicator of dehydration, the UAP should document I&O and give results outside the normal range to the nurse. The nurse is specifically assessing dehydration and should request to receive this information from the UAP before it is charted and reported to the next shift.

 CN: Management of care; CL: Synthesize

158. 4. A bedside commode should be near the client for easy, safe access. Measurement of urine output is also important in a client with heart failure. Putting diapers on an alert and oriented individual would be demeaning and inappropriate. Indwelling catheters are associated with increased risk of infection and are not a solution to possible incontinence. There is no reason to think that the client would not be able to use the bedside commode.

 CN: Safety and infection control; CL: Synthesize

159. 1. Ongoing assessment by the **RN**  is required to evaluate the client with dyspnea to monitor for potential deterioration of the respiratory status. If the RN is the care provider, the RN will have greater interaction with the individual client. The RN is responsible for assessment of all the clients. The other clients would not be considered unstable, and maintaining a patent airway is always the priority in providing care. Care for the other clients could be assigned safely, according to the abilities of the **LPN/VN**  and **UAP** .

 CN: Management of care; CL: Synthesize

160. 1,2,5. Employers should provide appropriate PPE to protect workers who handle hazardous drugs in the workplace. The following general guidelines apply to PPE use and care: select specific respirators and

protective clothing based on an assessment of the potential exposure to hazardous drugs; understand proper use and limitations of any selected PPE to ensure that it functions properly; and use care in donning and removing all items to prevent damage to PPE and to reduce the spread of contamination. The PPE must be constructed of materials that are appropriate for hazardous drug exposure. Hands must be thoroughly washed with soap and water both before donning and after removing gloves. Consider all PPE worn when handling hazardous drugs as being contaminated; contain and dispose of such PPE as contaminated waste.

CN: Safety and infection control; CL: Synthesize

161. 4. When the duration of intravascular therapy is likely to be more than 6 days, a midline catheter or peripherally inserted central catheter (PICC) is preferred to a short peripheral catheter. In adult clients, use of the femoral vein for central venous access should be avoided. Steel needles should be avoided when administering fluids and medications that might cause tissue necrosis if extravasation occurs.

CN: Reduction of risk potential; CL: Apply

The Client Having Surgery

- The Client Who Is Preparing for Surgery
- The Client Who Is Receiving or Recovering from Anesthesia
- The Client Who Has Had Surgery
- Legal and Ethical Issues Associated with Surgery
- Managing Care, Quality, and Safety of Clients Having Surgery
- Answers, Rationales, and Test-Taking Strategies

The Client Who Is Preparing for Surgery

1. A client tells the nurse on admission that she is uneasy about having to leave her children with a relative while being in the hospital for surgery. What should the nurse do?

- ☐ **1.** Reassure the client that her children will be fine and she should stop worrying.
- ☐ **2.** Contact the relative to determine his/her capacity to be an adequate care provider.
- ☐ **3.** Encourage the client to call the children to make sure they are doing well.
- ☐ **4.** Gather more information about the client's feelings about the childcare arrangements.

2. The client has a latex allergy. What should the nurse teach the client to do before having surgery? Select all that apply.

- ☐ **1.** Determine that there will be a latex-safe environment for surgery.
- ☐ **2.** Report symptoms experienced with the latex allergy (e.g., rhinitis, conjunctivitis, flushing).
- ☐ **3.** Notify the healthcare providers (HCPs) at the surgery center.

- ☐ 4. Wear a stainless steel medical alert bracelet into the surgical suite.
- ☐ 5. Ask to have the surgery at a hospital.

3. When the nurse asks the client who is having abdominal surgery today if the client understands the procedure, the client replies, “No, not really; I talked about several different things with my surgeon, and I am just not sure.” The nurse should:

- ☐ 1. teach the client all the details of the planned procedure.
- ☐ 2. utilize a second witness when the client signs for consent.
- ☐ 3. notify the surgeon of the client’s expressed lack of understanding.
- ☐ 4. administer the prescribed preoperative narcotics and/or sedatives.

4. During preadmission testing for same-day surgery, a client states that she has added two cloves of garlic each day to her diet to help control her blood pressure. The nurse should further inquire about:

- ☐ 1. the type of surgery the client is having.
- ☐ 2. what her blood pressure has been running.
- ☐ 3. the amount of garlic she is eating.
- ☐ 4. her preference for the type of anesthesia.

5. When removing protective covering, what action should this nurse (see figure) take to avoid spreading nosocomial infections?

- ☐ 1. Remove the face mask.
- ☐ 2. Place the face mask over the mouth and nose before removing the hair covering.
- ☐ 3. Wash hands before tying the strings on the mask.
- ☐ 4. Tie the dangling strings of the mask around the neck.

6. The client is to have surgery on the fourth metatarsal. Identify the place on the illustration below where the client should confirm the operative site to the healthcare provider (HCP).

7. The nurse is reviewing the medical record of a 55-year-old male client who is scheduled for a lumbar laminectomy. The nurse should report which finding to the surgeon?

- ☐ **1.** pimple on the lower back
- ☐ **2.** abnormal electrocardiogram (ECG)
- ☐ **3.** hearing aid

- ☐ 4. allergy to iodine

8. Prior to going to surgery, the client tells the nurse that she cannot hear without her hearing aid and asks to wear it to surgery and recovery. What is the nurse's **best** response?

- ☐ 1. Explain to the client that it is policy not to take personal items to surgery because they may be lost or broken.
- ☐ 2. Tell the client that a nurse will bring the hearing aid to the postanesthesia care unit so that she can have it as soon as she wakes up.
- ☐ 3. Explain to the client that she will have a premedication that will make her sleepy before she goes to surgery and she will not need to hear.
- ☐ 4. Call the surgery unit to explain the client's concern, and ask if she can wear her hearing aid to surgery.

9. The adult daughters of an elderly male client inform the nurse that they fully expect their father to be combative after surgery. Preoperatively, they request that the nurse put all four side rails up and use restraints to keep him safe. The nurse should tell the daughters:

- ☐ 1. "Certainly; we will want to be sure to keep your father safe too."
- ☐ 2. "We will call the healthcare provider (HCP) to get a prescription right away."
- ☐ 3. "We will first try to keep him safe without restraint."
- ☐ 4. "Restraint use is prohibited at our hospital at all times."

10. The client is to take nothing by mouth after 0400. The nurse recognizes that the client has deficient knowledge when he states that he:

- ☐ 1. ate a gelatin dessert at 0330.
- ☐ 2. brushed his teeth at 0400 but did not swallow.
- ☐ 3. held a cold washcloth against his lips.
- ☐ 4. smoked a cigarette at 0600.

11. The surgeon prescribes cefazolin 1 g to be given IV at 0730 when the client's surgery is scheduled at 0800. What is the **primary** reason to start the antibiotic exactly at 0730?

- ☐ 1. Legally the medication has to be given at the prescribed time.
- ☐ 2. The antibiotic is most effective in preventing infection if it is given 30

to 60 minutes before the operative incision is made.

- ☐ 3. The postoperative dose of cefazolin needs to be started exactly 8 hours after the preoperative dose of cefazolin.
- ☐ 4. The peak and titer levels are needed for antibiotic therapy.

12. Which approach is the **best** way for the nurse to begin the preoperative interview?

- ☐ 1. Walk in the client's room and ask, "Are you Mrs. Smith?"
- ☐ 2. Walk in the client's room, sit down, and take the client's blood pressure.
- ☐ 3. Walk in the client's room, sit down, maintain eye contact, and make an introduction.
- ☐ 4. Walk in the client's room, and ask the client's name.

13. A client who is to receive general anesthesia has a serum potassium level of 5.8 mEq/L (5.8 mmol/L). What should be the nurse's **first** response?

- ☐ 1. Call the operating room to cancel the surgery.
- ☐ 2. Send the client to surgery.
- ☐ 3. Make a note on the client's record.
- ☐ 4. Notify the anesthesiologist.

14. Prior to being transported to the surgery suite, the nurse asks the client whether the client has any allergies. The client responds, "Does anyone communicate with anyone? I have been asked that question over and over!" What is the nurse's **best** response?

- ☐ 1. "I am sorry! I just have to ask that question for the record."
- ☐ 2. "It is an important question, and we just have to check."
- ☐ 3. "You will hear it again and again as you go through surgery."
- ☐ 4. "This question is asked for verification and safety with each new phase of treatment."

15. On the day of surgery, a client with diabetes who takes insulin on a sliding scale is to have nothing by mouth and all medications withheld. The client's 0600 glucose level is 300 mg/dL (16.7 mmol/L). What should the nurse do?

- ☐ 1. Withhold all medications.

- ☐ 2. Administer the insulin dose dictated by the sliding scale.
- ☐ 3. Call the healthcare provider (HCP) for specific prescriptions based on the glucose level.
- ☐ 4. Notify the surgery department.

16. The nurse is preparing a preoperative teaching plan for a client who is undergoing a bilateral breast reduction. Which aspect of the plan is the **priority**?

- ☐ 1. reduction of risk potential
- ☐ 2. physiologic adaptation
- ☐ 3. psychosocial integrity
- ☐ 4. health promotion and maintenance

17. A client is scheduled to have an elective mandibular osteotomy to correct a mandibular fracture sustained in an accident 6 months earlier. Which statement by the client indicates to the nurse the client is having difficulty coping?

- ☐ 1. "I will be glad to have my jaw fixed because my wife thinks I do not look like myself."
- ☐ 2. "I am somewhat afraid to have the surgery but feel OK about it."
- ☐ 3. "My wife will help me, but I do not think I will need that much help."
- ☐ 4. "I am ready to get this over with."

18. The nurse is assessing a client's nutritional status before surgery. Which observation would indicate poor nutrition in a 5-foot 7-inch female (170 cm) client who is 21 years of age?

- ☐ 1. poor posture
- ☐ 2. brittle nails
- ☐ 3. dull expression
- ☐ 4. weight of 128 lb (58.1 kg)

19. A 92-year-old is being discharged following a repair of an inguinal hernia. The client is independent and lives alone, and the client's family lives 60 miles from the client's house. When at home, the client is to cleanse and inspect the incision for signs of infection. The client and family are able to read and understand written instructions. When giving discharge instructions,

what should the nurse do? Select all that apply.

- ☐ 1. Explain the instructions to the client.
- ☐ 2. Ask the client to demonstrate the procedure.
- ☐ 3. Explain the instructions to a family member.
- ☐ 4. Provide written instructions for the client.
- ☐ 5. Give the family a link to a video showing the procedure.

20. A client is admitted for an arthroscopy of the right shoulder through same-day surgery. Which nurse is responsible for starting the client's discharge planning?

- ☐ 1. preadmission nurse
- ☐ 2. preoperative nurse
- ☐ 3. intraoperative nurse
- ☐ 4. postoperative nurse

21. The nurse is preparing to administer a preoperative medication that includes a sedative to a client who is having abdominal surgery. The nurse should **first**:

- ☐ 1. have the family present.
- ☐ 2. ensure that the operative area has been shaved.
- ☐ 3. have the client empty the bladder.
- ☐ 4. make sure the client is covered with a warm blanket.

22. Before surgery, a client expresses a fear of surgery because 10 years ago the client's sister died in surgery related to complications of anesthesia. What should the nurse do?

- ☐ 1. Reassure the client that technology has changed over the last 10 years.
- ☐ 2. Encourage the client to further express concerns.
- ☐ 3. Explain to the client that it is normal to be afraid.
- ☐ 4. Ask the client if anyone else in the family has had trouble when they had surgery.

23. The nurse is preparing to start an intravenous infusion and has raised the head of the client's bed. After the nurse applies gloves to insert an IV catheter, the client begins to rub the eyes and wipe away nasal drainage. What should the nurse do **first**?

- ☐ 1. Distract the client's attention.
- ☐ 2. Assess the client for pain.
- ☐ 3. Remove the gloves and assess the client's vital signs.
- ☐ 4. Lower the head of the client's bed.

24. When evaluating a client's preoperative cognitive-perceptual pattern, which question should the nurse ask the client?

- ☐ 1. "Do you have difficulty swallowing?"
- ☐ 2. "Do you need special equipment to walk?"
- ☐ 3. "Do you smoke?"
- ☐ 4. "Do you wear glasses?"

25. When attempting to check the pupils of a client scheduled to receive general anesthesia, the nurse notices that the client has trouble tilting the head back. What is the **primary** concern related to this finding?

- ☐ 1. The client has limited movement of his neck.
- ☐ 2. The client is at risk for postoperative neck pain.
- ☐ 3. The client is at risk for difficult intubation.
- ☐ 4. The ability to assess the client's pupils is limited.

26. A client is to have a below-the-knee amputation. Prior to the surgery, the circulating nurse in the operating room should:

- ☐ 1. insert a Foley catheter.
- ☐ 2. start an intravenous infusion.
- ☐ 3. initiate a time-out.
- ☐ 4. verify that the surgeon possesses the degree of expertise needed.

27. The nurse is developing a plan to teach a client deep-breathing exercises to expand collapsed alveoli and prevent postoperative atelectasis and pneumonia. Which steps should be included? Select all that apply.

- ☐ 1. Splint or support the incision to promote maximal comfort.
- ☐ 2. Inhale slowly through the nostrils; exhale through pursed lips.
- ☐ 3. Hold the breath for about 5 seconds to expand the alveoli.
- ☐ 4. Repeat this breathing method 5 to 10 times hourly.
- ☐ 5. Close one nostril while inhaling.

28. The nurse receives the preoperative blood work report for a client who is scheduled to undergo surgery. Which laboratory finding should be reported to the surgeon and anesthesiologist?

- ☐ 1. red blood cells, 4.5 million/mm³ (4.5×10^{12} /L)
- ☐ 2. creatinine, 2.6 mg/dL (198 µmol/L).
- ☐ 3. hemoglobin, 12.2 g/dL (122 g/L)
- ☐ 4. blood urea nitrogen, 15 mg/dL (5.4 mmol/L)

29. A client will receive IV midazolam hydrochloride during surgery. Which finding indicates a therapeutic effect?

- ☐ 1. amnesia
- ☐ 2. nausea
- ☐ 3. mild agitation
- ☐ 4. blurred vision

30. As the client receives IV midazolam hydrochloride, the nurse should:

- ☐ 1. assess the blood pressure.
- ☐ 2. monitor the pulse oximeter.
- ☐ 3. encourage slow, deep breaths.
- ☐ 4. explain relaxation techniques.

31. When the nurse administers IV midazolam hydrochloride, the client demonstrates signs of an overdose. The nurse should **next** collaborate with the surgical team to:

- ☐ 1. ventilate with an oxygenated bag-valve mask.
- ☐ 2. shock the client with ECG paddles.
- ☐ 3. administer 0.5 mL 1:1,000 epinephrine.
- ☐ 4. titrate flumazenil.

32. Metoclopramide is prescribed as a premedication for a client about to undergo a gastroduodenoscopy. The expected therapeutic effect is:

- ☐ 1. increased gastric pH.
- ☐ 2. increased gastric emptying.
- ☐ 3. reduced anxiety.
- ☐ 4. inhibited respiratory secretions.

33. What therapeutic outcome does the nurse expect for a client who has received a premedication of glycopyrrolate?

- ☐ 1. increased heart rate
- ☐ 2. increased respiratory rate
- ☐ 3. decreased secretions
- ☐ 4. decreased amnesia

34. Atropine sulfate is contraindicated as a preoperative medication for which clients? Select all that apply.

- ☐ 1. a client with diabetes
- ☐ 2. a client with glaucoma
- ☐ 3. a client with urine retention
- ☐ 4. a client with bowel obstruction

35. After the nurse has administered droperidol, care is taken to move the client slowly based on the knowledge of droperidol's effect on the:

- ☐ 1. central nervous system.
- ☐ 2. respiratory system.
- ☐ 3. cardiovascular system.
- ☐ 4. psychoneurologic system.

36. A client is to receive enoxaparin 6 hours before the scheduled time of laparoscopically assisted vaginal hysterectomy. Which effect does the nurse recognize as an intended therapeutic action of the enoxaparin?

- ☐ 1. increase in red blood cell production
- ☐ 2. reduction of postoperative thrombi
- ☐ 3. decrease in postoperative bleeding
- ☐ 4. promotion of tissue healing

37. During the preoperative interview, the nurse obtains information about the client's medication history. Which information is **not** necessary to record about the client?

- ☐ 1. current use of medications, herbs, and vitamins
- ☐ 2. over-the-counter medication use in the last 6 weeks
- ☐ 3. steroid use in the last year

- ☐ 4. all drugs taken in the last 18 months

38. When the nurse is conducting a preoperative interview with a client who is having a vaginal hysterectomy, the client states that she forgot to tell her surgeon that she had a total hip replacement 3 years ago. The nurse communicates this information to the perioperative nurse because:

- ☐ 1. the prosthesis may cause a problem with the electrosurgical unit used to control bleeding.
- ☐ 2. the client should not have her hip externally rotated when she is positioned for the procedure.
- ☐ 3. the perioperative nurse can inform the rest of the team about the total hip replacement.
- ☐ 4. there is not enough time to notify the surgeon and note this finding on the history and physical information before the procedure.

39. The nurse learns that a client who is scheduled for a tonsillectomy has been taking 40 mg of oral prednisone daily for the last week for poison ivy on the leg. What should the nurse do **first**?

- ☐ 1. Document the prednisone with current medications.
- ☐ 2. Notify the surgeon of the poison ivy.
- ☐ 3. Notify the anesthesiologist of the prednisone administration.
- ☐ 4. Send the client to surgery.

40. A client who is scheduled for an open cholecystectomy has been smoking a pack of cigarettes a day for 20 years. For which postoperative complication is the client **most** at risk?

- ☐ 1. deep vein thrombosis
- ☐ 2. atelectasis
- ☐ 3. delayed wound healing
- ☐ 4. prolonged immobility

41. The family cannot go with the client past the doors that separate the public from the restricted area of the operating room suite. These measures are designed to:

- ☐ 1. protect the privacy of clients.
- ☐ 2. prevent electrical sparks that could ignite the anesthetic gases.

- ☐ 3. separate the family from the surgical team while they are operating on the client.
- ☐ 4. provide for an aseptic environment to prevent infection.

42. Which client is **most** at risk for potential hazards from the surgical experience?

- ☐ 1. an 80-year-old client
- ☐ 2. a 50-year-old client
- ☐ 3. a 30-year-old client
- ☐ 4. a 15-year-old client

43. In which client is an autotransfusion possible?

- ☐ 1. the client who has cancer
- ☐ 2. the client who is in danger of cardiac arrest
- ☐ 3. the client with a contaminated wound
- ☐ 4. the client with a ruptured bowel

44. The nurse teaches a client who had cystoscopy about the urge to void when the procedure is over. What other teaching should be included?

- ☐ 1. Ignore the urge to void.
- ☐ 2. Increase intake of fluids.
- ☐ 3. Ask for the bedpan.
- ☐ 4. Ring for assistance to go to the bathroom.

45. Which nursing intervention is **most** important in preventing postoperative complications?

- ☐ 1. progressive diet planning
- ☐ 2. pain management
- ☐ 3. bowel and elimination monitoring
- ☐ 4. early ambulation

46. When preparing a teaching plan for an adult client about general anesthesia induction, which explanation would be **most** appropriate?

- ☐ 1. "Your premedication will put you to sleep."
- ☐ 2. "You will breathe in an inhalant anesthetic mixed with oxygen through a facial mask and receive intravenous medication to make you sleepy."

- ☐ 3. “You will receive intravenous medication to make you sleepy.”
- ☐ 4. “You will breathe in medication through a facial mask to make you sleepy.”

The Client Who Is Receiving or Recovering from Anesthesia

47. A client who had a gastrectomy has been in the postanesthesia recovery room for 30 minutes when the vital signs suddenly change. The nurse checks the recovery room record (see chart). In addition to notifying the healthcare provider (HCP), what other action should the nurse take immediately?

Vital Signs

Date	06/30	06/30	06/30
Time	1345	1400	1415
Pulse	70	82	90
Respiration	12	14	20
Blood pressure	100/60	110/70	140/90
Temperature	98°F (36.7°C)	99°F (37.2°C)	102°F (38.9°C)

- ☐ 1. Administer dantrolene.
- ☐ 2. Elevate the head of the bed 30 degrees.
- ☐ 3. Administer a bolus of IV fluids.
- ☐ 4. Insert an indwelling urinary catheter.

48. To decrease a female client’s anxiety about being placed in the lithotomy position for surgery, the nurse should:

- ☐ 1. explain in detail what will occur in the operating room.
- ☐ 2. determine what the client is concerned about.
- ☐ 3. pad the stirrups for comfort.
- ☐ 4. reassure the client that an all-female surgical team will be present.

49. A client is to receive medication by a continuous nerve block route. Prior to insertion of the catheter by the anesthesiologist, what information must the nurse document? Select all that apply.

- ☐ 1. vital signs
- ☐ 2. weakness/numbness
- ☐ 3. location of pain
- ☐ 4. results of laboratory tests
- ☐ 5. allergies

50. Prior to placement of an epidural/intrathecal catheter, what should the nurse instruct the client to do? Select all that apply.

- ☐ 1. Take showers instead of baths while the catheter is in place.
- ☐ 2. Tell the nurse about having nausea or vomiting.
- ☐ 3. Call for assistance with turning or repositioning while in bed.
- ☐ 4. Inform the nurse of numbness or weakness in the legs.
- ☐ 5. Take shallow breaths to prevent dislodging the catheter.
- ☐ 6. Call the nurse if the catheter becomes dislodged.

51. A client arrives from surgery to the postanesthesia care unit. Which respiratory assessment should the nurse complete **first**?

- ☐ 1. oxygen saturation
- ☐ 2. respiratory rate
- ☐ 3. breath sounds
- ☐ 4. airway flow

52. The nurse assesses vital signs on a client who had epidural anesthesia 4 hours ago. The nurse should assess the client **first** for:

- ☐ 1. bladder distention.
- ☐ 2. headache.
- ☐ 3. postoperative pain.

- ☐ 4. ability to move the legs.

53. When assessing a client who has had spinal anesthesia, which finding is expected?

- ☐ 1. The client feels pain before moving the legs.
- ☐ 2. The blood pressure is significantly increased.
- ☐ 3. Sensation returns to the toes first and then progresses to the perineal area.
- ☐ 4. The client has a headache while in the lying position.

54. The nurse in the postanesthesia care unit notes that one of the client's pupils is larger than the other. The nurse should:

- ☐ 1. rate the client on the Glasgow Coma Scale.
- ☐ 2. administer oxygen.
- ☐ 3. check the client's baseline data.
- ☐ 4. call the surgeon.

55. A client is admitted to the postanesthesia care unit following a left hip replacement. The initial nursing assessment is as follows: temperature, 96.6°F (35.9°C); pulse, 90 bpm; respiration rate, 14 breaths/min; and blood pressure, 128/80 mm Hg. The client only responds with moaning when spoken to. What should the nurse do **first**?

- ☐ 1. Observe the surgical dressing.
- ☐ 2. Position the client on the right side.
- ☐ 3. Remove the oral airway remaining from surgery.
- ☐ 4. Administer sedation reversal agent such as flumazenil.

56. The surgical floor receives a client from the postanesthesia care unit. Ten minutes ago, the final assessment in the postanesthesia care unit indicated that the client had a patent airway and stable vital signs. The client's pain level was 2. The nurse should **next**:

- ☐ 1. check the dressing for signs of bleeding.
- ☐ 2. empty any peri-incisional drains.
- ☐ 3. reassess the client's pain level.
- ☐ 4. determine if the client has a full bladder.

57. A client with impaired cardiac functioning is at risk during anesthesia induction with thiopental sodium because this drug causes:

- ☐ 1. bradycardia.
- ☐ 2. complete muscle relaxation.
- ☐ 3. hypotension.
- ☐ 4. tachypnea.

58. The nurse anticipates that a client who has received propofol as the induction and maintenance agent for general anesthesia will **most** likely - experience:

- ☐ 1. minimal nausea and vomiting.
- ☐ 2. hypotension.
- ☐ 3. slow induction of anesthesia.
- ☐ 4. small tremors of the skeletal muscles.

59. What is the **main** reason desflurane and sevoflurane, volatile liquid anesthesia agents, are used for surgical clients who go home the day of surgery?

- ☐ 1. These agents are better tolerated.
- ☐ 2. These agents are predictable in their cardiovascular effects.
- ☐ 3. These agents are nonirritating to the respiratory tract.
- ☐ 4. These agents are rapidly eliminated.

60. A 250-lb (113-kg) male client recovering from general anesthesia has the following assessment findings: pulse, 150 bpm; blood pressure, 90/50 mm Hg; respiratory rate, 28 breaths/min; tympanic temperature, 99.8°F (37.7°C); and rigid muscles. The nurse determines that the client is:

- ☐ 1. recovering as expected from the anesthesia and continues monitoring him.
- ☐ 2. exhibiting the effects of excessive blood loss experienced in the operating room and increases the rate of his IV infusion.
- ☐ 3. in the early stages of malignant hyperthermia and obtains emergency medications and notifies the anesthesiologist.
- ☐ 4. in pain and offers him pain medication.

61. The nurse is assessing a client recovering from anesthesia. Which is an

early indicator of hypoxemia?

- ☐ 1. somnolence
- ☐ 2. restlessness
- ☐ 3. chills
- ☐ 4. urgency

62. When administering flumazenil intravenously for reversal of sedation, what should the nurse do? Select all that apply.

- ☐ 1. Administer the medication as a 2-mg bolus.
- ☐ 2. Give the medication undiluted in incremental doses.
- ☐ 3. Be alert for shivering and hypotension.
- ☐ 4. Use only a free-flowing IV line in a large vein.
- ☐ 5. Monitor the client's level of consciousness.

63. An 80-year-old client had spinal anesthesia for a transurethral resection of the prostate and received 4,000 mL of room temperature isotonic bladder irrigation. He now has continuous irrigation through a three-way indwelling urinary catheter. Which postoperative nursing intervention is **most** important to include in his plan of care?

- ☐ 1. Empty the catheter drainage bag.
- ☐ 2. Cover the client with warm blankets.
- ☐ 3. Hang new bags of irrigation.
- ☐ 4. Turn the client.

64. Which client is expected to retain anesthetic agents longest?

- ☐ 1. a client who is 6 feet 2 inches tall (188 cm) and weighs 250 lb (113 kg)
- ☐ 2. a client who is 5 feet 4 inches (163 cm) tall and weighs 110 lb (49.9 kg)
- ☐ 3. a client who is 5 feet 1 inches (155 cm) tall and weighs 200 lb (90.7 kg)
- ☐ 4. a client who is 5 feet 7 inches (170 cm) tall and weighs 145 lb (65.8 kg)

65. An awake postoperative client received an intravenous regional nerve block (Bier block) in the arm that is now casted and elevated on a pillow. What action should the nurse encourage the client to avoid until sensation

returns?

- ☐ 1. holding the operated arm close to the face
- ☐ 2. holding the operated arm with the unoperated arm
- ☐ 3. using the unoperated arm
- ☐ 4. using pain medication

66. The healthcare provider (HCP) prescribed intravenous naloxone to reverse the respiratory depression from morphine administration. After administration of the naloxone, the nurse should:

- ☐ 1. check respirations in 5 minutes because naloxone is immediately effective in relieving respiratory depression.
- ☐ 2. check respirations in 30 minutes because the effects of morphine will have worn off by then.
- ☐ 3. monitor respirations frequently for 4 to 6 hours because the client may need repeated doses of naloxone.
- ☐ 4. monitor respirations each time the client receives morphine sulfate 10 mg IM.

67. When administering naloxone, the nurse should monitor the surgical client closely for which clinical manifestation?

- ☐ 1. dizziness
- ☐ 2. biliary colic
- ☐ 3. bleeding
- ☐ 4. urine retention

68. The nurse anticipates that the client who has received epidural anesthesia is at decreased risk for a spinal headache because:

- ☐ 1. a 17-gauge needle is used.
- ☐ 2. a subarachnoid injection is made.
- ☐ 3. a noncutting needle is used.
- ☐ 4. a faster onset occurs.

69. Which body system is **not** blocked by spinal anesthesia?

- ☐ 1. the sympathetic nervous system
- ☐ 2. the sensory system

- ☐ 3. the parasympathetic nervous system
- ☐ 4. the motor system

70. The nurse is to administer midazolam 2.5 mg. The medication is available in a 5-mg/mL vial. How many mL should the nurse administer? Record your answer using one decimal point.

_____ mL.

The Client Who Has Had Surgery

71. On the first day after abdominal surgery, the nurse auscultates a client's abdomen for bowel sounds; there are none. The nurse should:

- ☐ 1. notify the healthcare provider (HCP).
- ☐ 2. ask another nurse to validate the absence of bowel sounds.
- ☐ 3. encourage the client to take more ice chips.
- ☐ 4. document assessment findings in the client's medical record.

72. Three days after a cholecystectomy, a client states, "I feel like my stomach is going to burst." The client is taking a regular diet. After determining that vital signs are stable, in which order of priority from first to last does the nurse assist the client? All options must be used.

1. Position the client on the right side.

2. Offer 120 mL of hot liquids.

3. Auscultate for bowel sounds.

4. Encourage ambulation.

73. The nurse assesses that a client is restless in the immediate postoperative period. The nurse should **first**:

- ☐ 1. administer a sedative.
- ☐ 2. offer ice chips.
- ☐ 3. administer oxygen.
- ☐ 4. apply wrist restraints.

74. A client requests a narcotic analgesic shortly after the oncoming nurse receives change-of-shift report. The nurse who is leaving reported that the client had received morphine 10 mg (IM) within the past hour. In what order from first to last should the oncoming registered nurse (RN) perform the actions? All options must be used.

1. Validate with the outgoing RN that morphine 10 mg (IM) had been administered.

2. Assess the client for manifestations of pain.

3. Check the medication documentation as to when morphine 10 mg (IM) was dispensed and to whom.

4. Check to ascertain if any discrepancy had been documented with accompanying reason(s).

75. On the day of surgery, a client has been breathing room air. The vital signs are normal, and the O₂ saturation is 89%. The nurse should **first**:

- ☐ 1. lower the head of the bed.
- ☐ 2. notify the healthcare provider (HCP).
- ☐ 3. assist the client to take several deep breaths and cough.
- ☐ 4. administer oxygen by nasal cannula as prescribed at 2 L/min.

76. A client has been unable to void since having abdominal surgery 7 hours ago. The nurse should **first**:

- ☐ 1. encourage the client to increase oral fluid intake.
- ☐ 2. insert an intermittent urinary catheter.
- ☐ 3. notify the healthcare provider (HCP).
- ☐ 4. assist the client up to the toilet to attempt to void.

77. Following abdominal surgery, a client refuses to deep breathe and cough every 2 hours as prescribed. What should the nurse do **first**?

- ☐ 1. Ask the client's wife to insist that the client take the deep breaths every 2 hours.
- ☐ 2. Respect the client's wishes, and turn the client from side to side more frequently.
- ☐ 3. Suggest that the client increase the daily fluid intake to at least 2,500 mL.
- ☐ 4. Explain the risks of not expanding the lungs and why the exercise is important.

78. Eight hours after laparoscopic abdominal surgery, a client has a distended bladder and is unable to void in bed using a urinal. The client can be out of bed as tolerated, but has not done so yet. The nurse should **first**:

- ☐ 1. Assist the client to stand at the bedside to use the urinal.
- ☐ 2. Pour running water over perineum to stimulate emptying of the bladder.
- ☐ 3. Encourage the client to ambulate to prevent further bladder distention.
- ☐ 4. Notify the healthcare provider (HCP) to request a prescription for catheterization.

79. The nurse is assessing the level of consciousness for a client who just had open heart surgery. When asked, the client can give his name but is not sure about where he is or the time of day. What should the nurse do?

- ☐ 1. Notify the surgeon.
- ☐ 2. Rub the client's sternum to arouse the client.
- ☐ 3. Encourage the client's wife to orient the client.
- ☐ 4. Tell the client where he is and the time of day.

80. Following surgery, a client is receiving 1,000 mL normal saline (IV) with 40 mEq (40 mmol/L) KCl, which has been prescribed to be infused at 125 mL/h. The client states, "My IV hurts." What should the nurse do **first**?

- ☐ 1. Contact the client's healthcare provider (HCP) for a different IV prescription.
- ☐ 2. Slow down the infusion to a keep-open rate (20 to 50 mL/h).
- ☐ 3. Assess the IV site for signs of phlebitis, extravasation, or IV-related infection.
- ☐ 4. Check the hanging parenteral fluid and administration set for documentation as to when they were last changed.

81. A nurse is assessing a client when she returns from same-day surgery for a dilatation and curettage. The nurse checks preoperative vital signs at 0830 to compare them with the current vital signs at 2230 (see chart). What should the nurse do **first**?

Vital Signs

	0830	2230
Pulse	80	90
Respirations	16	20
Blood pressure	90/60	100/80
Temperature	99.5 (37.5)	97 (36.1)

- ☐ 1. Call the healthcare provider (HCP) for pain medication.
- ☐ 2. Cover the client with warmed blankets.
- ☐ 3. Administer oxygen at 4 L/min.
- ☐ 4. Increase the IV fluid rate.

82. The nurse is caring for a client receiving morphine in an intravenous infusion using a patient-controlled anesthesia pump (PCA) for relief of postoperative pain. On assessment, the client's vital signs are as follows: heart rate, 84 bpm; respirations, 8 breaths/min; blood pressure, 104/56 mm Hg; and oxygen saturation of 88% on room air. What should the nurse do **first**?

- ☐ 1. Contact the healthcare provider (HCP) to request a prescription for naloxone.
- ☐ 2. Stop the infusion of morphine.
- ☐ 3. Assist the client to sit and stimulate coughing/deep breathing.
- ☐ 4. Call the rapid response team.

83. A client had a colectomy 8½ hours ago and has received 1,500 mL of dextrose 5% in water with normal saline solution. The client has just used a patient-controlled analgesia pump to administer morphine for pain, has been repositioned for comfort, and has stable pulse rate, respirations, and blood pressure. What should the nurse do **next**?

- ☐ 1. Check that the family is comfortable.
- ☐ 2. Assess vital signs following the use of morphine.
- ☐ 3. Dim the lights in the room.
- ☐ 4. Increase nasal oxygen from 2 to 3 L.

84. A client who had an esophageal hernia repair 4 hours ago has a pulse rate of 90 bpm; respiration rate of 16 breaths/min; blood pressure of 130/80 mm Hg; pulse oximeter of 91%, on room air; and a temperature of 100.4°F (38°C). What should the nurse do **first**?

- ☐ 1. Obtain a culture of the incision.
- ☐ 2. Notify the surgeon to obtain an antibiotic prescription.
- ☐ 3. Offer pain medication.
- ☐ 4. Assist the client to a sitting position to take deep breaths.

85. After completing client teaching on the use of patient-controlled analgesia (PCA), the nurse determines that the client understands the use of the PCA when the client states:

- ☐ 1. "It is OK for my family to press the button for me if I am too tired to do it myself."
- ☐ 2. "I should wait until the pain is really bad before I push the button to get more pain medicine."
- ☐ 3. "The machine will only give me the prescribed amount of pain medication even if I push the button too soon."
- ☐ 4. "I have to be careful about pushing the button too many times or I will overdose myself."

86. A client had a total abdominal hysterectomy and bilateral oophorectomy for ovarian carcinoma yesterday. She received 2 mg of morphine sulfate IV by patient-controlled analgesia (PCA) 10 minutes ago. The nurse was assisting her from the bed to a chair when the client felt dizzy and fell into the chair. The nurse should:

- ☐ 1. discontinue the PCA pump.
- ☐ 2. administer oxygen.
- ☐ 3. take the client's blood pressure.
- ☐ 4. assist the client back to bed.

87. Immediately following pelvic surgery, a client has an indwelling urinary catheter. Which nursing action would be **most** helpful to prevent a catheter-related urinary tract infection?

- ☐ 1. Provide catheter and perineal care twice daily.
- ☐ 2. Monitor the color, clarity, and amount of urine output.
- ☐ 3. Advocate for limited use of and duration of indwelling urinary catheters.
- ☐ 4. Palpate for lower abdominal distension once per shift.

88. A nurse is instructing a client who had abdominal surgery that day to do deep-breathing exercises. In which order from first to last should the nurse teach the client to perform diaphragmatic breathing and coughing? All options must be used.

1. Inhale through the nose.

2. Cough deeply from the lungs.

3. Exhale through pursed lips.

4. Splint the incisional site.

89. The postoperative nursing assessment of a client's ability to swallow fluids before providing oral fluids is based on the type of anesthesia given. Which client would **not** have delayed fluid restrictions?

- ☐ 1. the client who has undergone a bronchoscopy under local anesthesia

- ☐ 2. the client who has undergone a transurethral resection of a bladder tumor under general anesthesia
- ☐ 3. the client who has undergone a repair of carpal tunnel syndrome under local anesthesia
- ☐ 4. the client who has undergone an inguinal herniorrhaphy with spinal and intravenous conscious sedation

90. The client has just returned to bed following the first ambulation since abdominal surgery. The client's heart rate and blood pressure are slightly elevated; oxygen saturation is 91% on room air. The client reports being "a little short of breath," but does not have dizziness or pain. The nurse should **first**:

- ☐ 1. Obtain a 12-lead ECG.
- ☐ 2. Administer pain medication.
- ☐ 3. Allow the client to rest for a few minutes, then reassess.
- ☐ 4. Request new activity prescriptions from the healthcare provider (HCP).

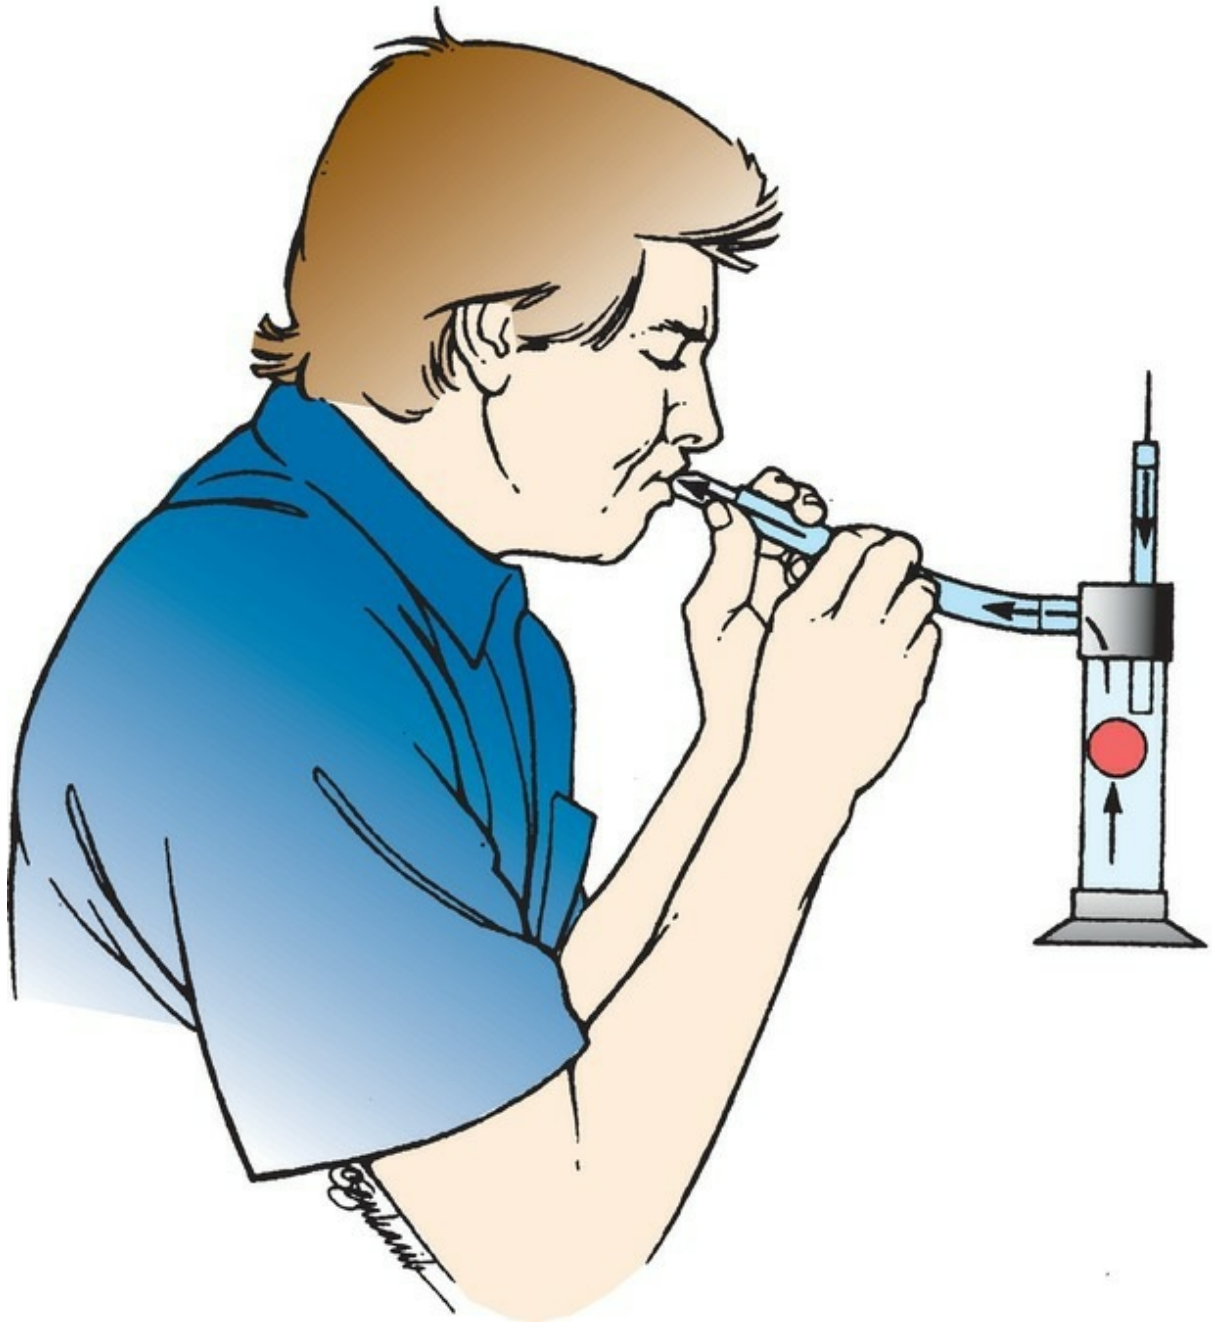

91. Eight hours following bowel surgery, the nurse observes that the client's urine output has decreased from 50 to 20 mL/h. The nurse should assess the client further for:

- ☐ 1. bowel obstruction.
- ☐ 2. adverse effect of opioid analgesics.
- ☐ 3. hemorrhage.
- ☐ 4. hypertension.

92. A client who had a left thoracoscopy sustained an injury secondary to the surgery position. The nurse should assess the client for:

- ☐ 1. foot drop.
- ☐ 2. knee swelling and pain.
- ☐ 3. tingling in the arm.
- ☐ 4. absence of the Achilles reflex.

93. The nurse is evaluating a client who is using a flow incentive spirometer (see figure) following abdominal surgery 1 day ago. The client is performing the procedure correctly when the client: Select all that apply.

- ☐ 1. inhales before using the spirometer.
- ☐ 2. inhales for 3 seconds following fully expanding the lungs.
- ☐ 3. coughs after using the spirometer.
- ☐ 4. uses the spirometer once every 8 hours.
- ☐ 5. exhales passively before using the spirometer.
- ☐ 6. is sitting upright.

94. The nurse is teaching a client how to take care of an incision at home. The nurse should tell the client:

- ☐ 1. “Do not touch your incision before your next appointment.”
- ☐ 2. “Clean your incision three times a day with hydrogen peroxide and water.”
- ☐ 3. “Do not be concerned about uneven lumps under the suture lines.”
- ☐ 4. “If the staples do not come out by themselves before your next appointment, the surgeon will remove them.”

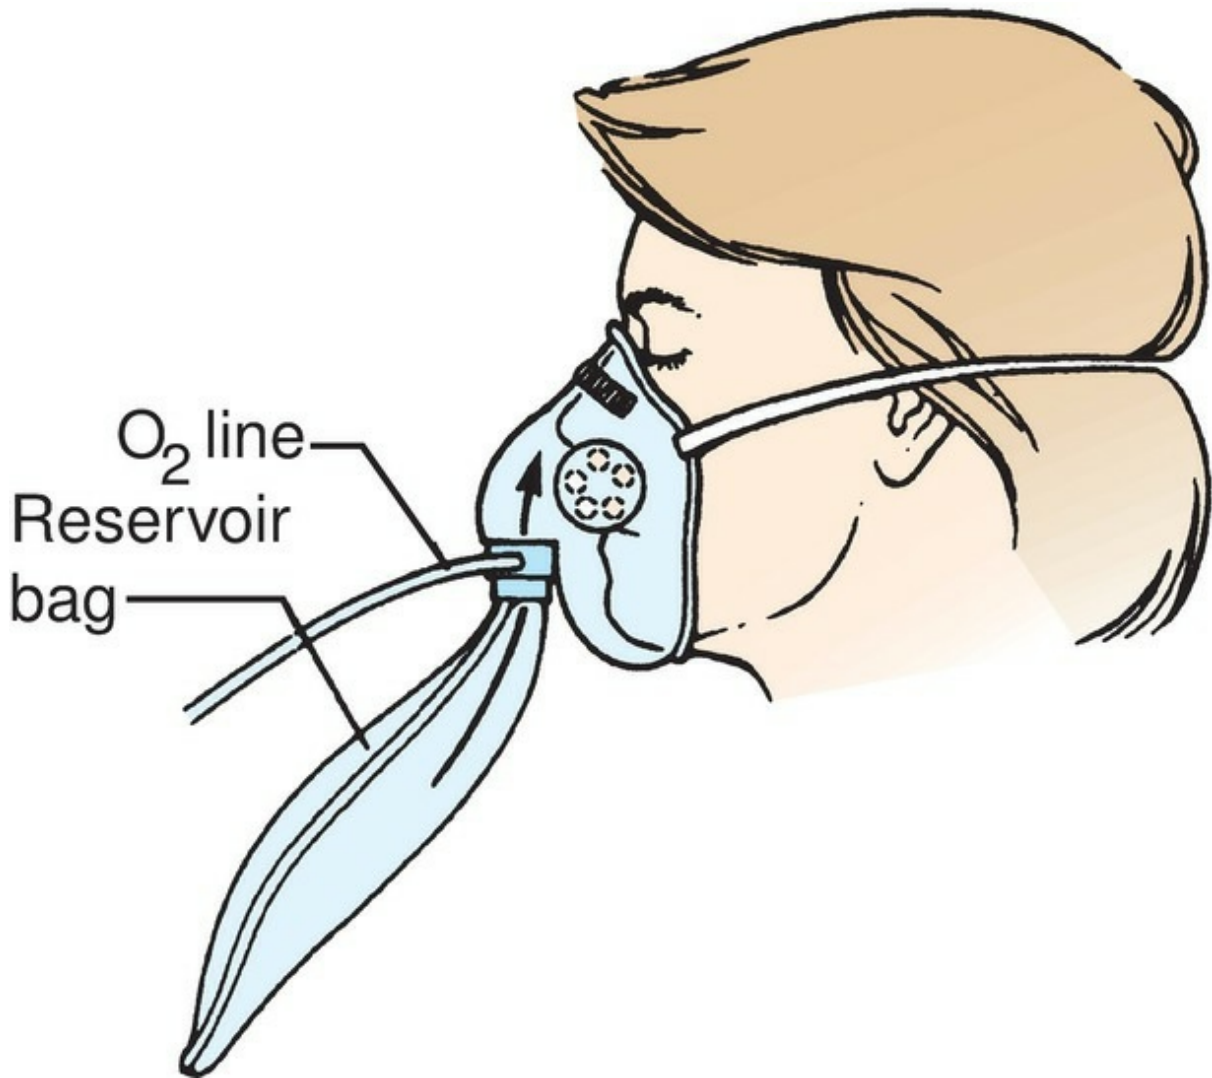

95. The nurse is removing the client’s staples from an abdominal incision when the client sneezes and the incision splits open, exposing the intestines. What should the nurse do **first**?

- ☐ 1. Press the emergency alarm to call the resuscitation team.
- ☐ 2. Cover the abdominal organs with sterile dressings moistened with sterile normal saline.
- ☐ 3. Have all visitors and family leave the room.
- ☐ 4. Call the surgeon to come to the client’s room immediately.

96. On the fourth day after surgery, a client’s incision is red and inflamed. There is moderate drainage from the incision. The client has a temperature of 102°F (38.9°C). The total white blood count (WBC) 10,000/mm³ (10 × 10⁹/L). The nurse should **first**:

- ☐ 1. encourage the client to increase the fluid intake.
- ☐ 2. cleanse the incision site with soap and water.
- ☐ 3. ask the client about the level of pain.
- ☐ 4. notify the healthcare provider (HCP).

97. The nurse is making rounds and observes the client receiving oxygen (see figure). The nurse should:

- ☐ 1. position the mask lower on the client's nose.
- ☐ 2. verify that the reservoir bag remains deflated.
- ☐ 3. confirm that the flow rate is set to deliver oxygen at 6 to 10 L/min.
- ☐ 4. loosen the elastic band on the client's face.

98. When changing a wet-to-dry dressing covering a surgical wound, what should the nurse do?

- ☐ 1. Place a dry dressing in the wound.
- ☐ 2. Use an aqueous solution of aluminum acetate (Burow's solution) to wet the dressing.
- ☐ 3. Pack the wet dressing tightly into the wound.
- ☐ 4. Cover the wet packing with a dry sterile dressing.

99. Two days following abdominal surgery, a client is refusing to take a narcotic pain medication, even though the pain rating is an 8 on a 0 to 10 scale. The client tells the nurse, “I do not want to get dependent on that stuff.” Which response from the nurse is the **most** appropriate?

- ☐ 1. “You will recover more quickly and more effectively if you take pain medication now.”
- ☐ 2. “Newer pain medications do not cause dependence or addiction.”
- ☐ 3. “It is your right to not take pain medication.”
- ☐ 4. “You do not need to worry about becoming addicted so soon.”

100. The nurse empties a Jackson-Pratt drainage bulb. Which nursing action ensures correct functioning of the drain?

- ☐ 1. irrigating it with normal saline
- ☐ 2. connecting it to low intermittent suction
- ☐ 3. compressing it and then plugging it to establish suction
- ☐ 4. connecting it to a drainage bag and clamping it off

101. To prevent pulmonary emboli in a client who has had abdominal surgery, the nurse should:

- ☐ 1. have the client perform leg exercises every hour while awake.
- ☐ 2. encourage the client to cough and deep breathe.
- ☐ 3. massage the client’s calves.
- ☐ 4. have the client wear antiembolism stockings when out of bed.

102. The nurse assesses a client who has just received morphine sulfate. The client’s blood pressure is 90/50 mm Hg; pulse rate, 58 bpm; and respiration rate, 4 breaths/min. The nurse should check the client’s record for a prescription to administer:

- ☐ 1. flumazenil.
- ☐ 2. naloxone hydrochloride.
- ☐ 3. doxacurium.
- ☐ 4. remifentanil.

103. The nurse observes the client with an intermittent compression device in place after abdominal surgery (see figure). The nurse should:

- ☐ 1. elevate the client's legs.
- ☐ 2. apply thromboembolic stockings to be worn under the device.
- ☐ 3. instruct the client not to move while the device is inflated.
- ☐ 4. make sure the client is comfortable.

104. A client is being discharged from same-day surgery. Which statement indicates that the client does not understand postoperative instructions about transportation to home?

- ☐ 1. "My husband is taking the day off from work to drive me home."
- ☐ 2. "I can drive myself home after surgery."
- ☐ 3. "I am taking a taxi home, and my daughter will meet me at home."
- ☐ 4. "My son will be here at noon to take me home."

105. The initial postoperative assessment is completed on a client who had an arthroscopy of the knee. Which information is **not** necessary to obtain

every 15 minutes during the first postoperative hour?

- ☐ 1. vital signs including pulse oximeter
- ☐ 2. pain rating of the operative site
- ☐ 3. urine output
- ☐ 4. neurovascular check distal to the operative site

106. After surgery, a client was treated for postoperative nausea and vomiting and now is experiencing hypotension and tachycardia. The nurse should review the medication record to determine if the client has received which medication?

- ☐ 1. ondansetron hydrochloride
- ☐ 2. droperidol
- ☐ 3. prochlorperazine
- ☐ 4. promethazine

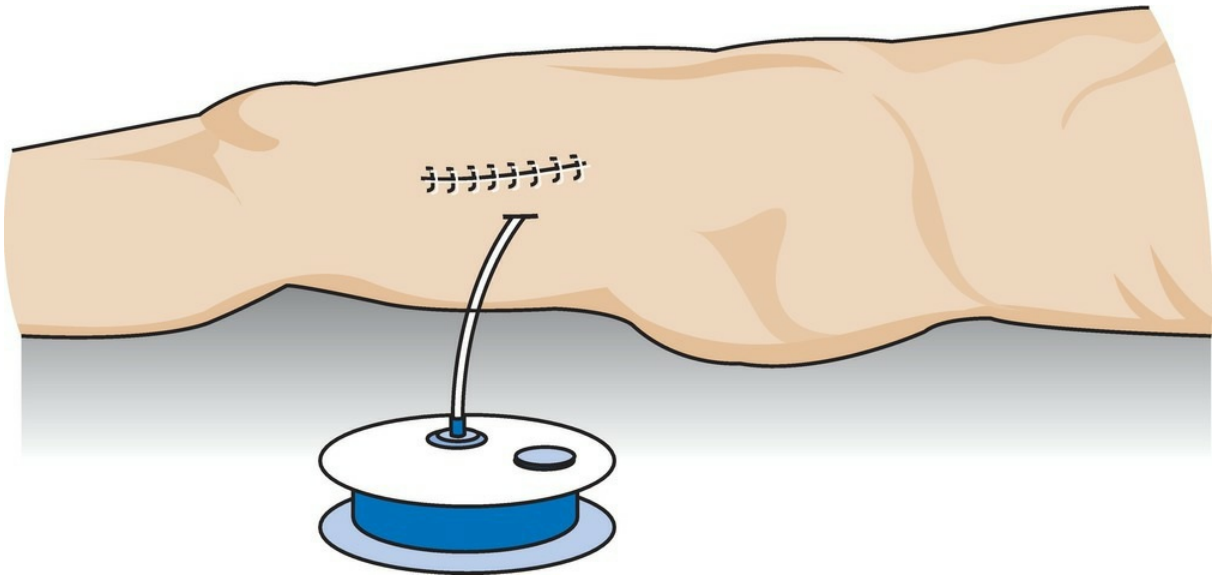

107. When an epidural catheter is used for postoperative pain management, the nurse should:

- ☐ 1. assess but not disturb the epidural dressing.
- ☐ 2. change the epidural dressing daily.
- ☐ 3. change the epidural dressing daily only if it is wet.
- ☐ 4. use strict aseptic technique when handling the epidural catheter.

108. The nurse understands that the client who has epidural pain management postoperatively can ambulate because:

- ☐ 1. the analgesia is periodically administered through the epidural catheter.
- ☐ 2. a low concentration of analgesia is used with the catheter.
- ☐ 3. the analgesia from the epidural catheter bathes the spinal fluid.
- ☐ 4. the epidural medication affects the sympathetic and motor function.

109. The nurse is caring for a client who is using a portable wound suction unit (see figure). Six hours following surgery, the drainage unit is full. What should the nurse do?

- ☐ 1. Remove the drain from the incision.
- ☐ 2. Notify the surgeon.
- ☐ 3. Empty drainage.
- ☐ 4. Record the amount in the unit as output on the client's medical record.

110. Three days after surgery, a client continues to take hydrocodone 7.5 mg and acetaminophen 500 mg for postoperative pain. What should the nurse ask the client before administering the pain medication?

- ☐ 1. "When did you last have a bowel movement?"
- ☐ 2. "Have you emptied your bladder?"
- ☐ 3. "How long has it been since your last dose?"
- ☐ 4. "Is your pain better than before you had surgery?"

111. Upon waking up in the postanesthesia care unit and seeing a drain with bright red fluid in it exiting from his total hip incision, a client asks the nurse, "Is this the way it is supposed to be?" The nurse should tell the client:

- ☐ 1. "The drainage is blood and fluid that must be drained out for healing."
- ☐ 2. "Do not worry about it. I will explain it when you are more awake."
- ☐ 3. "This blood is being kept sterile and will be given back to you."
- ☐ 4. "I will give you something to make you sleep so you will not worry."

112. A client has a Jackson-Pratt drainage tube in place the first day after surgical repair of a ruptured diverticulum. The client asks the nurse the purpose of the drain. What is the nurse's **best** response? "The drainage tube

is used to prevent:

- ☐ 1. infection in the peritoneal cavity.”
- ☐ 2. bleeding into the peritoneal cavity.”
- ☐ 3. pressure on the bladder.”
- ☐ 4. pressure on the gallbladder.”

113. A client who had a cholecystectomy has a biliary drainage tube in place. What color of the drainage is expected?

- ☐ 1. pinkish red
- ☐ 2. dark yellow-orange
- ☐ 3. clear
- ☐ 4. green

114. A client is to be discharged from same-day surgery 7 hours after his inguinal hernia repair. Which nursing observation indicates this client is ready to be discharged?

- ☐ 1. The client voids 500 mL of urine.
- ☐ 2. The client tolerates eating a hamburger.
- ☐ 3. The client is pain free.
- ☐ 4. The client walks in the hallway unassisted.

115. A client is eligible for patient-controlled analgesia (PCA) when:

- ☐ 1. a family member is able to assist with self-dosing.
- ☐ 2. there are advanced directives in place.
- ☐ 3. the client has the ability to self-administer.
- ☐ 4. there is a nurse to assist with self-administration.

116. How often should the client’s temperature be assessed during the first 24 hours after surgery?

- ☐ 1. every 2 hours
- ☐ 2. every 4 hours
- ☐ 3. every 6 hours
- ☐ 4. every 8 hours

117. A nurse is assessing a client’s blood pressure 8 hours after surgery. The client’s blood pressure before surgery was 120/80 mm Hg, and on

admission to the postsurgical nursing unit it was 110/80 mm Hg. The client's blood pressure is now 90/70 mm Hg. After determining that other vital signs are normal, what should the nurse do **first**?

- ☐ 1. Notify the healthcare provider (HCP).
- ☐ 2. Elevate the head of the bed.
- ☐ 3. Administer pain medication.
- ☐ 4. Check the intake and output record.

118. A client has been positioned in the lithotomy position under general anesthesia for a pelvic procedure. In which anatomic area may the client expect to experience postoperative discomfort?

- ☐ 1. shoulders
- ☐ 2. thighs
- ☐ 3. legs
- ☐ 4. feet

119. Which nursing action does **not** aid in meeting the goal of clear breath sounds?

- ☐ 1. offering pain relief before having the client cough
- ☐ 2. providing a minimum of 1,000 mL of fluid per day
- ☐ 3. using an incentive spirometer
- ☐ 4. assisting with early ambulation

120. The nurse is teaching the client about deep-breathing techniques. Which statement from the client indicates the need for additional education?

- ☐ 1. "I will use my incentive spirometer every hour while I am awake."
- ☐ 2. "I should place my hands lightly over my lower ribs and upper abdomen."
- ☐ 3. "I should get into a comfortable position before doing my breathing exercises."
- ☐ 4. "I should take four deep breaths and then cough deeply from the lungs."

121. A client has had a nasogastric tube connected to low intermittent suction. The client is at risk for:

- ☐ 1. confusion.

- ☐ 2. muscle cramping.
- ☐ 3. edema.
- ☐ 4. tremors.

Legal and Ethical Issues Associated with Surgery

122. On admission to same-day surgery, the nurse reviews the medical record to verify the client's identification documentation. Which information is **most** important?

- ☐ 1. admitting record
- ☐ 2. preprinted labels
- ☐ 3. identification bracelet
- ☐ 4. location of family

123. A 15-year-old client needs lifesaving emergency surgery, but the relatives live an hour away from the hospital and cannot sign the consent form. What is the nurse's **best** response?

- ☐ 1. Send the client to surgery without the consent.
- ☐ 2. Call the family for a consent over the telephone, and have another nurse listen as a witness.
- ☐ 3. No action is necessary in this case because consent is not needed.
- ☐ 4. Have the family sign the consent form as soon as they arrive.

124. A client who has type 1 diabetes is being prepared to have a craniotomy for a brain tumor. As a client advocate, the nurse is evaluating the client's understanding of the informed consent before witnessing the client's signature on the operative consent form. Which statement from the client indicates that the nurse needs to contact the surgeon for further communication with the client?

- ☐ 1. "We talked about the effect of my diabetes on healing."
- ☐ 2. "The surgeon explained how the craniotomy was done."
- ☐ 3. "There are no major risks from this surgery."
- ☐ 4. "I will die if the tumor is not removed from my brain."

125. The nurse is helping to prepare a client for nonemergency surgery. The nurse should:

- ☐ 1. obtain informed consent from the client.
- ☐ 2. explain the surgical procedure in detail.
- ☐ 3. verify that the client understands the informed consent form.
- ☐ 4. inform the client about the risks of the surgery to be performed.

126. When a client cannot read or write but is of sound mind, the nurse should read the informed consent to the client in the presence of two witnesses and:

- ☐ 1. have the client's next of kin sign the informed consent.
- ☐ 2. have the client put an "X" on the signature line.
- ☐ 3. have a court appoint a guardian for the client.
- ☐ 4. have a hospital quality management coordinator sign for the client.

Managing Care, Quality, and Safety of Clients Having Surgery

127. The nurse should review the glucose level of which clients who are going to surgery today? Select all that apply.

- ☐ 1. a client with diabetes mellitus controlled by diet
- ☐ 2. a client with a high stress response to surgery
- ☐ 3. a client receiving corticosteroids for the past 3 months
- ☐ 4. a client with a family history of diabetes receiving dextrose 5% in lactated Ringer's solution (D₅LR) IV fluids
- ☐ 5. a client who consumes a high-carbohydrate diet

128. Which client has the **greatest** risk for latex allergies?

- ☐ 1. a woman who is admitted for her seventh surgery
- ☐ 2. a man who works as a sales clerk
- ☐ 3. a man with well-controlled type 2 diabetes
- ☐ 4. a woman who is having laser surgery

129. A client is admitted on the day of surgery for an arthroscopy of the left knee. Which nursing activities should be completed prior to administering anesthesia to the client to avoid wrong-site surgery? Select all that apply.

- ☐ 1. Verify that the surgeon has marked with a permanent marker the correct knee for the surgical site.
- ☐ 2. Verbally ask the client to state his or her name, surgical site, and procedure.
- ☐ 3. Verify the correct client with the correct operative site from medical records and diagnostic reports.
- ☐ 4. Call a “time-out” in the operating room to have the surgeon verify the correct knee before making the incision.
- ☐ 5. Show the client an anatomic model of the surgery site.

130. The nurse is planning care for a client with severe postoperative pain. There is a prescription for morphine written as “10 mg MSO₄” on the medical record. What should the nurse do **first**?

- ☐ 1. Obtain an intravenous infusion system.
- ☐ 2. Prepare the medication for administration.
- ☐ 3. Contact the pharmacy department.
- ☐ 4. Contact the healthcare provider (HCP) who prescribed the medication.

131. The client has returned to the surgery unit from the postanesthesia care unit (PACU). The client’s respirations are rapid and shallow, the pulse is 120 bpm, and the blood pressure is 88/52 mm Hg. The client’s level of consciousness is declining. The nurse should **first**:

- ☐ 1. call the PACU.
- ☐ 2. call the healthcare provider (HCP).
- ☐ 3. call the respiratory therapist.
- ☐ 4. call the rapid response team (RRT)/medical emergency team.

132. When completing the preoperative checklist on the nursing unit, the nurse discovers an allergy that the client has not reported. What should the nurse do **first**?

- ☐ 1. Administer the prescribed preanesthetic medication.
- ☐ 2. Note this new allergy prominently on the medical record.
- ☐ 3. Contact the scrub nurse in the operating room.
- ☐ 4. Inform the anesthesiologist.

133. Which activities should the nurse encourage the unlicensed assistive

personnel (UAP) to assist with in the care of postoperative clients? Select all that apply.

- ☐ 1. Empty and measure indwelling urinary catheter collection bags.
- ☐ 2. Reposition clients for pain relief.
- ☐ 3. Teach clients the proper use of the incentive spirometer.
- ☐ 4. Tell the nurse if clients report they are having pain.
- ☐ 5. Assess IV insertion site for redness.

134. The client's identification armband was cut and removed to start an IV line as a part of the preoperative preparation. The transport team has arrived to transport the client to the operating room. The nurse notices that the client's identification band is not on either wrist. What should the nurse do?

- ☐ 1. Send the removed armband with the medical record and the client to the operating room.
- ☐ 2. Place a new identification armband on the client's wrist before transport.
- ☐ 3. Tape the cut armband back onto the client's wrist.
- ☐ 4. Send the client without an armband because the client is alert and can respond to questions about his or her identity.

135. On the 2nd day after surgery, the nurse assesses an elderly client and finds the following:

- ☐ 1. blood pressure, 148/92 mm Hg; heart rate, 98 bpm; respirations 32 breaths/min
- ☐ 2. O₂ saturation of 88% on 4 L/min of oxygen administered by nasal cannula
- ☐ 3. breath sounds are coarse and wet bilaterally with a loose, productive cough
- ☐ 4. client voided 100 mL very dark, concentrated urine during the last 4 hours
- ☐ 5. bilateral pitting pedal edema

Using the SBAR method to notify the healthcare provider (HCP) of current assessment findings, the nurse should recommend that the HCP write a prescription for a(n):

- ☐ 1. antihypertensive medication.
- ☐ 2. additional fluid intake.
- ☐ 3. diuretic medication.
- ☐ 4. increased oxygen liter flow rate.

136. Which prescription is entered correctly on the medical record?

- ☐ 1. fentanyl 50 mcg given IV every 2 hours as needed for pain greater than 6/10
- ☐ 2. give 4 U regular insulin IV now
- ☐ 3. .5 mg MS given IM for c/o pain
- ☐ 4. 60.0 mg ketorolac tromethamine given IM for c/o pain

137. The nurse has just received morning change-of-shift report on four clients. In what order from first to last should the nurse perform the actions? All options must be used.

1. Discuss the plan for the day with the unlicensed assistive personnel (UAP), delegating duties as appropriate.

2. Assess the client who has been vomiting according to the report from the night nurse.

3. Begin discharge paperwork for a client who is eager to go home.

4. Notify the healthcare provider (HCP) about a client who has a serum potassium level of 6.2.

138. While making rounds, the nurse observes that a client's primary bag of intravenous (IV) solution is light yellow. The label on the IV bag says the solution is D5W. What should the nurse do **first**?

- ☐ 1. Continue to monitor the bag of IV solution.
- ☐ 2. Ask another nurse to look at the solution.
- ☐ 3. Notify the healthcare provider (HCP).
- ☐ 4. Hang a new bag of D5W, and complete an incident report.

139. A client informs the nurse that the venipuncture site "hurts." The nurse should assess the site for what findings? Select all that apply.

- ☐ 1. redness
- ☐ 2. pain
- ☐ 3. coolness
- ☐ 4. blanching
- ☐ 5. firmness
- ☐ 6. edema

140. A client has accidentally received twice the normal dose of a medication that was administered on the previous shift. What should the nurse who discovers the error do **first**?

- ☐ 1. Call the person who made the error, and request that an incident report be completed.
- ☐ 2. Assess the client, and note any changes in condition.
- ☐ 3. Call the healthcare provider (HCP) to obtain a prescription for additional IV fluids to dilute the drug.
- ☐ 4. Administer a drug antidote per standing prescription.

141. A client is in the operating room having surgery to replace a hip. Prior to starting the surgery, there is confusion about the view of the hip on the x-ray. The surgical team requests a "time-out" and stops the surgery. When can surgery continue? Select all that apply.

- ☐ 1. The surgeon verifies the correct procedure.
- ☐ 2. The surgeon verifies correct surgical site.
- ☐ 3. The nurse reestablishes the sterile field.
- ☐ 4. The surgical team identifies the client using two sources of

identification.

- ☐ 5. Another x-ray is obtained.

142. A client is being transferred from the recovery room to the medical-surgical nursing unit. The nurse from the recovery room should report which information to the nurse in the medical-surgical unit? Select all that apply.

- ☐ 1. type of surgery
- ☐ 2. name of insurance provider
- ☐ 3. current vital signs
- ☐ 4. names of all surgeons participating in the surgery
- ☐ 5. amount of blood loss
- ☐ 6. fluids infusing including rate and type of fluid

143. A client with a history of myocardial infarction 3 years ago was admitted at 0700 for a cholecystectomy scheduled at 0900. The client has been NPO since midnight. At 0830, the client reports having chest pains. At 0700, the client's vital signs were pulse, 80 bpm; respirations, 14 breaths/min; and blood pressure, 110/70 mm Hg. At 0830 the nurse takes the vital signs again: pulse is 110 bpm; respirations, 20 breaths/min; and blood pressure, 90/60 mm Hg. The nurse calls the surgeon and, using SBAR communication protocol, should discuss which information with the surgeon? Select all that apply.

- ☐ 1. that the client has remained NPO
- ☐ 2. history of myocardial infarction and current report of chest pains
- ☐ 3. the change in vital signs
- ☐ 4. the type of surgery scheduled
- ☐ 5. request for ECG
- ☐ 6. request to administer nitroglycerin tablet

144. When taking a client's vital signs on the first postoperative day, the unlicensed assistive personnel (UAP) reports to the nurse that the oral temperature is 100°F (37.8°C). After encouraging the client to use the incentive spirometer, the nurse should delegate which activity to the UAP?

- ☐ 1. Apply an ice cap to a client's forehead.
- ☐ 2. Bathe the client with cool water.

- ☐ 3. Place a hyperthermia blanket on the client's bed.
- ☐ 4. Continue to monitor the client's temperature.

145. A nurse is working with an unlicensed assistive personnel (UAP). Which clients should the nurse assign to the UAP? Select all that apply.

- ☐ 1. Adult client newly diagnosed with diabetes who is learning to administer insulin.
- ☐ 2. Older adult client who had hip replacement surgery and needs to walk in the hall with a walker.
- ☐ 3. Adult client who had abdominal surgery yesterday and requires a dressing change.
- ☐ 4. Young adult client who requires tube feedings.
- ☐ 5. Adult client who had a hysterectomy 3 days ago and requires vital sign checks every 4 hours.

146. A nurse is caring for a group of clients. After receiving shift report, the nurse should make rounds on the clients in which order? Place in order of the highest to lowest priority. All options must be used.

1. female client who is 34 years of age and just returning from the recovery room following an abdominal hysterectomy; IV running at 50 drops per minute with 100 mL remaining.

2. client who is 50 years of age and diagnosed with diabetes mellitus 3 days ago who is learning to administer insulin.

3. client who is 75 years of age with a fractured hip of 4 days who needs to be turned frequently.

4. client who is 79 years of age 2 days postsurgery for removal of cancer of the colon who has had a tracheotomy for 4 years.

147. A client scheduled for surgery is confused and shows signs of dementia. The nurse should ask which person to sign the consent for the client?

- ☐ 1. minister
- ☐ 2. nursing supervisor
- ☐ 3. attorney
- ☐ 4. spouse

Answers, Rationales, and Test-Taking Strategies

*The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in Part 1 of this book.*

The Client Who Is Preparing for Surgery

1. 4. The health history is conducted to ascertain a client's state of wellness or illness. A personal dialogue between a client and a nurse is conducted to obtain information. To achieve a relationship of mutual trust and respect, the nurse must have the ability to communicate a sincere interest in the client. The therapeutic communication must be adapted to the responses, problems, and needs of the client. Reassurance and the remaining options do not demonstrate that the nurse is genuinely interested in the client's needs.

 CN: Psychosocial integrity; CL: Synthesize

2. 1,2,3. Treatment and diagnostic evaluation must be done in a latex-safe environment. Signs and symptoms of latex allergy may range from mild to anaphylaxis. Clients with latex allergy are advised to notify their **HCPs** and to wear a medical ID; however, all metal and jewelry must be removed prior to surgery as they could conduct an electrical current. The surgery can be safely performed at a free-standing surgery center as long as latex precautions are observed.

 CN: Safety and infection control; CL: Create

3. 3. It is the surgeon's responsibility to discuss the planned procedure and review the risks, benefits, and alternatives to the planned procedure. If the client verbalizes that he or she does not understand the procedure that is planned, it is the nurse's responsibility to notify the surgeon of this lack of understanding right away, prior to any other/additional nursing actions. In this case, when the client verbalizes a lack of understanding, the nurse should not teach about the procedure; the surgeon needs to do this. The nurse cannot assist the client to sign for **consent**  and should not administer narcotics or sedatives until the client understands and agrees to the procedure.

 CN: Management of care; CL: Synthesize

4. 3. Garlic has anticoagulant properties and may pose a problem with bleeding if enough has been taken too close to surgery. Therefore, the nurse must obtain more quantifiable details about the client's statement. The nurse should check the surgical procedure, anesthesia preference, and blood pressure status with the client. However, the part of the client's statement that needs further investigation concerns intake of a herb with anticoagulant properties before a surgical procedure.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

5. 1. The nurse should remove the face mask. The face mask contains nasal and oral droplets, which are easily transmitted to the hands as the mask dangles when left hanging around the neck. When a face mask is not worn over the mouth and nose, it should be completely removed.

 CN: Safety and infection control; CL: Synthesize

6. This is the correct surgical site.

 CN: Physiological adaptation; CL: Apply

7. 1. A pimple close to the incision site may be reason for the surgeon to cancel the surgical procedure because it increases the risk of infection. If the client had an abnormal ECG, the nurse would notify the anesthesiologist who will be administering the anesthesia. The anesthesiologist is the decision-maker regarding the implications of the anesthesia on the cardiac system. The surgical team should be notified of the client's hearing disability, but the surgeon, who has already met the client, does not need to be notified. The surgical team should be notified of the client's allergy to iodine, and it should be documented in all the appropriate places, but the surgeon would not need to be notified in advance of the surgical procedure.

CN: Safety and infection control; CL: Synthesize

8. 4. The nurse serves as a client advocate when helping in addressing a client's concern. The nurse should call the operating room and inform the intraoperative nurse about the client's request. A special container with correct identification can be prepared so that when the client is anesthetized and her hearing aid is removed, it will not be lost or broken. It is usual policy not to send personal belongings to surgery because they are easily broken or lost in the transfer of an anesthetized client with higher priority needs, but special needs do exist. In some instances, the nurse does bring a client's personal belongings to the postanesthesia care unit, but in this case, the item involves the client's ability to communicate. Because the trend is to use little premedication, clients are more alert and may want to talk with their surgical team before going to sleep. Decreasing the client's anxieties preoperatively affects the amount of medication used to induce the client and her overall psychological and physiologic status. Telling the client that she will not need to hear is insensitive.

CN: Basic care and comfort; CL: Synthesize

9. 3. A least-restraint environment should always be provided as much as possible. Nursing staff are required to attempt lesser restrictive alternatives (e.g., use of family or sitter, reorientation, distraction, or a toileting schedule) prior to notifying the provider of the need for restraints. Nursing staff are also required to document clinical conditions requiring restraint, lesser restrictive alternatives attempted, and client/family education provided regarding restraint use. Provider prescriptions for restraints must be time limited and

specific regarding the type of restraint. Additionally, if restraints are implemented, nursing staff must monitor clients for safety (including skin checks and range of motion) and provide frequent food/fluids/toileting.

CN: Safety and infection control; CL: Synthesize

10. 4. The client has deficient knowledge if he smoked a cigarette after 0400 because, even though he did not have anything to eat or drink, smoking has increased the production of gastric hydrochloric acid, which can increase the risk of aspiration in an anesthetized client. The client consumed the gelatin dessert prior to the 0400 restriction for being NPO. Comfort measures, such as brushing the teeth without swallowing or holding a cold washcloth against the lips, are acceptable for a client who is to have nothing by mouth.

CN: Reduction of risk potential; CL: Evaluate

11. 2. The antibiotic is most effective in preventing infection, according to research, if it is given 30 to 60 minutes before the operative incision is made. When the surgeon prescribes the antibiotic to be given at a specific time related to the scheduled time of the surgical procedure, it is imperative that the antibiotic is given on time. Legally, the nurse considers 30 minutes on either side of the scheduled time to be acceptable for administering medications; however, in this situation, giving the antibiotic 30 minutes too soon can make the prophylactic antibiotic ineffective. The postoperative dose of antibiotic is not timed according to the preoperative dose. Peak and titer levels are measured for some antibiotics, but in this case, the primary reason is to have the antibiotic infused before the time of the incision.

CN: Reduction of risk potential; CL: Apply

12. 3. Nurses should provide the preoperative client individual and sincere attention by meeting the client at eye level and introducing themselves by name and role. The nurse should ask the client to tell her full name rather than asking if she is Mrs. Smith because there might be another client by that name on the schedule. Nurses should not start the physical assessment or ask the client's name without first identifying themselves and their role out of courtesy and to relieve the client's anxiety in the new environment of the surgical experience.

 CN: Psychosocial integrity; CL: Apply

13. 4. The nurse should notify the anesthesiologist because a serum potassium level of 5.8 mEq/L (5.8 mmol/L) places the client at risk for arrhythmias when under general anesthesia. It is not the role of the nurse to cancel surgery. The nurse should not automatically send a client with abnormal laboratory findings to surgery because the procedure may be canceled. Once the client is inside the operating room and sterile supplies have been opened up for the procedure, the client is usually charged. The nurse should call ahead of time to communicate the abnormal laboratory result instead of noting the finding on the client's record. The information on the record should not be reviewed until after the client has been transported to the operating room and the supplies have been opened.

 CN: Reduction of risk potential; CL: Synthesize

14. 4. Clients should be made aware that some questions are asked for verification and safety with each new phase of treatment. Indicating that the nurse is sorry, or needs to check several times, or telling the client that the question will be asked again does not tell the client why it is necessary to continue to verify information essential to the client's safety.

 CN: Psychosocial integrity; CL: Synthesize

15. 3. The nurse should notify the **HCP**  directly for specific prescriptions based on the client's glucose level. The nurse cannot ignore the elevated glucose level. The surgical experience is stressful, and the client needs specific insulin coverage during the perioperative period. The nurse should not administer the insulin without checking with the surgeon because there are specific prescriptions to withhold all medications. It is not necessary to notify the surgery department unless the HCP cancels the surgery.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

16. 3. Psychosocial integrity issues, including coping mechanisms, situational role changes, and body image changes, are more common in a client who undergoes elective cosmetic surgical procedures. Reduction of risk potential, physiologic adaptation, and health promotion and maintenance are greater needs for clients who are undergoing surgical correction of

functional, anatomic, or physiologic defects in nonelective surgical procedures.

CN: Psychosocial integrity; CL: Analyze

17. 1. A client should not elect surgery to meet someone else's needs. The nurse should encourage the client to share his feelings and his perception of the deformity and to clarify his reasons for electing to have the surgery. It is normal to be somewhat afraid, and it is good if a client says he feels "OK" about the surgery. The fact that a client believes that his wife will help him after surgery and that he will also be relatively independent reflects appropriate adaptation. It is a common feeling among preoperative clients that they are ready to "get this over with," indicating that the waiting period is stressful.

CN: Psychosocial integrity; CL: Evaluate

18. 2. Brittle nails indicate poor nutrition. Poor posture indicates that the client does not stand up straight and use her muscles to support herself. A dull expression reflects the client's affect and emotional status. The client's weight of 128 lb (58.1 kg) is within normal range.

CN: Health promotion and maintenance; CL: Analyze

19. 1,2,4. The nurse should explain and demonstrate the discharge instructions and then ask the client to give a return demonstration. The Joint Commission and Health Canada require that discharge instructions be written for the postoperative client. Clients need to be given discharge instructions orally and in written form because of stress, medications, and the volume of material to be learned. Explaining all the instructions to a family member and giving them a link to a video is important but does not replace the need for written instructions. Since the family does not live nearby, the nurse must be certain the client can manage the instructions by herself.

CN: Health promotion and maintenance; CL: Synthesize

20. 1. The preadmission nurse, the first person in contact with the client, starts the discharge planning for the client undergoing surgery. All nurses involved with the client, from preadmission through postoperative recovery, should continue to reinforce the discharge plan.

CN: Health promotion and maintenance; CL: Apply

21. 3. The nurse should have the client empty the bladder before the premedication is administered. This will be more comfortable and safe for the client. The purpose of the premedication is to decrease anxiety and promote a relaxed state. The client must have an empty bladder before being transferred to the operating room, where the client will be immobilized and receive IV fluids. The family does not have to be present, but it is usually desired. Shaving the operative area is not generally recommended because it can cause small nicks that harbor bacteria. If the client must be shaved, it is usually done in the operating room holding area. The client should be comfortable at all times and offered a warm blanket before or after the premedication.

CN: Basic care and comfort; CL: Synthesize

22. 4. The nurse should immediately think of the congenital metabolic tendency for malignant hyperthermia, which occurs in the presence of certain kinds of anesthetics. Whenever a preoperative client states that a family member has had problems with anesthesia or surgery, the nurse should inquire about the nature of the problems and whether other family members have had similar problems. Reassuring the client that technology has changed will do little to affect her fears and misses the opportunity to evaluate the risk for malignant hyperthermia. Encouraging the client to further express her concerns and reassuring her that her feelings are normal are important, but missing a familial tendency of malignant hyperthermia could be fatal.

CN: Reduction of risk potential; CL: Synthesize

23. 3. The nurse should assess the vital signs of the client who exhibits urticaria, rhinitis, and conjunctivitis a few seconds after coming in contact with rubber gloves, a plastic catheter, plastic IV tubing, or a plastic IV solution bag. The nurse should recognize that these symptoms indicate that a type I allergic reaction is occurring. Although many healthcare agencies now use latex-free materials, it is possible that the products contain latex or other materials that might be precipitating the client's allergic response. The client does not need to be distracted or assessed for pain. It is not necessary to lower the head of the bed.

 CN: Physiological adaptation; CL: Synthesize

24. 4. The nurse would ask the client whether he or she wears glasses to evaluate his or her preoperative cognitive-perceptual pattern. Asking about the client's swallowing pattern would evaluate his or her nutritional-metabolic pattern. Asking about the client's need for special equipment to walk would evaluate his or her activity-exercise pattern. Asking the client about his or her history of smoking would evaluate the client's health perception-health management pattern.

 CN: Physiological adaptation; CL: Analyze

25. 3. The client is at risk for a difficult intubation because the neck must be hyperextended to pass the endotracheal tube. Assessment of the pupils should not be limited. If the client is positioned appropriately during surgery, there is no risk of postoperative neck pain or limited neck movement.

 CN: Reduction of risk potential; CL: Analyze

26. 3. The Universal Protocol is used to prevent wrong site, wrong procedure, and wrong person surgery. Actions included in the protocol are as follows: conduct a preprocedure verification process, mark the procedure site, and perform a **time-out** . Exceptions to the Universal Protocol are routine or "minor" procedures, such as venipuncture, peripheral IV line placement, insertion of oral/nasal drainage or feeding tubes, or Foley catheter insertion. Prior to closure, the surgeon or circulating nurse will initiate a time-out to verbally confirm a review of **informed consent**  and procedures completed; all specimens are identified, accounted for, and accurately labeled; and all foreign bodies have been removed. The chief of surgery and medical director are the ones who will verify the surgeons' levels of expertise.

 CN: Safety and infection control; CL: Apply

27. 1,2,3,4. Splinting the incision is important to avoid stress on the surgical site and to promote comfort so that the client will adhere to the plan of care. Inhaling through the nostrils and exhaling through pursed lips are important to bring in adequate oxygen and clear out carbon dioxide; however, closing one nostril when inhaling would be inappropriate and ineffective. The

most important step is asking the client to hold the inhaled breath for about 5 seconds, which keeps the alveoli expanded. This step should be stressed the most. Repeating the exercise 5 to 10 times hourly is the second most important point to emphasize in this teaching plan.

CN: Reduction of risk potential; CL: Create

28. 2. The nurse should call the surgeon for a serum creatinine level of 2.6 mg/dL (198 μ mol/L), which is higher than the normal range of 0.1 to 0.4 mg/dL (8 to 31 μ mol/L). An elevated serum creatinine value indicates that the kidneys are not filtering effectively and has important implications for the surgical client because many anesthesia and analgesia medications need to be filtered out through the renal system. The red blood cell count, hemoglobin level, and blood urea nitrogen level are within normal limits and do not need to be reported to the surgeon.

CN: Reduction of risk potential; CL: Analyze

29. 1. Midazolam hydrochloride causes antegrade amnesia or decreased ability to remember events that occurred around the time of sedation. Nausea, mild agitation, and blurred vision are adverse effects of midazolam.

CN: Pharmacological and parenteral therapies; CL: Evaluate

30. 3. The client should be encouraged to take slow, deep breaths because midazolam hydrochloride is a respiratory depressant. The nurse should assess the client's blood pressure, monitor the pulse oximeter, and keep the client calm and relaxed, but the client will slip into very shallow, ineffective breathing if not encouraged to deep breathe.

CN: Pharmacological and parenteral therapies; CL: Synthesize

31. 1. The nurse should have a bag-valve mask in the client's room because midazolam hydrochloride can lead to respiratory arrest if it is administered too quickly. The client does not need to be shocked back into a normal rhythm or to receive epinephrine unless cardiac compromise developed after the respiratory arrest. The client would receive titrated dosing of flumazenil to reverse the midazolam, but first the nurse should ventilate the client.

CN: Pharmacological and parenteral therapies; CL: Synthesize

32. 2. Metoclopramide is an antiemetic given because of its gastric emptying ability, which is necessary in gastrointestinal procedures. It does not increase gastric pH, reduce anxiety, or inhibit respiratory secretions.

CN: Pharmacological and parenteral therapies; CL: Evaluate

33. 3. Glycopyrrolate is an anticholinergic given for its ability to reduce oral and respiratory secretions before general anesthesia. Increased heart rate and respiratory rate would be adverse effects of the drug. Amnesia should not be an effect of the drug.

CN: Pharmacological and parenteral therapies; CL: Apply

34. 2,3,4. The nurse can administer atropine sulfate, an anticholinergic, to a client with diabetes. Atropine is contraindicated in clients with glaucoma because it increases intraocular pressure. It is contraindicated in clients with urine retention because it relaxes smooth muscle in the urinary tract and can exacerbate the problem. It is contraindicated in clients with gastrointestinal obstruction because it relaxes smooth muscle in the gut and may worsen the obstruction.

CN: Pharmacological and parenteral therapies; CL: Apply

35. 3. Because droperidol causes tachycardia and orthostatic hypotension, the client should be moved slowly after receiving this medication. Droperidol produces a tranquilizing effect and does affect the central nervous, respiratory, or psychoneurologic system, but the primary reason for moving the client slowly is the potential cardiovascular effects of hypotension.

CN: Pharmacological and parenteral therapies; CL: Apply

36. 2. Research findings have shown that enoxaparin and low-dose heparin given 6 to 12 hours preoperatively reduce the incidence of deep vein thrombosis and pulmonary emboli by 60% in clients who are at risk for deep vein thrombosis, such as those who are placed in the lithotomy position. Enoxaparin has no effect on red blood cell production, postoperative bleeding, or tissue healing.

CN: Pharmacological and parenteral therapies; CL: Evaluate

37. 4. The nurse does not need to ask about all drugs used in the last 18

months unless the client is still taking them. The nurse does need to know all drugs the client is currently taking, including herbs and vitamins, over-the-counter medications such as aspirin taken in the past 6 weeks, the amount of alcohol consumed, and use of illegal drugs, because these can interfere with the anesthetic and analgesic agents. Steroid use is of concern because it can suppress the adrenal cortex for up to 1 year, and supplemental steroids may need to be administered in times of stress such as surgery.

CN: Reduction of risk potential; CL: Apply

38. 2. The nurse should notify the surgery department and document the past surgery in the **medical record**  in the preoperative notes so that the client's hip is not externally rotated and the hip dislocated while she is in the lithotomy position. The prosthesis should not be a problem as long as the perioperative nurse places the return electrode away from the prosthesis site. The perioperative nurse will inform the rest of the team, but the primary reason to inform the perioperative nurse is related to safe positioning of the client. The surgeon should enter this information on the client's medical record at this time.

CN: Reduction of risk potential; CL: Apply

39. 3. The nurse should notify the anesthesiologist because supplemental prednisone suppresses the adrenal cortex's natural ability to produce increased corticosteroids in times of stress such as surgery. The anesthesiologist may need to prescribe supplemental steroid coverage during the perioperative period. The nurse should document the prednisone with current medications, but it is a priority to inform the anesthesiologist. Because the poison ivy is not in the surgical field, the surgeon does not need to be called regarding the skin disruption.

CN: Pharmacological and parenteral therapies; CL: Synthesize

40. 2. The client who has a significant cigarette smoking history and an operative manipulation close to the diaphragm (the gallbladder is against the liver) is at increased risk for atelectasis and pneumonia. Postoperatively, this client will be reluctant to deep breathe because of pain, in addition to having residual lung damage from smoking. Therefore, the client is at greater-than-average risk for pulmonary complications. The client does not have an

increased risk of prolonged immobility (unless slowed by a respiratory problem), deep vein thrombosis (as long as the client performs leg exercises), or delayed wound healing (as long as the client maintains appropriate nutrition).

CN: Reduction of risk potential; CL: Analyze

41. 4. The purpose of separating the public from the restricted-attire area of the operating room is to provide an aseptic environment and prevent contamination of the environment by organisms. The client's privacy is protected, but the main purpose is infection control. Anesthetics currently in use do not pose a risk of being ignited.

CN: Safety and infection control; CL: Apply

42. 1. The 80-year-old client is at greater risk because an older adult client is more likely to have comorbid conditions, a less effective immune system, and less collagen in the integumentary system.

CN: Physiological adaptation; CL: Analyze

43. 2. An autotransfusion is acceptable for the client who is in danger of cardiac arrest. An autotransfusion cannot be collected from a client who has cancer, a contaminated wound, or contamination from *Escherichia coli* because of a ruptured bowel.

CN: Pharmacological and parenteral therapies; CL: Apply

44. 2. After a scope or catheter has been inserted into the urethra, the mucosal membrane is irritated and the client feels the need to void even though the bladder may not be full. The nurse should encourage the client to force fluids to make the urine dilute. The client should not ignore the urge to void. The client should be encouraged to use the bathroom; there is no need to use the bedpan. The client does not need assistance to the bathroom because this procedure does not require any anesthesia except a topical anesthetic for the male client.

CN: Basic care and comfort; CL: Synthesize

45. 4. Early ambulation is the most significant general nursing measure to prevent postoperative complications and has been advocated for more than 40

years. Walking the client increases vital capacity and maintains normal respiratory functioning, stimulates circulation, prevents venous stasis, improves gastrointestinal and genitourinary function, increases muscle tone, and increases wound healing. The client should maintain a healthy diet, manage pain, and have regular bowel movements. However, early ambulation is the most important intervention.

 CN: Reduction of risk potential; CL: Synthesize

46. 2. Adult clients are induced for general anesthesia by breathing in an inhalant anesthetic mixed with oxygen through a facial mask and receiving intravenous medication to make them sleepy. Clients are not induced with the premedication. Clients usually are not induced with the intravenous infusion or the mask alone.

 CN: Basic care and comfort; CL: Synthesize

The Client Who Is Receiving or Recovering from Anesthesia

47. 1. The client is demonstrating signs of malignant hyperthermia. Unless the body is cooled and the influx of calcium into the muscle cells is reversed, lethal cardiac arrhythmia and hypermetabolism occur. The client's body temperature can rise as high as 109°F (42.8°C) as body muscles contract. Dantrolene, an IV skeletal muscle relaxant, is used to reverse muscle rigidity. Elevating the head of the bed will not reverse the hyperthermia. Adding fluids and inserting an indwelling urinary catheter are not immediately beneficial steps in reversing the progression of malignant hyperthermia.

 CN: Management of care; CL: Synthesize

48. 2. The nurse should first attempt to find out what the client's concerns are and address them. Providing too much information with details can increase the client's anxiety and does not address specific concerns. Padding the stirrups will provide comfort, but does not address concerns. Having an all-female team may or may not be the source of the client's concerns, and probably is not possible.

 CN: Psychosocial integrity; CL: Synthesize

49. 1,2,3,5. Prior to the catheter insertion, the nurse must document location of pain and pain rating, level of consciousness (LOC), vital signs, and weakness or numbness, especially in the legs. The nurse should also ask if the client has allergies before medication administration. It is not the nurse's responsibility to chart laboratory results; the results will be documented on the client's health record.

CN: Safety and infection control; CL: Synthesize

50. 2,3,4,6. Complications may develop when a client is receiving medication via epidural, intrathecal, or continuous nerve block routes. The nurse should inform the **healthcare provider (HCP)** if there is a dislodged catheter, disconnected tubing, or an occluded line. The nurse must also notify the HCP if the client has nausea or vomiting as the movement involved could dislodge the catheter. Numbness or weakness in the legs could also indicate a dislodged catheter, and the nurse must assess the client for these signs and report them if they occur. The client should call for assistance when getting out of bed or ambulating. The client should not take a shower or a bath while the catheter is in place. The client does not need to take shallow breaths, and the nurse should encourage the client to breathe normally and take deep breaths regularly.

CN: Safety and infection control; CL: Synthesize

51. 4. Airway flow is always the first assessment. Once the nurse establishes that the client has a patent airway, the pulse oximeter is applied to measure the oxygen saturation, the respiratory rate is counted, and the breath sounds are auscultated bilaterally.

CN: Physiological adaptation; CL: Analyze

52. 1. The last area to regain sensation is the perineal area, and the nurse should check the client for a distended bladder. The client has received a large volume of IV fluids since the epidural was inserted, and the client may not feel the urge to void or may be unable to void. In that case, the nurse should obtain a prescription to catheterize the client before the bladder becomes so distended as to cause bladder spasms. The nurse should assess for a spinal headache, postoperative pain, and the client's ability to move after determining whether the bladder is distended.

CN: Reduction of risk potential; CL: Analyze

53. 3. Spinal anesthesia is an extensive conduction nerve block that is produced when a local anesthetic is introduced into the subarachnoid space at the lumbar level. A few minutes after induction of a spinal anesthetic, anesthesia and paralysis affect the toes and perineum and then, gradually, the legs and abdomen. When the autonomic nervous system is blocked, vasodilation occurs and hypotension occurs. The client will feel sensation to the toes before the perineal area. A spinal headache due to loss of fluid is a severe headache that occurs while in the upright position but is relieved in the lying position.

CN: Physiological adaptation; CL: Analyze

54. 3. The nurse should check the client's baseline data to ascertain whether the client's pupil has always been enlarged or this is a new finding. The preoperative assessment is valuable as the baseline for comparison of all subsequent assessments made throughout the perioperative period. The nurse may determine that a more involved neurologic examination is indicated or may choose to assess other signs using the Glasgow Coma Scale, administer oxygen, or call the surgeon, but the nurse still needs to know the baseline data before proceeding.

CN: Physiological adaptation; CL: Synthesize

55. 2. During the immediate postanesthesia period, the unconscious client should be positioned on the side to maintain an open airway and promote drainage of secretions; because of the type of surgery, the client should be positioned on the right side. Removing the oral airway and observing the surgical dressing are appropriate, but other actions should be implemented before these. Respiratory depression can occur in a client after a procedure requiring sedation. If the client cannot be aroused, the sedation drugs can be reversed by administering a sedation reversal agent, but this client's respiratory rate is 14, and the client is moaning, indicating expected recovery from anesthetics.

CN: Physiological adaptation; CL: Synthesize

56. 1. The nurse should check the dressing for signs of bleeding to

establish a baseline for future assessments of the dressing and to verify that there is no obvious sign of hemorrhage. The nurse does not need to empty peri-incisional drains at this time. All drains should have been emptied and reconstituted by the postanesthesia care nurse before the client was transferred to the surgical floor. Assessing the client's pain level and assessing the bladder are important; however, it is more important to assess the surgical site for bleeding because hemorrhage is a life-threatening complication of any surgical procedure.

CN: Physiological adaptation; CL: Synthesize

57. 3. Sodium pentothal, a short-acting barbiturate, can cause hypotension, which may be especially problematic for the client with impaired cardiac functioning. Sodium pentothal does not cause bradycardia, complete muscle relaxation, hypertension, or tachypnea.

CN: Pharmacological and parenteral therapies; CL: Apply

58. 1. Propofol, a nonbarbiturate anesthetic, causes less nausea and vomiting than do other induction agents because of a direct antiemetic action. It does not cause hypotension or skeletal muscle movement, and it does not act slowly.

CN: Pharmacological and parenteral therapies; CL: Analyze

59. 4. Desflurane and sevoflurane are volatile liquid anesthesia agents that are used for outpatient surgeries primarily because they are rapidly eliminated. They have the added benefits of being better tolerated and nonirritating to the respiratory tract, and they have predictable cardiovascular effects. However, rapid elimination is an important consideration for outpatient procedures.

CN: Pharmacological and parenteral therapies; CL: Apply

60. 3. A heart rate of 150 bpm or greater, hypotension, and muscle rigidity are early signs of malignant hyperthermia. The nurse should quickly assemble emergency supplies and personnel because malignant hyperthermia is potentially and rapidly fatal in more than 50% of cases. Rapid, extreme rise in temperature is a late sign. Another factor influencing the analysis is that the client has a large body frame, and having large, bulky muscles is a risk

factor for malignant hyperthermia. The client's vital signs are well out of the range of normal; analysis of the data and swift intervention are indicated. Excessive blood loss is unlikely, and the data do not support this conclusion. Although clients do have changes in vital signs when in acute pain, the nurse would expect the client to be hypertensive, not hypotensive.

CN: Physiological adaptation; CL: Analyze

61. 2. One of the earliest signs of hypoxia is restlessness and agitation. Decreased level of consciousness and somnolence are later signs of hypoxia. Chills can be related to the anesthetic agent used but are not indicative of hypoxia. Urgency is not related to hypoxia.

CN: Physiological adaptation; CL: Analyze

62. 2,3,4,5. Flumazenil should be administered in small quantities such as 0.2 mg over 15 to 30 seconds but never as a bolus. Flumazenil may be given undiluted in incremental doses. Adverse effects of flumazenil may include shivering and hypotension. The nurse should monitor the client's level of consciousness while recovering from sedation. Flumazenil should be administered through a free-flowing IV line in a large vein because extravasation causes local irritation.

CN: Pharmacological and parenteral therapies; CL: Synthesize

63. 2. It is important for the nurse to cover this client with warm blankets because he is at high risk for hypothermia secondary to age, spinal anesthesia, placement in a lithotomy position in the cool operating room for 1.5 hours, instillation of 4,000 mL of room temperature bladder irrigation, and ongoing bladder irrigation. Spinal anesthesia causes vasodilation, which results in heat loss from the core to the periphery. The nurse will empty the catheter drainage bag and hang new bags of irrigation as needed, but the client's potential for hypothermia should be addressed first. The client will not be turned at this time.

CN: Reduction of risk potential; CL: Synthesize

64. 3. The client who is 5 feet 1 inch tall (155 cm) and weighs 200 lb (90.7 kg) would be expected to retain the anesthetic agents longer because adipose tissue absorbs the drug before the desired systemic effect is reached for

anesthesia maintenance. Nursing interventions are aimed at encouraging the obese client to turn, cough, and deep breathe despite feeling sleepy and tired. The sooner this client ambulates, the sooner the retained anesthesia will be worked out of the adipose tissue.

CN: Reduction of risk potential; CL: Analyze

65. 1. The nurse should encourage the client to avoid holding the operated arm, the arm with the intravenous regional nerve block (Bier block), close to the face because the client does not have motor control over it. With the cast in place, the client could hit the eye, nose, or mouth and cause soft tissue damage. It is acceptable for the client to hold the operated arm with the unoperated arm or to use the unoperated arm. The nurse should administer the analgesic before the intravenous regional anesthetic completely wears off so that the pain does not peak before pain medication is administered.

CN: Reduction of risk potential; CL: Synthesize

66. 3. The nurse should monitor the client's respirations closely for 4 to 6 hours because naloxone has a shorter duration of action than do opioids. The client may need repeated doses of naloxone to prevent or treat a recurrence of the respiratory depression. Naloxone is usually effective in a few minutes; however, its effects last only 1 to 2 hours, and ongoing monitoring of the client's respiratory rate will be necessary. The client's dosage of morphine will be decreased or a new drug will be prescribed to prevent another instance of respiratory depression.

CN: Pharmacological and parenteral therapies; CL: Synthesize

67. 3. Abnormal coagulation test results have been associated with naloxone, and the nurse should monitor surgical clients closely for bleeding. Dizziness, biliary colic, and urine retention are not associated with naloxone.

CN: Pharmacological and parenteral therapies; CL: Analyze

68. 3. The client who receives epidural anesthesia is at decreased risk for a headache because a noncutting needle is used instead of a side angle-cutting needle. The epidural needle is a 25- to 27-gauge needle, which is much smaller than a 17-gauge needle. Epidural anesthesia involves an extradural injection; a subarachnoid injection is used in spinal anesthesia. The onset of

spinal anesthesia is faster because a larger dose of medication is usually administered.

 CN: Physiological adaptation; CL: Analyze

69. 3. Spinal anesthesia does not cause parasympathetic blockage. The spinal anesthetic agent usually is injected into the L2 subarachnoid space, where it produces sympathetic, sensory, and motor blockade.

 CN: Pharmacological and parenteral therapies; CL: Apply

70. 0.5 mL . To obtain the answer, treat the volume to be administered as X.

$$\frac{2.5 \text{ mg}}{X \text{ mL}} = \frac{5 \text{ mg}}{1 \text{ mL}}$$

$$5X = 2.5$$

$$X = \frac{2.5}{5} = 0.5$$

 CN: Pharmacological and parenteral therapies; CL: Apply

The Client Who Has Had Surgery

71. 4. Bowel sounds are not present until the 3rd or 4th postoperative day; the nurse should document the assessment findings. Since this is an expected finding it is not necessary to notify the HCP or have another nurse validate the findings. Too many ice chips may promote abdominal distention, especially if the client is not ambulating in the intermediate postoperative period.

CN: Physiological adaptation; CL: Synthesize

72. 3,2,1,4. The nurse first auscultates the abdomen for bowel sounds to determine if peristalsis has resumed and is present. The nurse then administers hot liquids to stimulate peristalsis and promote expulsion of the gas that is causing the client to be uncomfortable. Positioning the client on the right side permits gas to rise along the transverse colon and facilitates its release. Abdominal distention may be minimized by early and frequent ambulation, which stimulates intestinal motility. The nurse also assists the client to ambulate.

CN: Physiological adaptation; CL: Synthesize

73. 3. Restlessness in the immediate postoperative period may be a sign of cerebral hypoxia as a result of depression on the central nervous from anesthetic agents and sedatives. Administering sedatives would depress the central nervous system further. A client may aspirate ice chips when he or she is restless. Wrist restraints may increase agitation and cannot be used without justification.

CN: Physiological adaptation; CL: Analyze

74. 2,3,1,4. The oncoming nurse should first assess the client for pain. Next, the nurse should check the documentation and then validate with the nurse who reported giving the medication that the medication had been given. Finally, the nurse should determine if there is a discrepancy between administration and documentation.

CN: Management of care; CL: Synthesize

75. 3. Deep breathing and coughing help to increase lung expansion and prevent the accumulation of secretions in postoperative clients. An O₂ saturation of 89% is not an unexpected or emergent finding immediately following surgery. Frequent coughing and deep breathing will likely quickly remedy an O₂ saturation of 89% but will also effectively help to prevent atelectasis and pneumonia in the remainder of the postoperative period. It is not necessary to notify the **HCP**  prior to intervening with coughing/deep breathing, and it is not appropriate to position this client with the head of the bed lower because this would make it more difficult for the client to

expectorate secretions. Oxygen may be necessary, but the nurse should assist the client to cough and deep breathe first, in an attempt to improve his oxygenation and saturation.

CN: Physiological integrity; CL: Synthesize

76. 4. Urinary retention is common following surgery with anesthesia, following childbirth, or as a result of specific medication use, for example, narcotics for pain. Clients should be assisted to an anatomically comfortable position to void prior to resorting to more invasive methods such as intermittent or indwelling catheterization to manage urinary retention. Difficulty voiding after childbirth is expected, and it is not necessary to notify the **HCP** 📖. While increasing fluid intake is important, it will not help the client void now.

CN: Basic care and comfort; CL: Synthesize

77. 4. Following surgery, clients are at risk for respiratory complications and should take the necessary actions to prevent these. The nurse should first be sure that the client understands how to do the exercises and the potential complications if they are not done. It is not the wife's responsibility to make the client do the exercise, but she can help. Increasing fluid intake and frequent turning are appropriate, but not sufficient for aerating the lungs.

CN: Health promotion and maintenance; CL: Synthesize

78. 1. The nurse should first try to facilitate the client's ability to void by having the client stand at the bedside and use the urinal. Pouring running water over the perineum is a strategy that could be used if the client cannot void in a standing position. Ambulation will not help the client void. If such conservative methods fail, the nurse should obtain a prescription to catheterize the client, but an indwelling urinary catheter increases the risk of urinary tract infection because microbes ascend the catheter and travel to the bladder.

CN: Reduction of risk potential; CL: Synthesize

79. 4. The first cognitive response that returns after anesthesia is orientation to person. The nurse assesses this by asking the client his name. Orientation to place and time usually occurs after orientation by the nurse

because of confusion from anesthesia and waking in an unfamiliar place. The nurse can then continue to assess and document the client's cognitive ability to remember information. The nurse does not need to notify the surgeon. The client's cognitive response is normal. It is not necessary to ask the wife to reorient the client; however, she can continue to talk to him and help him regain consciousness.

 CN: Physiological adaptation; CL: Synthesize

80. 3 . Potassium in an IV solution may be irritating to a vein. The nurse should assess the IV site before taking any of the other actions listed. The infusion may have to be slowed and/or stopped, and the **HCP**  contacted. An outdated parenteral fluid setup does not cause pain, but may be a source of infection.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

81. 2. The client's body temperature dropped 2.5°F (1.4°C) from the preoperative to postoperative phase. The client lost heat during the preoperative period. The client has not had time to regain the heat she has lost and should not be discharged postoperatively until her postoperative vital signs, which include body temperature, are closer to her preoperative vital signs. The client's pulse rate, respiratory rate, and blood pressure have compensated according to the client's hypothermic state and will reflect changes as the client warms up. There are no indications that the client needs more pain medication, oxygen, or IV fluids.

 CN: Physiological adaptation; CL: Synthesize

82. 3. The client still has a respiratory rate of 8; the nurse should first assist the client to sit and stimulate the client to take deep breaths and cough. This action will also help the nurse to determine what the client's level of sedation is; if the client is too sedated to cooperate with coughing/deep breathing, it will be important to slow or stop the infusion of narcotics and to consider contacting the **HCP**  for a prescription for naloxone. The client is still breathing, so it is not necessary to call the **rapid response team**.

 CN: Physiologic adaptation; CL: Synthesize

83. 3. The nurse is helping the client manage pain and comfort level. The

nurse has completed the assessment of the client and should now dim the lights and create a quiet environment. Such nonpharmacologic measures as adjusting the light level in the room facilitate pain management. Decreasing stimulation from the environment, such as brightness to the optic nerve, promotes the client's ability to relax skeletal muscles and fall asleep. It is too soon to reassess vital signs. Checking that the family is comfortable is important but is not the next thing to do for this client. Increasing the oxygen flow rate is not indicated and, if needed, should have been done before repositioning the client.

CN: Management of care; CL: Synthesize

84. 4. When a postoperative client has a temperature elevation to $>100^{\circ}\text{F}$ (37.8°C) in the first 24 hours after surgery, the temperature elevation is usually related to atelectasis. Because this client had upper abdominal surgery with manipulation around the diaphragm, the client is more prone to guarding the operative site and shallow breathing. Encouraging the client to take deep breaths and use incentive spirometry is an appropriate measure to prevent atelectasis and pulmonary infection. The nurse must assist the client in filling the alveoli in the lower posterior lobes of the lungs. An incentive spirometer is a good visual biofeedback instrument that the client had practiced with preoperatively. Changing the client's position from lying to sitting for deep breathing will expand alveoli in the lower posterior lobes. There is no indication that a surgical wound infection is occurring. An antibiotic is not indicated at this time. Pain medication will decrease respirations, and the client is not indicating pain at the moment.

CN: Physiological adaptation; CL: Synthesize

85. 3. The client must be able to verbalize understanding about receiving no more pain medication than is prescribed no matter how many times the button is pushed. Only the client should press the button for the PCA. The client should administer the pain medication when the pain is first noticed, well before the pain is out of control. One of the advantages of the PCA is that the amount of pain medication is controlled; therefore, overdosing is not a client concern when using a PCA.

CN: Pharmacological and parenteral therapies; CL: Evaluate

86. 3. The nurse should take the client's blood pressure. She is likely experiencing orthostatic hypotension. The PCA pump does not need to be discontinued because as soon as the blood pressure stabilizes the pain medication can be resumed. Administering oxygen is not necessary unless the oxygen saturation also drops. The client should sit in the chair until the blood pressure stabilizes.

CN: Pharmacological and parenteral therapies; CL: Synthesize

87. 3. Urinary catheters should be limited in use and duration only as needed for client care. The guideline also specifies that if used, the catheter should be inserted using aseptic technique, secured to provide unobstructed flow and drainage, and maintained in a way that protects sterility of the catheter and the drainage system. It is not necessary to provide catheter care or cleanse the meatus as these can be a source of introducing an infection; it is not necessary to check for bladder distention if the catheter is draining correctly.

CN: Safety and infection control; CL: Synthesize

88. 4,1,3,2. The client must first splint the incision to avoid increased intolerable pain, or he or she may not cooperate with the pulmonary - ventilation. The next step is to inhale oxygen to expand the alveoli for a few seconds and then exhale carbon dioxide in successive steps 5 to 10 times. The client should try to cough on the end of the exhalation to remove retained secretions from the larger airways.

CN: Reduction of risk potential; CL: Synthesize

89. 3. The client who has not had the gag reflex anesthetized is the client who had a repair of the carpal tunnel syndrome under local anesthesia because the area being anesthetized was the tissue in the wrist. The client who had a bronchoscopy received a local anesthetic on the vocal cords, and the nurse should check the gag reflex or ability to swallow before administering fluids. Clients who had general anesthesia or intravenous conscious sedation received medication for central nervous system sedation, and the nurse should assess the level of consciousness and ability to swallow before administering fluids.

 CN: Reduction of risk potential; CL: Analyze

90. 3. The client is experiencing activity intolerance, which is common following the first ambulation following surgery. The nurse should allow the client to rest and continue to monitor vital signs. Since the client is not dizzy or in pain, the nurse should wait to see if the client recovers from ambulating and reports having pain prior to administering pain medication. There is no need to request different activity prescriptions; it will still be important for the client to ambulate. The client is not having chest pain; it is not necessary to obtain a 12-lead ECG.

 CN: Basic care and comfort; CL: Synthesize

91. 3. When the urine output is <30 mL/h, the nurse should assess for potential causes such as hypovolemia or hemorrhage. The nurse should assess and evaluate the client's vital signs, intake and output, dressing, and available laboratory values and notify the **healthcare provider (HCP)** . Bowel obstruction, although possible after surgery, is characterized most notably by abdominal distention and absent bowel sounds, not decreased urine output. The nurse would not expect the client to have hypertension, but rather hypotension.

 CN: Physiological adaptation; CL: Synthesize

92. 3. A client who had a left thoracoscopy is placed in the lateral position, in which the most common injury is an injury to the brachial plexus. Numbness and tingling in the arm suggests a brachial plexus injury. There is no undue pressure on the ankles or knees during thoracic surgery.

 CN: Physiological adaptation; CL: Analyze

93. 2,3,5,6. The client should be in an upright position when using the spirometer. The client should exhale fully prior to using the spirometer and then inhale to expand the lungs and continue inhaling for 3 more seconds. The client should relax and exhale before inhaling for the next use of the spirometer. The client should cough and clear retained secretions following the use of the spirometer. The client should use the spirometer every 2 hours during the immediate postoperative period.

 CN: Physiological adaptation; CL: Evaluate

94. 3. The nurse should inform the client that as the incision heals, uneven lumps might appear under the incision line because the collagen is growing new tissue at different rates. Eventually, the lumps will even out and the tissue will be smooth. The client can touch the incision with clean hands as needed to perform incisional care. The client should not clean the incision with hydrogen peroxide because it may dry out the natural skin oils. The surgeon will remove the staples for the client.

CN: Reduction of risk potential; CL: Synthesize

95. 2. When a wound eviscerates (abdominal organs protruding through the opened incision), the nurse should cover the open area with a sterile dressing moistened with sterile normal saline and then cover it with a dry dressing. The surgeon should then be notified to take the client back to the operating room to close the incision under general anesthesia. The nurse should not press the emergency alarm because this is not a cardiac or respiratory arrest. The nurse should have the visitors and family leave the room to decrease the chance of airborne contamination, but the primary focus should be on covering the wound with a moist, sterile covering.

CN: Safety and infection control; CL: Synthesize

96. 4. The findings (WBC count above normal; inflammation and drainage at the incision site; and an elevated temperature) indicate that the client has an infection. The nurse should first notify the **HCP** . Encouraging fluids will be helpful, but it is not the first action. The client may have incisional pain, and after the nurse has contacted the HCP, the nurse can determine if the client needs pain management. The nurse should not cleanse the site until the HCP writes a prescription to do so.

CN: Physiological adaptation; CL: Analyze

97. 3. The client is receiving oxygen using a partial rebreathing mask, which is positioned correctly. The correct flow rate for this type of oxygen mask is 6 to 10 L of oxygen per minute. To be effective, the mask must cover the client's face. The elastic band must be tight enough to secure the mask. When used correctly, the reservoir bag should inflate during the inspiratory phase.

CN: Physiological adaptation; CL: Synthesize

98. 4. A wet-to-dry dressing should be able to dry out between dressing changes. Thus, the dressing should be moist, not dry, when applied. As the moist dressing dries, the wound will be debrided of necrotic tissue and exudate. Normal saline is most commonly used to moisten the sponge; Burow's solution will irritate the wound. The sponge should not be packed into the wound tightly because the circulation to the site could be impaired. The moist sponge should be placed so that all surfaces of the wound are in contact with the dressing. Then the sponge is covered and protected by a dry sterile dressing to prevent contamination from the external environment.

CN: Safety and infection control; CL: Synthesize

99. 1. Common client misconceptions regarding pain and pain medication administration include a concern that taking pain medication regularly will lead to addiction. However, this misconception overstates the risk of addiction and greatly understates the risk of immobility due to poor pain control, including atelectasis, decubitus formation, and delayed healing. The nurse should assist the client to understand the importance of adequate pain medication to support and promote client mobilization following surgery and client/family satisfaction with care. There is a potential for dependence and addiction with all narcotic drugs, although not likely during the postoperative periods.

CN: Basic care and comfort; CL: Synthesize

100. 3. After emptying a Jackson-Pratt drainage bulb, the nurse should compress the bulb, plug it to establish suction, and then document the amount and type of drainage emptied. Irrigating a Jackson-Pratt drain is inappropriate because it could contaminate the wound. The Jackson-Pratt drain is not usually connected to wall suction. The purpose of the Jackson-Pratt drain is to remove bloody drainage from the deep tissues of the incision; clamping the drain would be counterproductive.

CN: Reduction of risk potential; CL: Synthesize

101. 1. Performing leg exercises, including ankle pumping, ankle rotation, and quadriceps setting exercises, will help prevent stasis of blood in the lower

extremities, which can lead to blood clot formation. Encouraging the client to cough and deep breathe is an important postoperative intervention; however, it is directed at preventing pneumonia, not pulmonary emboli. The nurse should not massage the calves because a deep vein thrombus could dislodge and travel to the pulmonary vasculature. Antiembolism stockings should be worn continuously during the postoperative period.

 CN: Physiological adaptation; CL: Synthesize

102. 2. Naloxone hydrochloride is the antidote for morphine sulfate. The signs of overdose on morphine sulfate are a respiration rate of 2 to 4 breaths/min, bradycardia, and hypotension. Flumazenil is the antidote for midazolam. Doxacurium is a nondepolarizing muscle relaxant. Remifentanyl is an opioid used as an anesthetic adjunct.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

103. 4. The device is applied correctly, and the nurse should ensure the client's comfort. The client's legs should remain extended as shown while using the device; legs may be elevated, but it is not necessary to elevate the client's legs. The device should be placed directly on the client's legs; it is not necessary to apply antiembolic stockings under them. The client may move in bed as needed; active and isometric movement is encouraged to promote blood flow.

 CN: Health promotion and maintenance; CL: Synthesize

104. 2. The client admitted for same-day surgery should not drive home after the surgical procedure because it is unsafe. Even without an anesthetic, the surgical event can be more stressful than anticipated. It is acceptable to have someone arrive after the surgery has started to take the client home. A taxi is permissible but not desirable.

 CN: Reduction of risk potential; CL: Evaluate

105. 3  The urine output does not have to be checked every 15 minutes for a client who has had an arthroscopy because this client probably does not have a catheter in place. If the client voids, the output would be recorded. Assessments every 15 minutes during the first hour would include vital signs, pulse oximeter values, and pain to monitor the client's comfort level and

check for compartment syndrome. Neurovascular checks distal to the operative site are especially vital because a tourniquet was used proximal to the operative site during the surgical procedure and because edema may develop during the postoperative period.

CN: Reduction of risk potential; CL: Analyze

106. 2. Hypotension and tachycardia are common adverse effects of droperidol and should be monitored closely by the nurse. Hypotension and tachycardia are not common adverse effects of ondansetron hydrochloride, prochlorperazine, or promethazine.

CN: Pharmacological and parenteral therapies; CL: Analyze

107. 1. The nurse should assess but not disturb the epidural dressing because the catheter can be easily dislodged and organisms can easily be transmitted into the central nervous system. The nurse should not have to change the dressing at all if a waterproof dressing is applied over the epidural site. Even with strict aseptic technique, a drain into a sterile cavity is a direct route for transmission of organisms and places a client at increased risk of infection, and the nurse should not handle the dressing or the catheter.

CN: Pharmacological and parenteral therapies; CL: Apply

108. 2. The client who has epidural pain management postoperatively can ambulate because a low concentration of local analgesia causes sensory blockage only. The catheter is placed so that constant pain management plus patient-controlled administration of an analgesic dose can block sensory innervation. Motor function should not be affected since the catheter is placed above the dura lining the spinal fluid. If the catheter would move through the dura sac, spinal analgesia would occur, affecting motor function as well as sympathetic nervous system function.

CN: Pharmacological and parenteral therapies; CL: Apply

109. 3. Portable wound suction units can be emptied and drained. The nurse should compress the unit after emptying to create suction before reinserting the plug. It is normal for the suction unit to be full 6 hours after surgery, and the nurse does not need to notify the surgeon. The drainage unit should be emptied when full or every 8 hours. The drain in the incision

should remain in place until the surgeon removes it. While all drainage should be noted as output on the **medical record** 📖, recording the amount without emptying the drainage unit is not accurate, nor is it safe practice.

🔑 CN: Safety and infection control; CL: Synthesize

110. 1. The nurse should ask the client about having a bowel movement because acetaminophen with hydrocodone is an opioid, which can be constipating. By the 3rd day, many clients become constipated and are feeling distended, with sharp, cramping pain due to gas, which is treated with ambulation, not more opioids. The client's emptying the bladder should not affect the pain level. The nurse should look at the client's **medical record** 📖 to determine when the client's last dose of pain medication was administered, rather than asking the client. The client's statement regarding the pain level before the surgery is not relevant to whether the nurse should administer the acetaminophen and hydrocodone.

🔑 CN: Physiological adaptation; CL: Synthesize

111. 1. Blood and serous fluid is drained from the operative site to prevent hematoma formation or a collection of fluid that could become a site for infection. This also minimizes postoperative swelling, which can be painful. A simple explanation such as this is appropriate because the client is just waking up from surgery. Blood from the operative site can be collected through an autotransfusion system so that it can be transfused to the client during or immediately after surgery. However, strict guidelines about volume of blood lost, how quickly the device fills, and how long the blood has been out of the client's body govern whether the blood can be transfused. Therefore, although it is possible that the drainage system to which the client refers is an autotransfusion system, it is more likely that the client has a simple Hemovac drain. It is incorrect to tell a client not to worry about something even if he or she is in the drowsy state of awakening from anesthesia. It is inappropriate to ignore the client and give the client something to make him or her drowsy instead of addressing his or her concerns.

🔑 CN: Psychosocial integrity; CL: Synthesize

112. 1. The purpose of the Jackson-Pratt drainage tube is to drain off the

purulent drainage from the sterile peritoneal cavity and prevent peritonitis. A Jackson-Pratt drain cannot prevent bleeding. The Jackson-Pratt drain has no effect on pressure on the bladder. There is no reason to be concerned about pressure on the gallbladder.

CN: Reduction of risk potential; CL: Apply

113. 2. Biliary drainage tubes (T tubes) are placed in the common bile duct and drain bile, which is dark yellow-orange. Serosanguineous drainage is thin and pinkish red. Bile is not clear and is not green unless it comes in contact with gastric fluid.

CN: Reduction of risk potential; CL: Analyze

114. 1. Urinary elimination in the first 8 hours postoperatively is a requirement before the client who has had an inguinal hernia repair can be discharged from same-day surgery. Ingestion of fluids without nausea and vomiting is important, but eating solid foods is not a requirement for discharge from same-day surgery. Being completely pain free is an unrealistic expectation for the time frame and is not a requirement for leaving same-day surgery. However, the client should be comfortable, and his pain should be controlled. It is not a requirement for the client to ambulate in the hallway, but the client should be able to sit up and go to the bathroom without assistance.

CN: Reduction of risk potential; CL: Analyze

115. 3. The ability to self-administer the drug is a requirement for the client to use PCA. Having a family member or advance directives is not a requirement for initiating PCA. The nurse teaches the client about how to use PCA and monitors effectiveness of the pain medication; however, it is not necessary for the nurse to assist with the administration of the drug.

CN: Pharmacological and parenteral therapies; CL: Evaluate

116. 2. The client's body temperature should be assessed every 4 hours during the first 24 hours because the client is still at risk for hypothermia or malignant hyperthermia. The client does not need to be checked every 2 hours unless indicated by an abnormal finding.

CN: Reduction of risk potential; CL: Apply

117. 1. The client's systolic blood pressure is dropping, and the pulse pressure is narrowing, indicating impending shock. The nurse should notify the surgeon. Elevating the head of the bed will not increase the blood pressure. Administering pain medication could cause the blood pressure to drop further. The intake and output record may indicate decreased urine output related to shock, but the nurse should first contact the **HCP** 📖.

🔑 CN: Reduction of risk potential; CL: Synthesize

118. 1. The client who has been positioned in the lithotomy position under general anesthesia may experience discomfort in the shoulders postoperatively because the client is placed in the Trendelenburg position to expose the perineal area. The client's weight is then shifted toward the shoulders, and the client experiences muscle soreness postoperatively. Although there may be pressure on the nerves in the thighs, legs, or feet from pressure from the stirrups, there should be no discomfort if the stirrups are well padded.

🔑 CN: Basic care and comfort; CL: Apply

119. 2. The client should drink a minimum of 2,500 mL of fluid per day (not 1,000 mL) to keep secretions liquefied and easier to cough up and eliminate from the upper respiratory tract. The client should use pain medication before coughing. The client should use the incentive spirometer every 2 to 4 hours. The nurse should monitor the client's breath sounds and temperature to detect early signs of infection. The nurse should assist with early ambulation.

🔑 CN: Reduction of risk potential; CL: Synthesize

120. 3. The client should sit in an upright position when doing breathing exercises to allow for full chest expansion of both lungs and all fields and bases. Using an incentive spirometer every hour while awake is appropriate and allows the client visual feedback. Placing his hands lightly over the lower ribs and upper abdomen allows the client to see muscles of inspiration and expiration and is appropriate. Coughing deeply from the lungs after four deep breaths allows the client to effectively cough up secretions.

🔑 CN: Reduction of risk potential; CL: Evaluate

121. 2. Muscle cramping is a sign of hypokalemia. Potassium is an electrolyte lost with nasogastric suctioning. Confusion is seen with hypercalcemia. Edema is seen with protein deficit or fluid volume overload. Tremors are seen with hypomagnesemia.

 CN: Reduction of risk potential; CL: Analyze

Legal and Ethical Issues Associated with Surgery

122. 3. The most critical piece of information is the client identification bracelet. Misidentification of clients can result in serious harm to the client. The nurse also needs the admitting records and any preprinted labels as part of verifying the client's identification. The location of the family is not included in verifying identification.

 CN: Reduction of risk potential; CL: Synthesize

123. 2. When the client cannot sign the operative **consent**  and it is a true lifesaving emergency, consent may be obtained over the telephone from the client's next of kin or guardian. The surgeon must obtain the telephone consent, but if it is a true lifesaving emergency, the surgeon often is already in surgery, so the nurse makes the telephone call and another nurse witnesses the call. Some institutions have a special consent form for emergency surgery. Consent can be waived in situations in which no family is available; however, if the family can be reached by telephone before surgery, verbal consent is legally required.

 CN: Management of care; CL: Synthesize

124. 3. There are risks with both the surgical procedure and the general anesthesia required for a craniotomy. The risks involved in the procedure are a part of the **informed consent**  . Other information that is part of an informed consent includes potential complications, expected benefits, inability of the surgeon to predict results, irreversibility of the procedure (if applicable), and other available treatments. Talking about the effects of the diabetes on healing, explaining how the craniotomy is performed, and explaining the consequences of declining treatment (e.g., death if the tumor is not removed) represent appropriate actions to provide information to the client.

 CN: Management of care; CL: Evaluate

125. 3. The surgeon is responsible for explaining the surgical procedure to be performed and the risks of the procedure, as well as for obtaining the **informed consent**  from the client. A nurse may be responsible for obtaining and witnessing a client's signature on the consent form. The nurse is the client's advocate, verifying that a client (or family member) understands the consent form and its implications and that consent for the surgery is truly voluntary.

 CN: Reduction of risk potential; CL: Apply

126. 2. When the client cannot read or write, the **consent**  can be read to the client and the client can sign in the presence of two witnesses. The client (not the next of kin) should always sign for self unless he or she is a minor or not of sound mind. The court does not appoint a guardian for a person of sound mind just because he or she cannot read or write. Hospital personnel would not and could not sign a consent form for a client.

 CN: Management of care; CL: Apply

Managing Care, Quality, and Safety of Clients Having Surgery

127. 1,2,3. Clients who have diabetes mellitus controlled by diet, those with a high stress response to surgery, or those who have been on steroid treatment for the last 3 months should have their serum glucose level assessed. A client with a family history of diabetes receiving D₅LR IV fluids does not need to have the serum glucose level checked unless other clinical manifestations are present. The client who has a high-carbohydrate diet should be able to metabolize the glucose unless there are other health problems.

 CN: Reduction of risk potential; CL: Analyze

128. 1. Clients who have had long-term multiple exposures to latex products, such as would occur with six previous surgeries and recoveries, are at increased risk for latex allergies. The nurse should explore what types of surgeries these were, how involved the client's recoveries were, and whether

signs of latex allergies have occurred in the past. Working as a sales clerk, having type 2 diabetes, and undergoing laser surgery do not expose a client to latex or increase the risk of latex allergy.

CN: Health promotion and maintenance; CL: Analyze

129. 1,2,3,4. The root cause of wrong-site surgery involves a breakdown in communication between the client and family and the healthcare team. Information retrieved from the client in the preoperative assessment, such as the client's name, surgical site, and procedure, should be verbally assessed and verified with medical records and radiographic diagnostic reports. This information should be compiled in a checklist that the intraoperative team can recheck, thus avoiding unnecessary distraction and delay in the operating room. The nurse in the operating room is responsible for calling a “**time-out**”  so that every surgical team member can double-check the correct site of surgery, verify the site using the operative **consent**   form, and verify that the surgeon has marked the operative site on the client. Showing the client an anatomic model will assist the client in understanding the location of the surgery, but it will not prevent anyone from identifying the wrong site on the client.

CN: Safety and infection control; CL: Apply

130. 4. The nurse should first contact the **HCP**  because the prescription for the morphine is not complete. The Joint Commission of the United States and the Institute for Safe Medication Practices Canada recommend not to use MSO_4 because it can apply to morphine as well as to magnesium sulfate. There is no mention of an IV system being needed. The morphine should not be in the medication cabinet because the prescription is not complete. Although pharmacy may offer a suggestion as to what the medication prescribed is, the best means to confirm the intent of the prescription is to contact the HCP who wrote the prescription.

CN: Safety and infection control; CL: Synthesize

131. 4. The nurse should first call the **rapid response team (RRT)**  or medical emergency team that provides a team approach to evaluate and treat immediately clients with alterations in vital signs or neurological deterioration. The client's vital signs have changed since the client was in the

PACU, and immediate action is required to manage the changes; the staff in PACU are not responsible for managing care once the client is transferred to the surgical unit. The respiratory therapist may be a part of the RRT but should not be called first.

 CN: Management of care; CL: Synthesize

132. 4. The anesthesiologist who administers the anesthetic agent and monitors the client's physical status throughout the surgery must have knowledge of all known allergies for client safety. The completed record (with the preoperative checklist) must be available to all members of the surgical team, and any unusual last-minute observations that may have a bearing on anesthesia or surgery are noted prominently at the front of the **medical record** . The preanesthetic medication can cause light-headedness or drowsiness. The nurse in the scrub role provides sterile instruments and supplies to the surgeon during the procedure.

 CN: Safety and infection control; CL: Synthesize

133. 1,2,4. Nurses can delegate to the **UAP**  to observe clients and promote their comfort following surgery and to empty and measure urinary catheter drainage bags. UAPs cannot teach clients; that is the responsibility of the **registered nurse (RN)**  or respiratory therapist. UAPs cannot assess IV insertion sites, which is the responsibility of an RN.

 CN: Management of care; CL: Synthesize

134. 2. The client must have an identification bracelet properly secured on the wrist before being transported to the operating room to ensure correct identification. It is incorrect to send the client without a properly secured identification bracelet. The perioperative nurse must verify the client's identification by checking for the same name on the **medical record**, armband, and schedule and by the client's statement. The preoperative nurse may be asked to physically identify the client and obtain a new armband.

 CN: Management of care; CL: Synthesize

135. 3. The client is experiencing a fluid overload and has vital signs that are outside of normal limits. The provider must be notified of the client's current status. It would be appropriate to recommend the provider administer

a diuretic to correct the fluid overload. It is not appropriate to administer an antihypertensive medication or administer more fluids. It may be appropriate to administer additional oxygen, but because of the fluid volume excess the client exhibits, diuretic administration is most important.

CN: Physiologic adaptation; CL: Analyze

136. 1. Prescriptions should be written clearly to avoid confusion or misinterpretation. Clearly written prescriptions do not use a “trailing” zero (a zero following a decimal point) and do use a “leading” zero (a zero preceding a decimal point). Additionally, the prescribed medication should be written in full and avoid abbreviations of the drug and the dosage, for example, “morphine sulfate” (avoiding use of “MS”), “mL” instead of “cc,” and “micrograms” instead of “mcg.”

CN: Safety and infection control; CL: Apply

137. 4,2,1,3. The nurse should first notify the **HCP**  of the high serum potassium level. Normal serum potassium level is 3.5 to 5.0; a level of 6.2 must be called to the HCP immediately because hyperkalemia may cause serious cardiac arrhythmias, potentially leading to death if left untreated. The nurse should next assess the client who has been vomiting and if necessary contact the HCP for a prescription for an antiemetic if none has been prescribed. After assessing all clients, the nurse should discuss the plan for the day, with the **UAP**  delegating duties as appropriate. Though the client is eager to go home, the discharge paperwork must wait until all clients have been assessed and immediate needs met.

CN: Reduction of risk potential; CL: Synthesize

138. 4. Maintenance of IV sites and systems includes regular assessment and rotation of the site and periodic changes of the dressing, solution, and tubing; these measures help prevent complications. The nurse should also observe the solution for discoloration, turbidity, and particulates. An IV solution is changed every 24 hours or as needed, and because the nurse noted an abnormal color, the nurse should change the bag of D5W and note this on an incident report. It is not necessary to verify this action with another nurse. Paging the **HCP**  is not necessary; maintaining the IV and using the correct solutions is a nursing responsibility. Although the first action is to

hang a new bag, hospital policy should be followed if there is a question as to whether there could have been an unknown substance in the bag that caused it to change color.

 CN: Safety and infection control; CL: Synthesize

139. 1,2,3,4,5,6. The venipuncture site must be assessed for signs of infection (redness and pain at the puncture site), infiltration (coolness, blanching, and edema at the site), and thrombophlebitis (redness, firmness, pain along the path of the vein, and edema).

 CN: Safety and infection control; CL: Analyze

140. 2 . In any situation that involves a medication error, the nurse first assesses the client immediately to determine any changes in condition and the need for urgent interventions. Calling the **HCP**  and/or administering an antidote is not done until the client is assessed and the necessary data are gathered. The nurse finding the error can complete an incident report after the client's safety is established and any emergency treatments are completed.

 CN: Management of care; CL: Synthesize

141. 1,2,4. When a “**time-out**”  is called prior to surgery, the surgical team must read back all prescriptions, verify the correct site, identify the client again, and double-check the echocardiogram. The sterile field has not been disrupted and does not need to be set up again. It is not necessary to obtain another x-ray as long as the confusion is clarified and the surgical team is satisfied that all are ready to begin the surgery.

 CN: Management of care; CL: Apply

142. 1,3,5,6. Transfer reports must include information about the client's surgery; all current treatments and medications; vital signs, including pain level; fluid status, including blood loss; and current IV infusions. It is not necessary to identify the surgeons who were present during the surgery or report the name of the insurance provider.

 CN: Management of care; CL: Apply

143. 2,3,5,6. Using SBAR (situation-background-assessment-recommendation), the nurse informs the surgeon of the current situation

(chest pains), the background (history of myocardial infarction), and assessment (chest pains, vital signs changes, likelihood of having a myocardial infarction). The nurse should also discuss recommendations and suggestions for prescriptions such as the ECG and nitroglycerin tablet. The nurse is focusing on the chest pain and change in vital signs and communicating recommendations for managing the chest pain; it is not necessary to report at this time that the client has been NPO or the type of surgery the client will have.

 CN: Management of care; CL: Synthesize

144. 4. Temperature variation in the postoperative period provides valuable information about a client's status. Fever may occur at any time during the postoperative period. A mild elevation (up to 100.4°F [38°C]) during the first 48 hours usually reflects the surgical stress response. After the first 48 hours, a moderate to marked elevation (higher than 99.9°F [37°C]) is usually caused by infection. It is not appropriate to do any of the other options to lower a client's temperature at this time.

 CN: Management of care; CL: Synthesize

145. 2,5. The **UAP**  can assist clients ambulate and take vital signs. It is within the RN scope of practice to teach the client to administer insulin, change dressings, and administer tube feedings.

 CN: Management of care; CL: Synthesize

146. 1,4,3,2. The nurse establishes priorities based on airway, breathing, circulation, and disability as well as immediacy of client needs. The client who is just returning from surgery needs to be assessed; the nurse will also need to check the IV. The client with cancer of the colon also needs to have vital signs, pain, and dressings checked; the tracheotomy is established, and in the report there was no mention of distress. The client with the fractured hip is at risk for pressure ulcers and should be seen next. The nurse should then make rounds on the client with diabetes and schedule the time to continue teaching injection technique at that time.

 CN: Management of care; CL: Synthesize

147. 4. Although practices for signing **informed consent**  

documents may vary across practice jurisdictions, generally, the spouse, or other responsible family member, may sign the consent form for a client with dementia. The minister, supervisor, and attorney cannot provide legal consent for surgery for this client.

CN: Management of care; CL: Synthesize

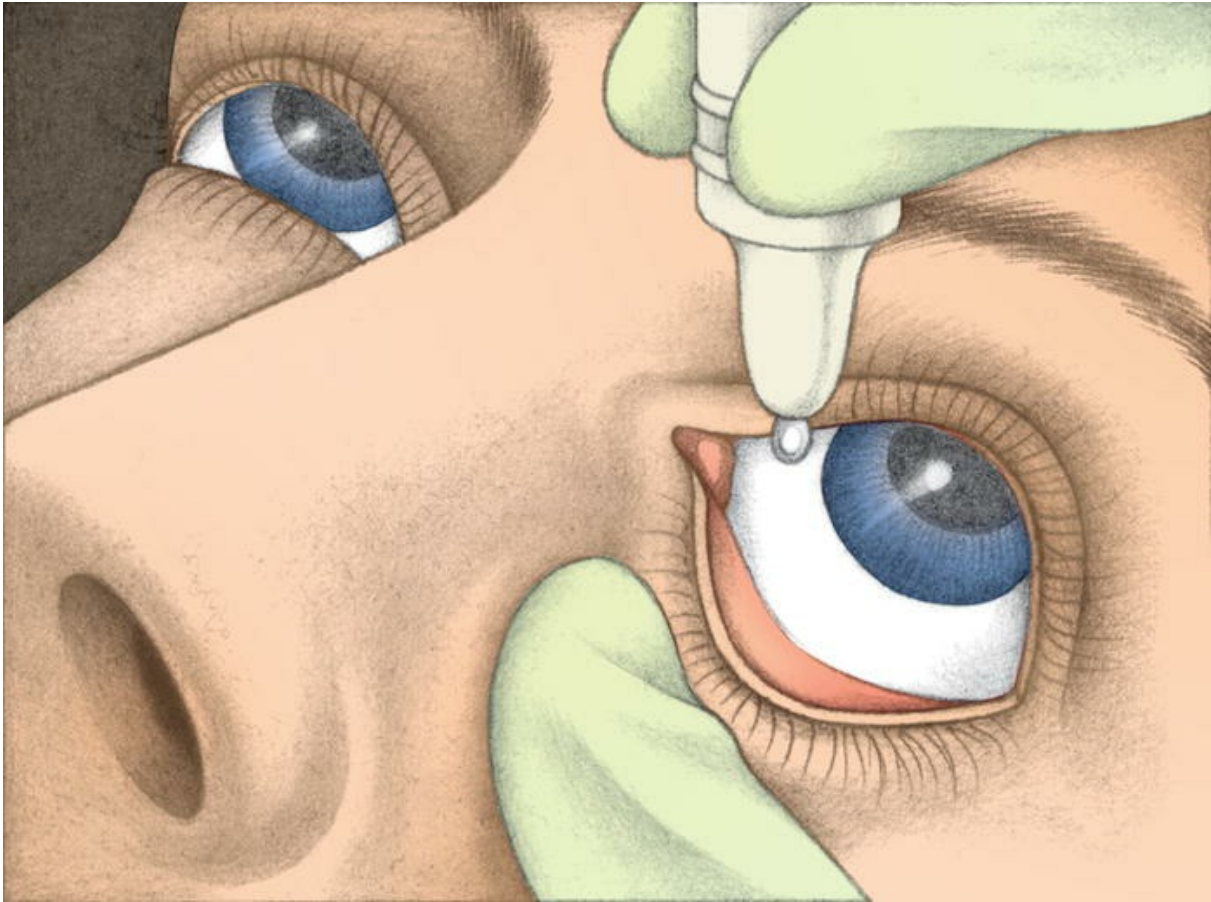

The Client with Health Problems of the Eyes, Ears, Nose, and Throat

- The Client with Cataracts
- The Client with a Retinal Detachment
- The Client with Glaucoma
- The Client with Adult Macular Degeneration
- The Client Undergoing Nasal Surgery
- The Client with a Hearing Disorder
- The Client with Ménière's Disease
- The Client with Cancer of the Larynx
- Managing Care, Quality, and Safety of Clients with Health Problems of the Eyes, Ears, Nose, and Throat
- Answers, Rationales, and Test-Taking Strategies

The Client with Cataracts

1. The nurse is observing a spouse administer eyedrops, as shown in the figure. What should the nurse instruct the spouse to do?

- ☐ **1.** Move the dropper to the inner canthus.
- ☐ **2.** Have the client raise the eyebrows.
- ☐ **3.** Administer the drops in the center of the lower lid.
- ☐ **4.** Have the client squeeze both eyes after administering the drops.

2. One day after cataract surgery, the client is having discomfort from bright light. The nurse should advise the client to:

- ☐ 1. dim lights in the house and stay inside for 1 week.
- ☐ 2. attach sun shields to existing eyeglasses when in direct sunlight.
- ☐ 3. use sunglasses that wrap around the side of the face when in bright light.
- ☐ 4. patch the affected eye when in bright light.

3. The nurse is discharging a client who just had cataract removal and intraocular lens implantation. The nurse is confident the client understands discharge instructions when the client states (select all that apply):

- ☐ 1. "I understand the schedule for my eyedrops and will use the medications."
- ☐ 2. "I feel good and am ready to drive home now."
- ☐ 3. "I will call in the morning if I cannot see clearly."
- ☐ 4. "I will wear the eye shield at night to protect my eye."

- ☐ 5. "I will avoid lifting or pulling anything over 15 lb (6.8 kg)."
- ☐ 6. "I will call if I still have eye pain after taking acetaminophen."

4. A client is having a cataract removed and will use eyeglasses after the surgery. What information should the nurse include in the teaching plan? Select all that apply.

- ☐ 1. Images will appear one-third larger.
- ☐ 2. Look through the center of the glasses.
- ☐ 3. The changes will be immediate.
- ☐ 4. Use handrails when climbing stairs.
- ☐ 5. Stay out of the sun for 2 weeks.

5. The client has had a cataract removed. The nurse's discharge instructions should include telling the client to:

- ☐ 1. keep the head aligned straight.
- ☐ 2. utilize bright lights in the home.
- ☐ 3. use an eye shield at night.
- ☐ 4. change the eye patch as needed.

6. The client with a cataract tells the nurse about being afraid of being awake during eye surgery. Which response by the nurse would be the **most** appropriate?

- ☐ 1. "Have you ever had any reactions to local anesthetics in the past?"
- ☐ 2. "What is it that disturbs you about the idea of being awake?"
- ☐ 3. "By using a local anesthetic, you will not have nausea and vomiting after the surgery."
- ☐ 4. "There is really nothing to fear about being awake. You will be given a medication that will help you relax."

7. A client tells the nurse about the vision being blurred and hazy throughout the entire day. The nurse should recommend that the client:

- ☐ 1. purchase a pair of magnifying glasses.
- ☐ 2. wear glasses with tinted lenses.
- ☐ 3. schedule an appointment with an optician.
- ☐ 4. schedule an appointment with an ophthalmologist.

8. The nurse is to instill drops of phenylephrine hydrochloride into the client's eye prior to cataract surgery. Which is the expected outcome?

- ☐ 1. dilation of the pupil and blood vessels
- ☐ 2. dilation of the pupil and constriction of blood vessels
- ☐ 3. constriction of the pupil and constriction of blood vessels
- ☐ 4. constriction of the pupil and dilation of blood vessels

9. A short time after cataract surgery, the client has nausea. The nurse should **first**:

- ☐ 1. instruct the client to take a few deep breaths until the nausea subsides.
- ☐ 2. explain that this is a common feeling that will pass quickly.
- ☐ 3. tell the client to call the nurse promptly if vomiting occurs.
- ☐ 4. medicate the client with an antiemetic, as prescribed.

10. Which complications can occur following cataract surgery? Select all that apply.

- ☐ 1. acute bacterial endophthalmitis
- ☐ 2. retrobulbar hemorrhage
- ☐ 3. rupture of the posterior capsule
- ☐ 4. suprachoroidal hemorrhage
- ☐ 5. vision loss

11. The nurse is instructing the client about postoperative care following cataract removal. What position should the nurse teach the client to use?

- ☐ 1. Remain in a semi-Fowler's position.
- ☐ 2. Position the feet higher than the body.
- ☐ 3. Lie on the operative side.
- ☐ 4. Place the head in a dependent position.

12. After returning home, a client who has had cataract surgery will need to continue to instill eyedrops in the affected eye. The client is instructed to apply slight pressure against the nose at the inner canthus of the eye after instilling the eyedrops. The expected outcome of applying pressure is that the pressure:

- ☐ 1. prevents the medication from entering the tear duct.

- ☐ 2. prevents the drug from running down the client's face.
- ☐ 3. allows the sensitive cornea to adjust to the medication.
- ☐ 4. facilitates distribution of the medication over the eye surface.

13. To decrease intraocular pressure following cataract surgery, the nurse should instruct the client to avoid:

- ☐ 1. lying supine.
- ☐ 2. coughing.
- ☐ 3. deep breathing.
- ☐ 4. ambulation.

14. After cataract removal surgery, the client is instructed to report sharp pain in the operative eye because this could indicate which postoperative complication?

- ☐ 1. detached retina
- ☐ 2. prolapse of the iris
- ☐ 3. extracapsular erosion
- ☐ 4. intraocular hemorrhage

The Client with a Retinal Detachment

15. The client is diagnosed with a detached retina in the right eye. What should the nurse do **first**?

- ☐ 1. Apply compresses to the eye.
- ☐ 2. Instruct the client to lie prone.
- ☐ 3. Remove all bed pillows.
- ☐ 4. Promote measures that limit mobility.

16. A client with detachment of the retina is to patch both eyes. The expected outcome of patching is to:

- ☐ 1. reduce rapid eye movements.
- ☐ 2. decrease the irritation caused by light entering the damaged eye.
- ☐ 3. protect the injured eye from infection.
- ☐ 4. minimize eye strain on the uninvolved eye.

17. The client with retinal detachment in the right eye is extremely

apprehensive and tells the nurse, “I am afraid of going blind. It would be so hard to live that way.” What factor should the nurse consider before responding to this statement?

- ☐ 1. Repeat surgery is impossible, so if this procedure fails, vision loss is inevitable.
- ☐ 2. The surgery will only delay blindness in the right eye, but vision is preserved in the left eye.
- ☐ 3. More and more services are available to help newly blind people adapt to daily living.
- ☐ 4. Optimism is justified because surgical treatment has a 90% to 95% success rate.

18. Which statement would provide the **best** guide for activity during the rehabilitation period for a client who has been treated for retinal detachment?

- ☐ 1. Activity is resumed gradually; the client can resume usual activities in 5 to 6 weeks.
- ☐ 2. Activity level is determined by the client’s tolerance; clients can be as active as they wish.
- ☐ 3. Activity level will be restricted for several months; the client should plan on being sedentary.
- ☐ 4. Activity level can return to normal; clients can resume regular aerobic exercises.

19. Which goal is a **priority** for a client who has undergone surgery for retinal detachment?

- ☐ 1. Control pain.
- ☐ 2. Prevent an increase in intraocular pressure.
- ☐ 3. Cleanse the eye with soap and water.
- ☐ 4. Maintain a darkened environment.

The Client with Glaucoma

20. A client with glaucoma is to receive 3 gtt of acetazolamide in the left eye. What should the nurse do?

- ☐ 1. Ask the client to close the right eye while administering the drug in the

left eye.

- ☐ 2. Have the client look up while the nurse administers the eyedrops.
- ☐ 3. Have the client lift the eyebrows while the nurse positions the hand with the dropper on the client's forehead.
- ☐ 4. Wipe the eyes with a tissue following administration of the drops.

21. A client who has been treated for chronic open-angle glaucoma (COAG) for 5 years asks the nurse, "How does glaucoma damage my eyesight?" The nurse's reply should be based on the knowledge that COAG:

- ☐ 1. results from chronic eye inflammation.
- ☐ 2. causes increased intraocular pressure.
- ☐ 3. leads to detachment of the retina.
- ☐ 4. is caused by decreased blood flow to the retina.

22. The nurse should assess clients with chronic open-angle glaucoma (COAG) for:

- ☐ 1. eye pain.
- ☐ 2. excessive lacrimation.
- ☐ 3. colored light flashes.
- ☐ 4. decreasing peripheral vision.

23. What information should the nurse provide when preparing the client for tonometry?

- ☐ 1. Oral pain medication will be given before the procedure.
- ☐ 2. It is a painless procedure with no adverse effects.
- ☐ 3. Blurred or double vision may occur after the procedure.
- ☐ 4. Medication will be given to dilate the pupils before the procedure.

24. A client uses timolol maleate eyedrops. The expected outcome of this drug is to control glaucoma by:

- ☐ 1. constricting the pupils.
- ☐ 2. dilating the canals of Schlemm.
- ☐ 3. reducing aqueous humor formation.
- ☐ 4. improving the ability of the ciliary muscle to contract.

25. The nurse observes the client instill eyedrops. The client says, "I just

try to hit the middle of my eyeball so the drops do not run out of my eye.”
The nurse explains to the client that this method may cause:

- ☐ 1. scleral staining.
- ☐ 2. corneal injury.
- ☐ 3. excessive lacrimation.
- ☐ 4. systemic drug absorption.

26. Which clinical manifestation should the nurse assess when a client has acute angle-closure glaucoma?

- ☐ 1. gradual loss of central vision
- ☐ 2. acute light sensitivity
- ☐ 3. loss of color vision
- ☐ 4. sudden eye pain

27. A client has been diagnosed with an acute episode of angle-closure glaucoma. The nurse plans the client’s nursing care with the understanding that acute angle-closure glaucoma:

- ☐ 1. frequently resolves without treatment.
- ☐ 2. is typically treated with sustained bed rest.
- ☐ 3. is a medical emergency that can rapidly lead to blindness.
- ☐ 4. is most commonly treated with steroid therapy.

The Client with Adult Macular Degeneration

28. The nurse should assess an older adult with macular degeneration for:

- ☐ 1. loss of central vision.
- ☐ 2. loss of peripheral vision.
- ☐ 3. total blindness.
- ☐ 4. blurring of vision.

29. A client has a history of macular degeneration. While in the hospital, the **priority** nursing goal will be to:

- ☐ 1. provide education regarding community services for clients with adult macular degeneration (AMD).
- ☐ 2. provide health care related to monitoring the eye condition.

- ☐ 3. promote a safe, effective care environment.
- ☐ 4. improve vision.

30. Which measure should the nurse teach the client with adult macular degeneration (AMD) as a safety precaution?

- ☐ 1. Wear a patch over one eye.
- ☐ 2. Place personal items on the sighted side.
- ☐ 3. Lie in bed with the unaffected side toward the door.
- ☐ 4. Turn the head from side to side when walking.

31. The nurse is assessing a client with macular degeneration. Identify the illustration that **best** depicts what clients with this disorder typically see.

32. The nurse is assisting a client who has new-onset vision loss to transition to home from the hospital. The client can see shadow and light in the right eye only. When at home, the client is at **greatest** risk for:

- ☐ 1. loss of sensory perception.
- ☐ 2. injury from falls.
- ☐ 3. denial of changes in vision.

- ☐ 4. isolation from social activities.

The Client Undergoing Nasal Surgery

33. A young adult is admitted for elective nasal surgery for a deviated septum. Which sign would be an important indicator of bleeding even if the nasal drip pad remained dry and intact?

- ☐ 1. presence of nausea
- ☐ 2. repeated swallowing
- ☐ 3. rapid respiratory rate
- ☐ 4. feelings of anxiety

34. The client is ready for discharge after surgery for a deviated septum. Which instruction would be appropriate?

- ☐ 1. Avoid activities that elicit Valsalva's maneuver.
- ☐ 2. Take aspirin to control nasal discomfort.
- ☐ 3. Avoid brushing the teeth until the nasal packing is removed.
- ☐ 4. Apply heat to the nasal area to control swelling.

35. Which statement indicates that the client who has undergone repair of the nasal septum has understood the discharge instructions?

- ☐ 1. "I should not shower until my packing is removed."
- ☐ 2. "I will take stool softeners and modify my diet to prevent constipation."
- ☐ 3. "Coughing every 2 hours is important to prevent respiratory complications."
- ☐ 4. "It is important to blow my nose each day to remove the dried secretions."

The Client with a Hearing Disorder

36. To approach a deaf client, what should the nurse do **first**?

- ☐ 1. Knock on the room's door loudly.
- ☐ 2. Close and open the vertical blinds rapidly.
- ☐ 3. Talk while walking into the room.

- ☐ 4. Get the client's attention.

37. A 75-year-old client who has been taking furosemide regularly for 4 months tells the nurse about having trouble hearing. What should the nurse do?

- ☐ 1. Tell the client that at age 75 years, it is inevitable that there will be hearing loss.
- ☐ 2. Report the hearing loss to the healthcare provider (HCP).
- ☐ 3. Schedule the client for audiometric testing and a hearing aid.
- ☐ 4. Tell the client that the hearing loss is only temporary; when the body adjusts to the furosemide, hearing will improve.

38. The nurse is providing preoperative instructions to a client who is deaf. Which strategy is **most** effective in assuring that the client understands the information?

- ☐ 1. Stand in front of the client, and slowly explain the instructions.
- ☐ 2. Provide instructions to the spouse, and have the spouse explain them to the client.
- ☐ 3. Give the client written material to read, and follow up with time for questions.
- ☐ 4. Show the client a DVD with instructions.

39. A client who is prescribed by the healthcare provider (HCP) to take aspirin daily in order to prevent thrombus formation reports having ringing in the ears. The nurse advises the client to take which measure?

- ☐ 1. Increase fluid intake.
- ☐ 2. Stop taking the aspirin.
- ☐ 3. Use acetaminophen instead.
- ☐ 4. Contact the HCP.

40. The son of an older adult reports that his father just “stares off into space” more and more in the last several months but then eagerly smiles and nods once the son can get his attention. The nurse should assess the client further for:

- ☐ 1. dementia.
- ☐ 2. hearing loss.

- ☐ 3. anger.
- ☐ 4. depression.

41. The nurse has been assigned to a client who is hearing impaired and reads speech. Which strategies should the nurse incorporate when communicating with the client? Select all that apply.

- ☐ 1. Avoid being silhouetted against strong light.
- ☐ 2. Do not block out the person's view of the speaker's mouth.
- ☐ 3. Face the client when talking.
- ☐ 4. Have bright light behind so the individual can see.
- ☐ 5. Ensure the client is familiar with the subject material before discussing.
- ☐ 6. Talk to the client while doing other nursing procedures.

42. Eardrops have been prescribed to be instilled in the adult client's left ear to soften cerumen. To position the client, what should the nurse do?

- ☐ 1. Have the client lie on the left side.
- ☐ 2. Pull the auricle lobe up and back.
- ☐ 3. Pull the ear lobe down and back.
- ☐ 4. Chill the eardrops prior to administering.

43. Sensorineural hearing loss results from which condition?

- ☐ 1. presence of fluid and cerumen in the external canal
- ☐ 2. sclerosis of the bones of the middle ear
- ☐ 3. damage to the cochlear or vestibulocochlear nerve
- ☐ 4. emotional disturbance resulting in a functional hearing loss

44. What should the nurse instruct a client who has cerumen buildup in the ear to do? Select all that apply.

- ☐ 1. Wash the external ear with a washcloth.
- ☐ 2. Instill cerumenolytic drops in the ear canal.
- ☐ 3. Use cotton-tipped applicators to remove the wax from the ear canal.
- ☐ 4. Use small forceps to extract the wax.
- ☐ 5. Irrigate the ear with sterile water after softening the wax with a cerumenolytic solution.

45. A client is about to have a tympanoplasty and asks the nurse what the

surgical procedure involves. The nurse begins the conversation by:

- ☐ 1. assessing the client's understanding of what the healthcare provider (HCP) has explained.
- ☐ 2. describing the surgical procedure.
- ☐ 3. educating the client that the procedure will close the perforation and prevent recurrent infection.
- ☐ 4. informing the client that the procedure will improve hearing.

46. An older adult takes two 81-mg aspirin tablets daily to prevent a heart attack. The client reports having a constant “ringing” in both ears. How should the nurse respond to the client's comment?

- ☐ 1. Tell the client that “ringing” in the ears is associated with the aging process.
- ☐ 2. Refer the client to have a Weber test.
- ☐ 3. Schedule the client for audiometric testing.
- ☐ 4. Explain to the client that the “ringing” may be related to the aspirin.

The Client with Ménière's Disease

47. An older adult has vertigo accompanied with tinnitus as the result of Ménière's disease. The nurse should instruct the client to restrict which dietary element?

- ☐ 1. protein
- ☐ 2. potassium
- ☐ 3. fluids
- ☐ 4. sodium

48. A client has vertigo. Which goal would be **most** appropriate to prevent injury related to altered immobility and gait disturbances? Select all that apply.

- ☐ 1. The client assumes a safe position when dizzy.
- ☐ 2. The client experiences no falls.
- ☐ 3. The client performs vestibular/balance exercises.
- ☐ 4. The client demonstrates family involvement.
- ☐ 5. The client keeps the head still when dizzy.

49. The client with Ménière's disease is instructed to modify the diet. The nurse should explain that the **most** frequently recommended diet modification for Ménière's disease is:

- ☐ 1. low sodium.
- ☐ 2. high protein.
- ☐ 3. low carbohydrate.
- ☐ 4. low fat.

50. Which statement indicates the client understands the expected course of Ménière's disease?

- ☐ 1. "The disease process will gradually extend to the eyes."
- ☐ 2. "Control of the episodes is usually possible, but a cure is not yet available."
- ☐ 3. "Continued medication therapy will cure the disease."
- ☐ 4. "Bilateral deafness is an inevitable outcome of the disease."

51. The risk for injury during an attack of Ménière's disease is high. The nurse should instruct the client to take which immediate action when experiencing vertigo?

- ☐ 1. "Place your head between your knees."
- ☐ 2. "Concentrate on rhythmic deep breathing."
- ☐ 3. "Close your eyes tightly."
- ☐ 4. "Assume a reclining or flat position."

The Client with Cancer of the Larynx

52. Following a laryngectomy, the nurse notices that the client has saliva collecting beneath the skin flaps. This finding is indicative of:

- ☐ 1. skin necrosis.
- ☐ 2. carotid artery rupture.
- ☐ 3. stomal stenosis.
- ☐ 4. development of a fistula.

53. The nurse is developing a care plan with a client who had a laryngectomy 3 days ago. To assure adequate nutrition, what should the nurse

instruct the client to do? Select all that apply.

- ☐ 1. Weigh weekly and report weight loss.
- ☐ 2. When eating, sit and lean slightly forward.
- ☐ 3. Have serum albumin level checked regularly.
- ☐ 4. Administer enteral tube feedings as prescribed.
- ☐ 5. Manipulate the nasogastric tube daily.

54. The client with a laryngectomy is being discharged. The nurse should determine that the client understands to do which self-care measures? Select all that apply.

- ☐ 1. Provide humidification in the home.
- ☐ 2. Use a protective shield over the stoma for bathing.
- ☐ 3. Consume a liberal intake of fluids (2 to 3 L/day).
- ☐ 4. Limit spicy seasonings on food.
- ☐ 5. Follow a low-fiber diet.

55. After a total laryngectomy, the client has a feeding tube. The feeding tube is effective if the tube feedings:

- ☐ 1. meet the fluid and nutritional needs of the client.
- ☐ 2. prevent aspiration.
- ☐ 3. prevent fistula formation.
- ☐ 4. maintain an open airway.

56. Complications associated with having a tracheostomy tube include:

- ☐ 1. decreased cardiac output.
- ☐ 2. damage to the laryngeal nerve.
- ☐ 3. pneumothorax.
- ☐ 4. acute respiratory distress syndrome (ARDS).

57. A **priority** goal for the hospitalized client who 2 days earlier had a total laryngectomy with creation of a new tracheostomy is to:

- ☐ 1. decrease secretions.
- ☐ 2. learn to care for the tracheostomy.
- ☐ 3. relieve anxiety related to the tracheostomy.
- ☐ 4. maintain a patent airway.

Managing Care, Quality, and Safety of Clients with Health Problems of the Eyes, Ears, Nose, and Throat

58. The client with glaucoma is scheduled for a hip replacement. Which prescription would require clarification before the nurse carries it out?

- ☐ 1. Administer morphine sulfate.
- ☐ 2. Administer atropine sulfate.
- ☐ 3. Teach deep-breathing exercises.
- ☐ 4. Teach leg lifts and muscle-setting exercises.

59. To ensure safety for a hospitalized blind client, the nurse should:

- ☐ 1. require that the client has a sitter for each shift.
- ☐ 2. request that the client stays in bed until the nurse can assist.
- ☐ 3. orient the client to the room environment.
- ☐ 4. keep the side rails up when the client is alone.

60. The nurse is taking care of a client who had a laryngectomy yesterday. To assure client safety, the nurse should give “hand-off reports” at which times? Select all that apply.

- ☐ 1. change of shift
- ☐ 2. change of nurses
- ☐ 3. when the nurse goes to lunch
- ☐ 4. when the unit clerk goes to a staff meeting
- ☐ 5. when new medication prescriptions are written

61. The nurse is admitting a client with glaucoma. The client brings prescribed eyedrops from home and insists on using them in the hospital. The nurse should:

- ☐ 1. allow the client to keep the eyedrops at the bedside and use as prescribed on the bottle.
- ☐ 2. place the eyedrops in the hospital medication drawer and administer as labeled on the bottle.
- ☐ 3. explain to the client that the healthcare provider (HCP) will write a prescription for the eyedrops to be used at the hospital.
- ☐ 4. ask the client’s wife to assist the client in administering the eyedrops

while the client is in the hospital.

62. The nurse is assigned to care for a client with an ocular prosthesis who is having surgery under a local anesthetic. Prior to surgery, the nurse should:

- ☐ 1. maintain surgical asepsis when caring for the prosthesis.
- ☐ 2. leave the prosthesis in place.
- ☐ 3. cleanse the ocular prosthesis with full-strength hydrogen peroxide.
- ☐ 4. instruct the client to cleanse the prosthesis daily.

Answers, Rationales, and Test-Taking Strategies

The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in Part 1 of this book.

The Client with Cataracts

1. 3. The spouse has positioned the dropper and the client correctly to prevent injury to the client's eye. The spouse should administer the drops in the center of the lower lid. Following administration of the eyedrops, the client should blink the eyes to distribute the medication; squeezing or rubbing the eyes might cause the medication to drip out of the eye.

 CN: Safety and infection control; CL: Apply

2. 3. To prevent discomfort from bright light, the client should wear sunglasses that cover the front and side of the face, thus minimizing light that comes into the eye from any direction. It is not necessary to remain in dim light or inside. Attaching sun shields or sunglasses to existing glasses will not cover the eye sufficiently, and bright light will come in on the side of the face. It is not necessary to patch the affected eye.

CN: Basic care and comfort; CL: Synthesize

3. 1,4,5,6. To promote success of lens implant without complication (infection, inflammation, hemorrhage), it is important for the client to instill eyedrops as prescribed, protect the eye, and avoid placing any stress on the eye by lifting, pulling, or pushing objects that weigh more than 15 lb. Pain should be minimal and relieved with acetaminophen; if not, the client should notify the **healthcare provider (HCP)** . Clients should not expect to drive or see clearly immediately following lens implant; it may take several days for vision to clear, and limitations will be discussed at the follow-up appointment.

CN: Reduction of risk potential; CL: Evaluate

4. 1,2,4. The use of glasses following cataract surgery does not totally restore binocular vision. Glasses will cause images to appear larger, and peripheral vision will be distorted; the client should look through the center of the glasses and turn his or her head to view objects in the periphery. The client should also use caution when walking or climbing stairs until he or she has adjusted to the change in vision. Changes in vision following cataract surgery are not immediate, and the nurse can instruct the client to be patient while adjusting to the changes. The client does not need to stay out of the sun but should wear dark glasses to prevent discomfort from photophobia.

CN: Physiological adaptation; CL: Create

5. 3. Using an eye shield at night prevents rubbing the eye. The head should be turned to the side to scan the entire visual field to compensate for impaired peripheral vision. Eye medications may initially cause sensitivity to bright light. The surgeon changes the eye patch on the second postoperative day.

CN: Reduction of risk potential; CL: Synthesize

6. 2. The nurse should give a client who seems fearful of surgery an opportunity to express his or her feelings. Only after identifying the client's concerns can the nurse intervene appropriately. Asking the client about previous reactions to local anesthetics may be warranted, but it does not address the client's concerns in this instance. Telling the client that he or she

will not have nausea or vomiting ignores the client's feelings of fear and does not provide any data about the client's feelings. More data would help the nurse plan care. Telling the client that there is nothing to be afraid of minimizes the client's feelings and does not address his or her concerns. Premature explanations and clichés do not provide the needed assessment data and ignore the client's feelings.

CN: Psychosocial integrity; CL: Synthesize

7. 4. An ophthalmologist is a **healthcare provider (HCP)**  who specializes in the treatment of disorders of the eye, and the nurse should advise the client to see an ophthalmologist. An optician makes glasses, and it is not known at this point what the best treatment for the client is. Magnifying glasses, or glasses with tinted lenses, do not correct hazy or blurred vision. If glasses are needed to correct refractive errors, they should be prescription glasses.

CN: Health promotion and maintenance; CL: Synthesize

8. 2. Instilled in the eye, phenylephrine hydrochloride acts as a mydriatic, causing the pupil to dilate. It also constricts small blood vessels in the eye.

CN: Pharmacological and parenteral therapies; CL: Evaluate

9. 4. A prescribed antiemetic should be administered as soon as the client has nausea following a cataract extraction. Vomiting can increase intraocular pressure, which should be avoided after eye surgery because it can cause complications. Deep breathing is unlikely to relieve nausea. Postoperative nausea may be common; however, it does not necessarily pass quickly and can lead to vomiting. Telling the client to call only if vomiting occurs ignores the client's need for comfort and intervention to prevent complications.

CN: Pharmacological and parenteral therapies; CL: Synthesize

10. 1,5. Acute bacterial endophthalmitis can occur in about 1 out of 1,000 cases. Organisms that are typically involved include Staphylococcus epidermidis, Staphylococcus aureus, and Pseudomonas and Proteus species. Vision loss is one result of acute bacterial infection. In addition, vision loss can be the result of malposition of the intraocular lens implant or opacification of the posterior capsule. Retrobulbar hemorrhage is a

complication that may occur right before surgery and is a result of retrobulbar infiltration of anesthetic agents. Rupture of the posterior capsule and suprachoroidal hemorrhage are both complications that can result during - surgery.

CN: Physiological adaptation; CL: Analyze

11. 1. The nurse should instruct the client to remain in a semi-Fowler's position or on the nonoperative side. Positioning the feet higher than the body does not affect the operative eye; placing the head in a dependent position could increase pressure within the eyes.

CN: Reduction of risk potential; CL: Synthesize

12. 1. Applying pressure against the nose at the inner canthus of the closed eye after administering eyedrops prevents the medication from entering the lacrimal (tear) duct. If the medication enters the tear duct, it can enter the nose and pharynx, where it may be absorbed and cause toxic symptoms. Eyedrops should be placed in the eye's lower conjunctival sac. Applying pressure will not prevent the drug from running down the face as long as the drops are instilled in the eye. Pressure does not affect the cornea or facilitate distribution of the medication over the eye surface.

CN: Pharmacological and parenteral therapies; CL: Apply

13. 2. Coughing is contraindicated after cataract extraction because it increases intraocular pressure. Other activities that are contraindicated because they increase intraocular pressure include turning to the operative side, sneezing, crying, and straining. Lying supine, ambulating, and deep breathing do not affect intraocular pressure.

CN: Physiological adaptation; CL: Synthesize

14. 4. Sudden, sharp pain after eye surgery should suggest to the nurse that the client may be experiencing intraocular hemorrhage. The **healthcare provider (HCP)**  should be notified promptly. Detached retina and prolapse of the iris are usually painless. Extracapsular erosion is not characterized by sharp pain.

CN: Physiological adaptation; CL: Analyze

The Client with a Retinal Detachment

15. 4. Promoting measures that limit mobility may prevent further injury. Following surgical repair of a detached retina, cool or warm compresses are applied to edematous eyelids, if prescribed. The client should avoid lying face down, stooping, or bending preoperatively. It is not necessary to remove all pillows.

CN: Physiological adaptation; CL: Synthesize

16. 1. Patching the eyes helps decrease random eye movements that could enlarge and worsen retinal detachment. Although clients with eye injuries frequently are light sensitive, and preventing infection is important, the specific goal is to reduce rapid eye movements. Using the uninvolved eye would not cause eye strain, but random movements of one eye will involve the other eye.

CN: Physiological adaptation; CL: Evaluate

17. 4. Untreated retinal detachment results in increasing detachment and eventual blindness, but 90% to 95% of clients can be successfully treated with surgery. If necessary, the surgical procedure can be repeated about 10 to 14 days after the first procedure. Many more services are available for newly blind people, but ideally this client will not need them. Surgery does not delay blindness.

CN: Physiological adaptation; CL: Synthesize

18. 1. The scarring of the retinal tear needs time to heal completely. Therefore, resumption of activity should be gradual; the client may resume usual activities in 5 to 6 weeks. Successful healing should allow the client to return to a previous level of functioning.

CN: Basic care and comfort; CL: Synthesize

19. 2. After surgery to correct a detached retina, prevention of increased intraocular pressure is the priority goal. Control of pain with analgesics is a secondary goal. The client should avoid getting soap and water in the eye when bathing. Maintaining a darkened environment is not necessary for this client.

 CN: Physiological adaptation; CL: Synthesize

The Client with Glaucoma

20. 2. The client should look up while the nurse instills the eyedrops. The client will need to keep both eyes open while the nurse administers the drug. If the client raises the eyebrows while the nurse's hand is positioned on the eyebrows, the movement of the forehead may cause the dropper to move and injure the eye. The client should gently blink the eyes after the eyedrops have been instilled. Using a tissue to wipe the eyes could remove some of the medication; excess fluid can be removed with a cotton ball.

 CN: Pharmacological and parenteral therapies; CL: Apply

21. 2. In COAG, there is an obstruction to the outflow of aqueous humor, leading to increased intraocular pressure. The increased intraocular pressure eventually causes destruction of the retina's nerve fibers. This nerve destruction causes painless vision loss. The exact cause of glaucoma is unknown. Glaucoma does not lead to retinal detachment.

 CN: Physiological adaptation; CL: Analyze

22. 4. Although COAG is usually asymptomatic in the early stages, peripheral vision gradually decreases as the disorder progresses. Eye pain is not a feature of COAG but is common in clients with angle-closure glaucoma. Excessive lacrimation is not a symptom of COAG; it may indicate a blocked tear duct. Flashes of light are a common symptom of retinal detachment.

 CN: Physiological adaptation; CL: Analyze

23. 2. Tonometry, which measures intraocular pressure, is a simple, noninvasive, and painless procedure that requires no particular preparation or postprocedure care and carries no adverse effects. It is not necessary to dilate the pupils for tonometry.

 CN: Reduction of risk potential; CL: Synthesize

24. 3. Timolol maleate is commonly administered to control glaucoma. The drug's action is not completely understood, but it is believed to reduce

aqueous humor formation, thereby reducing intraocular pressure. Timolol does not constrict the pupils; miotics are used for pupillary constriction and contraction of the ciliary muscle. Timolol does not dilate the canal of Schlemm.

CN: Pharmacological and parenteral therapies; CL: Evaluate

25. 2. The cornea is sensitive and can be injured by eyedrops falling onto it. Therefore, eyedrops should be instilled into the lower conjunctival sac of the eye to avoid the risk of corneal damage. The drops do not cause scleral staining or excessive lacrimation. Systemic absorption occurs when eyedrops enter the tear ducts.

CN: Pharmacological and parenteral therapies; CL: Evaluate

26. 4. Acute angle-closure glaucoma produces abrupt changes in the angle of the iris. Clinical manifestations include severe eye pain, colored halos around lights, and rapid vision loss. Gradual loss of central vision is associated with macular degeneration. The loss of color vision, or achromatopsia, is a rare symptom that occurs when a stroke damages the fusiform gyrus. It most often affects only half of the visual field.

CN: Physiological adaptation; CL: Analyze

27. 3. Acute angle-closure glaucoma is a medical emergency that rapidly leads to blindness if left untreated. Treatment typically involves miotic drugs and surgery, usually iridectomy or laser therapy. Both procedures create a hole in the periphery of the iris, which allows the aqueous humor to flow into the anterior chamber. Bed rest does not affect the progression of acute angle-closure glaucoma. Steroids are not a treatment for acute angle-closure glaucoma; in fact, they are associated with the development of glaucoma.

CN: Physiological adaptation; CL: Apply

The Client with Adult Macular Degeneration

28. 1. Macular degeneration generally involves loss of central vision. Gradual blurring of vision can occur as the disease progresses and may result in blindness; however, loss of central vision is the most common finding. Tiny yellowish spots, known as drusen, develop beneath the retina. Loss of

peripheral vision is characteristic of glaucoma.

CN: Physiological adaptation; CL: Analyze

29. 3. AMD generally affects central vision. Confusion may result related to the changes in the environment and the inability to see the environment clearly. Therefore, providing safety is the priority goal in the care of this client. Educating him regarding community resources or monitoring his AMD may have been done at an earlier date or can be done after assessing his knowledge base and experience with the disease process. Improving his vision may not be possible.

CN: Safety and infection control; CL: Synthesize

30. 4. To expand the visual field, the partially sighted client should be taught to turn the head from side to side when walking. Neglecting to do so may result in accidents. This technique helps maximize the use of remaining sight. A patch does not address the problem of hemianopsia. Appropriate client positioning and placement of personal items will increase the client's ability to cope with the problem but will not affect safety.

CN: Safety and infection control; CL: Synthesize

31. In macular degeneration, the center vision is blackened out, and only the outer visual fields are clear.

 CN: Physiological adaptation; CL: Analyze

32. 2. Because of the client's recent vision loss, the client is at high risk for injury. Sensory alterations often affect other areas of functional ability, including leaving clients with sensory deficits at risk for injuries as a result. Disturbed sensory perception, denial and difficulty adjusting to the vision loss, and social isolation may also be of concern and may accompany changes in sensory function, but they are not of higher priority than risk for injury.

 CN: Management of care; CL: Analyze

The Client Undergoing Nasal Surgery

33. 2. Because of the dense packing, it is relatively unusual for bleeding to be apparent through the nasal drip pad. Instead, the blood runs down the throat, causing the client to swallow frequently. The back of the throat can be assessed with a flashlight. An accumulation of blood in the stomach may cause nausea and vomiting but is not an initial sign of bleeding. Increased respiratory rate occurs in shock and is not an early sign of bleeding in the

client after nasal surgery. Feelings of anxiety are not indicative of nasal bleeding.

CN: Physiological adaptation; CL: Synthesize

34. 1. The client should be instructed to avoid any activities that cause Valsalva's maneuver (e.g., straining at stool, vigorous coughing, exercise) to reduce stress on suture lines and bleeding. The client should not take aspirin because of its antiplatelet properties, which may cause bleeding. Oral hygiene is important to rid the mouth of old dried blood and to enhance the client's appetite. Cool compresses, not heat, should be applied to decrease swelling and control discoloration of the area.

CN: Reduction of risk potential; CL: Synthesize

35. 2. Constipation can cause straining during defecation, which can induce bleeding. Showering is not contraindicated. The client should take measures to prevent coughing. The client should avoid blowing the nose for 48 hours after the packing is removed. Thereafter, the client should blow the nose gently using the open-mouth technique to minimize bleeding in the surgical area.

CN: Physiological adaptation; CL: Evaluate

The Client with a Hearing Disorder

36. 4. The nurse should avoid startling the client who is deaf and should obtain the attention of the client before speaking. The client who is deaf cannot hear knocking on the door or talking. Opening the blinds is not a helpful way to get the client's attention.

CN: Psychosocial integrity; CL: Synthesize

37. 2. Furosemide may cause ototoxicity. The nurse should tell the client to promptly report the hearing loss, dizziness, or tinnitus to help prevent permanent ear damage. Hearing loss is not inevitable, and it is inappropriate to make assumptions about the cause of symptoms without a thorough evaluation. The client's system will not "adjust," and hearing loss will not resolve.

CN: Pharmacological and parenteral therapies; CL: Synthesize

38. 3. A client who is deaf benefits most from reading information and then having an opportunity to ask questions and follow up. Verbal communication, while appropriate, may not be sufficient. The spouse can be included in the teaching, but the nurse is responsible for ensuring that the client understands the instructions. DVDs may be helpful, but unless they have closed captioning, key points may be missed in the audio portion.

CN: Physiological adaptation; CL: Synthesize

39. 4. Because aspirin is ototoxic, the ringing in the ears is likely caused by long-term aspirin use. The nurse advises the client to contact the **HCP** ; if the aspirin is to be discontinued, other drugs may be ordered. The client is not instructed to stop taking the drug without discussing the change with the HCP. Acetaminophen does not have the same antithrombotic properties as does aspirin. Increasing fluid intake will not stop the ringing in the ears.

CN: Physiological adaptation; CL: Synthesize

40. 2. Blank looks, decreased attention span, positioning of the head toward sound, and smiling/nodding in agreement once attention is gained are all behaviors that indicate hearing loss in adults. It is common to confuse sensory deficits for a change in cognitive status. The nurse should focus assessments of sensory function on considering any pathophysiology of existing or new-onset deficits and consider all client factors that might contribute to deficits. The blank looks do not indicate that this client is angry with his son.

CN: Basic care and comfort; CL: Analyze

41. 1,2,3,5. When working with a client who is hearing impaired and reads speech, the presenter must face the person directly and devote full attention to the communication process. In addition, it will be useful for the client that the speaker not be too silhouetted against strong light, that the speaker's mouth not be blocked from the client's view, and that there are no objects in the mouth of the speaker. Finally, it is recommended that the presenter provide the client with the needed information to study before reviewing. This will provide the client with the ability to use contextual clues in speech reading.

CN: Basic care and comfort; CL: Synthesize

42. 2. The nurse should have the client lie on the side opposite the affected ear. To straighten the client's ear canal, pull the auricle of the ear up and back for an adult. For an infant or a young child, gently pull the auricle down and back to the nasopharynx. The eardrops should be administered at body temperature.

CN: Pharmacological and parenteral therapies; CL: Apply

43. 3. A sensorineural hearing loss results from damage to the cochlear or vestibulocochlear nerve. Presence of fluid and cerumen in the external canal or sclerosis of the bones of the middle ear results in a conductive hearing loss. Hearing loss resulting from an emotional disturbance is called a psychogenic hearing loss.

CN: Physiological adaptation; CL: Apply

44. 1,2,5. The nurse can advise the client with cerumen that is impacted in the ear to use a washcloth to clean the exterior part of the ear. The client can also instill cerumenolytic drops to soften the earwax. The client can then irrigate the ear canal with sterile water using a small bulb syringe. The client should not use cotton-tipped applicators as they often push the cerumen further into the ear canal. The client should never put forceps in the ear.

CN: Pharmacological and parenteral therapies; CL: Synthesize

45. 1. The nurse should first assess the client's knowledge base. Working within the framework of the client's knowledge and educational level, the nurse then can describe the procedure and its benefits.

CN: Reduction of risk potential; CL: Synthesize

46. 4. Tinnitus (ringing in the ears) is an adverse effect of aspirin. Aspirin contains salicylate, which is an ototoxic drug that can induce reversible hearing loss and tinnitus. The nurse should explain this to the client and then encourage the client to inform the **healthcare provider (HCP)**  of the symptom. Tinnitus is not a function of aging. The Weber test and audiometric testing are useful for determining hearing loss but are not necessarily helpful in the management or diagnosis of drug-induced tinnitus.

CN: Pharmacological and parenteral therapies; CL: Synthesize

The Client with Ménière's Disease

47. 4. Ménière's disease is commonly seen in older women; the disorder is caused by pressure within the labyrinth of the inner ear as a result of excess endolymph resulting in swelling in the cochlea. Therefore, the nurse should instruct the client about dietary restrictions of sodium to reduce fluid retention. Pharmacologic treatment includes antvertiginous drugs and diuretics. If the client is prescribed a diuretic, the fluid and electrolytes are monitored. The amount of protein does not have a direct influence in this disease process.

CN: Physiological adaptation; CL: Synthesize

48. 1,2,3,5. Assessment of vertigo, including history, onset, description of attacks, duration, frequency, and associated ear symptoms, is important. Vestibular/balance therapy or exercises should be taught and practiced. The client needs to be instructed to sit down when dizzy and decrease the amount of head movement. The client will benefit from recognizing whether he or she experiences an “aura” before an attack so appropriate action can be taken. Finally, it is recommended that the client keep the eyes open and look straight ahead when lying down. These expected outcomes will prevent the problem of injury. Family involvement is essential when dealing with a client experiencing vertigo but is not essential for this client who must manage the vertigo with or without family involvement.

CN: Reduction of risk potential; CL: Synthesize

49. 1. A low-sodium diet is frequently an effective mechanism for reducing the frequency and severity of the disease episodes. About three-quarters of clients with Ménière's disease respond to treatment with a low-salt diet. A diuretic may also be prescribed. Other dietary changes, such as high protein, low carbohydrate, and low fat, do not have an effect on Ménière's disease.

CN: Basic care and comfort; CL: Apply

50. 2. There is no cure for Ménière's disease, but the wide range of medical and surgical treatments allows for adequate control in many clients. The disease often worsens, but it does not spread to the eyes. The hearing

loss is usually unilateral.

CN: Physiological adaptation; CL: Evaluate

51. 4. The client needs to assume a safe and comfortable position during an attack, which may last several hours. The client's location when the attack occurs may dictate the most reasonable position. Ideally, the client should lie down immediately in a reclining or flat position to control the vertigo. The danger of a serious fall is real. Placing the head between the knees will not help prevent a fall and is not practical because the attack may last several hours. Concentrating on breathing may be a useful distraction, but it will not help prevent a fall. Closing the eyes does not help prevent a fall.

CN: Safety and infection control; CL: Synthesize

The Client with Cancer of the Larynx

52. 4. A salivary fistula is suspected when there is saliva collecting beneath skin flaps or leaking through the suture line or drain site. Salivary fistula or skin necrosis usually precedes carotid artery rupture. Stomal stenosis may be present when there are suprasternal and intercostal retractions and difficult breathing.

CN: Physiological adaptation; CL: Analyze

53. 1,2,3,4. The nurse should monitor nutritional status through frequent weighing and checking the serum albumin level. The nurse also should administer enteral tube feedings until there is sufficient healing of pharynx and the client can consume sufficient oral feedings to meet body needs. The nurse should avoid manipulation of the nasogastric tube during this time so it does not disrupt the suture line. The nurse should place the client in a sitting position, leaning slightly forward, which allows the larynx to move forward and the hypopharynx to partially open; the epiglottis normally prevents fluid and food from entering the larynx during swallowing.

CN: Physiological adaptation; CL: Create

54. 1,2,3. The nurse should advise the client to provide humidification at home. Instruct the client to use a protective shield for bathing, showering, or shampooing or cutting hair to prevent aspiration. The nurse can also

encourage the client to obtain a fluid intake of 2 to 3 L daily to help liquefy secretions. To counteract any loss of smell and impairment of taste sensation, the client can add additional seasoning to food. The client should follow a high-fiber diet and use stool softeners because the client may not be able to hold the breath and bear down for bowel movements.

CN: Health promotion and maintenance; CL: Evaluate

55. 1. The goal of postoperative care is to maintain physiologic integrity. Therefore, inserting a feeding tube is a strategy to ensure the fluid and nutritional needs of the client as the surgical site is healing. The feeding tube does help prevent aspiration by preventing ingested fluid from leaking through the wound into the trachea before healing occurs; however, the primary rationale is to meet the client's nutritional and fluid needs. A tracheoesophageal fistula is a rare complication of total laryngectomy and may occur if radiation therapy has compromised wound healing. A feeding tube does not help maintain an open airway.

CN: Reduction of risk potential; CL: Evaluate

56. 2. Tracheostomy tubes carry several potential complications, including laryngeal nerve damage, bleeding, and infection. Tracheostomy tubes alone do not affect cardiac output or cause acute respiratory distress. The tube is inserted in the trachea, not the lung, so there is no risk of pneumothorax.

CN: Physiological adaptation; CL: Apply

57. 4. The main goal for a client with a new tracheostomy is to maintain a patent airway. A fresh tracheostomy frequently causes bleeding and excess secretions, and clients may require frequent suctioning to maintain patency. Decreasing secretions may be a component of a client's care after laryngectomy and tracheostomy, and relieving anxiety is always an important goal; however, the primary goal is to maintain a patent airway. Instruction in care of a tracheostomy is a priority later in the client's recovery.

CN: Physiological adaptation; CL: Synthesize

Managing Care, Quality, and Safety of Clients with Health Problems of the Eyes, Ears, Nose, and Throat

58. 2. Atropine sulfate causes pupil dilation. This action is contraindicated for the client with glaucoma because it increases intraocular pressure. The drug does not have this effect on intraocular pressure in people who do not have glaucoma. Morphine causes pupil constriction. Deep-breathing exercises will not affect glaucoma. The client should resume taking all medications for glaucoma immediately after surgery.

CN: Pharmacological and parenteral therapies; CL: Synthesize

59. 3. The priority goal of care for a client who is blind is safety and preventing injury. The initial action is to orient the client to a new environment. Taking time to identify the objects and where they are located in the room can achieve this goal. It is unrealistic to have someone stay with the client at all times or for the client to stay in bed until the nurse can assist. Using side rails creates unnecessary barriers and may be a safety hazard.

CN: Safety and infection control; CL: Synthesize

60. 1,2,3. Effective communication is essential when managing client safety and preventing errors. “Hand-off reports” should be made at shift change, when there is a change of nurses or when the nurse leaves the unit, and when the client is discharged or transfers to another unit. There does not need to be a hand-off report when the unit clerk leaves the unit or when new medication prescriptions are written.

CN: Safety and infection control; CL: Apply

61. 3. In order to prevent medication errors, clients may not use medications they bring from home; the **HCP**  will prescribe the eyedrops as required. It is not safe to place the eyedrops in the client’s medication box or to permit the client to use them at the bedside. The nurse should ask the wife to take the eyedrops home.

CN: Safety and infection control; CL: Synthesize

62. 2. The nurse should maintain medical asepsis to care for an ocular prosthesis. Because the client will have a local anesthetic, the nurse should leave the prosthesis in place. Daily removal and cleansing is not necessary and may be irritating to the socket; removal for cleansing once or twice a month is sufficient. The nurse should never use anything stronger than liquid

soap and water to cleanse an ocular prosthesis.

CN: Reduction of risk potential; CL: Apply

The Client with Health Problems of the Integumentary System

- The Client with Burns
- The Older Adult with General Problems of the Integumentary System
- The Client with Shingles
- The Client with a Pressure Ulcer
- The Client with Skin Cancer
- Managing Care, Quality, and Safety of Clients with Health Problems of the Integumentary System
- Answers, Rationales, and Test-Taking Strategies

The Client with Burns

1. There has been a fire in an apartment building. All residents have been evacuated, but many are burned. Which clients should be transported to a burn center for treatment? Select all that apply.

- ☐ **1.** an 8-year-old with third-degree burns over 10% of the body surface area (BSA)
- ☐ **2.** a 20-year-old who inhaled the smoke of the fire
- ☐ **3.** a 50-year-old diabetic with first- and second-degree burns on the left forearm (about 5% of the body surface area [BSA])
- ☐ **4.** a 30-year-old with second-degree burns on the back of the left leg (about 9% of body surface area [BSA])
- ☐ **5.** a 40-year-old with second-degree burns on the right arm (about 10% of BSA)

2. The nurse is assessing an 80-year-old client who has scald burns on the

hands and both forearms (first- and second-degree burns on 10% of the body surface area). What should the nurse do **first**?

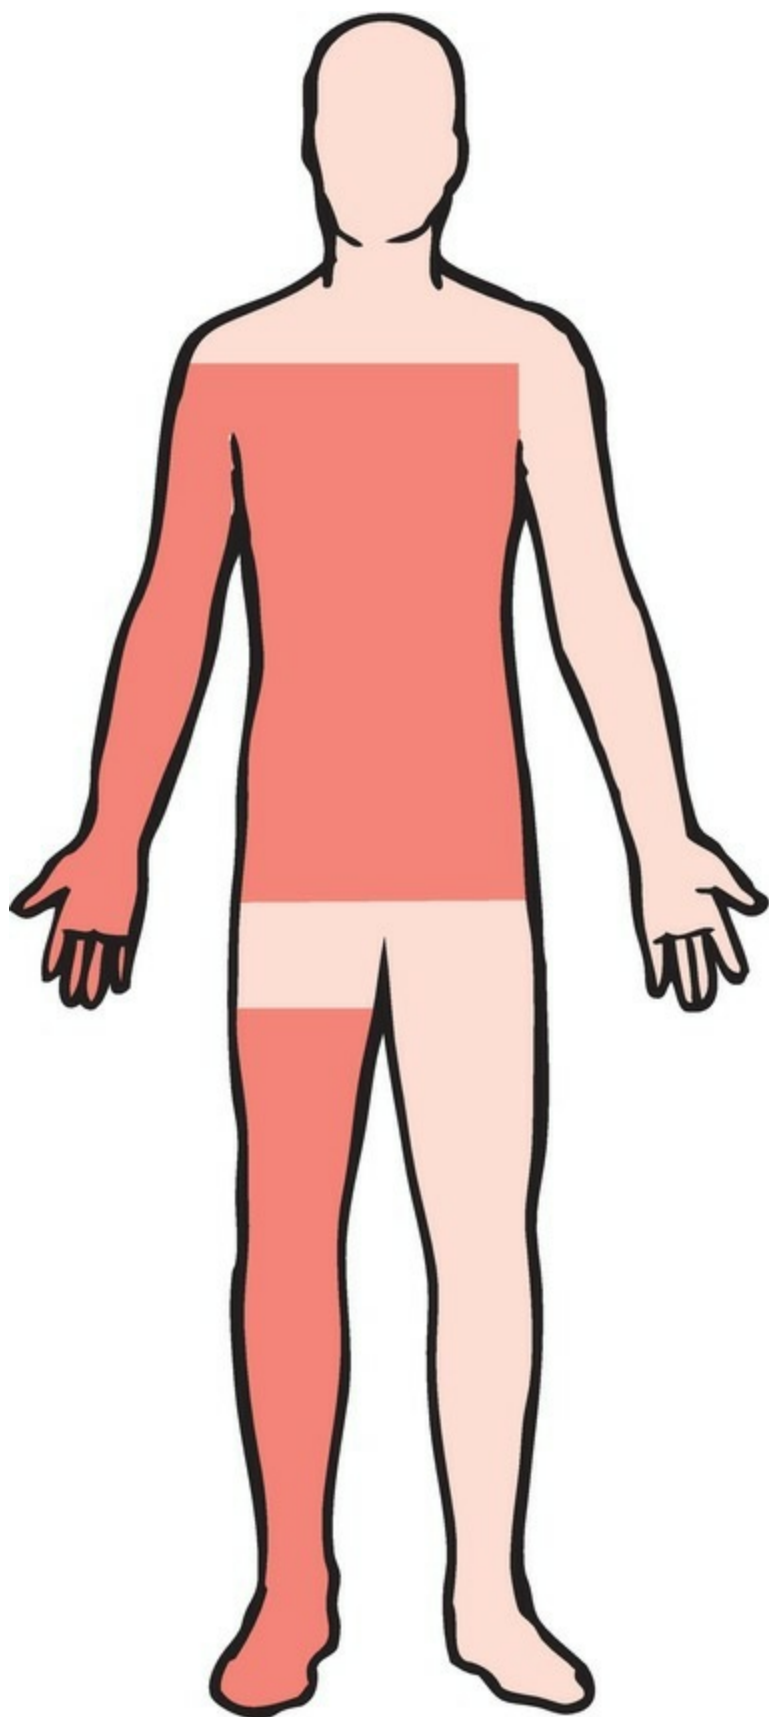

- ☐ 1. Clean the wounds with warm water.
- ☐ 2. Apply antibiotic cream.
- ☐ 3. Refer the client to a burn center.
- ☐ 4. Cover the burns with a sterile dressing.

3. During the emergent (resuscitative) phase of burn injury, which finding indicates that the client requires additional volume with fluid resuscitation?

- ☐ 1. serum creatinine level of 2.5 mg/dL (221 μ mol/L)
- ☐ 2. little fluctuation in daily weight
- ☐ 3. hourly urine output of 60 mL
- ☐ 4. serum albumin level of 3.8 mg/dL (38 g/L)

4. A client is admitted to the hospital after sustaining burns to the chest, abdomen, right arm, and right leg. The shaded areas in the illustration indicate the burned areas on the client's body. Using the "rule of nines," estimate what percentage of the client's body surface has been burned.

- ☐ 1. 18%
- ☐ 2. 27%
- ☐ 3. 45%
- ☐ 4. 64%

5. The nurse is caring for a client with severe burns who is receiving fluid resuscitation. Which finding indicates that the client is responding to the fluid resuscitation?

- ☐ 1. pulse rate of 112 bpm
- ☐ 2. blood pressure of 94/64 mm Hg
- ☐ 3. urine output of 30 mL/h
- ☐ 4. serum sodium level of 136 mEq/L (136 mmol/L)

6. At about one-half hour **before** the daily whirlpool bath and dressing change, the nurse should:

- ☐ 1. soak the dressing.
- ☐ 2. remove the dressing.
- ☐ 3. administer an analgesic.
- ☐ 4. slit the dressing with blunt scissors.

7. The client with a major burn injury receives total parenteral nutrition (TPN). The expected outcome is to:

- ☐ 1. correct water and electrolyte imbalances.
- ☐ 2. allow the gastrointestinal tract to rest.
- ☐ 3. provide supplemental vitamins and minerals.
- ☐ 4. ensure adequate caloric and protein intake.

8. An advantage of using biologic burn grafts such as porcine (pigskin) grafts is that they:

- ☐ 1. encourage the formation of tough skin.
- ☐ 2. promote the growth of epithelial tissue.
- ☐ 3. provide for permanent wound closure.
- ☐ 4. facilitate the development of subcutaneous tissue.

9. Which factor would have the **least** influence on the survival and effectiveness of a burn victim's porcine grafts?

- ☐ 1. absence of infection in the wounds
- ☐ 2. adequate vascularization in the grafted area
- ☐ 3. immobilization of the area being grafted
- ☐ 4. use of analgesics as necessary for pain relief

10. The nurse should plan to begin rehabilitation efforts for the burn client:

- ☐ 1. immediately after the burn has occurred.
- ☐ 2. after the client's circulatory status has been stabilized.
- ☐ 3. after grafting of the burn wounds has occurred.
- ☐ 4. after the client's pain has been eliminated.

11. During the early phase of burn care, the nurse should assess the client for:

- ☐ 1. hypernatremia.
- ☐ 2. hyponatremia.
- ☐ 3. metabolic alkalosis.
- ☐ 4. hyperkalemia.

12. Which client with burns will **most** likely require an endotracheal or tracheostomy tube? A client who has:

- ☐ 1. electrical burns of the hands and arms causing arrhythmias.
- ☐ 2. thermal burns to the head, face, and airway resulting in hypoxia.
- ☐ 3. chemical burns on the chest and abdomen.
- ☐ 4. secondhand smoke inhalation.

13. A client is receiving fluid replacement with lactated Ringer's after 40% of the body was burned 10 hours ago. The assessment reveals temperature 97.1°F (36.2°C), heart rate 122 bpm, blood pressure 84/42 mm Hg, central venous pressure (CVP) 2 mm Hg, and urine output 25 mL for the last 2 hours. The IV rate is currently at 375 mL/h. Using the SBAR (Situation-Background-Assessment-Recommendation) technique for communication, the nurse calls the healthcare provider (HCP) with a recommendation for:

- ☐ 1. furosemide.
- ☐ 2. fresh frozen plasma.
- ☐ 3. IV rate increase.
- ☐ 4. dextrose 5%.

14. After the initial phase of the burn injury, the client's plan of care will focus **primarily** on:

- ☐ 1. helping the client maintain a positive self-concept.
- ☐ 2. promoting hygiene.
- ☐ 3. preventing infection.
- ☐ 4. educating the client regarding care of the skin grafts.

15. The rate at which IV fluids are infused is based on the burn client's:

- ☐ 1. lean muscle mass and body surface area (BSA) burned.
- ☐ 2. total body weight and BSA burned.
- ☐ 3. total BSA and BSA burned.
- ☐ 4. height and weight and BSA burned.

16. The nurse is conducting a focused assessment of the gastrointestinal system of a client with a burn injury. The nurse should assess the client for:

- ☐ 1. paralytic ileus.
- ☐ 2. gastric distention.
- ☐ 3. hiatal hernia.
- ☐ 4. Curling's ulcer.

17. In the acute phase of burn injury, which pain medication would **most** likely be given to the client to decrease the perception of the pain?

- ☐ 1. oral analgesics such as ibuprofen or acetaminophen
- ☐ 2. intravenous opioids
- ☐ 3. intramuscular opioids
- ☐ 4. oral antianxiety agents such as lorazepam

18. Using the Parkland formula, calculate the hourly rate of fluid replacement with lactated Ringer's solution during the first 8 hours for a client weighing 75 kg with total body surface area (TBSA) burn of 40%. Record your answer using a whole number.

_____ mL/h.

The Older Adult with General Problems of the Integumentary System

19. The nurse is assessing an older adult's skin. The assessment will involve inspecting the skin for color, pigmentation, and vascularity. The

critical component in the nurse's assessment is noting the:

- ☐ 1. similarities from one side to the other.
- ☐ 2. changes from the normal expected findings.
- ☐ 3. appearance of age-related wrinkles.
- ☐ 4. skin turgor.

20. Which change in the integumentary system is associated with normal aging?

- ☐ 1. The outer layer of skin is replaced with new cells every 3 days.
- ☐ 2. Subcutaneous fat and extracellular water decrease.
- ☐ 3. The dermis becomes highly vascular and assists in the regulation of body temperature.
- ☐ 4. Collagen becomes elastic and strong.

21. Which findings should the nurse expect to assess as normal skin changes in an elderly client? Select all that apply.

- ☐ 1. diminished hair on scalp and pubic areas
- ☐ 2. dusky rubor of left lower extremity
- ☐ 3. solar lentigo
- ☐ 4. wrinkles
- ☐ 5. xerosis
- ☐ 6. yellow pigmentation

22. Which problem related to changes of the integumentary system can result for the older adult undergoing abdominal surgery?

- ☐ 1. increased scarring
- ☐ 2. decreased melanin and melanocytes
- ☐ 3. decreased healing
- ☐ 4. increased immunocompetence

23. Which activity reflects health maintenance for an otherwise healthy older adult?

- ☐ 1. drinks 1,500 mL of fluids per day
- ☐ 2. consumes a balanced diet of 1,200 cal/day
- ☐ 3. walks briskly for 10 minutes three times per week

- ☐ 4. sleeps at least 8 hours each night

24. Which factor puts an older adult at the **greatest** risk for impaired wound healing after abdominal surgery?

- ☐ 1. age 75 years
- ☐ 2. age 30 years, with poorly controlled diabetes
- ☐ 3. age 55 years, with myocardial infarction
- ☐ 4. age 60 years, with peripheral vascular disease

25. An older adult has several ecchymotic areas on the left arm. The nurse should further assess the client for (select all that apply):

- ☐ 1. elder abuse.
- ☐ 2. self-inflicted injury.
- ☐ 3. increased capillary fragility and permeability.
- ☐ 4. increased blood supply to the skin.
- ☐ 5. shingles

26. An older adult reports being cold in the room even though the thermostat is set at 75°F (24°C). The client may feel cold because older adults have:

- ☐ 1. increased cellular cohesion.
- ☐ 2. increased moisture content of the stratum corneum.
- ☐ 3. slower cellular renewal time.
- ☐ 4. decreased ability to thermoregulate.

27. What should the nurse instruct the client with tinea capitis to do? Select all that apply.

- ☐ 1. Place a dressing saturated with vinegar and water on the area.
- ☐ 2. Apply topical antibacterial ointment to the area.
- ☐ 3. Shampoo hair two or three times with selenium sulfide shampoo.
- ☐ 4. Use antibacterial soap for bathing.
- ☐ 5. Take antifungal medication as prescribed.

28. A **priority** for nursing care for an older adult who has pruritus, is continuously scratching the affected areas, and demonstrates agitation and anxiety regarding the itching is:

- ☐ 1. preventing infection.
- ☐ 2. instructing the client not to scratch.
- ☐ 3. increasing fluid intake.
- ☐ 4. avoiding social isolation.

29. The nurse is applying a hand mitt restraint for a client with pruritus (see figure). The nurse should **first**:

- ☐ 1. verify the prescription to use the restraint.
- ☐ 2. secure the mitt with ties around the wrist tied to the bed frame.
- ☐ 3. place a folded pillow under the wrist.
- ☐ 4. place the mitt on top of the hand.

30. An older adult client in stage 2 of Parkinson's disease is being discharged with cellulitis of the right lower extremity. The nurse should base the discharge plan on which information? Select all that apply.

- ☐ 1. The client has decreased tissue perfusion.
- ☐ 2. The client is at risk for skin breakdown.
- ☐ 3. The client is at risk for falls or injuries.

- ☐ 4. The client has difficulty communicating.
- ☐ 5. The client has limited activity.

31. An alert and oriented elderly client is admitted to the hospital for treatment of cellulitis of the left shoulder after an arthroscopy. Which fall prevention strategy is **most** appropriate for this client?

- ☐ 1. Keep all the lights on in the room at all times.
- ☐ 2. Use a night-light in the bathroom.
- ☐ 3. Keep all four side rails up at all times.
- ☐ 4. Place the client in a room with a camera monitor.

32. The nurse is discharging an older adult to home after hospitalization for cellulitis of the right foot. The client originally scraped the foot on a rock while walking barefoot outside; the scrape became infected and eventually required hospitalization for wound care and several days of IV antibiotics. After reviewing discharge instructions, what statement by the client indicates the need for further teaching by the nurse?

- ☐ 1. "I will eat lots of fruit and vegetables and take vitamin C to help this heal."
- ☐ 2. "I will be sure to wear shoes to protect my feet when I go out to get the mail."
- ☐ 3. "I will manage my pain by putting this foot up on a pillow when it hurts."
- ☐ 4. "I will take the antibiotics until the redness goes away and my foot feels better."

33. Prevention of skin breakdown and maintenance of skin integrity among older clients is important because they are at greater risk secondary to:

- ☐ 1. altered balance.
- ☐ 2. altered protective pressure sensation.
- ☐ 3. impaired hearing ability.
- ☐ 4. impaired visual acuity.

The Client with Shingles

34. The client has been diagnosed with herpes zoster (shingles). The nurse

should include which information in a teaching plan? Select all that apply.

- ☐ 1. Instruct the client about taking antiviral agents as prescribed.
- ☐ 2. Demonstrate how to apply wet-to-dry dressings.
- ☐ 3. Explain how to follow proper hand hygiene techniques.
- ☐ 4. Assure the client that the pain from herpes zoster will be gone by 7 days.
- ☐ 5. Tell the client to remain in isolation in a bedroom until the lesions have healed.

35. Which client should receive a shingles vaccine? A client who:

- ☐ 1. has never had chickenpox.
- ☐ 2. is at risk for genital herpes.
- ☐ 3. is over 60 years of age.
- ☐ 4. has a compromised immune system.

36. A nurse is caring for an older adult with shingles. The client is experiencing considerable pain related to open blisters on the client's abdomen and back. The client is taking acyclovir and low-dose prednisone. The nurse has several prescriptions available. What additional medications or nursing care strategies to promote comfort may be helpful? Select all that apply.

- ☐ 1. diphenhydramine 25 mg by mouth every 6 hours prn
- ☐ 2. calamine lotion applied to the affected areas
- ☐ 3. cool, wet compresses to the affected areas
- ☐ 4. acetaminophen 325 mg by mouth every 6 hours prn
- ☐ 5. ondansetron 4 mg by mouth every 4 hours prn
- ☐ 6. diversionary activities to prevent client scratching

The Client with a Pressure Ulcer

37. The nurse is assessing a client with dark skin for the presence of a stage I pressure ulcer. The nurse should:

- ☐ 1. use a fluorescent light source to assess the skin.
- ☐ 2. inspect the skin only when the Braden score is above 12.
- ☐ 3. look for skin color that is darker than the surrounding tissue.

- ☐ 4. avoid touching the skin during inspection.

38. The nurse is assessing a client who is immobile and notes that an area of sacral skin is reddened, but not broken. The reddened area continues to blanch and refill with fingertip pressure. The **most** appropriate nursing action at this time is to:

- ☐ 1. apply a moist to moist dressing, being careful to pack just the wound bed.
- ☐ 2. consult with a wound-ostomy-contenance nurse specialist.
- ☐ 3. reposition the client off of the reddened skin and reassess in a few hours.
- ☐ 4. complete and document a Braden skin breakdown risk score for the client.

39. The nurse is assessing a hospitalized older client for the presence of pressure ulcers. The nurse notes that the client has a 1" × 1" (3 cm × 3 cm) area on the sacrum in which there is skin breakdown as far as the dermis. What should the nurse note on the medical record?

- ☐ 1. stage I pressure ulcer
- ☐ 2. stage II pressure ulcer
- ☐ 3. stage III pressure ulcer
- ☐ 4. stage IV pressure ulcer

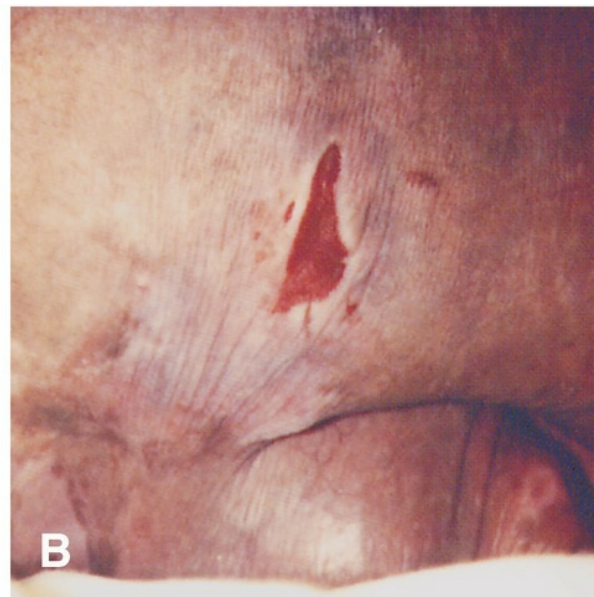

40. A stage II pressure ulcer is characterized by:

- ☐ 1. redness in the involved area.
- ☐ 2. muscle spasms in the involved area.
- ☐ 3. pain in the involved area.
- ☐ 4. tissue necrosis in the involved area.

41. The nurse is using home telehealth monitoring to manage care for an 80-year-old who is home bound. The client spends most of the day in bed. Two months ago, the nurse detected sacral redness from friction and shearing force of being in bed. Last month, the client had increased sacral redness, and the area was classified as a stage I pressure ulcer. On this visit, the nurse is assessing the sacral area using a video camera. The nurse compares the site from a visit made 1 month ago (see figure part A) to the assessment made at

this visit (see figure part **B**). Upon comparing the change of the pressure ulcer from this visit to the previous visit, what should the nurse do **first**?

- ☐ 1. Instruct the home health aide to reposition the client every 2 hours while the client is awake.
- ☐ 2. Ask the client's daughter to observe the area and report changes to the nurse.
- ☐ 3. Contact the healthcare provider (HCP) to request a hydrocolloid dressing.
- ☐ 4. Make a home visit to verify the changes in the ulcer.

The Client with Skin Cancer

42. Which factor places a client at **greatest** risk for skin cancer?

- ☐ 1. fair skin and history of chronic sun exposure
- ☐ 2. Caucasian race and history of hypertension
- ☐ 3. dark skin and family history of skin cancer
- ☐ 4. dark skin and history of hypertension

43. A nurse is teaching a client about skin cancer. Which risk factors for skin cancer should the nurse explain? Select all that apply.

- ☐ 1. increasing age
- ☐ 2. exposure to chemical pollutants

- ☐ 3. long-term exposure to the sun
- ☐ 4. increased pigmentation
- ☐ 5. genetics
- ☐ 6. immunosuppression

44. The nurse is developing a program about skin cancer prevention for a community group. Which information should be included in the program? Select all that apply.

- ☐ 1. Purchase sunscreen containing benzophenones to block UVA and UVB rays.
- ☐ 2. Use sunscreen with a minimum of 30 sun protection factor (SPF).
- ☐ 3. Obtain genetic screening to identify risk of melanoma.
- ☐ 4. Apply sunscreen only on sunny days, especially between 1000 and 1400.
- ☐ 5. Have a pigmented lesion biopsied by shaving if it looks suspicious.
- ☐ 6. Rub baby oil to lubricate skin before going out in the sun.

45. A client with malignant melanoma asks the nurse about the prognosis. The nurse should base a response that informs the client that the prognosis depends on:

- ☐ 1. the amount of ulceration of the lesion.
- ☐ 2. the age of the client.
- ☐ 3. the location of the lesion on the body.
- ☐ 4. the thickness of the lesion.

Managing Care, Quality, and Safety of Clients with Health Problems of the Integumentary System

46. The nurse finds an unlicensed assistive personnel (UAP) massaging the reddened bony prominences of a client on bed rest. The nurse should:

- ☐ 1. Reinforce the UAP's use of this intervention over the bony prominences.
- ☐ 2. Explain that massage is effective because it improves blood flow to the area.
- ☐ 3. Inform the UAP that massage is even more effective when combined

with lotion during the massage.

- ☐ 4. Instruct the UAP that massage is contraindicated because it decreases blood flow to the area.

47. The nurse manager on the orthopedic unit is reviewing a report that indicates that in the last month, five clients were diagnosed with pressure ulcers. The nurse manager should:

- ☐ 1. use benchmarking procedures to compare the findings with other nursing units in the hospital.
- ☐ 2. ask the staff education department to conduct an educational session about preventing pressure ulcers.
- ☐ 3. institute a quality improvement plan that identifies contributing factors, proposes solutions, and sets improvement outcomes.
- ☐ 4. conduct a chart audit to determine which nurses on which shifts were giving nursing care to the clients with pressure ulcers.

48. A client has been admitted to the hospital with draining foot lesions. What should the nurse do? Select all that apply.

- ☐ 1. Place the client in a room with negative air pressure.
- ☐ 2. Admit the client to a semiprivate room.
- ☐ 3. Admit the client to a private room.
- ☐ 4. Post a “contact isolation” sign on the door.
- ☐ 5. Wear a protective gown when in the client’s room.
- ☐ 6. Wear gloves when providing direct care.

49. The nurse is to administer an antibiotic to a client with burns, but there is no medication in the client’s medication box. What should the nurse do **first**?

- ☐ 1. Inform the unit’s shift coordinator.
- ☐ 2. Contact the client’s healthcare provider (HCP).
- ☐ 3. Call the pharmacy department.
- ☐ 4. Borrow the medication from another client.

50. A client has a wound on the ankle that is not healing. The nurse should assess the client for which risk factors for delayed wound healing? Select all that apply.

- ☐ 1. atrial fibrillation
- ☐ 2. advancing age
- ☐ 3. type 2 diabetes mellitus
- ☐ 4. hypertension
- ☐ 5. smoking

51. The nurse is assessing the left lower extremity of a client with type 2 insulin-requiring diabetes and cellulitis. What should the nurse do?

- ☐ 1. Instruct the client to elevate the left leg when sitting in the chair.
- ☐ 2. Encourage the client to ambulate in the halls on the unit.
- ☐ 3. Massage the left leg with alcohol to stimulate circulation.
- ☐ 4. Cleanse the left lower leg with perfumed liquid soap.

52. A client is admitted with pneumonia and shingles with draining lesions over the right anterior and posterior chest wall. Of the nurses scheduled for the shift, which nurses may be assigned to care for this client? Select all that apply.

- ☐ 1. 43-year-old female who had a preexposure varicella vaccination
- ☐ 2. 48-year-old male who had shingles 1 year prior
- ☐ 3. 32-year-old female who is in the first trimester of pregnancy
- ☐ 4. 24-year-old female who has never had the pneumococcal vaccine
- ☐ 5. 36-year-old male taking steroids for an autoimmune disease

Answers, Rationales, and Test-Taking Strategies

*The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in Part 1 of this book.*

The Client with Burns

1. 1,2,3. Clients who should be transferred to a burn center include children under age 10 or adults over age 50 with second- and third-degree burns on 10% or greater of their BSA, clients between ages 11 and 49 with second- and third-degree burns over 20% of their BSA, clients of any age with third-degree burns on more than 5% of their BSA, clients with smoke inhalation, and clients with chronic diseases, such as diabetes and heart or kidney disease.

CN: Management of care; CL: Analyze

2. 3. The nurse should have the client transported to a burn center. The client's age and the extent of the burns require care by a burn team, and the client meets triage criteria for referral to a burn center. Because of the age of the client and the extent of the burns, the nurse should not treat the burn. Scald burns are not at high risk for infection and do not need to be cleaned, covered, or treated with antibiotic cream at this time.

CN: Physiological adaptation; CL: Synthesize

3. 1. Fluid shifting into the interstitial space causes intravascular volume depletion and decreased perfusion to the kidneys. This would result in an increase in serum creatinine. Urine output should be frequently monitored and adequately maintained with intravenous fluid resuscitation that would be increased when a drop in urine output occurs. Urine output should be at least 30 mL/h. Fluid replacement is based on the Parkland or Brooke formula and also the client's response by monitoring urine output, vital signs, and CVP readings. Daily weight is important to monitor for fluid status. Little fluctuation in weight suggests that there is no fluid retention and the intake is equal to output. Exudative loss of albumin occurs in burns, causing a decrease in colloid osmotic pressure. The normal serum albumin is 3.5 to 5 g/dL (35 to 50 g/L).

CN: Physiological adaptation; CL: Analyze

4. 3. According to the rule of nines, this client has sustained burns on about 45% of the body surface. The right arm is calculated as being 9%, the right leg is 18%, and the anterior trunk is 18%, for a total of 45%.

 CN: Physiological adaptation; CL: Apply

5. 3. Ensuring a urine output of 30 to 50 mL/h is the best measure of adequate fluid resuscitation. The heart rate is elevated, but is not an indicator of adequate fluid balance. The blood pressure is low, likely related to the hypervolemia, but urinary output is the more accurate indicator of fluid balance and kidney function. The sodium level is within normal limits.

 CN: Physiologic adaptation; CL: Evaluate

6. 3. Removing dressings from severe burns exposes sensitive nerve endings to the air, which is painful. The client should be given a prescribed analgesic about one-half hour before the dressing change to promote comfort. The other activities are done as part of the whirlpool and dressing change process and not one-half hour beforehand.

 CN: Reduction of risk potential; CL: Synthesize

7. 4. Nutritional support with sufficient calories and protein is extremely important for a client with severe burns because of the loss of plasma protein through injured capillaries and an increased metabolic rate. Gastric dilation and paralytic ileus commonly occur in clients with severe burns, making oral fluids and foods contraindicated. Water and electrolyte imbalances can be corrected by administration of IV fluids with electrolyte additives, although TPN typically includes all necessary electrolytes. Resting the gastrointestinal tract may help prevent paralytic ileus, and TPN provides vitamins and minerals; however, the primary reason for starting TPN is to provide the protein necessary for tissue healing.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

8. 2. Biologic dressings such as porcine grafts serve many purposes for a client with severe burns. They enhance the growth of epithelial tissues, minimize the overgrowth of granulation tissue, prevent loss of water and protein, decrease pain, increase mobility, and help prevent infection. They do not encourage growth of tougher skin, provide for permanent wound closure, or facilitate growth of subcutaneous tissue.

 CN: Physiological adaptation; CL: Apply

9. 4. Analgesic administration to keep a burn victim comfortable is important but is unlikely to influence graft survival and effectiveness. Absence of infection, adequate vascularization, and immobilization of the grafted area promote an effective graft.

 CN: Physiological adaptation; CL: Evaluate

10. 2. Rehabilitation efforts are implemented as soon as the client's condition is stabilized. Early emphasis on rehabilitation is important to decrease complications and to help ensure that the client will be able to make the adjustments necessary to return to an optimal state of health and independence. It is not possible to completely eliminate the client's pain; pain control is a major challenge in burn care.

 CN: Basic care and comfort; CL: Synthesize

11. 4. Immediately after a burn, excessive potassium from cell destruction is released into the extracellular fluid. Hyponatremia is a common electrolyte imbalance in the burn client that occurs within the first week after being burned. Metabolic acidosis usually occurs as a result of the loss of sodium bicarbonate.

 CN: Reduction of risk potential; CL: Analyze

12. 2. Airway management is the priority in caring for a burn client. Tracheostomy or endotracheal intubation is anticipated when significant thermal and smoke inhalation burns occur. Clients who have experienced burns to the face and neck usually will be compromised within 1 to 2 hours. Electrical burns of the hands and arms, even with cardiac arrhythmias, or a chemical burn of the chest and abdomen is not likely to result in the need for intubation. Secondhand smoke inhalation does influence an individual's respiratory status but does not require intubation unless the individual has an allergic reaction to the smoke.

 CN: Physiological adaptation; CL: Analyze

13. 3. The decreased urine output, low blood pressure, low CVP, and high heart rate indicate hypovolemia and the need to increase fluid volume replacement. Furosemide is a diuretic that should not be given due to the existing fluid volume deficit. Fresh frozen plasma is not indicated. It is given

for clients with deficient clotting factors who are bleeding. Fluid replacement used for burns is lactated Ringer's solution, normal saline, or albumin.

CN: Management of care; CL: Synthesize

14. 3. The inflammatory response begins when a burn is sustained. As a result of the burn, the immune system becomes impaired. There are a decrease in immunoglobulins, changes in white blood cells, alterations of lymphocytes, and decreased levels of interleukin. The human body's protective barrier, the skin, has been damaged. As a result, the burn client becomes vulnerable to infections. Education and interventions to maintain a positive self-concept would be appropriate during the rehabilitation phase. Promoting hygiene helps the client feel comfortable; however, the primary focus is on reducing the risk for infection.

CN: Safety and infection control; CL: Synthesize

15. 2. During the first 24 hours, fluid replacement for an adult burn client is based on total body weight and BSA burned. Lean muscle mass considers only muscle mass; replacement is based on total body weight. Total surface area is estimated by taking into account the individual's height and weight. Height is not a common variable used in formulas for fluid replacement.

CN: Physiological adaptation; CL: Apply

16. 4. Curling's ulcer, or gastrointestinal ulceration, occurs in about half of the clients with a burn injury. The incidence of ulceration appears proportional to the extent of the burns, and the ulceration is believed to be caused by hypersecretion of gastric acid and compromised gastrointestinal perfusion. Paralytic ileus and gastric distention do not result from hypersecretion of gastric acid and stress and thus are not expected findings at this time. Hiatal hernia is not necessarily a potential complication of a burn injury.

CN: Physiological adaptation; CL: Analyze

17. 2. The severe pain experienced by burn clients requires opioid analgesics. In addition, opioids such as morphine sedate and alleviate apprehension. Oral analgesics such as ibuprofen or acetaminophen are unlikely to be strong enough to effectively manage the intense pain

experienced by the client who is severely burned. Because of the altered tissue perfusion from the burn injury, intravenous medications are preferred. Antianxiety agents are not effective against pain.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

18. 750 mL/h. When calculating fluid replacement, only the burned portion of the TBSA is used to calculate fluid volume; thus, the nurse should administer the solution at 750 mL/h. Lactated Ringer's solution $4 \text{ mL} \times \text{weight in kg} \times \text{TBSA}$; half given over the first 8 hours and half given over the next 16 hours.

$$4 \text{ mL} \times 75 \text{ kg} \times 40 = 12,000 \text{ mL or}$$

$$\frac{4 \text{ mL} \times 75 \text{ kg} \times 40}{8 \text{ hours}} \times \frac{1}{2} = \frac{750 \text{ mL}}{\text{hour}}$$

$$12,000 \text{ mL} \times 21 = 6,000 \text{ mL}$$

$$\frac{6,000 \text{ mL}}{8 \text{ hours}} = 750 \text{ mL / h}$$

 CN: Pharmacological and parenteral therapies; CL: Apply

The Older Adult with General Problems of the Integumentary System

19. 2. Noting changes from the normal expected findings is the most important component when assessing an older client's integumentary system. Comparing one extremity with the contralateral extremity (i.e., comparing one side with the other) is an important assessment step; however, the most important component is noting changes from an expected normal baseline. Noting wrinkles related to age is not of much consequence unless the client is admitted for cosmetic surgery to reduce the appearance of age-related

wrinkling. Noting skin turgor is an assessment of fluid status, not an assessment of the integumentary system.

CN: Health promotion and maintenance; CL: Analyze

20. 2. With age, there is a decreased amount of subcutaneous fat, muscle laxity, degeneration of elastic fibers, and collagen stiffening. The outer layer of skin is almost completely replaced every 3 to 4 weeks. The vascular supply diminishes with age. Collagen thins and diminishes with age.

CN: Health promotion and maintenance; CL: Analyze

21. 1,3,4,5. Skin changes associated with aging include the following: diminished hair on scalp and pubic areas, solar lentigo (liver spots), wrinkles, and xerosis (dryness). Dusky rubor of the left lower extremity may indicate the individual has a venous stasis problem in the affected extremity and is - generally associated with “unsuccessful aging.” Yellow pigmentation of the skin that may be associated with liver inflammation is generally known as jaundice.

CN: Health promotion and maintenance; CL: Analyze

22. 3. Normal aging consists of decreased proliferative capacity of the skin. Decreased collagen synthesis slows capillary growth, impairs phagocytosis among older clients, and results in slow healing. Increased scarring is not a result of age-related skin changes. Both melanin and melanocytes give color to the skin and hair but are increased with aging. There is a decrease in the immunocompetence of the aging client.

CN: Health promotion and maintenance; CL: Analyze

23. 1. Drinking at least 1,500 mL of fluid per day helps the client stay well hydrated. Maintaining optimal fluid balance is important for all body systems. Caloric intake varies according to an individual’s size and activity level. An intake of 1,200 cal/day may be insufficient for some older clients. Walking 10 minute/day is useful, but an otherwise healthy older client should try to walk 20 to 30 minute/day three or more times a week. It is important to get adequate rest; however, the amount of sleep needed varies with the individual.

CN: Health promotion and maintenance; CL: Evaluate

24. 2. Poorly controlled diabetes is a serious risk factor for postoperative wound infection. Other factors that delay wound healing include advanced age, nutritional deficiencies (vitamin C, protein, zinc), inadequate blood supply, use of corticosteroid, infection, mechanical friction on the wound, obesity, anemia, and poor general health.

CN: Reduction of risk potential; CL: Analyze

25. 1,2,3. The nurse should always assess an older adult who has signs of bruising (ecchymosis) for signs of abuse, self-inflicted injuries, or injuries that might have occurred from falls. Also, the aging process involves increased capillary fragility and permeability, and because older adults have a decreased amount of subcutaneous fat, it is also likely that there is an increased incidence of bruise-like lesions caused by collection of extravascular blood in the loosely structured dermis. In addition, older clients do not always realize that injury has occurred because of a diminished awareness of pain, touch, and peripheral vibration. Blood supply to the skin decreases with aging and thus is not a cause of the ecchymotic areas. Shingles presents as a red rash and fluid-filled blisters.

CN: Health promotion and maintenance; CL: Analyze

26. 4. Older clients have a decreased thermoregulation that is related to decreased blood supply and reabsorption of body fat. As a result, older adults are at risk for hypothermia. Cellular cohesion and moisture content diminish with age, and cellular renewal time is slowed; however, these do not result in impaired thermoregulation.

CN: Health promotion and maintenance; CL: Analyze

27. 3,5. Tinea capitis is a contagious fungal infection of the hair shaft. The hair should be shampooed two or three times with selenium sulfide shampoo. An oral medication will typically be prescribed as well, since the shampoo alone will not cure tinea capitis. Vinegar and water may be used to treat tinea pedis. The most common fungal skin infection is tinea (also called ringworm because of its characteristic appearance of a ring or rounded tunnel under the skin). Tinea infections affect the head, body, groin, feet, and nails. Antibacterial ointment and soap are not effective for treating fungal infections.

CN: Physiological adaptation; CL: Create

28. 1. The client is at risk for infection because of the pruritus, and the nurse should institute measures to help the client control the scratching such as cutting fingernails, using protective gloves or mitts, and, if necessary, using antianxiety medications. More information is required regarding the knowledge level of the client, but learning cannot take place when an individual's attention is distracted with pruritus. Increasing fluid intake is not a priority at this time. There are no data to indicate the client is experiencing social isolation.

CN: Reduction of risk potential; CL: Synthesize

29. 1. Before using any restraints, the nurse must verify that a **healthcare provider (HCP)**  has written a prescription for the restraint. The mitt does not need to be secured with ties. The client can move the hand as needed. It is not necessary to place a pillow under the wrist. The nurse should place the mitt on the palmar surface of the hand.

CN: Safety and infection control; CL: Synthesize

30. 2,3. Usual aging is associated with dry skin; however, seborrhea (oily skin and dandruff) is one result of the biochemical changes associated with Parkinson's disease. The client with Parkinson's disease has a higher risk of skin breakdown due to the moist and oily skin. To maintain skin integrity, a client with Parkinson's disease needs frequent skin care and aeration of the skin. Gait instability in a client with Parkinson's disease is a result of muscle rigidity, change in the center of gravity, and gait shuffling. Because of these changes in gait and balance, the client is at higher risk for injuries in the environment, such as hitting furniture or obstacles in the client's path. As a result, the environment should be evaluated for potential injury or falls. Tissue perfusion and verbal communication are not problems typically associated with Parkinson's disease. The client should not experience activity intolerance from the cellulitis or Parkinson's disease.

CN: Pharmacological and parenteral therapies; CL: Analyze

31. 2. Many falls occur when older clients attempt to get to the bathroom at night. The risk is even greater in an unfamiliar environment. Use of a

night-light in the bathroom enables the older adult client to see the way to the bathroom. Keeping the lights on in the room at all times may contribute to sensory overload and prevent adequate rest. Raised side rails paradoxically contribute to falls when the older client tries to climb over them to get to the bathroom. The upper side rails may be raised, but it is not recommended that all four side rails be elevated. Camera monitoring can be used but does nothing to prevent a fall.

CN: Safety and infection control; CL: Synthesize

32. 4. It is important for the client to understand the need to complete the entire course of oral antibiotics as prescribed in order to prevent recurrence/worsening of cellulitis. Further, if the pain and redness continue despite antibiotics, the client needs to understand the need to follow up with the healthcare provider. Extra vitamin C, protective footwear, and elevating the foot are strategies to promote healing.

CN: Management of care; CL: Synthesize

33. 2. Pressure ulcers usually occur over bony prominences. An alteration in the protective pressure sensation results from a decline in the number of Meissner's and pacinian corpuscles. Older adults do have altered balance that may result in falls but not skin breakdown. Impaired hearing and vision do not contribute to pressure ulcers.

CN: Reduction of risk potential; CL: Analyze

The Client with Shingles

34. 1,2,3. The nurse should instruct the client and family members about the importance of taking antiviral agents as prescribed. The client must be taught how to apply wet dressings or medication to the lesions and to follow proper hand hygiene techniques to avoid spreading the virus. The healing time varies from 7 to 26 days. The most common complication is postherpetic neuralgia, which may last longer than 6 months. It is not necessary for the client to remain in isolation.

CN: Health promotion and maintenance; CL: Create

35. 3. People older than 60 years should receive shingles vaccine to

prevent the disease. The vaccine is not effective for genital herpes. The vaccine can be given to persons who have or have not had chickenpox. The vaccine is not advised for persons with a compromised immune system, for example, those receiving chemotherapy or radiation therapy.

CN: Health promotion and maintenance; CL: Apply

36. 1,2,3,4,6. Diphenhydramine is an antihistamine that reduces allergic reactions, calamine lotion is a topical antipruritic, and acetaminophen is an analgesic. These medications may help increase client comfort by reducing pain, inflammation, and itching, which, in turn, may reduce client scratching and potentially spreading the virus. Cool wet compresses also relieve itching and pain. Ondansetron is an antiemetic and would not be helpful for this client's discomfort.

CN: Physiological integrity; CL: Synthesize

The Client with a Pressure Ulcer

37. 3. When assessing a client with dark skin, the nurse should observe for skin that is darker, brownish, purplish, or bluish compared to surrounding skin. Fluorescent light casts a blue light, making skin assessment difficult; natural or halogen light sources help to accurately assess the skin. Risk assessment using the Braden Scale should be performed on all clients. A Braden score of 12 indicates a high risk for pressure ulcer, and the lower the Braden score, the higher the risk (no risk 19 to 23, at risk 15 to 18, moderate risk 13 to 14, high risk 10 to 12, and very high risk 9 or below). The nurse should touch the skin to assess consistency and temperature differences.

CN: Physiological adaptation; CL: Analyze

38. 3. A stage I ulcer presents as an area of intact, nonblanchable redness, usually over a bony prominence, caused by pressure. If a reddened area blanches and refills with fingertip pressure, it indicates that there is still some blood flow to the injured area, and the redness may be reversible. It may be appropriate to complete and document a Braden score or consult a wound nurse specialist, but it is imperative to reposition the client off the reddened skin area first. Since there is no break in the skin, it is not appropriate to apply a moist to moist dressing.

 CN: Basic care and comfort; CL: Synthesize

39. 2. Stage I pressure ulcers appear as nonblanching macules that are red in color. Stage II ulcers have breakdown of the dermis. Stage III ulcers have full-thickness skin breakdown. In stage IV ulcers, the bone, muscle, and supporting tissue are involved. The nurse should immediately initiate plans to relieve the pressure, ensure good nutrition, and protect the area from abrasion.

 CN: Reduction of risk potential; CL: Analyze

40. 3. A stage II skin breakdown involves epidermal sloughing and pain. Redness without blanching is noted in stage I. Stage III involves tissue necrosis with subcutaneous involvement. Stage IV involves muscle or bone destruction. Muscle spasm is not a criterion used in the staging process.

 CN: Physiological adaptation; CL: Analyze

41. 3. The pressure ulcer has changed from stage I to stage II and requires the use of a protective dressing. Repositioning and use of foam mattresses are appropriate interventions for stage I pressure ulcers. While the daughter can assess the client and report changes, it is the nurse's responsibility to make decisions about needed care. Telehealth monitoring equipment is providing sufficient visualization of the skin changes; the nurse does not need to make a home visit at this time.

 CN: Reduction of risk potential; CL: Synthesize

The Client with Skin Cancer

42. 1. Caucasians who have fair skin and a high exposure to ultraviolet light are at increased risk for malignant neoplasms of the skin. The other risk factors include exposure to tar and arsenicals and family history. History of hypertension is a coronary artery disease risk factor. Clients with dark skin have increased melanin and are not as prone to skin cancer.

 CN: Health promotion and maintenance; CL: Analyze

43. 1,2,3,5,6. Risk factors associated with skin cancer include age, exposure to chemical pollutants, exposure to the sun, genetics, and

immunosuppression. As individuals age, the risk of developing skin cancer increases. Longtime exposure to the sun and exposure to chemical pollutants (nitrates, coal, tar, etc.) increase the risk of skin cancer. Individuals who have less skin pigmentation (e.g., fair, blue-eyed people) have a higher risk of skin cancer because they tend to incur sunburns rather than tan. Family history plays a role in cancer. Regardless, immunosuppressed individuals are at a higher risk for the development of any type of cancer, as the body's defenses are not functioning properly.

CN: Health promotion and maintenance; CL: Apply

44. 1,2. Sunscreen should be applied 20 to 30 minutes before going outside, even in cloudy weather. Sunscreen with a minimum of 30 SPF should be used. Sunscreen containing benzophenones block both UVA and UVB rays. The rays of the sun are most dangerous between 1000 and 1400. Genetic screening is not indicated, although a mutated gene has been identified in some families with high incidence of melanoma. A prior diagnosis of melanoma and having a first-degree relative diagnosed with melanoma increase a person's risk. Lesions should not be shave biopsied; excisional biopsy technique is used. Baby oil will increase the adverse effects of sun exposure; sunscreen protection should be used.

CN: Health promotion and maintenance; CL: Create

45. 4. Tumor or lesion thickness is the predictive factor for survival. Cutaneous melanoma that is confined to the epidermis has a high cure rate. Asymmetry, border, color, and diameter are known as the "ABCDs" of melanoma. Thus, the amount of ulceration, age, and location are not clearly associated with the prognosis.

CN: Health promotion and maintenance; CL: Synthesis

Managing Care, Quality, and Safety of Clients with Health Problems of the Integumentary System

46. 4. Massaging areas that are reddened due to pressure is contraindicated because it further reduces blood flow to the area. The **UAP**  should not massage the bony prominences or use lotion on the area. Massage does improve circulation and blood flow to muscle areas; however, because the

area is reddened, the client is at risk for further skin breakdown.

CN: Management of care; CL: Synthesize

47. 3. The problem of pressure ulcers in hospitalized clients is best addressed by using quality improvement techniques to identify the problem, determining strategies for improvement, and setting goals for outcomes. Benchmarking for comparison will indicate where this nursing unit compares with other units, but does not address the problem for this unit; having clients with pressure ulcers on any unit is not acceptable. Educational programs are more effective after there is an understanding of the problem. Chart audits and blaming do not solve the problem or address quality improvement measures.

CN: Management of care; CL: Synthesize

48. 3,4,5,6. Infection control policies must be followed to prevent the spread of infection. Until the pathogens are identified, the client must be isolated in a private room. Utilizing contact isolation and wearing a protective isolation gown and clean gloves, in addition to following isolation protocol to exit the room, may aid in the prevention of spread of infectious agents to others. A draining foot lesion does not require a negative air pressure room, which is primarily reserved for preventing spread of tuberculosis.

CN: Safety and infection control; CL: Synthesize

49. 3. By contacting the pharmacy to report the absence of the medication, the pharmacy can bring the medication to the client's medication box. From there on, the pharmacy can make sure the correct medications are present. Contacting the shift coordinator or the client's **HCP**  will not correct the original cause of the variance. It is never appropriate to "borrow" a medication from another client.

CN: Management of care; CL: Synthesize

50. 2,3,5. Advancing age, type 2 diabetes mellitus, and smoking are risk factors for delayed healing. Advanced age slows collagen synthesis by - fibroblasts, impairs circulation, and requires a longer time for epithelialization of the skin. Type 2 diabetes mellitus reduces supply of oxygen and nutrients secondary to vascular complications. Nicotine is a

potent vasoconstrictor and impedes blood flow, which reduces the supply of oxygen and nutrients necessary for healing. Atrial fibrillation causes venous stasis in the atria, but does not have an effect on wound healing.

Hypertension does not have an effect on healing.

CN: Reduction of risk potential; CL: Analyze

51. 1. The client has cellulitis and should elevate the affected area above heart level. Ambulation stimulates circulation and promotes deposition of pathogens in other areas of the body. Alcohol and perfumed soaps are drying to the skin. Massaging the lower extremities could dislodge a clot.

CN: Reduction of risk potential; CL: Synthesize

52. 1,2,4. While the 43-year-old female has not had chickenpox, she has been vaccinated against the disease. A person can have shingles twice, but there is nothing in the 48-year-old nurse's history that precludes him from caring for this client. Having or not having the pneumococcal vaccine does not preclude a healthcare worker for caring for someone with pneumonia or shingles. Anyone who is immunocompromised or pregnant is at an increased risk for contracting varicella and should not be assigned to care for a client with shingles. All healthcare workers should have evidence of immunity to varicella and, if not, should receive two doses of vaccine at the recommended intervals at the time of employment. However, in this scenario, the immunity status of the pregnant nurse is not given, and risk reduction is warranted.

CN: Management of care; CL: Synthesize

Responding to Emergencies, Mass Casualties, and Disasters

- Emergencies
- Mass Casualties
- Disasters
- Managing Care, Quality, and Safety of Clients
- Answers, Rationales, and Test-Taking Strategies

Emergencies

1. A client is admitted to the emergency department with a headache, weakness, and slight confusion. The healthcare provider (HCP) diagnoses carbon monoxide poisoning. What should the nurse do **first**?

- ☐ **1.** Initiate gastric lavage.
- ☐ **2.** Maintain body temperature.
- ☐ **3.** Administer 100% oxygen by mask.
- ☐ **4.** Obtain a psychiatric referral.

2. Three hours ago, a client was thrown from a car into a ditch and is now admitted to the emergency department in a stable condition with vital signs within normal limits, alert and oriented with good coloring, and an open fracture of the right tibia. For which sign should the nurse be especially alert?

- ☐ **1.** hemorrhage
- ☐ **2.** infection
- ☐ **3.** deformity
- ☐ **4.** shock

3. A client admitted to the emergency department with atrial fibrillation

has a heart rate of 160 bpm. The nurse should implement which prescription **first**?

- ☐ 1. Administer a heparin bolus.
- ☐ 2. Administer a beta-blocker.
- ☐ 3. Administer oxygen via nasal cannula.
- ☐ 4. Prepare the client for an immediate cardioversion.

4. A client is admitted to the emergency department with atrial fibrillation and does not recall how long the rapid pulse and irregular heart rate has been occurring. The nurse should include which goals of care at this time? Select all that apply.

- ☐ 1. Convert the heart rate to sinus rhythm.
- ☐ 2. Decrease cardiac output and workload.
- ☐ 3. Increase exercise tolerance.
- ☐ 4. Maintain a ventricular response below 100 bpm.
- ☐ 5. Prevent an embolic stroke.

5. The nurse is discharging a client who had a fish hook embedded in the eye. The fish hook was removed surgically in the emergency department, but the client currently has no vision in that eye. The surgeon has informed the client that a corneal transplant may restore some vision but the surgery cannot be performed for 6 to 8 weeks and only if no infection occurs. A **priority** 📖 in the teaching plan includes:

- ☐ 1. resting to reduce strain to the eye and promote healing after surgery.
- ☐ 2. washing hands carefully to keep the area clean and decrease risk of infection.
- ☐ 3. verbalizing feelings regarding vision loss.
- ☐ 4. eating a healthy diet to promote healing and prevent constipation.

6. A client is admitted to the emergency department with sneezing and coughing. The client is in the triage area, waiting to be seen by a healthcare provider (HCP). To prevent spread of infection to others in the area and to the healthcare staff, the nurse should:

- ☐ 1. place the client in an isolation room.
- ☐ 2. ask the others in the area to move away from the client.

- ☐ 3. give the client a surgical mask to wear.
- ☐ 4. ask the client to wash the hands before being examined.

7. There has been a car accident involving four vehicles on a remote highway. The nearest emergency department is 15 minutes away. Which victim should be transported by helicopter rather than an ambulance to the nearest hospital?

- ☐ 1. a 10-year-old with a simple fracture of the femur, who is crying and cannot find his parents
- ☐ 2. a middle-aged female with cold, clammy skin, heart rate of 120 bpm, and is unconscious
- ☐ 3. middle-aged male with severe asthma, heart rate of 120 bpm, and is having difficulty breathing
- ☐ 4. an older adult with severe headache, but conscious

8. The nurse notices a fire in a wastebasket in a client's room. In which order of priority from first to last should the nurse perform the actions? All options must be used.

1. Confine the fire by closing the door to the client's room.

2. Extinguish the fire.

3. Remove the client from the room.

4. Pull the fire alarm at the alarm pull station.

9. A client is admitted to the emergency department with a full-thickness burn to the right arm. Upon assessment, the arm is edematous, fingers are mottled, and radial pulse is now absent. The client states that the pain is 8 on a scale of 1 to 10. The nurse should:

- ☐ 1. administer morphine sulfate IV push for the severe pain.
- ☐ 2. call the healthcare provider (HCP) to report the loss of the radial pulse.
- ☐ 3. continue to assess the arm every hour for any additional changes.
- ☐ 4. instruct the client to exercise the fingers and wrist.

10. A client is brought to the emergency department with abdominal trauma following an automobile accident. The vital signs are as follows: heart rate, 132 bpm; respirations, 28 breaths/min; blood pressure, 84/58 mm Hg; temperature, 97.0°F (36.1°C); and oxygen saturation 89% on room air.

Which prescription should the nurse implement **first**?

- ☐ 1. Administer 1 L 0.9% normal saline IV.
- ☐ 2. Draw a complete blood count (CBC) with hematocrit and hemoglobin.
- ☐ 3. Obtain an abdominal x-ray.
- ☐ 4. Insert an indwelling urinary catheter.

11. A middle-aged man collapses in the emergency department waiting room. The triage nurse should **first**:

- ☐ 1. Ask the client to state his name.
- ☐ 2. Perform the head tilt/chin lift to open the victim's airway.
- ☐ 3. Feel for any air movement from the victim's nose or mouth.
- ☐ 4. Watch the client's chest for respirations.

12. A client is experiencing an allergic response. The nurse should perform the actions in which order from first to last? All options must be used.

1. Assess for urticaria.

2. Assess the airway and breathing pattern.

3. Notify the healthcare provider (HCP).

4. Activate the rapid response team.

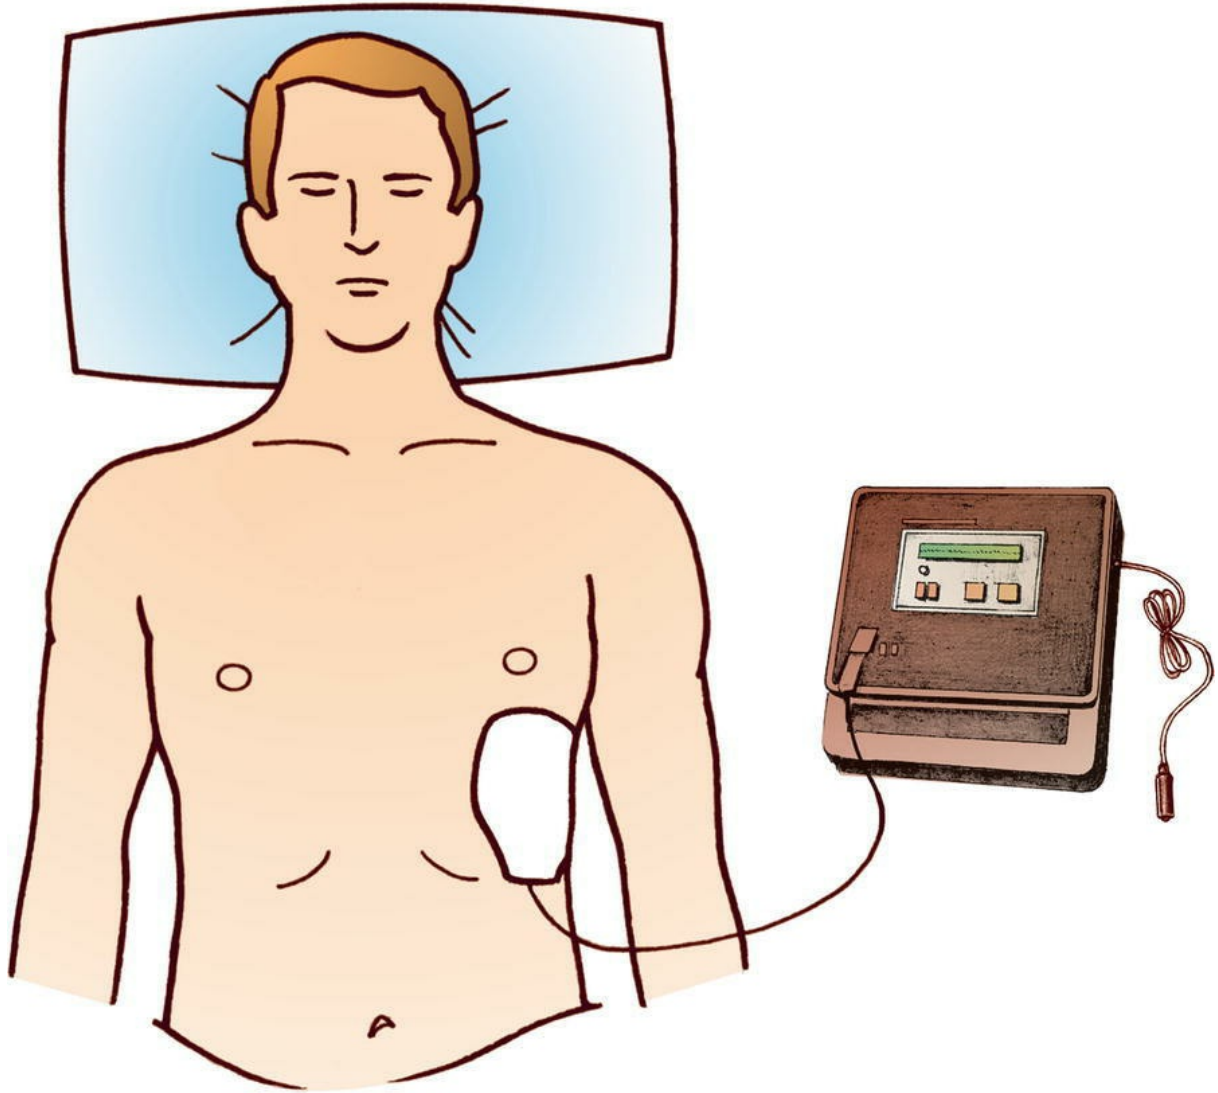

13. Proper hand placement for chest compressions during cardiopulmonary resuscitation (CPR) is essential to reduce the risk of which complication?

- ☐ 1. gastrointestinal bleeding
- ☐ 2. myocardial infarction
- ☐ 3. emesis
- ☐ 4. rib fracture

14. Automated external defibrillators (AEDs) are used in cardiac arrest situations for:

- ☐ 1. early defibrillation in cases of atrial fibrillation.
- ☐ 2. cardioversion in cases of atrial fibrillation.
- ☐ 3. pacemaker placement.
- ☐ 4. early defibrillation in cases of ventricular fibrillation.

15. Indicate on the illustration where the nurse would place the other electrode of the automated external defibrillator (AED) on a victim who has collapsed and does not have a pulse.

16. An adult has been admitted to the emergency department diagnosed with food poisoning following an outdoor picnic. What should the nurse do? Select all that apply.

- ☐ 1. Tell the family to discard contaminated food.
- ☐ 2. Collect specimens for laboratory examination.
- ☐ 3. Assess vital signs.
- ☐ 4. Initiate support for the respiratory system.
- ☐ 5. Monitor fluid and electrolyte status.
- ☐ 6. Provide antiemetics, as prescribed.

17. A client is admitted to the emergency department after being found in a daze walking away from her burning car after an accident. She was not

injured in the accident, but the other driver died. She states, “I cannot handle it anymore. There is no point to it all.” The crisis nurse recommends hospital admission based on the identification of which concern?

- ☐ 1. The client was walking around in a daze.
- ☐ 2. The client has a lack of knowledge of what to do next.
- ☐ 3. The client is having delusions and is not in touch with reality.
- ☐ 4. The client is expressing helplessness and hopelessness and is a risk for suicide.

18. A client is brought to the emergency department via ambulance accompanied by her sister. The sister states, “She was playing cards with us and had a seizure. Then she had another seizure just as the first one was stopping, so I called the ambulance.” The client is currently not demonstrating any seizure activity, her eyes are closed, and she does not respond to commands. Which intervention should the nurse implement **first**?

- ☐ 1. Make sure suction equipment is set up bedside.
- ☐ 2. Draw blood for a phenytoin level.
- ☐ 3. Assess the client’s vital signs.
- ☐ 4. Prepare the client for a head computed tomography (CT).

19. The nurse in the emergency department reports there is a possibility of having had direct contact with blood of a client who is suspected of having HIV/AIDS. The nurse requests that the client have a blood test. Consent for human immunodeficiency virus (HIV) testing can only be completed when which circumstances are present? Select all that apply.

- ☐ 1. An emergency medical provider has been exposed to the client’s blood or body fluids.
- ☐ 2. Testing is prescribed by a healthcare provider (HCP) under emergency circumstances.
- ☐ 3. Testing is prescribed by a court, based on evidence that the client poses a threat to others.
- ☐ 4. Testing is done on blood collected anonymously in an epidemiologic survey.
- ☐ 5. A healthcare provider (HCP) who is taking care of a client suspected of having HIV/AIDS requests a blood test.

Mass Casualties

20. Thirty people are injured in a train derailment. Which client should be transported to the hospital **first**?

- ☐ 1. a 20-year-old who is unresponsive and has a high injury to his spinal cord
- ☐ 2. an 80-year-old who has a compound fracture of the arm
- ☐ 3. a 10-year-old with a laceration on his leg
- ☐ 4. a 25-year-old with a sucking chest wound

21. An explosion at a chemical plant produces flames and smoke. More than 20 persons have burn injuries. Which victims, all adults, should be transported to a burn center? Select all that apply.

- ☐ 1. the victim with chemical spills on both arms
- ☐ 2. the victim with third-degree burns of both legs
- ☐ 3. the victim with first-degree burns of both hands
- ☐ 4. the victim in respiratory distress
- ☐ 5. the victim who inhaled smoke

22. An apartment fire spreads to seven apartment units. Victims suffer burns, minor injuries, and broken bones from jumping from windows. Which client should be transported **first**?

- ☐ 1. a woman who is 5 months pregnant with no apparent injuries
- ☐ 2. a middle-aged man with no injuries who has rapid respirations and coughs
- ☐ 3. a 10-year-old with a simple fracture of the humerus who is in severe pain
- ☐ 4. a 20-year-old with first-degree burns on her hands and forearms

23. There is a shooting in a shopping mall. Three victims with gunshot wounds are brought to the emergency department. What should the nurse do to preserve forensic evidence? Select all that apply.

- ☐ 1. Cut around blood stains to remove clothing.
- ☐ 2. Place each item of clothing in a separate paper bag.
- ☐ 3. Hang wet clothing to dry.
- ☐ 4. Refrain from documenting client statements.

☐ 5. Place bullets in a sterile container.

24. An airplane crash results in mass casualties. The nurse is directing personnel to tag all victims. Which information should be placed on the tag? Select all that apply.

- ☐ 1. triage priority
- ☐ 2. identifying information when possible (such as name, age, and address)
- ☐ 3. medications and treatments administered
- ☐ 4. presence of jewelry
- ☐ 5. next of kin

25. Four people who have been injured in a car accident are admitted to the emergency department. Using the emergency severity index (ESI), in which order should the victims be seen by a healthcare provider (HCP)?

1. an adult with severe bleeding from a laceration in the leg

2. a child with lacerations on the arms and legs

3. an adult with a history of asthma and respirations of 30 breaths per minute.

4. an older adult with normal vital signs, but is confused

26. A small airplane crashes in a neighborhood of 10 houses. One of the victims appears to have a cervical spine injury. What should first aid for this

victim include? Select all that apply.

- ☐ 1. Establish an airway with the jaw-thrust maneuver.
- ☐ 2. Immobilize the spine.
- ☐ 3. Logroll the victim to a side-lying position.
- ☐ 4. Elevate the feet 6 inches (15.2 cm).
- ☐ 5. Place a cervical collar around the neck.

27. Thirty-two children are brought to the emergency department after a school bus accident. Two children were killed along with the three people in the car that caused the crash. Before the victims arrive, in addition to ensuring that the hospital staff are prepared for the emergency, which step should the nurse anticipate carrying out?

- ☐ 1. calling the nearest crisis response team
- ☐ 2. alerting the news media
- ☐ 3. notifying the hospital volunteer office
- ☐ 4. calling the school to inform teachers of the accident

28. The nurse in the emergency department is triaging victims of an airplane crash. Prioritize the clients in the order in which they should be treated from first to last. All options must be used.

1. a 75-year-old with a 2-inch (5.1-cm) laceration to the left forearm

2. a 22-year-old with a 2-inch (5.1-cm) laceration to the left temple, slightly confused

3. a 14-year-old with a 2-inch (5.1-cm) laceration to the chin, history of asthma, respirations 26 breaths/min, audible wheezing

4. a 22-year-old female, 36 weeks pregnant with contractions every 10 to 15 minutes

Disasters

29. A suspected outbreak of anthrax has been transmitted by skin exposure. A client is admitted to the emergency department with lesions on the hands. The healthcare provider prescribes antibiotics and sends the client home. What should the nurse instruct the client to do? Select all that apply.

- ☐ 1. Take the prescribed antibiotics for 60 days.
- ☐ 2. Avoid contact with other members of the family during the treatment period.
- ☐ 3. Wear a mask for 60 days.
- ☐ 4. Expect the skin lesions to clear up within 1 to 2 weeks.
- ☐ 5. Wash hands frequently.

30. A severe acute respiratory syndrome (SARS) epidemic is suspected in a community of 10,000 people. As clients with SARS are admitted to the hospital, what type of precautions should the nurse institute?

- ☐ 1. enteric precautions
- ☐ 2. handwashing precautions
- ☐ 3. reverse isolation precautions
- ☐ 4. airborne precautions

31. Several clients who work in the same building are brought to the emergency department. They all have fever, headache, a rash over the entire body, and abdominal pain with vomiting and diarrhea. Upon initial assessment, the nurse finds that each client has low blood pressure and has developed petechiae in the area where the blood pressure cuff was inflated. Which isolation precautions should the nurse initiate?

- ☐ 1. contact isolation with double gloving and shoe covers
- ☐ 2. respiratory isolation with positive pressure rooms
- ☐ 3. enteric precautions

- ☐ 4. reverse isolation

32. Eight farm workers are admitted to the emergency department after they were splashed with “a couple of chemicals” at work 30 minutes ago. They have watery/itchy eyes, slight cough, diaphoresis, and constricted pupils and are conscious and oriented. Their clothes are wet. What action should the nurse do **first**?

- ☐ 1. Apply oxygen at 3 L per nasal cannula.
- ☐ 2. Remove their clothing.
- ☐ 3. Begin decontamination shower.
- ☐ 4. Isolate the clients.

33. The nurse is triaging victims of an earthquake who were removed from a building following its collapse. Which victims should be classified as red? Select all that apply.

- ☐ 1. a 10-year-old male with crushing chest wound, tachypnea with labored breathing, unconscious, impaled object in the forehead
- ☐ 2. a 49-year-old male with crushing chest pain radiating to the jaw, is diaphoretic, nauseated, and has an open fracture of the left wrist
- ☐ 3. a 75-year-old female with obvious fracture of the femur, absent pedal pulses on the affected side; heart rate 110 bpm, respirations 34 breaths/min, skin diaphoretic; awake/alert, states pain is 10 on a scale of 1 to 10
- ☐ 4. a 32-year-old female who is unconscious, 3-inch (7.6-cm) laceration to her forehead, ecchymosis behind the ears, respiratory rate 10 breaths/min and shallow; radial pulse is weak/thready/rapid; no breath sounds on the right side

34. The nurse is assessing the client (see photo) who has recently returned from a 2-month mission in Africa. What type of respiratory protection is appropriate for the staff?

- ☐ 1. N95 particulate respirator
- ☐ 2. double-layered surgical mask
- ☐ 3. surgical mask with eye shield
- ☐ 4. no respiratory protection needed

Managing Care, Quality, and Safety of Clients

35. A client who was a victim of a gunshot wound was treated in the emergency department and died. What should the nurse direct the unlicensed assistive personnel (UAP) to do during postmortem care? Select all that apply.

- ☐ 1. Remove all tubes and IV lines.
- ☐ 2. Cover the body with a sheet.
- ☐ 3. Notify the family.
- ☐ 4. Transport the body to the morgue.
- ☐ 5. Notify the chaplain.

36. The nurse in the emergency department is administering a prescription for 20 mg intravenous furosemide, which is to be given immediately. The nurse scans the client's identification band and the medication barcode. The medication administration system does not verify that furosemide is prescribed for this client; however, the furosemide is prepared in the accurate unit dose for intravenous infusion. What should the nurse do **next**?

- ☐ 1. Contact the pharmacist immediately to check the prescription and the barcode label for accuracy.
- ☐ 2. Administer the medication now, knowing the medication is labeled and the client is identified.
- ☐ 3. Report the problem to the information technology team to have the barcode system recalibrated.
- ☐ 4. Ask another nurse to verify the medication and the client so the medication can be given now.

37. The nurse notices a pair of nervous-acting individuals entering the emergency department. When reporting suspicious activity, the nurse should include which information in the report? Select all that apply.

- ☐ 1. vehicle/vehicles description
- ☐ 2. current location of parties involved
- ☐ 3. names and phone numbers of parties involved
- ☐ 4. relationship to hospitalized client
- ☐ 5. tone of voice of each party involved

38. There has been an increase in medication errors and errors in prescribing laboratory studies in the emergency department. The nurse manager is conducting a staff education session on when to use “read-back” procedures. “Read-back” procedures should be performed in which situations? Select all that apply.

- ☐ 1. when a medication prescription or critical laboratory result is received verbally or over the telephone
- ☐ 2. when any verbal or phone prescription is received
- ☐ 3. whenever a written prescription or printed critical test result is received
- ☐ 4. when the unit secretary takes a phone prescription
- ☐ 5. when the agency uses computerized healthcare records

39. Which client admitted to the emergency department should the nurse see **first**? A client:

- ☐ 1. experiencing a “ripping” sensation in the chest.
- ☐ 2. with a blood pressure of 170/95 mm Hg.
- ☐ 3. with a urine output of 240 mL in 12 hours.

- ❑ 4. taking anticoagulants with bloody stool.

Answers, Rationales, and Test-Taking Strategies

*The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in part 1 of this book.*

Emergencies

1. 3. Carbon monoxide poisoning develops when carbon monoxide combines with hemoglobin. Because carbon monoxide combines more readily with hemoglobin than oxygen does, tissue anoxia results. The nurse should administer 100% oxygen by mask to reduce the half-life of carboxyhemoglobin. Gastric lavage is used for ingested poisons. With tissue anoxia, metabolism is diminished, with a subsequent lowering of the body's temperature; thus, steps to increase body temperature would be required. Unless the carbon monoxide poisoning is intentional, a psychiatric referral would be inappropriate.

CN: Physiological adaptation; CL: Synthesize

2. 2. Because of the degree of contamination of the open fracture and the time that has passed since the accident, the risk of infection is very high. Therefore, the nurse should be especially alert for signs and symptoms of possible existing infection or early signs of infections, such as debris in the wound site, temperature abnormalities, results of laboratory studies (such as complete blood cell count and wound culture and sensitivities), or heat or redness around or in the wound. Because the client's vital signs and cardiovascular status are stable at this time, hemorrhage is not the primary

concern. The client is talking coherently at this point, which does not suggest shock. However, the nurse should continue to assess the client for signs and symptoms of hemorrhage and shock. The fracture would be corrected by surgery as soon as possible, thereby minimizing the risk of deformity.

CN: Physiological adaptation; CL: Analyze

3.3. The nurse should first administer oxygen; in atrial fibrillation, the workload of the heart is increased, and as a result, myocardial oxygen demands are also increased. A heparin bolus may be prescribed; it is not clear how long the client has been in atrial fibrillation, and it is critical to determine this before treatment is initiated. Beta-blockers and cardioversion are not primary interventions, and it is important first to determine if the client is hemodynamically stable and the length of time the client has had atrial fibrillation.

CN: Physiological integrity; CL: Analyze

4.3,4,5. Clients who experience atrial fibrillation for more than 48 hours are at an increased risk of developing blood clots due to stasis of blood in the atria. Initially, it will be important to maintain a ventricular heart rate of <100 bpm and prevent complications related to clot formation including an embolic stroke. Decreasing heart rate will help to increase exercise tolerance. Atrial fibrillation causes a decrease in cardiac output, and a goal of therapy would be to increase cardiac output. It is imperative to determine the length of time a client has been in atrial fibrillation prior to performing a cardioversion. If a client has been in atrial fibrillation longer than 48 hours and a cardioversion is performed, a clot may be dislodged and find its way to the brain, lungs, or coronary arteries.

CN: Physiological integrity; CL: Synthesize

5.2. Infection prevention is the immediate priority for this client in order to promote healing and successful corneal transplant with potential restoration of vision. Rest and a diet rich in nutrients and fiber to prevent straining due to constipation are important considerations as well as allowing the client to discuss feelings regarding vision loss. However, these are currently lower priority than infection prevention.

CN: Reduction of risk potential; CL: Analyze

6. 3. In order to prevent infections in hospitals, the nurse institutes measures to contain respiratory secretions in symptomatic clients. The nurse gives the client a mask to wear and tissues; the nurse instructs the client to dispose of used tissues in a no-touch receptacle. It is not necessary to place the client in isolation. It is not appropriate to ask others to move away from the client, but the nurse can ask the client to keep 3 feet away from others in the waiting room, if there is room. The nurse instructs the client to perform hand hygiene after blowing his nose or touching his nose or face, but doing so is not a prerequisite for being examined by the **HCP**. The nurse and HCP also use hand hygiene practices when caring for this client.

CN: Safety and infection control; CL: Synthesize

7. 2. The middle-aged female is likely in shock; she is classified as a triage level I, requiring immediate care. The child with moderate trauma is classified as triage level III, urgent, and can be treated within 30 minutes. The man with asthma and the man with the severe headache are classified as emergent, triage level II, and can be transported by ambulance and reach the hospital within 15 minutes.

CN: Physiological adaptation; CL: Synthesize

8. 3,4,1,2. The nurse uses the RACE procedure to manage a fire: Rescue, Alarm, Confine, Extinguish.

CN: Safety and infection control; CL: Apply

9. 2. Circulation can be impaired by circumferential burns and edema, causing compartment syndrome. Early recognition and treatment of impaired blood supply is key. The **HCP**  should be informed since an escharotomy (incision through full-thickness eschar) is frequently performed to restore circulation. Pain management is important for burn clients, but restoration of circulation is the priority. Assessments should be performed every 15 minutes while there is absence of the radial pulse. Exercise will not restore the obstructed circulation.

CN: Safety and infection control; CL: Synthesize

10. 1. The client is demonstrating vital signs consistent with fluid volume deficit, likely due to bleeding and/or hypovolemic shock as a result of the

automobile accident. The client will need intravenous fluid volume replacement using an isotonic fluid (e.g., 0.9% normal saline) to expand or replace blood volume and normalize vital signs. The other prescriptions can be implemented once the intravenous fluids have been initiated.

CN: Physiologic adaptation; CL: Analyze

11. 1. Calling the victim's name and gently shaking the victim is used to establish unresponsiveness. The head-tilt, chin-lift maneuver is used to open the victim's airway. Feeling for any air movement from the victim's nose or mouth indicates whether the victim is breathing on his own. The rescuer can watch the victim's chest for respirations to see if the victim is breathing.

CN: Physiological adaptation; CL: Synthesize

12. 2,1,4,3. If a client is experiencing an allergic response, the nurse's initial action is to assess the client for signs/symptoms of anaphylaxis, first checking the airway, breathing pattern, and vital signs, with particular attention to signs of increasing edema and respiratory distress. The nurse should then assess for other indications of anaphylaxis, such as urticaria, feelings of impending doom or fright, weakness, sweating (because a severe systemic response to an allergen can result in massive vasodilation), increased capillary permeability, decreased perfusion, decreased venous return, and subsequent decreased cardiac output. The nurse should call the **rapid response team** and then notify the **HCP** 📖.

CN: Reduction of risk potential; CL: Synthesize

13. 4. Proper hand placement during chest compressions is essential to reduce the risk of rib fractures, which may lead to pneumothorax and other internal injuries. Gastrointestinal bleeding and myocardial infarction are generally not considered complications of CPR. Although the victim may vomit during CPR, this is not associated with poor hand placement, but rather with distention of the stomach.

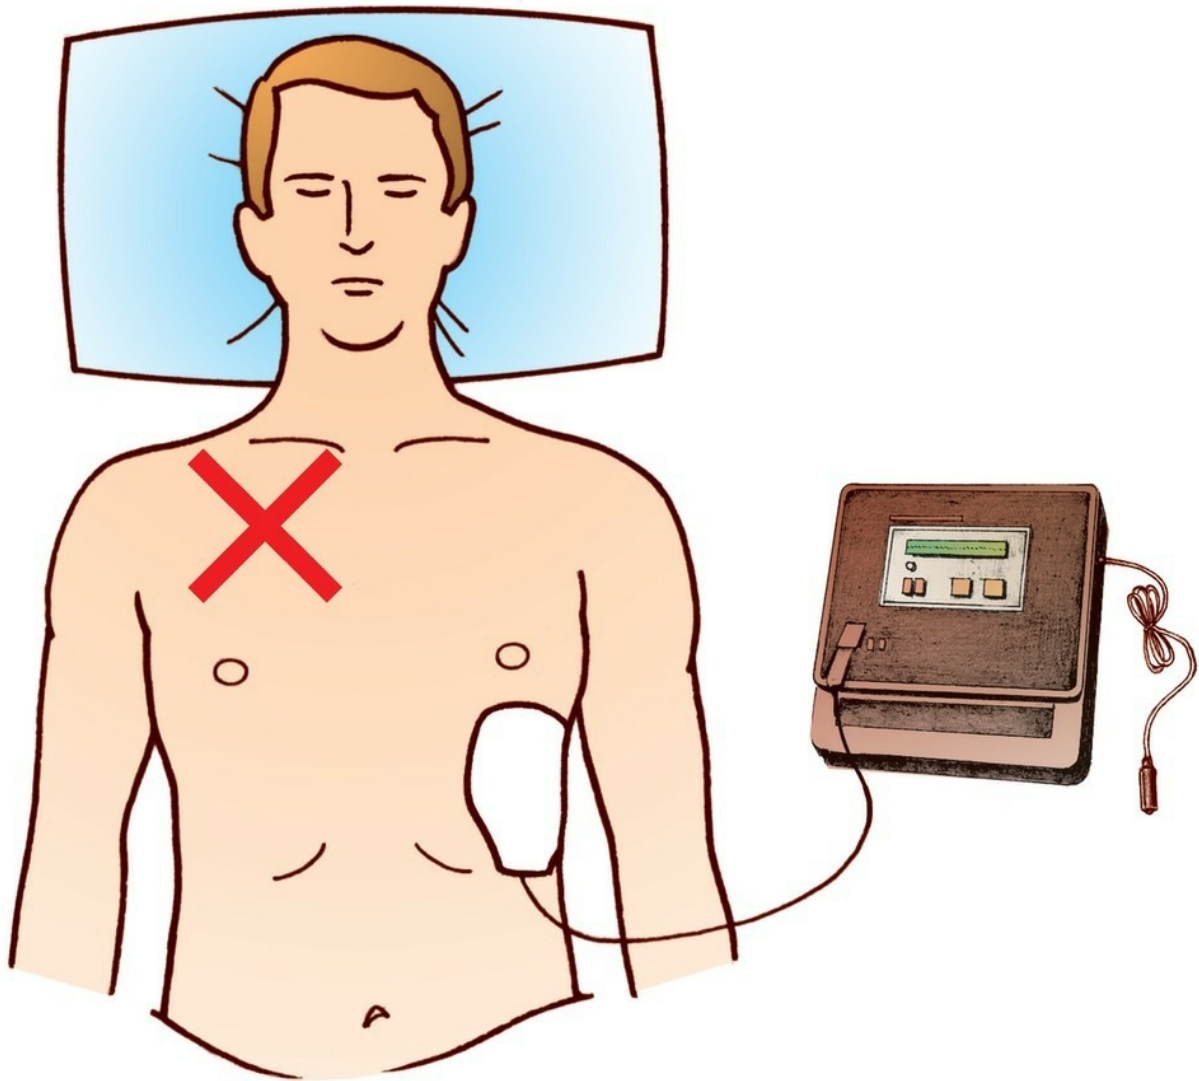

CN: Physiological adaptation; CL: Apply

14. 4. AEDs are used for early defibrillation in cases of ventricular fibrillation. The AHA and Canadian Heart and Stroke Foundation place major emphasis on early defibrillation for ventricular fibrillation and use of

the AED as a tool to increase sudden cardiac arrest survival rates.

 CN: Reduction of risk potential; CL: Apply

15. One electrode is placed to the right of the upper sternum just below the right clavicle. The other is placed, as shown, over the fifth or sixth intercostal space at the left anterior axillary line.

 CN: Reduction of risk potential; CL: Apply

16. 2,3,4,5,6. Food poisoning is a sudden illness that occurs after ingestion of contaminated food or drink. The nurse should first assess vital signs and then ensure that the client is not in respiratory distress because death from respiratory paralysis can occur with botulism, fish poisoning, and other food poisonings. Measures to control nausea are important to prevent vomiting,

which could exacerbate fluid and electrolyte imbalance. Because large volumes of electrolytes and water are lost by vomiting and diarrhea, fluid and electrolyte status needs to be continuously monitored. The key to treatment is determining the source and type of food poisoning. If possible, rather than discarding the food, the suspected food should be brought to the medical facility and a history obtained from the client or family.

CN: Physiological adaptation; CL: Synthesize

17. 4. The client is demonstrating helplessness and hopelessness during a crisis, as evidenced by her statement, “I cannot handle it. There is no point to it.” Feelings of helplessness and hopelessness are common factors associated with suicidal ideation. Therefore, the client must be hospitalized to ensure safety to herself. There is not sufficient information to know if the client has a lack of knowledge of what to do next. The client is not having delusions, which would be evidenced by statements such as “The devil set my car on fire,” not just the inability to think clearly.

CN: Psychosocial integrity; CL: Analyze

18. 1. Following a seizure (postictal stage), the client will most likely be tired and want to sleep. Maintaining the airway is the priority; the nurse should verify that suction equipment is available in case the client aspirates or chokes. Assessing vital signs and obtaining a phenytoin level are both appropriate actions by the nurse, but assuring safety is the first priority. There is no indication of a need to obtain a head CT at this time.

CN: Physiological integrity; CL: Synthesize

19. 1,2,3,4. Upon an **HCP’s** written prescription requesting an HIV test for a client, **consent** for HIV testing must be obtained. Consent exceptions include the following: testing is prescribed by an HCP under emergency circumstances, and the test is medically necessary to diagnose or treat the client’s condition; testing is prescribed by a court, based on clear and convincing evidence of a serious and present health threat to others posed by an individual; testing is done on blood collected or tested anonymously as part of an epidemiologic survey; or an emergency medical provider has been exposed to the client’s blood or body fluids.

CN: Safety and infection control; CL: Apply

Mass Casualties

20. 4. During a disaster, the nurse must make difficult decisions about which persons to treat first. The guidelines for triage offer general priorities for immediate, delayed, minimal, and expectant care. The client with a sucking chest wound needs immediate attention and will likely survive. The 80-year-old is classified as delayed; emergency response personnel can immobilize the fracture and cover the wound. The 10-year-old has minimal injuries and can wait to be treated. The client with a spinal cord injury is not likely to survive and should not be among the first to be transported to the healthcare facility.

 CN: Management of care; CL: Analyze

21. 1,2,4,5. Victims with chemical burns, second- and third-degree burns over more than 20% of their body surface area, and those with inhalation injuries should be transported to a burn center. The victim with first-degree burns of the hands can be treated with first aid on the scene and referred to a healthcare facility.

 CN: Management of care; CL: Analyze

22. 2. The man with respiratory distress and coughing should be transported first because he is probably experiencing smoke inhalation. The pregnant woman is not in imminent danger or likely to have a precipitous birth. The 10-year-old is not at risk for infection and could be treated in an outpatient facility. First-degree burns are considered less urgent.

 CN: Management of care; CL: Analyze

23. 2,3. Preserving forensic evidence is essential for investigative purposes following injuries that may be caused by criminal intent. The nurse should put each item of clothing in a separate paper bag and label it; wet clothing should be hung to dry. The nurse should not cut or otherwise unnecessarily handle clothing, particularly clothing with such evidence as blood or body fluids. The nurse should document carefully the client's description of the incident and use quotes around the client's exact words where possible. The documentation will become a part of the client's record and can be subpoenaed for subsequent investigation. The nurse should not handle bullets

from the client because they are an important piece of forensic evidence.

 CN: Management of care; CL: Apply

24. 1,2,3. Tracking victims of disasters is important for casualty planning and management. All victims should receive a tag, securely attached, that indicates the triage priority, any available identifying information, and what care, if any, has been given along with time and date. Tag information should be recorded in a disaster log and used to track victims and inform families. It is not necessary to document the presence of jewelry or next of kin.

 CN: Management of care; CL: Apply

25. 1,3,2,4. Using the emergency severity index, the nurse should triage the clients to be seen by an **HCP**  as follows: the adult with severe bleeding is categorized as level 1, life threatening and should be seen first; the adult with asthma and rapid bleeding is in the emergent category and should be seen next; the child with lacerations is categorized as less urgent and can be seen next; and the older adult has vital signs within normal range and is assessed as being nonurgent and can be seen last.

 CN: Management of care; CL: Analyze

26. 1,2. The victim of a neck injury should be immobilized and moved as little as possible. It is also important to ensure an open airway; this can be accomplished with the jaw-thrust maneuver, which does not require tilting the head. The victim should not be rolled to a side-lying position nor have his feet elevated. Both actions can cause additional injury to the spinal cord. Placing a cervical collar causes movement of the spinal column and should not be done as a first aid measure.

 CN: Management of care; CL: Synthesize

27. 1. The children and their families are at risk for experiencing a crisis. Disaster teams are available for crisis intervention in such emergencies. Usually, the news media monitors emergency radio frequencies and most likely are aware of the accident already. Although volunteers may help in some ways, they are not responsible for crisis intervention. Calling the school might be done, but the emergency issues take precedence.

 CN: Psychosocial integrity; CL: Synthesize

28. 3,2,4,1. The 14-year-old with asthma needs immediate, lifesaving interventions for the wheezing and should be seen first. The 22-year-old who is confused should be seen next to assess for head injury; the location of the laceration could indicate a significant blunt force traumatic injury. The pregnant female requires assessment but is not urgent unless other symptoms appear. The 75-year-old is nonurgent and can wait safely for several hours.

CN: Management of care; CL: Evaluate

Disasters

29. 1,4. Anthrax is treated with antibiotics, and the client must continue the prescription for 60 days, even if symptoms do not persist. The client may have skin lesions at the point of contact, with macula or papule formation; the eschar will fall off in 1 to 2 weeks. Clients with anthrax are not contagious; the client does not need to follow isolation procedures at home. Anthrax from skin exposure is not transmitted by respiratory contact, and the client does not need to wear a mask.

CN: Safety and infection control; CL: Synthesize

30. 4. Transmission of SARS can be contained by airborne precautions that include an isolation room with negative pressure, use of N95 respirator, and use of personal protective equipment. The disease is spread by the respiratory, not enteric, route. Handwashing alone is not sufficient to prevent transmission. Reverse isolation (protection of the client) is not sufficient to prevent transmission.

CN: Safety and infection control; CL: Synthesize

31. 1. The nurse should institute treatment for hemorrhagic fever viruses, including contact isolation with double gloving and shoe covers, strict hand hygiene, and protective eyewear. The nurse should start respiratory isolation with negative pressure rooms, not positive pressure rooms. Enteric precautions are not needed because the virus is spread by droplet and contact. Reverse isolation protects the client; in this situation, the healthcare team also needs protection.

CN: Reduction of risk potential; CL: Synthesize

32. 4. Safety of the staff and others is the first priority. Isolating reduces the chance of contaminating others (secondary contamination). Vital signs can be obtained when it is safe—after protecting staff, clients, and visitors from secondary contamination. Oxygen is not indicated for any of the listed symptoms. Removing clothing is important to prevent further exposure to the client, but must be done in a safe manner to prevent secondary contamination to others. The clients can remove their own clothes and place them in plastic bags. After the safety of the staff and others is addressed, and the facility is prepared and properly trained staff is ready, the clients can be given a decontamination shower. If the staff is not trained, 911 may be the most appropriate response. Finding out which chemicals were involved is important but does not take priority over preventing secondary contamination.

CN: Management of care; CL: Synthesize

33. 2,3. The client with crushing chest pain has an acute cardiac condition and can have a successful outcome if immediate interventions are initiated. The client with the open fracture could be stabilized and is not a significant factor in triage in a mass casualty incident. The client with a displaced femur fracture can also be classified as immediate because the fracture can impair circulation. There are also signs of shock and severe pain. All conditions can improve with interventions. In a mass casualty incident, the goal is to do the greatest good for the greatest number—which sometimes means that limited resources are not allocated to the very critically injured who have a very low probability of survival. The other two clients are categorized as “black”/expectant because of their critical injuries and the unavailability of advance trauma care.

CN: Management of care; CL: Analyze

34. 1. Any type of blistering lesion, such as smallpox, requires extreme care to prevent exposure. Transmission-based precautions for smallpox includes airborne, droplet, and contact precautions. The N95 mask filters at least 95% of airborne particles. To prevent exposure through the respiratory tract, the N95 mask must be fitted and worn properly.

CN: Safety and infection control; CL: Synthesize

Managing Care, Quality, and Safety of Clients

35. 2,4. The **UAP**  can cover the body and transport it to the morgue. Deaths by gunshot wound are considered reportable deaths. All evidence in a reportable death, including tubes and IV lines, should remain intact until the coroner has been contacted. The **healthcare provider (HCP)**  should be the one to notify the family. The nurse should be the one to notify the chaplain.

 CN: Management of care; CL: Synthesize

36. 1. The nurse should contact the pharmacist first to be sure the medication is labeled for administration to this client. The nurse should not administer the drug until all safety precautions have been observed; the nurse should also not ask another nurse to verify the medication or client. Later, if the problem cannot be resolved with relabeling the medication, the nurse or pharmacist can contact the information technology team to check the barcode system.

 CN: Safety and infection control; CL: Synthesize

37. 1,2. All suspicious individuals or activities should be reported as soon as possible to the security department. When reporting an incident, nurses/employees should provide the following: (a) type of incident, (b) persons involved/physical description, (c) vehicles involved and description, (d) date and time the incident occurred, (e) location where the incident occurred, (f) weapons involved, and (g) current location of parties involved. All reports of threats, actual episodes of violence, or suspicious individuals or activities must be investigated.

 CN: Safety and infection control; CL: Synthesize

38. 1,2. A goal of client safety is to improve the effectiveness of communication among caregivers. For verbal or telephone prescriptions, or for telephone reporting of critical test results, one must verify the complete prescription or test result by having the individual receiving the information record “read-back” the complete prescription or test result. The unit secretary is not a licensed healthcare professional who has a scope of practice or the authority to receive prescriptions or results. The type of charting system used

by the healthcare agency is not a factor in using “read-back” prescriptions.

CN: Safety and infection control; CL: Synthesize

39. 1. A client experiencing a “ripping” sensation in the chest is indicative of a ruptured thoracic aneurysm and warrants an immediate intervention. While a blood pressure of 170/95 mm Hg is high, there is not enough information that suggests that this client is a higher priority than the others. A urine output of 240 mL in 12 hours is <30 mL/h; however, this is this client’s only problem now, and the nurse can investigate the cause next. A client experiencing bloody stools will need to be seen; however, no other information is present that would warrant this client being seen first.

The Nursing Care of Clients with Psychiatric Disorders and Mental Health Problems

TEST

1

Mood Disorders

- The Client with Major Depression
- The Client with Bipolar Disorder, Manic Phase
- The Client with Suicidal Ideation and Suicide Attempt
- The Client with Psychosexual Disorders
- Managing Care, Quality, and Safety of Clients with Psychiatric Disorders and Mental Health Problems
- Answers, Rationales, and Test-Taking Strategies

The Client with Major Depression

1. The nurse is planning care with a Latino client who is diagnosed with a depressive disorder. The client believes in “mal de ojo” (the evil eye) and uses treatment by a root healer. Which intervention is **most** indicated?

- ☐ 1. Avoid talking to the client about the root healer.
- ☐ 2. Explain to the client that Western medicine has a scientific, not mystical, basis.
- ☐ 3. Explain that such beliefs are superstitious and should be forgotten.
- ☐ 4. Involve the root healer in a consultation with the client, healthcare provider (HCP), and nurse.

2. After a period of unsuccessful treatment with amitriptyline, a client

diagnosed with depression is switched to tranylcypromine. Which statement by the client indicates the client understands the side effects of tranylcypromine?

- ☐ 1. "I need to increase my intake of sodium."
- ☐ 2. "I must refrain from strenuous exercise."
- ☐ 3. "I must refrain from eating aged cheese or yeast products."
- ☐ 4. "I should decrease my intake of foods containing sugar."

3. A client is scheduled for the first electroconvulsive therapy (ECT) treatment in the morning and has been unable to sleep. In what order should the nurse perform the interventions from first to last? All options must be used.

1. Sit quietly with the client.

2. Encourage the use of prescribed PRN temazepam.

3. Offer use of an audio recording with relaxing music.

4. Discuss specific concerns.

4. A client visits the mental health clinic and tells the nurse that she is lethargic, experiences pain in her back, cannot concentrate, and is depressed. The nurse observes patches of hair loss on the client's scalp. Which referral should the nurse make **first**?

- ☐ 1. occupational therapist

- ☐ 2. physical therapist
- ☐ 3. psychologist
- ☐ 4. a healthcare provider (HCP)

5. A client has been taking 30 mg of duloxetine twice daily for 2 months because of depression and vague aches and pains. While interacting with the nurse, the client discloses a pattern of drinking a six-pack of beer daily for the past 10 years to help with sleep. What should the nurse do **first**?

- ☐ 1. Refer the client to the concurrent disorders program at the clinic.
- ☐ 2. Share the information at the next interdisciplinary treatment conference.
- ☐ 3. Report the client's beer consumption to the healthcare provider (HCP).
- ☐ 4. Teach the client relaxation exercises to perform before bedtime.

6. A client was admitted to the inpatient unit 3 days ago with a flat affect, psychomotor retardation, anorexia, hopelessness, and suicidal ideation. The healthcare provider (HCP) prescribed 75 mg of venlafaxine extended release to be given every morning. The client interacted minimally with the staff and spent most of the day in his room. As the nurse enters the unit at the beginning of the evening shift, the client is smiling and cheerful and appears to be relaxed. What should the nurse interpret as the **most** likely cause of the client's behavior?

- ☐ 1. The venlafaxine is helping the client's symptoms of depression significantly.
- ☐ 2. The client's sudden improvement calls for close observation by the staff.
- ☐ 3. The staff can decrease their observation of the client.
- ☐ 4. The client is nearing discharge due to the improvement of his symptoms.

7. The client is taking 50 mg of lamotrigine daily for bipolar disorder. The client shows the nurse a rash on his arm. What should the nurse do?

- ☐ 1. Report the rash to the healthcare provider (HCP).
- ☐ 2. Explain that the rash is a temporary adverse effect.
- ☐ 3. Give the client an ice pack for his arm.

- ☐ 4. Question the client about recent sun exposure.

8. The nurse is reviewing the laboratory report with the client's lithium level prior to administering the 1700 hours dose. The lithium level is 1.8 mEq/L (1.8 mmol/L). The nurse should:

- ☐ 1. administer the 1700 hours dose of lithium.
- ☐ 2. hold the 1700 hours dose of lithium.
- ☐ 3. give the client 240 mL of water with the lithium.
- ☐ 4. give the lithium after the client's supper.

9. A nurse is conducting a psychoeducational group for family members of clients hospitalized with depression. Which family member's statement indicates a need for additional teaching?

- ☐ 1. "My husband will slowly feel better as his medicine takes effect over the next 2 to 4 weeks."
- ☐ 2. "My wife will need to take her antidepressant medicine and go to group to stay well."
- ☐ 3. "My son will only need to attend outpatient appointments when he starts to feel depressed again."
- ☐ 4. "My mother might need help with grocery shopping, cooking, and cleaning for a while."

10. A 16-year-old client is prescribed 10 mg of paroxetine at bedtime for major depression. The nurse should instruct the client and parents to monitor the client closely for which adverse effect?

- ☐ 1. headache
- ☐ 2. nausea
- ☐ 3. fatigue
- ☐ 4. agitation

11. A client diagnosed with major depression spends most of the day lying in bed with the sheet pulled over his head. Which approach by the nurse is **most** therapeutic?

- ☐ 1. Wait for the client to begin the conversation.
- ☐ 2. Initiate contact with the client frequently.
- ☐ 3. Sit outside the client's room.

- ☐ 4. Question the client until the client responds.

12. The client exhibits a flat affect, psychomotor retardation, and depressed mood. The nurse attempts to engage the client in an interaction, but the client does not respond to the nurse. Which response by the nurse is **most** appropriate?

- ☐ 1. "I will sit here with you for 15 minutes."
☐ 2. "I will come back a little bit later to talk."
☐ 3. "I will find someone else for you to talk with."
☐ 4. "I will get you something to read."

13. After a few minutes of conversation, a female client who is depressed wearily asks the nurse, "Why pick me to talk to? Go talk to someone else." Which reply by the nurse is **best**?

- ☐ 1. "I am assigned to care for you today, if you will let me."
☐ 2. "You have a lot of potential, and I would like to help you."
☐ 3. "I will talk to someone else later."
☐ 4. "I am interested in you and want to help you."

14. A client is receiving paroxetine 20 mg every morning. After taking the first three doses, the client tells the nurse that the medication upsets the stomach. What instructions should the nurse give to the client?

- ☐ 1. "Take the medication an hour before breakfast."
☐ 2. "Take the medication with some food."
☐ 3. "Take the medication at bedtime."
☐ 4. "Take the medication with 4 oz (120 mL) of orange juice."

15. The healthcare provider (HCP) prescribes fluoxetine orally every morning for a 72-year-old client with depression. Which transient adverse effect of this drug requires **immediate** action by the nurse?

- ☐ 1. nausea
☐ 2. dizziness
☐ 3. sedation
☐ 4. dry mouth

16. Which statement by a client taking trazodone as prescribed by the

healthcare provider (HCP) indicates to the nurse that further teaching about the medication is needed?

- ☐ 1. "I will continue to take my medication after a light snack."
- ☐ 2. "Taking trazodone at night will help me to sleep."
- ☐ 3. "My depression will be gone in about 5 to 7 days."
- ☐ 4. "I will not drink alcohol while taking trazodone."

17. A 62-year-old female client with severe depression and psychotic symptoms is scheduled for electroconvulsive therapy (ECT) tomorrow morning. The client's daughter asks the nurse, "How painful will the treatment be for Mom?" The nurse should respond with which statement?

- ☐ 1. "Your mother will be given something for pain before the treatment."
- ☐ 2. "The healthcare provider (HCP) will make sure your mother does not suffer needlessly."
- ☐ 3. "Your mother will be asleep during the treatment and will not be in pain."
- ☐ 4. "Your mother will be able to talk to us and tell us if she is in pain."

18. During a group session, a client who is depressed tells the group that he lost his job. Which response by the nurse is **best**?

- ☐ 1. "It must have been very upsetting for you."
- ☐ 2. "Would you tell us about your job?"
- ☐ 3. "You will find another job when you are better."
- ☐ 4. "You were probably too depressed to work."

19. A client who is very depressed exhibits psychomotor retardation, a flat affect, and apathy. The nurse observes the client to be in need of grooming and hygiene. Which nursing action is **most** appropriate?

- ☐ 1. explaining the importance of hygiene to the client
- ☐ 2. asking the client if he is ready to shower
- ☐ 3. waiting until the client's family can participate in the client's care
- ☐ 4. stating to the client that it is time for him to take a shower

20. Which interventions should the nurse include in the plan of care to prepare a client for ECT? Select all that apply.

- ☐ 1. Maintain NPO status.

- ☐ 2. Verify if consent is signed.
- ☐ 3. Orient the client to place and time.
- ☐ 4. Remove dentures.
- ☐ 5. Request the client to void.
- ☐ 6. Assess client vital signs every 30 minutes.

21. Which comment indicates that a client understands the nurse's teaching about sertraline?

- ☐ 1. "Sertraline will probably cause me to gain weight."
- ☐ 2. "This medicine can cause delayed ejaculations."
- ☐ 3. "Dry mouth is a permanent side effect of sertraline."
- ☐ 4. "I can take my medicine with St. John's wort."

22. The client with recurring depression will be discharged from the psychiatric unit. What instructions for the family are **most** important to include in the plan of care?

- ☐ 1. Discourage visitors while the client is at home.
- ☐ 2. Provide for a schedule of activities outside the home.
- ☐ 3. Involve the client in usual at-home activities.
- ☐ 4. Encourage the client to sleep as much as possible.

23. A client with major depression and psychotic features is admitted involuntarily to the hospital. He will not eat because his "bowels have turned to jelly," which the client states is punishment for his wickedness. The client requests to leave the hospital. The nurse denies the request because commitment papers have been initiated by the healthcare provider (HCP). The nurse understands this client legally committable based on which - criterion?

- ☐ 1. evidence of psychosis
- ☐ 2. being gravely disabled
- ☐ 3. risk of harm to self or others
- ☐ 4. diagnosis of mental illness

24. The client who has been taking venlafaxine 25 mg PO three times a day for the past 2 days states, "This medicine is not doing me any good. I am still so depressed." Which response by the nurse is **most** appropriate?

- ☐ 1. "Perhaps we will need to increase your dose."
- ☐ 2. "Let us wait a few days and see how you feel."
- ☐ 3. "It takes about 2 to 4 weeks to receive the full effects."
- ☐ 4. "It is too soon to tell if your medication will help you."

25. The client states to the nurse, "I take citalopram 40 mg every day as my healthcare provider (HCP) prescribed. I have also been taking St. John's wort 750 mg daily for the past 2 weeks." Which findings would indicate that the client is developing serotonin syndrome? Select all that apply.

- ☐ 1. confusion
- ☐ 2. restlessness
- ☐ 3. constipation
- ☐ 4. diaphoresis
- ☐ 5. ataxia

26. Which food should the nurse tell the client to avoid while taking phenelzine?

- ☐ 1. roasted chicken
- ☐ 2. salami
- ☐ 3. fresh fish
- ☐ 4. hamburger

27. A client is taking phenelzine 15 mg PO three times a day. The nurse is about to administer the next dose when the client tells the nurse about having a throbbing headache. Which action should the nurse do **first**?

- ☐ 1. Give the client an analgesic prescribed PRN.
- ☐ 2. Call the healthcare provider (HCP) to report the symptom.
- ☐ 3. Administer the client's next dose of phenelzine.
- ☐ 4. Obtain the client's vital signs.

28. A client with severe depression and weight loss has not eaten since admission to the hospital 2 days ago. Which approach should the nurse include when developing the plan of care to ensure that the client eats?

- ☐ 1. serving the client her meal trays in her room
- ☐ 2. sitting with the client and spoon-feeding if required

- ☐ 3. calling the family to bring the client food from home
- ☐ 4. explaining the importance of nutrition in recovery

29. After administering a prescribed medication to a client who becomes restless at night and has difficulty falling asleep, which nursing action is **most** appropriate?

- ☐ 1. sitting quietly with the client at the bedside until the medication takes effect
- ☐ 2. engaging the client in interaction until the client falls asleep
- ☐ 3. reading to the client with the lights turned down low
- ☐ 4. encouraging the client to watch television until the client feels sleepy

30. Which behavior if exhibited by a client with a depressive disorder should lead the nurse to determine that the client is ready for discharge?

- ☐ 1. interactions with staff and peers
- ☐ 2. sleeping for 4 hours at a time
- ☐ 3. verbalization of feeling in control of self and situations
- ☐ 4. statements of dissatisfaction over not being able to perform at work

31. The client with major depression and suicidal ideation has been taking bupropion 100 mg PO 3 times daily for 5 days. Assessment reveals the client to be somewhat less withdrawn, able to perform activities of daily living with minimal assistance, and eating 50% of each meal. At this time, the nurse should monitor the client specifically for which behavior?

- ☐ 1. seizure activity
- ☐ 2. suicide attempt
- ☐ 3. visual disturbances
- ☐ 4. increased libido

32. Which outcome should the nurse include in the initial plan of care for a client who is exhibiting psychomotor retardation, withdrawal, minimal eye contact, and unresponsiveness to the nurse's questions?

- ☐ 1. The client will initiate interactions with peers.
- ☐ 2. The client will participate in milieu activities.
- ☐ 3. The client will discuss adaptive coping techniques.
- ☐ 4. The client will interact with the nurse.

33. When preparing a teaching plan for a client about imipramine, which substance should the nurse tell the client to avoid while taking the - medication?

- ☐ 1. caffeinated coffee
- ☐ 2. sunscreen
- ☐ 3. alcohol
- ☐ 4. artificial tears

34. The client with depression who is taking imipramine states to the nurse, "My psychiatrist wants me to have an electrocardiogram (ECG) in 2 weeks, but my heart is fine." Which response by the nurse is **most** appropriate?

- ☐ 1. "It is routine practice to have an ECG periodically because there is a slight chance that the drug may affect the heart."
- ☐ 2. "It is probably a precautionary measure because I am not aware that you have a cardiac condition."
- ☐ 3. "Try not to worry too much about this. Your healthcare provider is just being very thorough in monitoring your condition."
- ☐ 4. "You had an ECG before you were prescribed imipramine, and the procedure will be the same."

35. When assessing a client who is receiving tricyclic antidepressant therapy, which finding should alert the nurse to the possibility that the client is experiencing anticholinergic effects?

- ☐ 1. tremors and cardiac arrhythmias
- ☐ 2. sedation and delirium
- ☐ 3. respiratory depression and convulsions
- ☐ 4. urine retention and blurred vision

36. The healthcare provider (HCP) prescribes mirtazapine 30 mg PO at bedtime for a client diagnosed with depression. The nurse should:

- ☐ 1. give the medication as prescribed.
- ☐ 2. question the HCP's prescription.
- ☐ 3. request to give the medication in the morning.
- ☐ 4. give the medication in three divided doses.

37. A client taking mirtazapine is disheartened about a 20-lb (9 kg) weight gain over the past 3 months. The client tells the nurse, “I stopped taking my mirtazapine 15 days ago. I do not want to get depressed again, but I feel awful about my weight.” Which response by the nurse is **most** appropriate?

- ☐ 1. “Focusing on diet and exercise alone should control your weight.”
- ☐ 2. “Your depression is much better now, so your medication is helping you.”
- ☐ 3. “Look at all the positive things that have happened to you since you started mirtazapine.”
- ☐ 4. “I hear how difficult this is for you and will help you approach your healthcare provider about it.”

38. When developing a teaching plan for a client about the medications prescribed for depression, which component is **most** important for the nurse to include?

- ☐ 1. pharmacokinetics of the medication
- ☐ 2. current research related to the medication
- ☐ 3. management of common adverse effects
- ☐ 4. dosage regulation and adjustment

39. The client diagnosed with severe major depression has been taking escitalopram 10 mg daily for the past 2 weeks. Which parameter should the nurse monitor **most** closely at this time?

- ☐ 1. suicidal ideation
- ☐ 2. sleep
- ☐ 3. appetite
- ☐ 4. energy level

40. A client taking paroxetine 40 mg PO every morning tells the nurse that her mouth “feels like cotton.” Which statement by the client necessitates further assessment by the nurse?

- ☐ 1. “I am sucking on ice chips.”
- ☐ 2. “I am using sugarless gum.”
- ☐ 3. “I am sucking on sugarless candy.”
- ☐ 4. “I am drinking 12 glasses of water every day.”

41. The client with a depressive disorder has been consistent with taking 12.5 mg of paroxetine extended release daily. The nurse judges the client to be benefiting from this drug therapy when the client demonstrates which behaviors? Select all that apply.

- ☐ 1. takes 2-hour evening naps daily
- ☐ 2. completes homework assignments
- ☐ 3. decreases pacing
- ☐ 4. increases somatization
- ☐ 5. verbalizes feelings

42. A client diagnosed with major depression has sleep and appetite disturbances and a flat affect and is withdrawn. The client has been taking fluvoxamine 50 mg twice daily for 5 days. Which client behavior is **most** important to report to the next shift?

- ☐ 1. client's flat affect
- ☐ 2. client's interacting with a visitor
- ☐ 3. client sleeping from 2300 hours to 0600 hours
- ☐ 4. client spending the entire evening in her room

43. When educating a client who has been diagnosed with dysthymia about possible treatment for the disorder, which information should the nurse include?

- ☐ 1. "Antidepressants offer you the best treatment for your dysthymia."
- ☐ 2. "You are a good candidate for electroconvulsive therapy (ECT)."
- ☐ 3. "Dysthymia often responds to the combination of psychotherapy and antidepressants."
- ☐ 4. "Your condition will most likely need long-term psychoanalysis."

44. A client with a major depressive disorder comes to the mental health clinic for a follow-up visit. The client has been taking escitalopram for 3 months and tells the nurse that he is feeling "like my old self again." Now the client wants to stop taking medication. "I do not want to be dependent on meds like my father." What is the nurse's **best** initial response to him?

- ☐ 1. "After another 3 months of stability, it might be safe for you to go off the escitalopram."

- ☐ 2. “After two significant episodes, you will need to take an antidepressant indefinitely.”
- ☐ 3. “Research indicates that individuals who have had two major depressive episodes have a 70% chance of having a third episode.”
- ☐ 4. “It is likely that you can learn to manage your depression with a regular exercise regime and a healthy diet.”

45. Which statement made by an adolescent who has just begun taking an antidepressant would indicate the need for further teaching?

- ☐ 1. “Now that I have been taking my antidepressant for a week, I am going to feel better about myself.”
- ☐ 2. “A week ago when I started my antidepressant, I did not care about eating, but now I want to eat a bit more.”
- ☐ 3. “After a week of taking my antidepressant, I can sleep a little better—6 hours or so each night.”
- ☐ 4. “Now that I have had a week of my antidepressant, it is a little easier to get up in the morning.”

The Client with Bipolar Disorder, Manic Phase

46. A client comes to the mental health clinic saying that he feels so down and lacking in energy with “loss of interest in everything.” He tells the nurse that he received some samples of a new medication from his healthcare provider (HCP) last week to relieve his depression. The nurse recalls that this client has a history of bipolar disorder with hospitalization for a significant manic episode. With this knowledge, the nurse would have special concern if he is taking which category of medication?

- ☐ 1. atypical antipsychotics
- ☐ 2. mood stabilizers/antimanics
- ☐ 3. antianxiety agents/benzodiazepines
- ☐ 4. selective serotonin reuptake inhibitor antidepressants

47. In a predischarge program to educate clients with bipolar disorder and their family members, the nurse emphasizes which symptom is the **most** significant indicator for the onset of relapse?

- ☐ 1. a sense of pleasure and motivation for new endeavors

- ☐ 2. decreased need for sleep and racing thoughts
- ☐ 3. self-concern about increase in energy
- ☐ 4. leaving a good job to start a new business

48. Which statement by a client taking lithium **most** indicates a need for more teaching?

- ☐ 1. "My healthcare provider tells me that my lithium level is 1.0, so I do not have to worry about my levels."
- ☐ 2. "I have been getting a lot of good exercise playing on a local soccer team."
- ☐ 3. "I am trying hard to watch my diet and eat healthy."
- ☐ 4. "I have learned to take my lithium even when I am not feeling well, like when I had the stomach flu."

49. A young woman comes to the mental health clinic for her routine medication follow-up. She has been married for 2 years and reports that she and her husband are ready to start a family. She has a diagnosis of bipolar disorder and has been well managed on divalproex for at least 3 years. What is the **most** essential counsel for the nurse to give her?

- ☐ 1. "Schedule an appointment for a complete gynecological exam if you have not had one in the past year."
- ☐ 2. "Pay careful attention to eating healthy from this point on in order to maximize the health of both mother and baby."
- ☐ 3. "Check with your prescriber today as divalproex carries an increased risk for birth defects."
- ☐ 4. "Learning to reduce stress now is important to reduce your chances of developing postpartum depression."

50. A healthcare provider (HCP) has prescribed valproic acid for a client with bipolar disorder who has achieved limited success with lithium carbonate. Which information should the nurse teach the client about taking valproic acid?

- ☐ 1. Follow-up blood tests are necessary while on this medication.
- ☐ 2. The extended-release tablet can be crushed if necessary for ease of swallowing.
- ☐ 3. Tachycardia and upset stomach are common side effects.

- ☐ 4. Consumption of a moderate amount of alcohol is safe if the medication is taken in the morning.

51. A young adult client diagnosed with bipolar disorder has been managing the disorder effectively with medication and treatment for several years. The client suddenly becomes manic. The nurse reviews the client's medication record. Which new medication may have contributed to the development of his manic state?

Medication Record

Amitriptyline 50 mg PO daily at bedtime
Prednisone 20 mg PO daily
Buspirone HCl 5 mg PO three times a day
Gabapentin 300 mg PO three times a day

- ☐ 1. amitriptyline
☐ 2. prednisone
☐ 3. buspirone
☐ 4. gabapentin

52. The client with acute mania has been admitted to the inpatient unit voluntarily. The nurse approaches the client with medication to be taken orally as prescribed by the healthcare provider (HCP). The client states, "I do not need that stuff." Which response by the nurse is **best**?

- ☐ 1. "You cannot refuse to take this medication."
☐ 2. "If you do not take it orally, I will give you a shot."
☐ 3. "The medication will help you feel calmer."
☐ 4. "I will get you some written information about the medication."

53. A nurse observes a male client who is hyperactive and intrusive sitting very close to a female client with his arm around her shoulders. The nurse hears the male client tell a sexually explicit joke. The nurse approaches the

client and asks him to walk down the hallway. Which statement by the nurse should benefit the client?

- ☐ 1. "She will not want to be around you with that kind of talk."
- ☐ 2. "Telling sexual jokes and touching others is not permitted here."
- ☐ 3. "You need to be careful about what you say to other people."
- ☐ 4. "I think a time-out in your room would be appropriate now."

54. A client with acute mania fails to respond to a nurse's interventions to decrease his agitation. The nurse has attempted to defuse the client's anger, but the client refuses to participate in interventions that would lower anxiety. Which action should the nurse take **next**?

- ☐ 1. Seclude the client.
- ☐ 2. Restrain the client.
- ☐ 3. Medicate the client.
- ☐ 4. Control the client.

55. The client with mania is irritable and insulting to an unlicensed assistive personnel (UAP). The UAP states, "I cannot believe Mark is so rude. Should he not be overly happy?" Which response by the nurse should help the UAP understand the client's behavior?

- ☐ 1. "It is our responsibility to listen to him even though we might not like what he is saying."
- ☐ 2. "We must reprimand Mark for doing that, because there is no reason for him to behave like that."
- ☐ 3. "I will go and speak to him about his behavior and make sure he understands that he needs to control what he is saying."
- ☐ 4. "I know it is difficult, but Mark is a client whose irritable mood is a symptom of his mania."

56. Which milieu activity should the nurse recommend to a client with acute mania? Select all that apply.

- ☐ 1. scheduled rest periods
- ☐ 2. relaxation exercises
- ☐ 3. listening to soft music
- ☐ 4. watching television

- ☐ 5. aerobic exercise

57. A nurse is assessing a client experiencing hypomania who wants to stop her mood-stabilizing medication because she is “feeling good,” has a high energy level, and thinks she is productive at work. Which response by the nurse is **most** appropriate?

- ☐ 1. “Are you thinking about hurting yourself?”
- ☐ 2. “If you stop your medication, your behavior will quickly spiral out of control.”
- ☐ 3. “I believe you were hospitalized the last time you stopped your medication.”
- ☐ 4. “Why do you not cut your medication dosage in half for a while and see how you respond?”

58. The client with acute mania is prescribed 600 mg of lithium PO three times per day. The healthcare provider (HCP) also prescribes 5 mg of haloperidol PO at bedtime. Which action should the nurse take?

- ☐ 1. Administer the medication as prescribed.
- ☐ 2. Question the HCP about the prescription.
- ☐ 3. Administer the haloperidol but not the lithium.
- ☐ 4. Consult with the nursing supervisor before administering the medications.

59. The client with a diagnosis of bipolar disorder, manic phase, states to the nurse, “I am the Queen of England. Bow before me.” The nurse interprets this statement as important to document as which area of the mental status examination?

- ☐ 1. psychomotor behavior
- ☐ 2. mood and affect
- ☐ 3. attitude toward the nurse
- ☐ 4. thought content

60. The client is laughing and telling jokes to a group of clients. Suddenly, the client is crying and talking about a death in the family. A moment later, the client is laughing and joking again. The nurse should:

- ☐ 1. call the healthcare provider (HCP) for a prescription for lorazepam as

needed.

- ☐ 2. place the client in seclusion and call the HCP for a prescription for the seclusion.
- ☐ 3. ignore the client's behavior in order not to give the client too much attention.
- ☐ 4. ask the client to come to a quiet area to talk to the nurse individually.

61. A client with acute mania exhibits euphoria, pressured speech, and flight of ideas. The client has been talking to the nurse nonstop for 5 minutes, and lunch has arrived on the unit. What should the nurse do **next**?

- ☐ 1. Excuse oneself while telling the client to come to the dining room for lunch.
- ☐ 2. Tell the client he needs to stop talking because it is time to eat lunch.
- ☐ 3. Do not interrupt the client, but wait for him to finish talking.
- ☐ 4. Walk away, and approach the client in a few minutes before the food gets cold.

62. A female client with acute mania brings six suitcases and three shopping bags of personal belongings on admission to the unit. When informed that some of the suitcases and bags need to be returned home with her husband because of a lack of storage space, the client begins to use profanity against the nurse. Which response by the nurse is **most** therapeutic?

- ☐ 1. "You are acting inappropriately."
- ☐ 2. "I will not tolerate your talking to me like that."
- ☐ 3. "Swearing and profanity are unacceptable here."
- ☐ 4. "We do not want to put you in seclusion yet."

63. The husband of a client who is experiencing acute mania and is swearing and using profanity apologizes to the nurse for his wife's behavior. Which of the reply by the nurse is **most** therapeutic?

- ☐ 1. "This must be difficult for you."
- ☐ 2. "It is okay. We have heard worse."
- ☐ 3. "How long has she been like this?"
- ☐ 4. "She needs some medication."

64. The nurse is caring for a client with acute mania who is euphoric and

flirtatious. The nurse overhears the client describing a sexual exploit with a group of clients seated at a table. What should the nurse do **next**?

- ☐ 1. Continue walking down the hall, ignoring the conversation.
- ☐ 2. Speak to the client later in private while saying nothing at this time.
- ☐ 3. Tell the client others may not want to hear about sex, and invite him to play a game of ping-pong.
- ☐ 4. Inform the client that if he continues to talk about sex, no one will want to be around him.

65. The client with acute mania states to the nurse, “I am the prince of peace and can save the world. Those against me will find me and take me to another world. They will come. I know it.” The client is beginning to scan the room and starts to repeat his delusion. Which response by the nurse is **most** therapeutic?

- ☐ 1. “Describe the people who will come.”
- ☐ 2. “The staff and I will protect you.”
- ☐ 3. “You are not the prince of peace. Your name is Joe.”
- ☐ 4. “Let us walk around the unit for a while.”

66. A client with bipolar disorder, manic phase, is scheduled for a chest x-ray. Before taking the client to the radiology department, the nurse should:

- ☐ 1. give a thorough explanation of the procedure.
- ☐ 2. explain the procedure in simple terms.
- ☐ 3. call security to be on standby for possible problems.
- ☐ 4. cancel the appointment until the client can go unescorted.

67. The client with bipolar disorder, manic phase, appears at the nurse’s station wearing a transparent shirt, miniskirt, high heels, 10 bracelets, and 8 necklaces. Her makeup is overdone, and she is not wearing underwear. What should the nurse do?

- ☐ 1. Tell the client to dress appropriately while out of her room.
- ☐ 2. Ask the client to put on hospital pajamas until she can dress appropriately.
- ☐ 3. Instruct the client to go to her room and change clothes.
- ☐ 4. Escort the client to her room, and assist with choosing appropriate

attire.

68. A client diagnosed with bipolar disorder and experiencing acute mania states to the nurse, “Where is my son? I love Lucy. Rain, rain go away. Dogs eat dirt.” Another client approaches the nurse and says, “Man, is he ever nuts! He is driving me crazy with all his weird talk.” Which response by the nurse to the second client is **most** appropriate?

- ☐ 1. “I agree. He is a little hard to take sometimes.”
- ☐ 2. “Just walk away and leave him alone. There is nothing else you can do.”
- ☐ 3. “I realize his behavior bothers you, but he cannot control it right now.”
- ☐ 4. “I will give him some medication so he will not bother you.”

69. The client with mania is skipping up and down the hallway, nearly running into other clients. The nurse should include which activity in the client’s plan of care?

- ☐ 1. leading a group activity
- ☐ 2. watching television
- ☐ 3. reading the newspaper
- ☐ 4. cleaning the dayroom tables

70. A client admitted to the nursing unit with bipolar disorder, manic phase, is accompanied by his wife. The wife states that her husband has been overly energetic and happy, talking constantly, purchasing many unneeded items, and sleeping about 4 hours a night for the past 5 days. When completing the client’s daily assessment, the nurse should be especially alert for which finding?

- ☐ 1. exhaustion
- ☐ 2. vertigo
- ☐ 3. gastritis
- ☐ 4. bradycardia

71. The wife of a client with bipolar disorder, manic phase, states to the nurse, “He is acting so crazy. What did he do to get this way?” The nurse bases the response on which understanding of this disorder?

- ☐ 1. It is caused by underlying psychological difficulties.

- ☐ 2. It is caused by disturbed family dynamics in the client's early life.
- ☐ 3. It is the result of an imbalance of chemicals in the brain.
- ☐ 4. It is the result of a genetic inheritance from someone in the family.

72. A client diagnosed with bipolar disorder asks the nurse why it is necessary to have a serum lithium level drawn every 3 to 4 months. The nurse's response should be based on which factor?

- ☐ 1. to monitor compliance with the medication
- ☐ 2. to prevent toxicity related to the drug's therapeutic range
- ☐ 3. to monitor the client's white blood cell count
- ☐ 4. to comply with governmental safety requirements

73. The healthcare provider (HCP) prescribes a serum lithium level tomorrow for a client with bipolar disorder, manic phase, who has been receiving lithium 300 mg PO three times daily for the past 5 days. At what time should the nurse plan to have the blood specimen obtained?

- ☐ 1. before bedtime
- ☐ 2. after lunch
- ☐ 3. before breakfast
- ☐ 4. during the afternoon

74. A client will be discharged on lithium carbonate 600 mg three times daily. When teaching the client and his family about lithium therapy, the nurse determines that teaching has been effective if the client and family state that they will notify the prescribing healthcare provider (HCP) immediately with which symptoms? Select all that apply.

- ☐ 1. nausea
- ☐ 2. muscle weakness
- ☐ 3. vertigo
- ☐ 4. fine hand tremor
- ☐ 5. vomiting
- ☐ 6. anorexia

75. After the nurse teaches a client with bipolar disorder about lithium therapy, which client statement indicates the need for additional teaching?

- ☐ 1. "It is important to keep using a regular amount of salt in my diet."

- ☐ 2. "It is okay to double my next dose of lithium if I forget a dose."
- ☐ 3. "I should drink about 8 to 10 eight-ounce (240 to 300 mL) glasses of water each day."
- ☐ 4. "I need to take my medicine at the same time each day."

76. A client with acute mania is to receive lithium carbonate 600 mg PO three times daily and 2 mg of haloperidol PO at bedtime. The nurse should:

- ☐ 1. refuse to give the medications as prescribed.
- ☐ 2. give the lithium only.
- ☐ 3. request a decreased dosage of lithium.
- ☐ 4. give the medications as prescribed.

77. After the nurse teaches a client about bipolar disorder, which statement indicates that the client has developed insight about the diagnosis?

- ☐ 1. "I enjoy feeling high. I do not need much sleep then and get really creative."
- ☐ 2. "My medicine really helped me. I know I will not need it in about another week."
- ☐ 3. "I am cured now. I was really wild for a while even though I got into trouble."
- ☐ 4. "I know I am getting sick when I do not need much sleep and start buying things."

78. During morning community meeting, a client with bipolar disorder, manic phase, interrupts others to the point where no one can finish their statements. The nurse should tell the client:

- ☐ 1. "Please stop interrupting others. You can speak when it is your turn."
- ☐ 2. "Stop talking. It is time for you to leave the meeting."
- ☐ 3. "If you cannot control yourself, we will have to take action."
- ☐ 4. "Please behave like an adult. Your behavior is childish."

79. The client with bipolar disorder, manic phase, has a valproic acid level of 15 mg/mL (104 mmol/L). Which client behaviors should the nurse judge to be due to this level of valproic acid? Select all that apply.

- ☐ 1. irritability
- ☐ 2. grandiosity

- ☐ 3. anhedonia
- ☐ 4. hypersomnia
- ☐ 5. flight of ideas

80. The client with rapid-cycling bipolar disorder who is about to receive his 1700 hours dose of carbamazepine tells the nurse he has a sore throat and chills. What should the nurse do **next**?

- ☐ 1. Administer the prescribed dose of carbamazepine.
- ☐ 2. Give the client acetaminophen as prescribed PRN.
- ☐ 3. Report the symptoms to the healthcare provider (HCP) in the morning.
- ☐ 4. Call the HCP to report changes.

81. A client's wife states, "I do not know what to do sometimes. It is so hard having a husband with a mental illness like bipolar disorder." After talking with the client's wife about her feelings and difficulties, which action is **most** appropriate?

- ☐ 1. Suggest that the wife see her healthcare provider (HCP).
- ☐ 2. Give the wife information about a support group.
- ☐ 3. Recommend that the wife talk with her close friend.
- ☐ 4. Have the wife share her feelings with her husband.

82. The client with bipolar disorder is approaching discharge after being hospitalized with her first episode of acute mania. The client's husband asks the nurse what he can do to help her. What recommendation for the husband should the nurse anticipate including in the teaching plan?

- ☐ 1. Help the client to be free from worry and anxiety.
- ☐ 2. Communicate openly and offer support.
- ☐ 3. Relieve the client of all responsibilities.
- ☐ 4. Remind the client to control her symptoms.

83. A client experiencing a manic episode has been talking loudly, pacing the unit and trying to draw other clients into debates about the value of self-determination. Arrange in order the steps a nurse should take to help calm this client. All options must be used.

- 1. Use oral medication to decrease anxiety and increase appropriate social

interaction.

2. Talk with the client about the anxiety and stress the client is feeling.

3. Take client to a quiet area, such as his or her room, to decrease stimuli.

4. Teach the client coping strategies to deal with stressors.

84. The client with bipolar disorder, manic phase, states, “You are looking good. I am taking you out to dinner.” What reply by the nurse is **most** therapeutic?

- ☐ 1. “I do not want to go out to dinner.”
- ☐ 2. “I cannot go out to dinner with you.”
- ☐ 3. “It does not matter how I look; the answer is no.”
- ☐ 4. “I am Chris Smith, a nurse working on this unit.”

85. After the nurse administers haloperidol 5 mg PO to a client with acute mania, the client refuses to lie down on her bed, runs out on the unit, pushes clients in her vicinity out of the way, and screams threatening remarks to the staff. What should the nurse do **next**?

- ☐ 1. Follow the client and ask her to calm down.
- ☐ 2. Tell the client to lie down on the sofa in the community room.
- ☐ 3. Seclude the client and use restraints if necessary.
- ☐ 4. Tell the staff to ignore the client’s remarks.

86. As the nurse is turning off the television, a client with bipolar disorder,

manic phase, says, “I want the television on so I can watch the late show. I am not tired, and you cannot tell me what to do. I want it on!” The nurse should tell the client:

- ☐ 1. “I will let you watch television just this once, but you have to turn the sound off.”
- ☐ 2. “I will turn the television off when you get sleepy. Do not ask me to do this again.”
- ☐ 3. “Television hours are from 1900 hours to 2200 hours. It is 2200, and the television goes off so everyone can sleep.”
- ☐ 4. “The television goes off at 2200 hours. I have been telling you this for the past three evenings.”

The Client with Suicidal Ideation and Suicide Attempt

87. Which strategies would be helpful in preventing suicide for clients about to be discharged from a psychiatric inpatient unit? Select all that apply.

- ☐ 1. At discharge, give all depressed clients a card containing the crisis phone line number for their area.
- ☐ 2. Have all clients who have expressed suicidal ideation just prior to or during hospitalization make a written personal suicide prevention plan.
- ☐ 3. Require that all clients who have had previous suicidal ideation, plans, or attempts refill their medication every 2 weeks rather than monthly.
- ☐ 4. Educate family and friends of previously suicidal clients in ways to help clients remain safe after discharge.
- ☐ 5. Suggest that family and friends of previously suicidal clients know the client’s whereabouts at all times.

88. The nurse manager in the emergency department (ED) is conducting an in-service for the nursing staff about screening clients for suicide. One of the nurses states, “Questioning adolescents about suicide will only increase their thinking about self-harm, and they would not admit it to me anyhow.” How should the nurse manager respond?

- ☐ 1. “You could be correct. Let us assess only adults because they will be more honest.”
- ☐ 2. “We will limit the assessment to adolescents with psychiatric

diagnoses.”

- ☐ 3. “It is a myth that talking about suicide leads to suicide attempts. Adolescents will disclose suicidal thoughts when asked directly.”
- ☐ 4. “If you think the adolescent is not telling you the truth, you can question the parents.”

89. When assessing a client for suicidal risk, which method of suicide should the nurse identify as **most** lethal?

- ☐ 1. aspirin overdose
- ☐ 2. use of a gun
- ☐ 3. head banging
- ☐ 4. wrist cutting

90. The nurse manager overhears two staff members talking in the snack room. One of the staff members states, “Her superficial cuts are just a means of getting our attention. She never should have been admitted. I hope she is out of here soon.” Which response by the nurse manager is **most** appropriate?

- ☐ 1. “It is our job to help her no matter how we feel about her or what she did. She will be discharged soon.”
- ☐ 2. “I will not tolerate that kind of discussion from my staff. Now, it is time for you to go back to work.”
- ☐ 3. “I know it is hard to understand, but we need to do the best we can even though she will be back.”
- ☐ 4. “No matter what the intent, all suicidal behavior is serious and deserves our serious consideration.”

91. The history of a female client who has just been admitted to the unit and is very depressed reveals a weight loss of 10 lb (4.5 kg) in 2 weeks, sleeping 3 hours a night, and poor hygiene. The client states, “I am no good to anyone. Everyone would be better off without me.” Which question should the nurse ask **first**?

- ☐ 1. “What do you mean?”
- ☐ 2. “Are you thinking about hurting yourself?”
- ☐ 3. “Does your family not care about you?”
- ☐ 4. “What happened to make you think that?”

92. When developing the plan of care for a client with suicidal ideation, developing goals to address which issue is a **priority**?

- ☐ 1. self-esteem
- ☐ 2. sleep
- ☐ 3. stress
- ☐ 4. safety

93. Which question should the nurse ask to **best** determine the seriousness of a client's suicidal ideation?

- ☐ 1. "How are you planning on harming yourself?"
- ☐ 2. "Have you made out a will?"
- ☐ 3. "Does your family know you are here?"
- ☐ 4. "How long have you been thinking about harming yourself?"

94. The unlicensed assistive personnel (UAP) states to the nurse, "My client talks about how awful and useless she is. Sometimes, she sounds angry for no reason. I am tired of listening to her." Which response by the nurse is **most** appropriate?

- ☐ 1. "I will switch your assignment to someone who is less depressed and less tiring."
- ☐ 2. "It is important for you to listen to her because she needs to verbalize how she is feeling."
- ☐ 3. "Do not worry about it. I know you have not done anything to make her angry."
- ☐ 4. "Clients with depression are hard to deal with, but do not take what they say seriously."

95. A client who was recently discharged from the psychiatric unit telephones the unit to speak to the nurse. The client states that she took her children to the neighbors' house and has turned on the gas to kill herself. She is home alone and gives the nurse her address. Which action should the nurse take **next**?

- ☐ 1. Refer the caller to a 24-hour suicide hotline.
- ☐ 2. Tell the caller that another nurse will telephone the police.
- ☐ 3. Ask the caller whether she telephoned her healthcare provider (HCP).

- ☐ 4. Instruct the caller to telephone her family for help.

96. A client walks into the clinic and tells the nurse she wants to die because her boyfriend broke up with her. The client states, “I will show him. He will be sorry.” The nurse notes which underlying theme and method to deal with the client?

- ☐ 1. Sadness—ask the client to reveal how long she has felt this way.
- ☐ 2. Escape—ask the client to indicate what she wants to escape.
- ☐ 3. Loneliness—ask the client to state who she believes to be her friends.
- ☐ 4. Retaliation—ask the client about her specific plans to harm herself and/or her boyfriend.

97. The client has been hospitalized for major depression and suicidal ideation. Which statement indicates to the nurse that the client is improving?

- ☐ 1. “I could not kill myself because I do not want to go to hell.”
- ☐ 2. “I do not think about killing myself as much as I used to.”
- ☐ 3. “I am of no use to anyone anymore.”
- ☐ 4. “I know my kids do not need me anymore since they are grown.”

98. The client states to the nurse at the outpatient clinic, “I do not feel ready to go back to work. It has only been a week since I left the hospital.” Assessment reveals a flat affect, disheveled appearance, poor posture, and minimal eye contact during interaction. The nurse asks the client whether he is thinking about harming himself. The client tells the nurse he has a loaded revolver at home and will probably use it. What should the nurse do **next**?

- ☐ 1. Tell the client to go and remove the gun from his home.
- ☐ 2. Ask the client to call the nurse every hour when he gets home.
- ☐ 3. Ask the client to promise not to harm himself.
- ☐ 4. Initiate plans for hospitalization immediately.

99. The widow of a client who successfully completed suicide tearfully says, “I feel guilty because I am so angry at him for killing himself. It must have been what he wanted.” After assisting the widow with dealing with her feelings, which intervention is **most** helpful?

- ☐ 1. Referring her to a group for survivors of suicide.
- ☐ 2. Encouraging her to receive counseling from a chaplain.

- ☐ 3. Providing her with the local suicide hotline number.
- ☐ 4. Suggesting she receive individual therapy by the nurse.

100. The husband of a client to be discharged from the hospital after an episode of major depression and a suicide attempt asks, “What can I do if she tries to kill herself again?” Which response is **most** appropriate?

- ☐ 1. “Do not worry. She will be okay as long as she takes her medication.”
- ☐ 2. “She told me she wants to live, so I do not think she will try again.”
- ☐ 3. “Let us talk about some behavioral clues and resources that can help.”
- ☐ 4. “Tell her about your concern, and just take care of her.”

101. A client with depression is exhibiting a brighter affect and an ability to attend to hygiene and grooming tasks and is beginning to participate in group activities. The nurse asks the client to identify three of her strengths. After much hesitation and thinking, the client can state she is usually a nice person, a good cook, and a hard worker. What should the nurse do **next**?

- ☐ 1. Ask the client to identify additional three strengths.
- ☐ 2. Volunteer the client to lead the cooking group later in the day.
- ☐ 3. Educate the client about the importance of medication.
- ☐ 4. Reinforce the client for identifying and sharing her strengths.

102. The friend of a client with depression and suicidal ideation asks the nurse, “How should I act around her?” Which response by the nurse is **best**?

- ☐ 1. “Try to cheer her up.”
- ☐ 2. “Be caring and genuine.”
- ☐ 3. “Control your expressions.”
- ☐ 4. “Avoid asking how she is feeling.”

103. A client with depression and suicidal ideation voices feelings of self-doubt and powerlessness and is very dependent on the nurse for most aspects of her care. According to Erikson’s stages of growth and development, the nurse determines the client to be manifesting problems in which stage?

- ☐ 1. trust versus mistrust
- ☐ 2. autonomy versus shame/doubt
- ☐ 3. initiative versus guilt
- ☐ 4. industry versus inferiority

104. A client who overdosed on barbiturates is being transferred to the inpatient psychiatric unit from the intensive care unit. Assessing the client for which need should be a **priority** for the nurse receiving the client?

- ☐ 1. nutrition
- ☐ 2. sleep
- ☐ 3. safety
- ☐ 4. hygiene

105. A client is brought to the psychiatric unit from the emergency department (ED) escorted by ED staff and a security officer. The client's shoulder is bandaged and his arm is in a sling because of a self-inflicted gunshot wound to his shoulder. Later, the client's wife follows with a bag of her husband's belongings. Which nursing action is **most** appropriate at this time?

- ☐ 1. Tell the wife to take her husband's things home because he is suicidal.
- ☐ 2. Instruct the wife to unpack the bag and put her husband's things in the dresser.
- ☐ 3. Ask the wife whether the bag contains anything dangerous.
- ☐ 4. Inspect the bag and its contents in the presence of the client and his wife.

106. A suicidal client is placed in the seclusion room and given lorazepam because she tried to harm herself by banging her head against the wall. After 10 minutes, the client starts to bang her head against the wall in the seclusion room. Which action should the nurse take **next**?

- ☐ 1. Call hospital security for assistance.
- ☐ 2. Place the client in restraints.
- ☐ 3. Call the healthcare provider (HCP) for additional medication prescriptions.
- ☐ 4. Instruct a staff member to sit in the room with the client.

107. A client lives in a group home and visits the community mental health center regularly. During one visit with the nurse, the client states, "The voices are telling me to hurt myself again." Which question by the nurse is **most** important to ask?

- ☐ 1. “When do you hear the voices?”
- ☐ 2. “Are you going to hurt yourself?”
- ☐ 3. “How long have you heard the voices?”
- ☐ 4. “Why are the voices starting again?”

108. A 20-year-old client diagnosed with paranoid schizophrenia is recovering from his first psychotic break. Before discharge from the hospital, the client becomes depressed and states, “I do not want this illness. I am about to begin my junior year in college.” Which issue would be **most** important for the nurse to address at this time?

- ☐ 1. disturbed thought process
- ☐ 2. disturbed sensory perceptions
- ☐ 3. communication problems
- ☐ 4. potential for medication noncompliance

109. The nurse is teaching two unlicensed assistive personnel (UAP) who are new to the inpatient unit about caring for a client who is suicidal. The nurse determines that additional teaching is needed when which statement is made?

- ☐ 1. “I need to check the client precisely at 15-minute intervals.”
- ☐ 2. “Documenting suicide checks is absolutely necessary.”
- ☐ 3. “Clients on one-to-one suicide precautions can never be left alone.”
- ☐ 4. “All clients using razors must be supervised by staff.”

110. Which activity should the nurse recommend to the client on an inpatient unit when thoughts of suicide occur?

- ☐ 1. keeping track of feelings in a journal
- ☐ 2. engaging in physical activity
- ☐ 3. talking with the nurse
- ☐ 4. playing a card game with other clients

111. For the client receiving outpatient treatment for depression and suicidal ideation, what is the correct amount of imipramine to have at one time?

- ☐ 1. a 30-day supply
- ☐ 2. a 21-day supply

- ☐ 3. a 14-day supply
- ☐ 4. a 7-day supply

112. The client with recurrent depression and suicidal ideation tells the nurse, “I cannot afford this medicine anymore. I know I will be okay without it.” The nurse should:

- ☐ 1. inform the healthcare provider (HCP) of the client’s statement.
- ☐ 2. ask the social worker to find financial assistance for the client.
- ☐ 3. schedule a follow-up appointment in 2 weeks.
- ☐ 4. ask the client whether a family member could help.

113. Which statement by the nurse reflects the **best** understanding about suicide in an individual with depression?

- ☐ 1. “The more severe the depression, the greater the probability for suicidal behavior.”
- ☐ 2. “The person who talks about suicide is less likely to try it.”
- ☐ 3. “Every client with depression is potentially suicidal.”
- ☐ 4. “Suicide is less likely when the individual is receiving antidepressant therapy.”

The Client with Psychosexual Disorders

114. A couple informs the nurse that they have been having some “problems in the bedroom.” What is **most** appropriate response by the nurse?

- ☐ 1. “I can refer you to a therapist.”
- ☐ 2. “I need to obtain your admission history first.”
- ☐ 3. “I would like to hear your concerns.”
- ☐ 4. “Let me refer you to a marriage counselor.”

115. A client who is admitted to the adult unit of a mental healthcare facility with depression tells the nurse that he has pedophilia. The nurse should:

- ☐ 1. be aware of personal opinions and views.
- ☐ 2. recognize that because the client is depressed, the client will not be able to discuss the pedophilia.
- ☐ 3. ensure that the client is never alone with other clients on the unit.

- ☐ 4. refer the client to group therapy.

116. A client and her partner come to the clinic stating they have been unable to have sexual intercourse. The female client states she has pain and her “vagina is too tight.” The client was raped at age 15 years of age. Which nursing problem is **most** appropriate for this client?

- ☐ 1. Dysfunctional Grieving related to loss of self-esteem because of lack of sexual intimacy
- ☐ 2. Risk for Trauma related to fear of vaginal penetration
- ☐ 3. Vaginismus related to vaginal constriction
- ☐ 4. Sexual Dysfunction related to sexual trauma

117. A client with erectile disorder is taking sildenafil. What instructions should the nurse give the client?

- ☐ 1. Take the medication 8 hours before having intercourse.
- ☐ 2. Use nitroglycerin if chest pains occur during intercourse.
- ☐ 3. Take up to three tablets within 24 hours.
- ☐ 4. Expect an erection that may last up to 4 hours.

Managing Care, Quality, and Safety of Clients with Psychiatric Disorders and Mental Health Problems

118. The nurse is caring for a client with bipolar disorder who was recently admitted to an inpatient unit and is experiencing a manic episode. What is a **priority** nursing intervention for this client?

- ☐ 1. Order and administer all medications in a liquid form.
- ☐ 2. Base permission for family visits on the client’s attendance at therapy groups.
- ☐ 3. Closely monitor the client’s eating and sleeping habits.
- ☐ 4. Encourage the client to keep a journal about feelings and emotions.

119. Which reaction to learning about a diagnosis of being HIV positive would put the client at the greatest need of intervention by the nurse?

- ☐ 1. A person who is angry, hostile, and alienated from the family.
- ☐ 2. A person who is obsessed with cleanliness and showers many times a day.

- ☐ 3. A person who is unable to make decisions and is helpless and tearful.
- ☐ 4. A person who says, "I have found a solution for this mess."

120. Which represents a breach of the nursing Code of Ethics regarding the rights of clients in psychiatric care situations?

- ☐ 1. The nurse discusses client's care with out-of-town family members who the client has formally indicated are allowed to know about the client's hospital care.
- ☐ 2. The nurse discusses the client's history and hospital course of treatment with a consulting healthcare provider (HCP).
- ☐ 3. The nurse discusses with peers in the hospital cafeteria the progress of a well-known client being cared for at the hospital.
- ☐ 4. The nurse discusses the client's care with the admission coordinator of a retirement home that the client plans to enter after discharge from the hospital.

121. A client diagnosed with schizophrenia for the last 2 years tells the nurse who has brought the morning medications, "That is not my pill! My pill is blue, not green." What should the nurse tell the client?

- ☐ 1. "Go ahead and take it. You can trust me. I am watching out for your safety and well-being."
- ☐ 2. "I know I took the correct medication out of the dispenser. Do you not trust me?"
- ☐ 3. "Do not worry; your medication is generic, and sometimes the manufacturers change the color of the pills without letting us know."
- ☐ 4. "I will go back and check the drawer as well as telephone the pharmacy to check about any possible changes in the medication color."

122. A colleague tells the nurse that she is feeling stressed and believes that she may be depressed. Healthy workplaces protect and promote the health and well-being of workers. What workplace strategies would **most** likely support the health and well-being of workers? Select all that apply.

- ☐ 1. workshops for workers nearing retirement
- ☐ 2. counseling for workers exposed to traumatic events
- ☐ 3. interventions for workers with substance-related problems
- ☐ 4. standard work hours that include scheduled rest periods

- ☐ 5. education for workers regarding customary workplace practices

123. When developing appropriate assignments for the staff, which client should the nurse manager judge to be at **highest** risk for suicide completion?

- ☐ 1. an 85-year-old Caucasian man who lives alone after his wife's death
- ☐ 2. a 34-year-old single Latino woman who has recently been diagnosed with cancer
- ☐ 3. a 15-year-old girl of African descent whose boyfriend broke up with her
- ☐ 4. a 52-year-old Asian man who was terminated from his job because of downsizing

124. A high school student tells a nurse in an outpatient clinic the reason he is depressed and suicidal is that he is being bullied at school. While discussing the circumstances of the bullying, the student indicates he is gay, which he thinks contributes to his being bullied. He tells the nurse his sexual orientation in confidence, stating that his parents do not know and that he does not want that information revealed to them. Which actions should the nurse take? Select all that apply.

- ☐ 1. Give him the crisis phone line number and contact information for a support group for gay teens.
- ☐ 2. Notify the student's parents despite his objections because of the risk to him.
- ☐ 3. Question him about the bullying and his current status regarding suicidal thoughts/plans.
- ☐ 4. Help him develop a safety plan regarding suicidal thoughts/plans.
- ☐ 5. Notify the school about the bullying without identifying the specific student.

125. A wife brings her husband to the emergency department with a bleeding gunshot wound to the leg. The wife tells the nurse that her husband was trying to commit suicide. In what order should the nurse perform the actions from first to last? All options must be used.

1. Assess current suicide risk.

2. Ensure constant observation.

3. Remove potentially harmful objects from the area.

4. Assess the gunshot wound.

Answers, Rationales, and Test-Taking Strategies

*The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of the book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in Part 1 of this book.*

The Client with Major Depression

1. 4. Including the root healer gives credibility and respect to the client's cultural beliefs. Avoiding talking about the healer demonstrates either ignorance or disregard for the client's cultural values. Negative comparison of root healing with Western medicine not only denigrates the client's beliefs but also is likely to alienate and cause the client to end treatment.

 CN: Psychosocial integrity; CL: Create

2. 3. Cheese and yeast products contain tyramine, which the client should avoid to prevent a negative interaction with tranylcypromine, a monoamine oxidase (MAO) inhibitor. Sodium will not interact with tranylcypromine, and neither exercise nor sugar needs to be limited.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

 CN: Psychosocial integrity; CL: Synthesize

3. 1,4,3,2. The client is likely anxious about the procedure. The nurse should first spend time with the client and then discuss the client's concerns about the procedure. Next, the nurse could suggest the client listen to relaxing music. The use of the sleeping medication would only be considered as a last resort since it might interfere with the effectiveness of the seizure required for the treatment.

4. 4. The client is exhibiting signs of hypothyroidism, which includes hair loss, pain, fatigue, and increased sensitivity to cold. Hypothyroidism may be impacting the client's mood, ability to concentrate, physical sensations, and energy levels. Resolving potential biological causes of her symptoms takes priority over rehabilitation strategies or psychological approaches.

 CN: Management of care; CL: Synthesize

5. 3. The nurse should report the client's beer consumption to the **HCP** . Duloxetine should not be administered to a client with renal or hepatic insufficiency because the medication can elevate liver enzymes and, together with substantial alcohol use, can cause liver injury. Referring the client to the concurrent diagnosis program, sharing information at the next interdisciplinary treatment conference, and teaching the client relaxation exercises are helpful interventions for the nurse to implement. However, reporting the findings to the HCP is most important.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

6. 2. The client's sudden improvement and decrease in anxiety most likely indicate that the client is relieved because he has made the decision to kill himself and may now have the energy to complete the suicide. Symptoms of

severe depression do not suddenly abate because most antidepressants work slowly and take 2 to 4 weeks to provide a maximum benefit. The client will improve slowly due to the medication. The sudden improvement in symptoms does not mean the client is nearing discharge, and decreasing observation of the client compromises the client's safety.

 CN: Psychosocial adaptation; CL: Analyze

7. 1. The nurse should immediately report the rash to the **HCP**  because lamotrigine can cause Stevens-Johnson syndrome, a toxic epidermal necrolysis. The rash is not a temporary adverse effect. Giving the client an ice pack and questioning the client about recent sun exposure are irresponsible nursing actions because of the possible seriousness of the rash.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

8. 2. The nurse should hold the 1700 hours dose of lithium because a level of 1.8 mEq/L (1.8 mmol/L) can cause adverse reactions, including diarrhea, vomiting, drowsiness, muscle weakness, and lack of coordination, which are early signs of lithium toxicity. The nurse should report the lithium level to the **healthcare provider (HCP)** , including any symptoms of toxicity. Administering the 1700 hours dose of lithium, giving the client the lithium with 240 mL of water, or giving it after supper would result in an increase of the lithium level, thus increasing the risk of lithium toxicity.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

9. 3. Additional teaching is needed for the family member who states her son will only need to attend outpatient appointments when he starts to feel depressed again. Compliance with medication and outpatient follow-up are key in preventing relapse and rehospitalization. The statements expressing expectations of feeling better as medication takes effect, needing medicine and group therapy to stay well, and needing help with grocery shopping, cooking, and cleaning for a while indicate the families' understanding of depression, medication, and follow-up care.

 CN: Psychosocial integrity; CL: Evaluate

10. 4. The nurse closely monitors the client taking paroxetine for the development of agitation, which could lead to self-harm in the form of a

suicide attempt. Headache, nausea, and fatigue are transient adverse effects of paroxetine.

CN: Pharmacological and parenteral therapies; CL: Synthesize

11. 2. The nurse should initiate brief, frequent contacts throughout the day to let the client know that he is important to the nurse. This will positively affect the client's self-esteem. The nurse's action conveys acceptance of the client as a worthwhile person and provides some structure to the seemingly monotonous day. Waiting for the client to begin the conversation with the nurse is not helpful because the depressed client resists interaction and involvement with others. Sitting outside of the client's room is not productive and not necessary in this situation. If the client were actively suicidal, then a one-on-one client-to-staff assignment would be necessary. Questioning the client until he responds would overwhelm him because he could not meet the nurse's expectations to interact.

CN: Psychosocial integrity; CL: Synthesize

12. 1. The most appropriate action is for the nurse to remain with the client even if the client does not engage in conversation with the nurse. A client with severe depression may be unable to engage in an interaction with the nurse because the client feels worthless and lacks the necessary energy to do so. However, the nurse's presence conveys acceptance and caring, thus helping to increase the client's self-worth. Telling the client that the nurse will come back later, stating that the nurse will find someone else for the client to talk with, or telling the client that the nurse will get her something to read conveys to the client that she is not important, reinforcing the client's negative view of herself. Additionally, such statements interfere with the client's development of a sense of security and trust in the nurse.

CN: Psychosocial integrity; CL: Synthesize

13. 4. The nurse tells the client that the nurse is interested in her to increase the client's sense of importance, worth, and self-esteem. Also, stating that the nurse wants to help conveys to the client that she is worthwhile and important. Telling the client that the nurse is assigned to care for her is impersonal and implies that the client is being uncooperative. Telling the client that the nurse is there because the client has potential for

improvement will not help the client with low self-esteem because most people develop a sense of self-worth through accomplishment. Simply saying that the client has a lot of potential will not convince her that she is worthwhile. Telling the client that the nurse will talk to someone else later is not client focused and does not address the client's question or concern.

 CN: Psychosocial integrity; CL: Synthesize

14. 2. Nausea and gastrointestinal upset are common, but usually temporary, side effects of paroxetine. Therefore, the nurse would instruct the client to take the medication with food to minimize nausea and stomach upset. Other more common side effects are dry mouth, constipation, headache, dizziness, sweating, loss of appetite, ejaculatory problems in men, and decreased orgasms in women. Taking the medication an hour before breakfast would most likely lead to further gastrointestinal upset. Taking the medication at bedtime is not recommended because paroxetine can cause nervousness and interfere with sleep. Because orange juice is acidic, taking the medication with it, especially on an empty stomach, may lead to nausea or increase the client's gastrointestinal upset.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

15. 2. The presence of dizziness could indicate orthostatic hypotension, which may cause injury to the client from falling. Nausea, sedation, and dry mouth do not require immediate intervention by the nurse.

 CN: Pharmacological and parenteral therapies; CL: Analyze

16. 3. Symptom relief can occur during the first week of therapy, with optimal effects possible within 2 weeks. For some clients, 2 to 4 weeks is needed for optimal effects. The client's statement that the depression will be gone in 5 to 7 days indicates to the nurse that clarification and further teaching is needed. Trazodone should be taken after a meal or light snack to enhance its absorption. Trazodone can cause drowsiness, and therefore, the major portion of the drug should be taken at bedtime. The depressant effects of central nervous system depressants and alcohol may be potentiated by this drug.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

17. 3. The nurse should explain that ECT is a safe treatment and that the client is given an ultrashort-acting anesthetic to induce sleep before ECT and a muscle relaxant to prevent musculoskeletal complications during the convulsion, which typically lasts 30 to 60 seconds to be therapeutic. Atropine is given before ECT to inhibit salivation and respiratory tract secretions and thereby minimize the risk of aspiration. Medication for pain is not necessary and is not given before or during the treatment. Some clients experience a headache after the treatment and may request and be given an analgesic such as acetaminophen. Telling the daughter that the **HCP**  will ensure that the client does not suffer needlessly would not provide accurate information about ECT. This statement also implies that the client will have pain during the treatment, which is untrue.

CN: Reduction of risk potential; CL: Synthesize

18. 1. By stating “It must have been very upsetting for you,” the nurse conveys empathy to the client by recognizing the underlying meaning of a painful occurrence. The nurse’s statement invites the client to verbalize feelings and thoughts and lets the client know that the nurse is listening to and respects the client. Telling the client to talk about the job disregards the client’s feelings and is nontherapeutic for the depressed client because of underlying feelings of worthlessness and guilt that are commonly present. Telling the client that he will find another job when he is better or that he was probably too depressed to work is inappropriate because it disregards the client’s feelings and may promote additional feelings of failure and inadequacy in the client.

CN: Psychosocial integrity; CL: Synthesize

19. 4. The client with depression is preoccupied, has decreased energy, and cannot make decisions, even simple ones. Therefore, the nurse presents the situation, “It is time for a shower,” and assists the client with personal hygiene to preserve his dignity and self-esteem. Explaining the importance of good hygiene to the client is inappropriate because the client may know the benefits of hygiene but is too fatigued and preoccupied to pay attention to self-care. Asking the client if he is ready for a shower is not helpful because the client with depression commonly cannot make even simple decisions. This action also reinforces the client’s feeling about not caring about

showering. Waiting for the family to visit to help with the client's hygiene is inappropriate and irresponsible on the part of the nurse. The nurse is responsible for making basic decisions for the client until the client can make decisions for himself.

CN: Psychosocial integrity; CL: Synthesize

20. 1,2,4,5. NPO status, a signed **consent** , removal of dentures, and preprocedure voiding are all preparations prior to a procedure involving anesthesia, such as ECT. Orientation and frequent assessment of vital signs occur after the procedure.

CN: Reduction of risk potential; CL: Synthesize

21. 2. Sertraline, like other selective serotonin reuptake inhibitors (SSRIs), can cause decreased libido and sexual dysfunction such as delayed ejaculation in men and an inability to achieve orgasm in women. SSRIs do not typically cause weight gain but may cause loss of appetite and weight loss. Dry mouth is a possible side effect, but it is temporary. The client should be told to take sips of water, suck on ice chips, or use sugarless gum or candy. St. John's wort should not be taken with SSRIs because a severe reaction could occur.

CN: Pharmacological and parenteral therapies; CL: Evaluate

22. 3. It is best to involve the client in usual at-home activities as much as the client can tolerate them. Discouraging visitors may not be in the client's best interest because visits with supportive significant others will help reinforce supportive relationships, which are important to the client's self-worth and self-esteem. Providing for a schedule of activities outside the home may be overwhelming for the client initially. Involving the client in planning for outside activities would be appropriate. Encouraging the client to sleep as much as possible is nontherapeutic and promotes withdrawal from others.

CN: Management of care; CL: Synthesize

23. 2. Criteria for commitment include being gravely disabled and posing a harm to self or others. This client is not threatening to harm himself in the form of suicide or to harm others. The client is gravely disabled because of his inability to care for himself—namely, not eating because of his delusion.

Evidence of psychosis or psychotic symptoms or diagnosis of a mental illness alone does not make the client legally eligible for commitment.

CN: Management of care; CL: Apply

24. 3. The client needs to be informed of the time lag involved with antidepressant therapy. Although improvement in the client's symptoms will occur gradually over the course of 1 to 2 weeks, typically it takes 2 to 4 weeks to get the full effects of the medication. This information will help the client be compliant with medication and will also help in decreasing any anxiety the client has about not feeling better. The client's dose may not need to be increased; it is too early to determine the full effectiveness of the drug. Additionally, such a statement may increase the client's anxiety and diminish self-worth. Telling the client to wait a few days discounts the client's feelings and is inappropriate. Although it is too soon to tell whether the medication will be effective, telling this to the client may cause the client undue distress. This statement is somewhat negative because it is possible that the medication will not be effective, possibly further compounding the client's anxiety about not feeling better.

CN: Pharmacological and parenteral therapies; CL: Synthesize

25. 1,2,4,5. Serotonin syndrome can occur if a selective serotonin reuptake inhibitor is combined with a monoamine oxidase inhibitor, a tryptophan-serotonin precursor, or St. John's wort. Signs and symptoms of serotonin syndrome include mental status changes (such as confusion, restlessness, or agitation), headache, diaphoresis, ataxia, myoclonus, shivering, tremor, diarrhea, nausea, abdominal cramps, and hyperreflexia. Constipation is not associated with serotonin syndrome.

CN: Pharmacological and parenteral therapies; CL: Analyze

26. 2. Phenelzine is a monoamine oxidase inhibitor (MAOI). MAOIs block the enzyme monoamine oxidase, which is involved in the decomposition and inactivation of norepinephrine, serotonin, dopamine, and tyramine (a precursor to the previously stated neurotransmitters). Foods high in tyramine—those that are fermented, pickled, aged, or smoked—must be avoided because, when they are ingested in combination with MAOIs, a hypertensive crisis occurs. Some examples include salami, bologna, dried

fish, sour cream, yogurt, aged cheese, bananas, pickled herring, caffeinated beverages, chocolate, licorice, beer, red wine, and alcohol-free beer.

CN: Pharmacological and parenteral therapies; CL: Apply

27. 4. The nurse should first take the client's vital signs because the client could be experiencing a hypertensive crisis, which requires prompt intervention. Signs and symptoms of a hypertensive crisis include occipital headache, a stiff or sore neck, nausea, vomiting, sweating, dilated pupils and photophobia, nosebleed, tachycardia, bradycardia, and constricting chest pain. Giving this client an analgesic without taking his vital signs first is inappropriate. After the client's vital signs have been obtained, the nurse would call the **HCP**  to report the client's problems and vital signs. Administering the client's next dose of phenelzine before taking his vital signs could result in a dangerous situation if the client is experiencing a hypertensive crisis.

CN: Pharmacological and parenteral therapies; CL: Synthesize

28. 2. A depressed client commonly is not interested in eating because of the psychopathology of the disorder. Therefore, the nurse must take responsibility to ensure that the client eats, including spoon-feeding the client (placing the food on the spoon, putting the food near the client's mouth, and asking her to eat) if necessary. Serving the client her tray in her room does not ensure that she will eat. Calling the family to bring the client food from home usually is allowed, but it is still the nurse's responsibility to ensure that the client eats. Explaining the importance of nutrition in recovery is not helpful. The client may intellectually know that eating is important but may not be interested in eating or want to eat.

CN: Psychosocial integrity; CL: Synthesize

29. 1. To promote adequate rest (6 to 8 hours per night) and to eliminate hypsomnia, the nurse should sit with the client at the bedside until the medication takes effect. The presence of a caring nurse provides the client with comfort and security and helps to decrease the client's anxiety. Engaging the client in interaction until the client falls asleep, reading to the client, or encouraging the client to watch television may be too stimulating for the client, consequently increasing rather than decreasing the client's

restlessness.

CN: Psychosocial integrity; CL: Synthesize

30. 3. The client who verbalizes feeling in control of self and situations no longer feels powerless to affect an outcome but realizes that one's actions can have an impact on self and situations. It is common for the client with depression to feel powerless to affect an outcome and to feel a lack of control over a situation. Although interacting with staff and peers is a positive action, the client could be conversing in a negative or nontherapeutic manner. Sleeping only 4 hours at a time is evidence of symptomatology and does not indicate improvement or recovery. Verbalizing dissatisfaction over not being able to perform at work indicates that the client is most likely focusing on shortcomings and powerlessness.

CN: Psychosocial integrity; CL: Analyze

31. 2. The nurse must monitor the client for a suicide attempt at this time when the client is starting to feel better because the depressed client may now have enough energy to carry out an attempt. Bupropion inhibits dopamine reuptake; it is an activating antidepressant and could cause agitation. Although bupropion lowers the seizure threshold, especially at doses greater than 450 mg/day, and visual disturbances and increased libido are possible adverse effects, the nurse must closely monitor the client for a suicide attempt. As the client with major depression begins to feel better, the client may have enough energy to carry out an attempt.

CN: Psychosocial integrity; CL: Analyze

32. 4. In the initial plan of care, the most appropriate outcome would be that the client will interact with the nurse. First, the client would begin interacting with one individual, the nurse. The nurse would gradually assist the client to engage in interactions with other clients in one-on-one contacts, progressing toward informal group gatherings and eventually taking part in structured group activities. The client needs to experience success according to the client's level of tolerance. Initiating interactions with peers occurs when the client can gain a measure of confidence and self-esteem instead of feeling intimidated or unduly anxious. Discussing adaptive coping techniques is an outcome the client may be able to reach when symptoms are not as

severe and the client can concentrate on improving coping skills.

CN: Psychosocial integrity; CL: Synthesize

33. 3. Imipramine, a tricyclic antidepressant, in combination with alcohol will produce additive central nervous system depression. Although caffeinated coffee is safe to use when the client is taking imipramine, it is not recommended for a client with depression who may be experiencing sleep disturbances. Imipramine may cause photosensitivity, so the client would be instructed to use sunscreen and protective clothing when exposed to the sun. Reduced lacrimation may occur as a side effect of imipramine. Therefore, the use of artificial tears may be recommended.

CN: Pharmacological and parenteral therapies; CL: Create

34. 1. Telling the client that ECGs are done routinely for all clients taking imipramine, a tricyclic antidepressant, is an honest and direct response. Additionally, it provides some reassurance for the client. Commonly, a client with depression will ruminate, leading to needless increased anxiety. Tricyclic antidepressants may cause tachycardia, ECG changes, and cardiotoxicity. Telling the client that it is probably a precautionary measure because the nurse is not aware of a cardiac condition instills doubt and may cause undue anxiety for the client. Telling the client not to worry because the **HCP** is very thorough dismisses the client's concern and does not give the client adequate information. Explaining that the client had an ECG before initiating therapy with imipramine and that the procedure will be the same does not answer the client's question.

CN: Pharmacological and parenteral therapies; CL: Synthesize

35. 4. Anticholinergic effects, which result from blockage of the parasympathetic nervous system, include urine retention, blurred vision, dry mouth, and constipation. Tremors, cardiac arrhythmias, and sexual dysfunction are possible side effects, but they are caused by increased norepinephrine availability. Sedation and delirium are not anticholinergic effects. Sedation may be a therapeutic effect because many clients with depression experience agitation and insomnia. Delirium, typically not a side effect, would indicate toxicity, especially in elderly clients. Respiratory depression, convulsions, ataxia, agitation, stupor, and coma indicate tricyclic

antidepressant toxicity.

CN: Pharmacological and parenteral therapies; CL: Analyze

36. 1. The nurse should give the medication as prescribed. Mirtazapine is given once daily, preferably at bedtime to minimize the risk of injury resulting from postural hypotension and sedative effects. The usual dosage ranges from 15 to 45 mg. There is no reason to question the **HCP's**  prescriptions. The nurse should administer the medication as prescribed. Requesting to give the medication in three divided doses is inappropriate and demonstrates the nurse's lack of knowledge about the drug.

CN: Pharmacological and parenteral therapies; CL: Synthesize

37. 4. The nurse should express concern for the client and offer to help the client speak with the **HCP** , which will lend support to the client's concerns. The client who has stopped the medication must be taken seriously because medication noncompliance could result in a recurrence of symptoms of depression. Telling the client to focus on diet and exercise ignores the client's feelings and subtly implies the weight gain is the client's fault. Pointing out that the medication has helped and that positive things have happened since the depression lifted may be true, but it does not address the client's current feelings or needs.

CN: Pharmacological and parenteral therapies; CL: Synthesize

38. 3. Compliance with medication therapy is crucial for the client with depression. Medication noncompliance is the primary cause of relapse among psychiatric clients. Therefore, the nurse needs to teach the client about managing common adverse effects to promote compliance with medication. Teaching the client about the medication's pharmacokinetics may help the client to understand the reason for the drug. However, teaching about how to manage common adverse effects to promote compliance is crucial. Current research about the medication is more important to the nurse than to the client. Teaching about dosage regulation and adjustment of medication may be helpful, but typically, the **HCP** , not the client, is the person in charge of this aspect.

CN: Pharmacological and parenteral therapies; CL: Create

39. 1. After about 2 weeks of medication therapy, the nurse should expect improvements in sleep, appetite, and energy though mood may not have improved significantly yet. The increased energy related to better sleep and food intake gives the client the ability to act on thoughts to harm self (suicide) since the depressed mood has not completely lifted.

CN: Pharmacological and parenteral therapies; CL: Analyze

40. 4. Dry mouth is a common, temporary side effect of paroxetine. The nurse needs to further assess the client's water intake when the client states she is drinking lots of water. Excessive intake of water could be harmful to the client and could lead to electrolyte imbalance. Dry mouth is caused by the medication, and drinking a lot of water will not eliminate it. Sucking on ice chips or using sugarless gum or candy is appropriate to ease the discomfort of dry mouth associated with paroxetine.

CN: Pharmacological and parenteral therapies; CL: Evaluate

41. 2,3,5. Symptoms of depression include depressed mood, anhedonia, appetite disturbance, sleep disturbance, psychomotor disturbance, fatigue, feelings of worthlessness, excessive or inappropriate guilt, decreased concentration, and recurrent thoughts of death or suicide. Paroxetine is a selective serotonin reuptake inhibitor antidepressant that also can be used to treat anxiety. Improved concentration, verbalization of feelings, and decreased agitation or pacing are signs of improvement. Taking 2-hour evening naps daily is still a sign of fatigue or lack of energy, and the increased use of somatization (bodily problems) could be signs of continued symptoms of depression.

CN: Pharmacological and parenteral therapies; CL: Evaluate

42. 3. The most important behavior to report to the next shift is that the client was able to sleep from 2300 to 0600. This indicates that improvement in the symptoms of depression is occurring as a result of pharmacologic therapy. The nurse would expect to observe improvement in sleep, appetite, and psychomotor behavior first before improvement in cognitive symptoms. The client's flat affect is still a symptom of depression. The fact that the client had a visitor is not as important as changes in the client's behavior. Spending the evening in her room is a continuation of the client's withdrawn

behavior and is important to report but not as important as the improvement in sleep.

CN: Psychosocial integrity; CL: Analyze

43. 3. Dysthymia is a milder, persistent type of depression in which sufferers are able to minimally carry on their work. The combination of psychotherapy with antidepressants is more effective in treating this order than using either treatment alone. ECT is a treatment used for occurrences of major depression as a last resort when several medications fail. Psychoanalysis is a very involved, long-term treatment rarely used now due to its cost and the long period of treatment required for results.

CN: Psychosocial integrity; CL: Synthesize

44. 3. After two episodes of a major depressive disorder, the likelihood of a third episode increases to 70%. This information would be useful to convey prior to discussing the importance of continuing his medication. This client also has a family history of depression. A healthy diet and exercise are very significant adjuncts to the therapeutic plan but may not be sufficient as stand-alone therapy.

CN: Physiological integrity; CL: Analyze

45. 1. In the first week or so of taking an antidepressant, the vegetative symptoms of depression (poor sleep, appetite, and energy level) improve. However, it takes 3 to 4 weeks for improvement in self-concept/self-esteem to take place.

CN: Pharmacological and parenteral therapies; CL: Evaluate

The Client with Bipolar Disorder, Manic Phase

46. 4. The most urgent consideration for intervention and for teaching is the fact that for individuals with a history of bipolar disorder, antidepressants when taken alone can push the person into mania. Antipsychotics are sometimes prescribed for clients with bipolar disorder and would not pose a special concern. Individuals with bipolar disorder are typically treated with mood stabilizers, and benzodiazepines are sometimes used in the short term to give a client relief before the mood stabilizers can take effect.

CN: Pharmacological and parenteral therapies; CL: Analyze

47. 2. Decreased need for sleep and racing thoughts are the most prominent hallmarks of mania. Feelings of pleasure, motivation, and increased energy, within reason, are desired experiences. Also, leaving a job to start a new business is not, in itself, a sign of impending illness.

CN: Psychosocial integrity; CL: Apply

48. 4. The therapeutic serum level for lithium is 0.6 to 1.2 mEq/L (0.6 to 1.2 mmol/L). Levels do fluctuate with fluid intake and output, however. Therefore, the most urgent matter for teaching is the client's comment about taking his lithium during excessive loss of fluids during an episode of "stomach flu" with diarrhea. Exercising is only concerning if the client becomes dehydrated. A healthy diet is indicated while taking lithium.

CN: Pharmacological and parenteral therapies; CL: Analyze

49. 3. All of these options need to be addressed. However, it is vital that this young woman receive counseling about the serious birth defects that have an increased incidence with the taking of divalproex during the first trimester of pregnancy. These problems include craniofacial abnormalities (cleft palate), organ malformations (holes in the heart and urinary tract problems), limb deficiencies, and developmental delays. The chances of preeclampsia and premature labor are also increased.

CN: Reduction of risk potential; CL: Analyze

50. 1. Valproic acid can cause hepatotoxicity, so regular liver function tests are needed. Other side effects include nausea and drowsiness. Extended-release tablets should not be split or crushed; doing so changes their absorption. Alcohol should never be mixed with this medication. There will be medication in the client's body at all times. Nausea and tachycardia are not common side effects of valproic acid.

CN: Pharmacological and parenteral therapies; CL: Synthesize

51. 2. The use of prednisone or other steroids can initiate a manic state in a bipolar client even if he is well controlled on medication. The other medications would decrease the client's depression, mood swings, and

anxiety, making him calmer rather than more agitated.

CN: Pharmacological and parenteral therapies; CL: Analyze

52. 3. The nurse should first attempt a collaborative approach to increasing adherence to the prescribed medication regimen. Giving written medication information to a client with acute mania is poor nursing judgment because a client with acute mania cannot benefit from written information as a result of impaired ability to focus and concentrate. The client was a voluntary admission and has the right to refuse any medication. Giving the medication as an injection against the client's **consent**  constitutes battery.

CN: Management of care; CL: Synthesize

53. 2. The nurse clearly informs the client about behavior that is unacceptable on the unit, such as voicing jokes with sexual content and touching others. Setting limits on behavior provides safety and security to the client and conveys to the client that he is worthy of help. Saying “She will not want to be around you with that kind of talk” and “You need to be careful about what you say to others” does not clearly inform the client about behaviors that are unacceptable and implies that the client can control behaviors if he chooses. A time-out in the client's room does not inform the client about the inappropriateness of his behaviors and could be interpreted by the client as punitive as well as diminishing his self-esteem.

CN: Psychosocial integrity; CL: Synthesize

54. 3. The nurse should medicate the client who does not respond to verbal interventions and whose anxiety is escalating. This will reduce the client's anxiety and agitation and prevent harm or injury to the client and others. Seclusion, restraint, and controlling the client are a last resort and require a **healthcare provider's (HCP's)**  prescription and close assessment for when the prescriptions can be discontinued.

CN: Psychosocial integrity; CL: Synthesize

55. 4. The nurse should help the **unlicensed assistive personnel (UAP)**  understand the client's behavior by stating that his irritable mood is a symptom of mania. Not all clients with mania are euphoric or have an expansive mood. Saying “It is our responsibility to listen to him even though

we might not like what he is saying” does not help the UAP understand the client with mania. Reprimanding the client for his behavior and asking him to control his behavior are inappropriate actions and show poor nursing judgment and a lack of understanding of the manic client.

CN: Psychosocial integrity; CL: Synthesize

56. 1,2,3,5. Scheduled rest periods, relaxation exercises, and listening to soft music are activities that reduce environmental stimuli for the client who is hyperactive, talkative, easily distracted, irritable, and angry. Aerobic exercise is also beneficial to discharge some of the client’s need to be active. Watching television is not therapeutic because it would stimulate the client with acute mania.

CN: Psychosocial integrity; CL: Apply

57. 3. Reminding the client of past consequences of stopping the medication may help her realize the risks of stopping the medication again. While increases in energy may precipitate suicide attempts, the priority here is to reinforce the need for maintenance medications. Encouraging the client to reduce her medication dose reinforces the client’s misperception that she only needs medication when she feels depressed or manic rather than recognizing that her mood stabilizer can prevent her from experiencing those extreme highs and lows. Saying she will “spiral out of control” if she stops her medication is not as specific as identifying the need for hospitalization.

CN: Pharmacological and parenteral therapies; CL: Synthesize

58. 1. The nurse should administer the medication as prescribed. Lithium has a clinical response lag time of 1 to 2 weeks. Haloperidol is prescribed temporarily to produce a neuroleptic effect until the lithium starts to produce a clinical response. Haloperidol is usually discontinued when the lithium starts to take effect. There is no need to contact the HCP or supervisor as the prescription is appropriate.

CN: Pharmacological and parenteral therapies; CL: Synthesize

59. 4. The client’s statement “I am the Queen of England. Bow before me” is an example of a grandiose delusion and refers to thought content of the mental status examination. Examples of psychomotor behavior to be

documented would include excited, typically exaggerated, and repetitive physical movements, and excessive talking and gesturing. Mood is a subjective state, and affect is an observable expression of emotion. Mood is what a client tells you she is feeling, and affect is what you see the client feeling. For example, the client may state that she feels sad or happy in reference to mood. Affect refers to the display of physical emotion, commonly described as “appropriate” or “flat.” Attitude toward the nurse refers to the client’s behavior in the presence of the nurse during the mental status examination (pleasant and cooperative, irritable, and guarded).

CN: Psychosocial integrity; CL: Analyze

60. 4. Decreasing external stimuli is the intervention most likely to decrease the emotional lability and minimize its effect on other clients. While the client is displaying emotional lability, this behavior has not reached the level where involuntary isolation (seclusion) or physical restraint is needed. The client is not totally out of control or threatening others. However, ignoring the behavior will not result in a decrease in the lability. Lorazepam can be used, but benzodiazepines can lead to dependence and should not be used before other measures have been tried.

CN: Psychosocial integrity; CL: Synthesize

61. 1. The nurse would request to be excused, showing respect and regard for the client, while telling the client to come to the dining room for lunch. Acutely manic clients need clear, concise comments and directions. Telling the client that he needs to stop talking because it is lunchtime is disrespectful and does not give the client directions for what he needs to do. Using the familiar skill of waiting without interrupting until the person pauses would not be effective with the very talkative, manic client. Walking away and approaching the client after a few minutes before the food gets cold is not helpful because the client would probably continue talking.

CN: Psychosocial integrity; CL: Synthesize

62. 3. By stating to the client “Swearing and profanity is unacceptable here,” the nurse is setting limits in a nonpunitive manner for behavior that is inappropriate or threatening to other clients and staff. Setting limits helps the client regain self-control, prevents alienation from others, and preserves self-

esteem. It is common for the irritable manic client to misperceive the nurse's and other's statements and intentions, feel threatened, and respond in a manner that is out of character for the client when not in a manic phase. Stating that the client is acting very inappropriately or that the nurse will not tolerate the client's swearing and profanity or threatening to put the client in seclusion is threatening and punitive and thus nontherapeutic.

CN: Psychosocial integrity; CL: Synthesize

63. 1. Stating that this must be difficult for the husband conveys empathy and understanding and offers him the opportunity to voice his feelings to the nurse. Telling the husband that it is okay and that the nurse has heard worse is inappropriate and minimizes the impact of the wife's illness on the husband. Asking about the length of the client's illness or telling the husband that his wife needs some medication ignores the husband's feelings, thereby minimizing his self-respect.

CN: Psychosocial integrity; CL: Synthesize

64. 3. Telling the client that others may not want to hear about sex and inviting him to play a game of ping-pong with the nurse informs the client that even though his behavior is unacceptable, the nurse considers him worthy of help. The client's thoughts and actions are out of control, and directing him to an activity with the nurse is an appropriate way of regaining control. The nurse is responsible for providing safety and security to this client and others on the unit. Continuing to walk down the hall while ignoring the conversation does nothing to meet the needs of this or other clients. Doing so also diminishes trust in the nurse. Speaking to the client later in private while saying nothing at the time allows the client to continue his provocative behavior instead of focusing his energy toward productive activity. Informing the client that if he continues to talk about sex, no one will want to be around him is not helpful because his behavior is a symptom of his illness and the statement diminishes his self-worth.

CN: Psychosocial integrity; CL: Synthesize

65. 4. The nurse suggests an activity such as walking around the unit to distract the client from the paranoid grandiose delusion that could result in loss of control. This action interrupts the client's anxious state and helps to

redirect energy and focus on an activity based in reality. The focus must be on the underlying need or feeling of the delusion and not on the content. Asking the client to describe the people who will come challenges the client and forces the client to cling to the delusion. Stating that the nurse and staff will protect the client conveys agreement with the client's belief system, reinforcing the client's delusion. Telling the client that he is not the prince of peace and repeating his name challenges the client and his present belief system. Doing so may lead to decreased trust in the nurse and an aggressive response, or it may force the client to defend his beliefs.

CN: Psychosocial integrity; CL: Synthesize

66. 2. The nurse needs to explain the procedure in simple terms because the client in a manic phase has difficulty concentrating, is easily distracted, and can misinterpret what the nurse states. Giving a thorough explanation of the procedure is not helpful and can confuse the client. Calling security to be on standby is inappropriate. If the nurse judges that the client might elope or become agitated, the nurse should schedule the appointment for another time. Canceling the appointment until the client can go unescorted is impractical and may not follow unit or hospital policy and the client's treatment plan.

CN: Psychosocial integrity; CL: Synthesize

67. 4. The nurse escorts the client to her room and assists with choosing appropriate attire to preserve the client's dignity and self-esteem and prevent ridicule from others on the unit. It is common for a client with bipolar disorder, manic phase, to exhibit poor judgment, provocative behavior, and hyperactivity. The client in the manic phase commonly dresses inappropriately and changes clothes many times throughout the day. The nurse needs to assist the client with hygiene, grooming, and proper attire until her judgment improves. Telling the client to dress appropriately while out of her room may be perceived by the client as an attack. Additionally, the client may be incapable of making that decision. Asking the client to put on hospital pajamas until she can dress appropriately is punitive and demeaning. Because of the client's cognitive difficulties, the client may not understand the instructions to go to her room to change clothes. Additionally, the client may become distracted by stimuli on the unit and may not reach her room.

 CN: Psychosocial integrity; CL: Synthesize

68. 3. While the client who is psychotic can upset other clients, the nurse must respond to the second client with both empathy for his feelings and a general explanation that the behavior is out of the psychotic client's control. Agreeing with the second client or giving medication to the psychotic client does not help the complaining client gain empathy for his peer and only temporarily deals with the problem.

 CN: Psychosocial integrity; CL: Synthesize

69. 4. The client with mania is very active and needs to have this energy channeled in a constructive task such as cleaning or tidying the dayroom. Because the client is distracted easily and can concentrate only for short periods, the successful completion of a helpful task would give the nurse the opportunity to thank the client for the help, thereby enhancing the client's self-esteem. Leading a group activity is too stimulating for the client. Participating in this type of activity also may cause the client to be disruptive. Watching television or reading the newspaper would be inappropriate for the client who cannot sit for a period of time.

 CN: Psychosocial integrity; CL: Synthesize

70. 1. The client in the manic phase experiences insomnia, as evidenced by his sleeping only for about 4 hours a night for the past 5 days. The client experiencing an acute manic episode is not capable of judging the need for sleep. Therefore, the nurse should assess the amount of rest the client is receiving daily to prevent exhaustion. The development of vertigo, gastritis, or bradycardia typically does not result from acute mania.

 CN: Psychosocial integrity; CL: Analyze

71. 3. Bipolar disorder is a biochemical disorder caused by an imbalance of neurotransmitters in the brain. Manic episodes seem to be related to excessive levels of norepinephrine, serotonin, and dopamine. Psychopharmacologic therapy aims to restore the balance of neurotransmitters. In the past, it was thought that bipolar disorder may have been caused by early psychodynamics or disturbed families, but the current view emphasizes the role of biology. Bipolar disorder could be genetic or

inherited from someone in the family, but it is best for the client and family to understand the disease concept related to neurotransmitter imbalance. This understanding also helps them to refrain from placing blame on anyone. Siblings and close relatives have a higher incidence of bipolar disorder and mood disorders in general when compared with the general population.

 CN: Psychosocial integrity; CL: Apply

72. 2. The serum lithium level has nothing to do with the client's white blood cell count, and there are no governmental safety regulations for blood testing. While a periodic serum lithium level could monitor whether or not a client was taking the prescribed medication, the most important reason for the blood test is to periodically assess the client's lithium level and prevent even mild toxicity on an ongoing basis.

 CN: Pharmacological and parenteral therapies; CL: Apply

73. 3. Because lithium reaches peak blood levels in 1 to 3 hours, blood specimens for serum lithium concentration determinations are usually drawn before the first dose of lithium in the morning (which is usually 8 to 12 hours after the previous dose) or before breakfast. Stat lithium levels can be drawn at any time, usually when toxicity is suspected.

 CN: Pharmacological and parenteral therapies; CL: Apply

74. 2,3,5. Serious side effects that may indicate lithium toxicity include muscle weakness, vertigo, vomiting, extreme hand tremor, and sedation. The prescribing **HCP**  should be notified immediately when these symptoms occur. When lithium is initiated, mild or transient side effects can occur, such as nausea, fine hand tremor, anorexia, increased thirst and urination, and diarrhea or constipation.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

75. 2. The therapeutic and toxic range of lithium is very narrow. If the client forgets to take a scheduled dose of lithium, the client needs to wait until the next scheduled time to take it because taking twice the amount of lithium can cause lithium toxicity. The client needs to maintain a regular diet and regular salt intake. Lithium and sodium are eliminated from the body through the kidneys. An increase in salt intake leads to decreased plasma

lithium levels because lithium is excreted more rapidly. A decrease in salt intake leads to increased plasma lithium levels. The client needs to drink 8 to 10 eight-ounce (240 to 300 mL) glasses of water daily to maintain fluid balance and decrease thirst. Decreased water intake can lead to an increase in the lithium level and consequently a risk of toxicity. Lithium must be taken on a regular basis at the same time each day to ensure maximum therapeutic effect.

CN: Pharmacological and parenteral therapies; CL: Evaluate

76. 4. Lithium commonly is combined with an antipsychotic agent, such as haloperidol, or a benzodiazepine such as lorazepam. Antipsychotic agents, such as haloperidol, are prescribed to produce a neuroleptic effect until the lithium produces a clinical response. After a clinical response is achieved, the antipsychotic agent usually is discontinued. Additionally, the dosages of each drug listed are appropriate. Therefore, the nurse would administer the drugs as prescribed.

CN: Pharmacological and parenteral therapies; CL: Synthesize

77. 4. The client's statement "I know I am getting sick when I do not need much sleep and start buying things" indicates insight into her illness because the client recognizes symptoms that can lead to relapse. The statement "I enjoy feeling high; I do not need much sleep then and get really creative" gives no indication that the client recognizes the detrimental effects of bipolar disorder. The statements about not needing medicine in another week and being cured indicate the client's lack of understanding about the chronic nature of the disorder. The client is not cured from bipolar disorder, but symptoms of the disorder are usually managed when she is stabilized on medication. Medication may be needed by the client for many years or throughout her life.

CN: Psychosocial integrity; CL: Evaluate

78. 1. For this client, the nurse needs to set limits on the client's intrusive, interruptive behavior by saying "Please stop interrupting others; you can speak when it is your turn." This statement also clearly points out to the client the specific unacceptable behavior. The nurse helps the client to attain control and helps the other clients become more tolerant of the situation. Saying

“Stop talking; it is time for you to leave the meeting” is not helpful because it leaves the client unaware of what has happened or the behavior that is unacceptable. Also, such a statement may seem punitive. The statement, “If you cannot control yourself, we will have to take action,” is threatening to the client and diminishes the client’s self-worth. Using the statement “Please behave like an adult. Your behavior is childish” is demeaning and scolding to the client, thereby diminishing the client’s self-esteem.

CN: Psychosocial integrity; CL: Synthesize

79. 1,2,5. The therapeutic level of valproic acid is 50 to 100 mg/mL (347 to 693 mmol/L). A level of 15 mg/mL (104 mmol/L) is not considered therapeutic. Therefore, the client would be manifesting symptoms of mania. Irritability, euphoria, grandiosity, pressured speech, flight of ideas, distractibility, and a decreased need for sleep are some characteristics of a manic episode. Anhedonia and hypersomnia are related to a depressive illness and not mania.

CN: Pharmacological and parenteral therapies; CL: Analyze

80. 4. The nurse should call the **HCP**  to report symptoms of a sore throat, fever, and chills because these symptoms may be signs of serious adverse effects of the medication, including potentially fatal hematologic, cardiovascular, and hepatic complications. Giving the dose of carbamazepine is contraindicated in this situation. Giving the acetaminophen would be inappropriate and potentially detrimental to the client’s health. Waiting until morning to report the client’s symptoms is a serious error in judgment.

CN: Pharmacological and parenteral therapies; CL: Synthesize

81. 2. The nurse’s most appropriate action is to give the wife information about a support group in her area. Family members need and want education and support. Suggesting that the wife see an **HCP**  is not necessary in this situation. She needs support and education. Recommending that she talk with her close friend may be helpful if she so chooses. However, this is not as helpful as attending a support group. Here, the wife can learn, share, obtain support from, and provide support to others with similar situations. Having the wife share her feelings with her husband may or may not be appropriate or helpful to her or her husband. The husband may be unable to help his wife

with adaptive coping, and therefore, the client's self-esteem could be diminished.

CN: Psychosocial integrity; CL: Synthesize

82. 2. The nurse should encourage the husband to support and communicate openly with his wife to maintain effective family-client interactions. During any illness, open communication and support helps the relationship between husband and wife. It is unrealistic for any individual to be free from anxiety or worry and impossible for the husband to be able to control what his wife may think or feel. Relieving the client of all responsibilities is unrealistic and not helpful. The client needs to resume activities as soon as she can manage them. Reminding his wife to control her symptoms is not appropriate and indicates that the husband needs further teaching about this condition.

CN: Psychosocial integrity; CL: Create

83. 3,1,2,4. None of the other interventions will be successful unless the stimuli that fuel the client's mania are removed or decreased. Once the client is in a quieter setting, oral medication will help calm the client so he or she can be calmer. Once the medication has taken effect, the nurse can help the client explore the client's feelings and problem. Finally, teaching coping techniques can be effective to address client problems after he or she has become calmer.

CN: Psychosocial integrity; CL: Synthesize

84. 4. The nurse should state her name and purpose on the unit to clarify her identity and to counteract other beliefs the client may have. Stating that the nurse does not want to or cannot go out to dinner is not therapeutic because it fails to clarify the client's misperceptions or erroneous beliefs, as is the statement "It does not matter how I look; the answer is no."

CN: Psychosocial integrity; CL: Synthesize

85. 3. The client is visibly out of control, and other measures have not helped. Therefore, the nurse needs to seclude the client and use restraints if necessary to protect the client and others from harm. Following the client and asking her to calm down or telling the client to lie down on the sofa is not

helpful because the client's level of anxiety is too high for her to attempt to calm down on her own and she cannot control her behavior. Telling the staff to ignore the client's remarks is not helpful because the client needs external means of control to protect the client, other clients on the unit, and the staff. Safety is the priority.

 CN: Safety and infection control; CL: Synthesize

86. 3. When the client in a manic state attempts to manipulate the nurse or demands privileges, the nurse must restate the unit rules in a calm and matter-of-fact manner. “The television hours are from 1900 hours to 2200 hours. It is 2200, and the television goes off so everyone can sleep” is the most therapeutic response because it restates the rules and is nonthreatening. During a manic phase, the client is impulsive and has difficulty concentrating. The client needs consistency and structure from the staff. The statement “I will let you watch television just this once” allows the client to manipulate the nurse, as does “I will turn the television off when you get sleepy. Do not ask me to do this again.” In addition, the last portion of the statement is a threat. The statement, “The television goes off at 2200 hours; I’ve been telling you this for the past three evenings,” is inappropriate because it is authoritative and demeaning to the client.

 CN: Psychosocial integrity; CL: Synthesize

The Client with Suicidal Ideation and Suicide Attempt

87. 1,2,4. Having resources such as a crisis phone line number and a specific prevention plan helps clients know what to do if they begin to feel they want to harm themselves. Likewise, having support people educated about how to help the client stay safe also improves the client's safety. Not all medications are lethal enough that access to a month's supply of medication should be limited. Further, such a limitation is likely to increase costs for the clients, which may increase the client's stress. It is unrealistic and potentially distressing to the client and family/friends to have the client under constant surveillance.

 CN: Safety and infection control; CL: Apply

88. 3. It is important to assess clients in the ED for suicide risk so that

those with the potential can receive help prior to discharge. Many visitors to the ED have no other source for health care. It is a myth that talking about suicide will cause young people to think about suicide, and evidence exists that they will talk about suicide if asked directly. Assessing adults only because they will be more honest is an incorrect assumption. Limiting the assessment of suicide risk only to adolescents with psychiatric diagnoses falsely assumes that other young people are not at risk for suicide.

Questioning the parents about their adolescent's suicide risk may be an unreliable method because the parents may not be aware that suicide risk is present.

CN: Psychosocial integrity; CL: Synthesize

89. 2. A crucial factor in determining the lethality of a method is the amount of time that occurs between initiating the method and the delivery of the lethal impact of the method. Lethal methods of suicide include using a gun, jumping from a high place, hanging, drowning, carbon monoxide poisoning, and overdose with certain drugs, such as central nervous system depressants, alcohol, and barbiturates. The more detailed the suicide plan, the more lethal and accessible the method, and the more effort exerted to block rescue, the greater the chance is for the suicide to be completed. Impulsive attempts at suicide even with rescuers in sight may be lethal depending on the method. Less lethal methods may include overdosing on aspirin and wrist cutting. Head banging is a self-injurious behavior that requires intervention and is not to be taken lightly; however, it is not considered a lethal method of suicide.

CN: Psychosocial integrity; CL: Apply

90. 4. The statement “No matter what the intent, all suicidal behavior is serious and deserves our serious consideration” is most appropriate because it provides accurate information for the staff. Superficial cuts may be termed *suicide gestures*. Nevertheless, they still are a cry for help and may indicate ambivalence about dying. Clients have accidentally and unintentionally killed themselves because previous attempts were not taken seriously, they acted on impulse, or rescue attempts were foiled. Stating “It is our job to help her no matter how we feel about her or what she did; she will be discharged soon” is inappropriate because it does not provide the staff members with accurate

information. Stating “I will not tolerate that kind of discussion from my staff; now it is time for you to go back to work” is authoritarian and punitive. Additionally, it does not help the staff members gain insight. Stating “I know it is hard to understand, but we need to do the best we can even though she will be back” voices agreement with the staff’s bias and lack of knowledge. As such, this statement is inappropriate.

CN: Management of care; CL: Synthesize

91. 2. On hearing the client’s statement, the nurse must ask the client directly if she plans to kill herself. It is erroneous to think that talking to the client about suicide will drive her to it. Asking directly about suicidal intent is absolutely necessary. Commonly, doing so provides the client with a sense of relief. In addition, the nurse conveys concern for and a sense of worth to the client, thus enabling appropriate planning for care. Asking “What do you mean?” is an indirect method of inquiry that provides the client with the opportunity to evade the nurse’s intent. Asking “Does your family not care about you?” shows poor judgment on the nurse’s part and is demeaning to the client. Asking “What happened to make you think that?” conveys a lack of knowledge of psychopathology.

CN: Psychosocial integrity; CL: Analyze

92. 4. For the client with suicidal ideation, client safety is the priority. The nurse protects the client from self-harm or self-destruction. Although self-esteem, sleep, and stress are common areas that require intervention for a client with suicidal ideation, ensuring the client’s safety is the most immediate and serious concern.

CN: Safety and infection control; CL: Synthesize

93. 1. To determine the seriousness of the suicidal ideation, the nurse must ask directly about the intent and the plan. The nurse needs to determine whether the client has a concrete plan and will act on his or her thoughts. Then, the nurse assesses the lethality of the method, immediacy, means to complete suicide, and possibility of rescue. Asking the client “Have you made out a will?” is not as important and does not necessarily imply that he or she is planning self-harm. Many individuals have made out wills without planning self-harm. Asking the client “Does your family know you are here?”

provides no information about the client's intent and plan. Asking the client "How long have you been thinking about harming yourself?" does provide information that the client is thinking about self-harm. However, it does not provide information about the client's immediate intent and plan.

CN: Psychosocial integrity; CL: Analyze

94. 2. The nurse's best response is to teach the **UAP**  about the appropriate intervention and why it is important for the client. Staff members need to be client focused and to understand why a specific intervention is important and appropriate. Telling the UAP that the assignment will be switched or not to worry about it is not appropriate because it does not teach the UAP about the client's illness and appropriate client care. The statement "Clients who are depressed are hard to deal with, but do not take what they say seriously" does not help the staff member understand why listening is important and may jeopardize the client's safety.

CN: Management of care; CL: Synthesize

95. 2. The immediate priority is to save the caller's life. Therefore, the nurse should tell the caller that another nurse will telephone the police. The immediate goal is to rescue the caller because the suicide attempt has begun. Referring the caller to a 24-hour suicide hotline or instructing the caller to telephone her family for help may be appropriate as part of discharge planning. Asking the caller whether she has telephoned her **HCP**  is not appropriate. The nurse is responsible for notifying the HCP.

CN: Psychosocial integrity; CL: Synthesize

96. 4. The statement refers to the suicidal client's wish to use her own death to retaliate or get even with her boyfriend. If a client wishes to retaliate, discovering the specific plans would be important to maintaining her safety as well as possibly her boyfriend's. Though sadness, escape, and loneliness can all be themes expressed by a suicidal client, they do not apply to the comment made by this client.

CN: Psychosocial integrity; CL: Analyze

97. 2. The statement "I do not think about killing myself as much as I used to" indicates a lessening of suicidal ideation and improvement in the client's

condition. The statement “I could not kill myself because I do not want to go to hell” indicates that the client will not attempt suicide but could still be thinking about death. The statements “I am of no use to anyone anymore” and “I know my kids do not need me anymore since they are on their own” indicate that the client feels worthless and may be experiencing suicidal ideation.

CN: Psychosocial integrity; CL: Evaluate

98. 4. Based on the client’s statement, the nurse must initiate plans for hospitalization immediately because the client has suicidal ideation with a definite plan, lethal method, and immediate access to the method. Telling the client to remove the gun, call the nurse, or promise not to hurt himself does not sufficiently reduce the risk of suicide.

CN: Psychosocial integrity; CL: Synthesize

99. 1. The survivor of suicide, in this situation, would be referred to a group for survivors of suicide to help her with her feelings and to work through the grief reaction. This group provides support and understanding of what the individual is experiencing by members who are experiencing similar reactions, including anger and guilt. Depression and unresolved grief can occur when the survivor does not receive appropriate help. Counseling by a chaplain or individual therapy by the nurse may be appropriate in addition to referral to the group. Giving the survivor the suicide hotline number would be appropriate if the survivor herself were thinking about suicide.

CN: Psychosocial integrity; CL: Synthesize

100. 3. The most appropriate response is to discuss the behavioral clues and resources because it provides the husband with important information that he needs to cope with his wife’s condition. Family members are commonly afraid of future suicidal activity and need helpful information and resources to turn to in a crisis. Telling the husband not to worry minimizes the husband’s concern and is not necessarily true. Additionally, past suicide attempts need to be considered when evaluating the client’s future risk of suicide. The statement “She told me she wants to live, so I do not think she will try again” ignores the husband’s request and concerns. Additionally, there is no way for the nurse to know whether the client will attempt suicide

again. The statement “Tell her about your concern, and just take care of her” is not helpful because the husband needs information and resources to turn to should a crisis develop.

CN: Psychosocial integrity; CL: Synthesize

101. 4. After the client identifies and shares her strengths, the nurse reinforces the client for her ability to evaluate herself in a positive manner. Doing so promotes self-esteem and offers hope for improvement. Asking the client to identify three additional strengths or volunteering the client to lead the cooking group could be too overwhelming for the client at this time and may increase her anxiety and feelings of worthlessness. Although educating the client about the importance of medication is important, doing so at another time would be more appropriate.

CN: Psychosocial integrity; CL: Synthesize

102. 2. The best response would be for the nurse to advise the visitor to be caring and genuine to the client as a friend normally would. Family and friends are commonly afraid or at a loss about how to act or what to say to someone with a mental illness or to someone who may voice thoughts of self-harm. The statement “Try to cheer her up” is inappropriate because the client may feel overwhelmed and thus become more despondent when she cannot meet or match the cheerful demeanor. The statement “Control your expressions” is inappropriate because the client is not helped when interactions are not natural and genuine. The statement “Avoid asking how she is feeling” is inappropriate because it conveys a lack of interest in and concern for the client.

CN: Psychosocial integrity; CL: Synthesize

103. 2. The client with feelings of self-doubt, inability to control her life, and dependency is manifesting problems evident in autonomy versus shame/doubt. Because of illness, regression has occurred, and the client’s behaviors affect how the nurse will intervene with the client. With trust versus mistrust, some behaviors reflecting problems include suspiciousness, projection of blame, and withdrawal from others. With initiative versus guilt, some behaviors reflecting problems include excessive guilt, reluctance to show emotions, and passivity. With industry versus inferiority, some

behaviors reflecting problems include feelings of being unworthy, poor work history, and inadequate problem-solving skills.

CN: Psychosocial integrity; CL: Analyze

104. 3. Client safety is the priority to prevent further self-harm. Nutrition, sleep, and hygiene are important concerns, but they are secondary to safety.

CN: Safety and infection control; CL: Analyze

105. 4. The nurse inspects the bag and its contents in the presence of the client and his wife so that they know what is allowed on the unit and what should be returned home and why. The nurse is responsible for the client's safety and that of the other clients and staff. Telling the wife to take her husband's things home because he is suicidal diminishes the client's self-worth and is inaccurate. Instructing the wife to unpack the bag and put her husband's things away is inappropriate because it is the nurse's responsibility to manage safety issues pertaining to the client and the unit. Asking the wife whether the bag contains anything dangerous would be poor judgment on the part of the nurse because the wife would not be knowledgeable about the safety factors.

CN: Safety and infection control; CL: Synthesize

106. 2. The nurse and staff should place the client in restraints to protect her from further self-harm. The client's behavior is out of control and necessitates external controls for her safety. The healthcare team is trained to deal with this type of behaviors, so there is no reason to call hospital security at this time. Calling the **HCP**  for additional medication prescriptions is not appropriate because the lorazepam given by the nurse may take effect if the client remains still. The nurse is responsible for judging whether additional medication is needed later. Instructing a staff member to sit in the room with the client is unsafe for the client and the staff member.

CN: Safety and infection control; CL: Synthesize

107. 2. The nurse needs to ask the client whether he is going to hurt himself to determine the client's ability to cope with the voices and to assess the client's impulse control. The nurse's assessment will then determine the course of action to take regarding the client's safety. Asking when the client

hears the voices and how long the client has heard them is important but not as important as determining whether the client will act on what the voices are saying. Asking “Why are the voices starting again?” would be inappropriate because the client may not know why and may not be able to answer the nurse.

 CN: Safety and infection control; CL: Analyze

108. 4. Though disturbed thoughts and sensory perceptions would be a concern to the nurse, as would communication issues, the primary issue for this client in terms of his comments would be the potential for medication noncompliance and relapse. Most college students want to be like their peers and perceive themselves as capable and well. These beliefs can lead a young client with schizophrenia to stop taking medication, which leads to relapse.

 CN: Psychosocial integrity; CL: Synthesize

109. 1. Clients on 15-minute suicide checks must be observed by a staff member every 15 minutes. However, the staff member must stagger the timing of the check so that the client cannot predict the precise time. The staff member could check the client at 10 minutes and then at 8 minutes, and so on, to protect the client from self-harm. The nurse would further explain the necessity of this procedure to help the staff understand its importance. Documenting that suicide checks have been done is absolutely necessary. Clients on one-to-one suicide precautions can never be left alone. All clients using razors must be supervised by staff.

 CN: Management of care; CL: Evaluate

110. 3. Talking with a staff member when suicidal thoughts occur is an important part of contracting for safety. The nurse or another staff member can then assess whether the client will act on the thoughts and assist the client with methods of coping when suicidal ideation occurs. Writing in a journal, engaging in physical activity, or playing games with others does not allow the client to verbalize suicidal thoughts to the nurse.

 CN: Safety and infection control; CL: Synthesize

111. 4. Because the client has a history of recurring depression and suicidal ideation, the nurse would give the client a 7-day supply of

imipramine to prevent possible overdose. Giving the client a 14-, 21-, or 30-day supply of medication would provide the client with enough medication to complete a suicide attempt. Tricyclic antidepressants are associated with a higher rate of death than are selective serotonin reuptake inhibitors.

CN: Pharmacological and parenteral therapies; CL: Apply

112. 2. Because the client is in danger of noncompliance with the medication due to financial concerns, the nurse should contact the social worker to assist with locating available resources for the client to ensure continuation of the medication needed for the recurrent illness. The client needs to continue the medications with no interruptions to minimize the chance of decompensation. Although the **HCP**  is the person responsible for prescribing the client's medication, routinely, the HCP is not involved in finding financial assistance for the client's medication needs. The client needs the medication at the present time. Scheduling a follow-up appointment in 2 weeks does not address the immediate concern. The client could stop the medication before being seen and could become severely depressed. A family member's assistance may not be a sufficient or a permanent means of financial help for the client in terms of medication needs.

CN: Management of care; CL: Synthesize

113. 3. Statistics do not apply when focusing on one individual, and every depressed client is potentially suicidal. During the most severe symptom period, the individual often does not have the energy to act on his or her suicidal ideation. The majority of people who complete suicide have talked about it or left clues to their intention. During the initial treatment period, the risk for suicide may be higher due to the delay of therapeutic onset.

CN: Psychosocial integrity; CL: Analyze

The Client with Psychosexual Disorders

114. 3. Telling the couple that the nurse would like to hear about their concerns invites open communication. Telling the clients that admission history is needed first gives the client the impression that the issue is not important; the couple may not want to bring the subject up in the future. Referring the client to a therapist or marriage counselor is appropriate only

after determining the nature of the problem.

 CN: Psychosocial integrity; CL: Apply

115. 1. The nurse must be aware of personal opinions and views when caring for clients with psychosexual disorders. The care plan for the client will be developed to manage both the depression and the pedophilia. It is not necessary to restrict the client's interactions with others on this adult mental health unit. The **healthcare provider (HCP)**  will determine the type of therapy that will be most appropriate for this client.

 CN: Management of care; CL: Apply

116. 4. Sexual dysfunction is the problem that is the most appropriate. Dysfunctional grieving because of lack of intimacy is not correct as the couple may have emotional intimacy. The trauma occurred when the female client was 15 years of age and thus is not an acute problem. Vaginismus is a medical diagnosis.

 CN: Psychosocial integrity; CL: Apply

117. 4. An expected outcome of taking sildenafil is an erection that can last up to 4 hours. The nurse instructs the client to take the medication 1 hour before having intercourse as an erection will occur within 1 hour and to take only one tablet in 24 hours. The nurse advises the client to avoid taking the drug if he takes nitrate therapy, such as nitroglycerin, to avoid unsafe decreases in blood pressure.

 CN: Pharmacological and parenteral therapies; CL: Apply

Managing Care, Quality and Safety of Clients with Psychiatric Disorders and Mental Health Problems

118. 3. Distraction and disorganization may prevent clients from eating or sleeping. Monitoring for needed intervention can prevent exhaustion and malnutrition. Liquid medications are indicated only if the client cannot or will not swallow tablets. Manic clients tend to disrupt group therapy, so this treatment usually is not for them. Family visits should not be tied to compliance with treatment. The client is unlikely to be able to concentrate and complete a journal at this time.

 CN: Psychological integrity; CL: Synthesize

119. 4. The statement by the person who says “I have found a solution for this mess” contains suicidal ideation, and that person is more of a safety risk than the angry, alienated client or the obsessed or helpless one. The other clients may need intervention as well, but the potentially suicidal client has the greatest need for nursing intervention.

 CN: Management of care; CL: Analyze

120. 3. The nurse communicates with consulting **HCPs**  and referral agencies as part of the client’s continuity of care to which the client **consented**  when admitted to the unit. The communication with family also has the client’s consent. The communication with someone outside the care team or with team members in a public place without the client’s permission is a breach of ethics by the nurse.

 CN: Management of care; CL: Apply

121. 4. It is important for the nurse to listen to the client and respect his or her knowledge about the medication. In the other options, the nurse dismisses the client’s concern or gives a possible explanation without checking out the specific situation. If the nurse has taken the wrong medication, the client can prevent a medication error, and if there has been a color change, the nurse can let the client know that information. In either case, helping a psychotic client deal with reality appropriately is therapeutic.

 CN: Safety and infection control; CL: Synthesize

122. 1,2,3. Strategies that assist and support the needs of specific workers or groups of workers most effectively promote and protect health and well-being. Standard hours of work and customary workplace practices do not support or address individual worker needs.

 CN: Management of care; CL: Analyze

123. 1. High-risk factors that have been related to suicide include hopelessness, Caucasian race, male gender, advanced age, living alone, previous suicide attempts, family history of suicide attempts, family history of substance abuse, general medical illnesses, psychosis, and substance

abuse. The highest suicide rate is among people over the age of 65, particularly Caucasian males age 85 and over. Psychiatric diagnosis is considered to be the most reliable factor for suicide, especially for those with depression, schizophrenia, and substance disorders. Therefore, an 85-year-old Caucasian male who lives alone after his wife's death is at high risk for suicide completion.

 CN: Management of care; CL: Analyze

124. 1,3,4,5. Exploring the bullying and giving the student resources as well as planning for his safety will help the client remain safe. Notifying the school is essential to ensuring the safety of other students in the community. Notifying the parents against the client's wishes destroys trust and could make him feel more desperate. A better action would be to help the student prepare to reveal his sexual orientation to his parents.

 CN: Management of care; CL: Create

125. 4,3,2,1. The nurse first assesses and treats the bleeding gunshot wound. Next, the nurse removes any objects the client could use to harm himself, and ensures that the client will have constant observation. The nurse then assesses the client's immediate risk for suicide and bases subsequent decisions on the level of risk. Once the client is safe and the wound is treated, the nurse contacts the crisis intervention team.

The Client with Schizophrenia or a Psychotic Disorder

1. A newly admitted client describes her mission in life as one of saving her son by eliminating the “provocative sluts” of the world. There are several attractive young women on the unit. What should the nurse do **first**?

- ☐ **1.** Ask the client for her definition of “provocative sluts.”
- ☐ **2.** Discuss dress code with all clients at the next group meeting.
- ☐ **3.** Have the client discuss her concerns in the next group session.
- ☐ **4.** Ask the client to inform the staff if she has negative thoughts about other clients.

2. A young client diagnosed with paranoid schizophrenia is talking with the nurse and says, “You know, when I thought everyone was out to get me, I was staying in my apartment all the time. Now, I would like to get out and do things again.” What is the **best** initial response by the nurse?

- ☐ **1.** “With whom do you want to do things?”

- ☐ 2. "What activities did you enjoy in the past?"
- ☐ 3. "What kind of transportation do you use?"
- ☐ 4. "How much money can you spend?"

3. The nurse recognizes the client in the emergency department from a picture in the local paper. The client has recently received a major scholarship for high academic achievement. The client tells the nurse that he hears voices that tell him he is worthless. He has tried to kill himself. What statement is the most appropriate for the nurse to use **first** when attempting to establish a therapeutic relationship?

- ☐ 1. "You have a lot to live for."
- ☐ 2. "The voices are not real."
- ☐ 3. "I am sorry this is happening to you."
- ☐ 4. "Would you like me to call your parents?"

4. A client who is neatly dressed and clutching a leather briefcase tightly in his arms scans the adult inpatient unit on his arrival at the hospital and backs away from the window. The client requests that the nurse move away from the window. The nurse recognizes that doing as the client requested is contraindicated for which reason?

- ☐ 1. The action will make the client feel that the nurse is humoring him.
- ☐ 2. The action indicates nonverbal agreement with the client's false ideas.
- ☐ 3. The client will then think that he will have his way when he wishes.
- ☐ 4. The nurse will be demonstrating a lack of composure over the situation.

5. A client reports having thoughts of being followed by foreign agents who are after his secret papers. Which response by the nurse is **most** appropriate when responding to the client's disturbed thought process?

- ☐ 1. "I do not see any foreign agents."
- ☐ 2. "I think these thoughts are frightening to you."
- ☐ 3. "I do not know what you mean."
- ☐ 4. "I would like you to come to group with me right now."

6. The police bring a client to the emergency department after she threatens to kill her ex-husband. The client states emphatically, "The police

should bring him in, not me. He is paranoid about my dating and has been stalking me for weeks. He is probably off his medicines. His case manager and the police will not do anything.” In what order should the following nursing actions be done from first to last? All options must be used.

1. Ask about the marital problems leading to the divorce.

2. Assess the client’s risk for harm to self and others.

3. Obtain the name of her ex-husband’s case manager.

4. Interview the client about her current needs and situation.

7. A client who has been stabilized on medications for several months is at the clinic for a medication check. During a conversation with the nurse, the client suddenly jumps up, begins pacing, and wrings her hands. In what order should the nurse do the following interventions from first to last? All options must be used.

1. Walk with the client to help decrease her anxiety.

2. Discuss productive ways to solve her problems causing anxiety.

3. Share observations about her anxiety-related behaviors.

4. Ask the client about the sources of her anxiety.

8. A client on haloperidol has stiff muscles, restlessness, and internal jumpiness. The client has all of the following medications prescribed as needed. Which one would be **most** appropriate for the nurse to administer to decrease the client's symptoms?

- ☐ 1. lorazepam
- ☐ 2. benztropine
- ☐ 3. trazodone
- ☐ 4. olanzapine

9. The parents of a 20-year-old female client diagnosed with paranoid schizophrenia admitted 4 days ago are attending a family psychoeducation group in the hospital. Which statement by the mother indicates that she understands her daughter's illness and management?

- ☐ 1. "I know that I will have to do everything for my daughter when she comes home."
- ☐ 2. "Tasks as simple as getting out of bed and showering in the morning may be difficult for her."
- ☐ 3. "I know that visits from her friends at home should be discouraged for a while."
- ☐ 4. "She will not experience a relapse as long as she takes her prescribed medication."

10. During a home visit for a client diagnosed with paranoid schizophrenia discharged 1 week ago, the client's mother tearfully states, "I can hardly sleep because I am so worried about my daughter. I am afraid to leave her alone in the house. What if something should happen while I am gone?"

Which caregiver problem would be the **most** inclusive one for the nurse to incorporate into the client's plan of care?

- ☐ 1. caregiver role strain
- ☐ 2. anxiety
- ☐ 3. fear
- ☐ 4. disturbed sleep pattern

11. When conducting a mental status examination with a newly admitted client who has a diagnosis of paranoid schizophrenia, the client states, "I am being followed; it is not safe. They are monitoring my every move." In which area of the mental status examination should the nurse document this information?

- ☐ 1. thought content
- ☐ 2. quality of speech
- ☐ 3. insight
- ☐ 4. judgment

12. The wife of a client admitted for treatment of newly diagnosed paranoid schizophrenia visits 2 days after her husband's admission and states to the nurse, "Why is he not eating? He is still talking about his food being poisoned." Which appraisal by the nurse is **most** accurate?

- ☐ 1. The wife's inquiry is reasonable.
- ☐ 2. Education about her husband's medications is needed.
- ☐ 3. Her expectations of her husband are realistic.
- ☐ 4. An increase in the client's medication is indicated.

13. A client states that she hears God's voice telling her that she has sinned and needs to punish herself. Which response by the nurse is **most** - important?

- ☐ 1. "How do you think you will be punished?"
- ☐ 2. "Do you think you need to punish yourself now?"
- ☐ 3. "What exactly do you think you have done to be punished?"
- ☐ 4. "Let us talk about your strengths."

14. When developing the plan of care for a client who is staying in his room because he perceives that staff want to harm him, which outcome of

care planning is **most** realistic?

- ☐ 1. Within 2 days, the client will complete activities of daily living.
- ☐ 2. Within 3 days, the client will participate in recreation with other clients.
- ☐ 3. Within 4 days, the client will demonstrate an absence of verbal aggression.
- ☐ 4. Within 5 days, the client will seek out staff to talk about feelings.

15. A client diagnosed with paranoid schizophrenia is still withdrawn, unkempt, and unmotivated to get out of bed. An unlicensed assistive personnel (UAP) asks the nurse why the client is behaving this way after being on fluphenazine 10 mg for 7 days. The nurse should tell the UAP:

- ☐ 1. "Fluphenazine is most effective with the positive symptoms of schizophrenia."
- ☐ 2. "The client will be less withdrawn and unmotivated when the fluphenazine takes effect."
- ☐ 3. "The client's fluphenazine dose probably needs to be increased again."
- ☐ 4. "Lack of motivation is a common side effect of fluphenazine."

16. A pregnant client in her third trimester is started on chlorpromazine 25 mg 4 times daily. Which instructions are **most** important for the nurse to include in the client's teaching plan?

- ☐ 1. "Do not drive because there is a possibility of seizures occurring."
- ☐ 2. "Avoid going out in the sun without a sunscreen with a sun protection factor of at least 30."
- ☐ 3. "Stop the medication immediately if constipation occurs."
- ☐ 4. "Tell your healthcare provider (HCP) if you experience an increase in blood pressure."

17. A client reports that men in blue clothes keep looking in her window and talking about her. Which response by the nurse is **most** appropriate?

- ☐ 1. "Those men are groundskeepers. They are talking about their work, not you."
- ☐ 2. "Do not take things so personally. Not everyone who is talking is talking about you."

- ☐ 3. "Let us not pay attention to the men. Let us play cards instead."
- ☐ 4. "I will close the drapes so you cannot see the men."

18. When preparing the teaching plan for a client who is to start clozapine, which information is crucial to include?

- ☐ 1. description of akathisia and drug-induced parkinsonism
- ☐ 2. measures to relieve episodes of diarrhea
- ☐ 3. the importance of reporting insomnia
- ☐ 4. an emphasis on the need for weekly blood tests

19. A client is sitting in the corner of the dayroom cocking his head to one side as if he hears something, but no one is nearby. The nurse suspects he is having auditory hallucinations. Which question should the nurse ask **first**?

- ☐ 1. "Are you seeing someone other than me?"
- ☐ 2. "What are you hearing right now?"
- ☐ 3. "What is going on with you right now?"
- ☐ 4. "Do you want to go to the recreation room?"

20. A client who is newly diagnosed with paranoid schizophrenia tells the nurse, "The aliens are telling me that I am defective and need to be eliminated." Which response by the nurse is **most** appropriate initially?

- ☐ 1. "I know those voices are real to you, but I do not hear them."
- ☐ 2. "You are having hallucinations as a result of your illness."
- ☐ 3. "I want you to agree to tell staff when you hear these voices."
- ☐ 4. "Your medications will help control these voices you are hearing."

21. An outpatient client who has a history of paranoid schizophrenia and chronic alcohol dependency has been taking risperidone for several months. She reports that she stopped drinking 4 days ago. The client is very frightened by the tactile hallucinations of bugs crawling under her skin. Which factor should the nurse incorporate into the plan of care when explaining the tactile hallucinations?

- ☐ 1. alcohol intoxication
- ☐ 2. ineffectiveness of risperidone
- ☐ 3. alcohol withdrawal
- ☐ 4. interaction of alcohol and risperidone

22. A client with a long history of paranoid schizophrenia is readmitted voluntarily after missing his last two injections of haloperidol. He reports, “I am not sleeping much, and my friend says I smell from not showering. God is telling me to protect myself from others. My parents are sick and tired of me and my illness. They wish I were dead.” Which admission notes by the nurse contains assumptions and potentially false accusations? Select all that apply.

- ☐ 1. Client has been noncompliant with his medications, causing decreased sleep and activities of daily living, increased auditory hallucinations, and paranoid delusions about his parents harming him.
- ☐ 2. Client has missed two injections of haloperidol and was admitted voluntarily. He reports he has decreased sleep and showering and that he hears God’s voice telling him to protect himself from others. He stated, “My parents are sick and tired of me and my illness. They wish I were dead.”
- ☐ 3. Client has missed two doses of haloperidol. He is not sleeping and showering. Has a strained relationship with his parents and delusions that they want him dead. Voluntary admission to restart haloperidol.
- ☐ 4. Client admitted for noncompliance with haloperidol injections, sleep disturbance, poor hygiene, auditory hallucinations, and suspiciousness of his parents. Needs to be monitored for suicidal and homicidal ideation.
- ☐ 5. Client admitted because of hallucinations and delusions. His parents may be abusing him. He states he has not taken his medications for 2 days.

23. A newly admitted client diagnosed with paranoid schizophrenia is pacing rapidly and wringing his hands. He states that another client is out to get him. Then he says, “Protect me, select me, reject me.” The nurse should next:

- ☐ 1. administer his oral PRN lorazepam and haloperidol.
- ☐ 2. place the client in temporary seclusion before he has a chance to hurt others.
- ☐ 3. call the healthcare provider (HCP) for a prescription for restraints.
- ☐ 4. ask the other clients to leave the immediate area.

24. A new nurse is coleading a family education group for those who have relatives with paranoid schizophrenia. Which statement by the new nurse indicates the need for further teaching about symptom management?

- ☐ 1. "When the clients get overwhelmed, it is best if they spend some time in their room."
- ☐ 2. "The more we push the clients to spend time with friends, the more their voices decrease."
- ☐ 3. "Until we get the clients up and going, they seem to have no motivation to do anything."
- ☐ 4. "We still have to remind the clients that we do not hear the voices they do."

25. A client is being successfully treated with clozapine. Which statement by the client reflects a need for further teaching about managing the drug's adverse effects?

- ☐ 1. "If I eat too many fruits, I will get constipated."
- ☐ 2. "I need to take the medicine with food to avoid nausea."
- ☐ 3. "I have to get up slowly so I do not get dizzy."
- ☐ 4. "Sometimes I have to push myself because I am sleepy."

26. Which statement indicates increased insight by the client about her newly diagnosed paranoid schizophrenia being stabilized on medications?

- ☐ 1. "Now that the voices are gone, I can decrease my medicines."
- ☐ 2. "I would feel better if I knew there was not poison in my food."
- ☐ 3. "Since I feel better, I know I can restart school next week."
- ☐ 4. "The voices go away when I tell them to, except if I am really nervous."

27. A client who is suspicious of others, including the staff, is brought to the hospital wearing a wrinkled dress with stains on the front. Assessment also reveals a flat affect, confusion, and slow movements. Which goal should the nurse identify as the **initial priority** when planning this client's care?

- ☐ 1. helping the client feel safe and accepted
- ☐ 2. introducing the client to other clients
- ☐ 3. giving the client information about the program
- ☐ 4. providing the client with clean, comfortable clothes

28. The parent of a young adult client diagnosed with paranoid schizophrenia is asking questions about his son's antipsychotic medication,

ziprasidone. Which statement by the parent reflects a need for further teaching?

- ☐ 1. "If he experiences restlessness or muscle stiffness, he should tell his healthcare provider (HCP)."
- ☐ 2. "I should give him benztropine to help prevent constipation from the ziprasidone."
- ☐ 3. "If he becomes dizzy, I will make sure he does not drive."
- ☐ 4. "The ziprasidone should help him be more motivated and less withdrawn."

29. While the nurse is performing an admission assessment, the client stops talking in the middle of a sentence, tips his head to the side, and listens carefully. The nurse recognizes that the client is most likely experiencing which problem?

- ☐ 1. somatic delusions
- ☐ 2. pseudoparkinsonism
- ☐ 3. delusions of reference
- ☐ 4. auditory hallucinations

30. A client diagnosed with schizophrenia gained 50 lb (22.7 kg) in 6 months while taking olanzapine. After a prescription change from olanzapine to ziprasidone, the client tells the nurse, "I do not want to take this ziprasidone either. I cannot gain any more weight." Which response by the nurse is **most** appropriate for this client?

- ☐ 1. "Ziprasidone causes less weight gain than do the other atypical antipsychotics."
- ☐ 2. "We can give it to you as an injection rather than in capsule form."
- ☐ 3. "Abnormal movements are not as common with ziprasidone."
- ☐ 4. "You can take it just before bedtime, so you will not need a snack."

31. As hospital-based care has become more oriented to crisis intervention, criteria for admission to the hospital have also changed. Which clients have **priority** for admission to an acute care facility? Select all that apply.

- ☐ 1. clients who live alone

- ☐ 2. clients who are acutely psychotic
- ☐ 3. clients who are acutely depressed
- ☐ 4. clients who are dangerous to self or others
- ☐ 5. clients who are not sleeping and have a lack of appetite
- ☐ 6. clients who are not complying with medication regimens

32. A 79-year-old woman is brought to the outpatient clinic by her daughter for a routine medication evaluation. The daughter reports that her mother is quite stable and has no adverse effects from the risperidone she is taking. Then, the daughter says, “I just think my mother could be even better if she was on a larger dosage. My son takes 1 mg of risperidone every day and my mother is only on 0.5 mg.” What is the **most** helpful response by the nurse?

- ☐ 1. “Maybe your son is sicker than your mother is.”
- ☐ 2. “We could increase your mother’s dosage if you want.”
- ☐ 3. “Older clients generally need lesser doses than do younger people.”
- ☐ 4. “I am not seeing any symptoms of illness in your mother. Let us wait until the next visit.”

33. At an outpatient visit 3 months after discharge from the hospital, a client says he has stopped his olanzapine even though it controls his symptoms of schizophrenia better than other medications. “I have gained 20 lb (9.1 kg) already. I cannot stand anymore.” Which response by the nurse is **most** appropriate?

- ☐ 1. “I do not think you look fat; why do you think so?”
- ☐ 2. “I can help you with a diet and exercise plan to keep your weight down.”
- ☐ 3. “You can be switched to another medicine.”
- ☐ 4. “Your weight gain will level off if you stay on the medication 3 more months.”

34. A client diagnosed with schizophrenia is being switched to risperidone long-acting injection. The client is told that he will remain on his oral dose of risperidone daily for approximately 1 month. The client says, “I did not have to take pills when I was on fluphenazine shots in the past.” The nurse should tell the client:

- ☐ 1. "Taking fluphenazine orally and by injection would not be as effective as the injection alone."
- ☐ 2. "Risperidone is less potent than fluphenazine."
- ☐ 3. "Your healthcare provider did not believe you would take both the pills and fluphenazine injections."
- ☐ 4. "Risperidone initially takes a little longer to reach the ideal blood level."

35. The nurse is developing a care plan with a client who is receiving ziprasidone and has stopped taking the drug. Which side effects that may occur and be a reason the client is noncompliant with taking this medication should the nurse discuss? Select all that apply.

- ☐ 1. somnolence
- ☐ 2. weight gain
- ☐ 3. urticaria
- ☐ 4. constipation
- ☐ 5. headache

36. A client has been perceiving her roommate's stuffed animal as her own dog at home. The nurse determines that this misperception of reality (illusion) is improving when the client makes which statement?

- ☐ 1. "Jan's stuffed dog looks somewhat like my dog, Trixie."
- ☐ 2. "Jan's dog and my dog could be twins."
- ☐ 3. "I wish Jan had not had my dog stuffed."
- ☐ 4. "I guess Jan needs a dog as much as I do."

37. When asked about her stresses before admission, an anxious client stares blankly at the nurse and mutters unintelligibly. Which description of the client's behaviors should the nurse document in the client's medical record?

- ☐ 1. "Client cannot answer any questions asked at this time."
- ☐ 2. "Client is uncooperative during the admission procedure, refusing to answer any questions."
- ☐ 3. "Client responded to questions with a blank look and incomprehensible mumble."

- ☐ 4. “Client stared at the wall when asked questions and was disoriented and incoherent.”

38. When planning care for a client with schizophrenia who lacks motivation to shower and dress, which outcome should the nurse expect the client to achieve by the end of 4 days?

- ☐ 1. Verbalize the need to shower and dress herself.
- ☐ 2. Recognize the need to shower and dress herself.
- ☐ 3. Explain reasons for showering and dressing herself.
- ☐ 4. Perform showering and dressing for herself.

39. A client diagnosed with schizophrenia is brought to the hospital from a group home where he became agitated, threw a chair at another client, and has been refusing medication for 8 weeks. The client exhibits a flat affect, is not caring for his hygiene, and has become increasingly withdrawn and asocial. The healthcare provider (HCP) prescribes treatment with risperidone to improve the client’s negative and positive symptoms of schizophrenia. When evaluating the drug’s effectiveness on the client’s negative symptoms, the nurse should expect improvement in which symptom?

- ☐ 1. apathy, affect, social isolation
- ☐ 2. agitation, delusions, hallucinations
- ☐ 3. hostility, ideas of reference, tangential speech
- ☐ 4. aggression, bizarre behavior, illusions

40. A 77-year-old client is brought to the emergency department by her son. The client has a severe headache and lack of sleep because “I am so worried about everything.” Her son says that she has heart failure and chronic schizophrenia. “In addition to all of her heart medicines, she is on aripiprazole, which was increased to 30 mg by her healthcare provider (HCP) 3 days ago.” In addition to documenting all of the client’s medications and exact dosages, the nurse should particularly investigate which factors? Select all that apply.

- ☐ 1. the qualifications of the client’s HCP
- ☐ 2. the client’s symptoms of schizophrenia
- ☐ 3. the dose of aripiprazole
- ☐ 4. the client’s symptoms of heart failure

- ☐ 5. the client's relationship with her son

41. A client with schizophrenia comes to the outpatient mental health clinic 5 days after being discharged from the hospital. The client was given a 1-week supply of clozapine. The client tells the nurse that she has too much saliva and frequently needs to spit. The nurse interprets the client's statement as being consistent with which factor?

- ☐ 1. delusion, requiring further assessment
- ☐ 2. unusual reaction to clozapine
- ☐ 3. expected adverse effect of clozapine
- ☐ 4. unresolved symptom of schizophrenia

42. The client with a diagnosis of schizophrenia is acutely psychotic and exhibits religious delusions and hallucinations, loose associations, and concrete thinking. When the nurse offers the client her medication, the client states, "I do not need that. God will heal me." The nurse should respond to the client by saying:

- ☐ 1. "God helps those who help themselves."
- ☐ 2. "God wants you to take your medicine."
- ☐ 3. "God is important in your life, but the medicine will help you too."
- ☐ 4. "This medicine will help clear your thoughts and decrease anxiety."

43. The nurse hands the medication cup to a client who is psychotic and exhibiting concrete thinking and tells the client to take his medicine. The client takes the cup, holds it in hand, and stares at it. What should the nurse do **next**?

- ☐ 1. Tell the client to put the medicine in the mouth and swallow it with some water.
- ☐ 2. Instruct the client to sit in the dayroom and wait for the nurse to assist him.
- ☐ 3. Ask another staff member to stay with the client until the client takes the medication.
- ☐ 4. Say nothing and wait for the client to put the medication in the mouth and swallow it.

44. Which action by the nurse is likely to increase the anxiety and

suspiciousness of a client who is delusional?

- ☐ 1. informing the client of schedule changes
- ☐ 2. whispering with others where the client can observe
- ☐ 3. telling the client gently that the nurse does not share the client's view
- ☐ 4. inviting the client to join in leisure activities

45. A client with schizophrenia tells the nurse that he does not go out much because he does not have anywhere to go and he does not know anyone in the apartment where he is staying. Which action is **most** beneficial for the client at this time?

- ☐ 1. encouraging him to call his family to visit more often
- ☐ 2. making an appointment for the client to see the nurse daily for 2 weeks
- ☐ 3. thinking about the need for rehospitalization for the client
- ☐ 4. arranging for the client to attend day treatment at the clinic

46. The plan of care for an outpatient client with schizophrenia includes risperidone therapy. The nurse prepares to administer this drug based on the understanding of which factor?

- ☐ 1. The positive symptoms of schizophrenia are usually more prominent than the negative symptoms.
- ☐ 2. Agranulocytosis is less of a risk with risperidone therapy than with clozapine.
- ☐ 3. Typical antipsychotics help with negative symptoms, but not as well as risperidone does.
- ☐ 4. Risperidone is less expensive than traditional antipsychotics.

47. A client diagnosed with schizophrenia is being discharged on aripiprazole 5 mg every night. When developing the teaching plan about the most common adverse effects, which information should the nurse include? Select all that apply.

- ☐ 1. headaches
- ☐ 2. transient mild anxiety
- ☐ 3. insomnia
- ☐ 4. torticollis
- ☐ 5. pill rolling movements

48. A newly admitted client with an acute exacerbation of psychotic symptoms of schizophrenia is having trouble deciding whether to live in a group home or a supervised apartment. Based on the client's current cognitive functioning, which activity is **most** appropriate for the nurse to ask the client to do initially?

- ☐ 1. List the pros and cons of each housing option.
- ☐ 2. Choose between apple and orange juice for breakfast.
- ☐ 3. Identify why the client cannot live in an unsupervised apartment.
- ☐ 4. Decide which staff member the client would like to have today.

49. An outpatient client who has been receiving haloperidol for 2 days develops muscular rigidity, altered consciousness, a temperature of 103°F (39.4°C), and trouble breathing on day 3. The nurse interprets these findings as indicating which complication?

- ☐ 1. neuroleptic malignant syndrome
- ☐ 2. tardive dyskinesia
- ☐ 3. extrapyramidal adverse effects
- ☐ 4. drug-induced parkinsonism

50. A client with schizophrenia reports doing very little all day except sleeping and eating. The nurse should:

- ☐ 1. have three meals per day brought in to increase the amount of time the client spends out of bed.
- ☐ 2. ask a relative to call the client at least 10 times a day to decrease the sleeping.
- ☐ 3. help the client set up a daily activity schedule to include setting a wake-up alarm.
- ☐ 4. arrange for the client to move to a group home with structured activities.

51. The nurse notes that a client sitting in a chair has not gotten up in 1 hour. The client does not respond to verbal directions, and her arm has been extended over the armrest for 30 minutes. What should the nurse do **next**?

- ☐ 1. Assist the client out of the chair to lead her back to bed.
- ☐ 2. Give PRN-prescribed doses of haloperidol and lorazepam.

- ☐ 3. Ask the client to describe what she is experiencing right now.
- ☐ 4. Sit quietly with the client until she begins to respond.

52. What is the most appropriate long-term goal for an outpatient client with schizophrenia who has been withdrawn from friends and family for 3 weeks?

- ☐ 1. calling the client's mother once a day
- ☐ 2. attending day therapy three times a week
- ☐ 3. allowing two friends to visit every day
- ☐ 4. remaining out of bed for 10 hours a day

53. For the client with catatonic behaviors, which outcome would indicate a medication has been most effective in improving long-term behavior?

- ☐ 1. The client can move all extremities occasionally.
- ☐ 2. The client walks with the nurse to the client's room.
- ☐ 3. The client responds to verbal directions to eat.
- ☐ 4. The client initiates simple activities without directions.

54. The mother of a client with schizophrenia calls the visiting nurse in the outpatient clinic to report that her daughter has not answered the phone in 10 days. "She was doing so well for months. I do not know what is wrong. I am worried." Which response by the nurse is **most** appropriate?

- ☐ 1. "Maybe she is just mad at you. Did you have an argument?"
- ☐ 2. "She may have stopped taking her medications. I will check on her."
- ☐ 3. "Do not worry about this. It happens sometimes."
- ☐ 4. "Go over to her apartment and see what is going on."

55. During a home visit, the nurse discovers that the client is less verbal, less active, less responsive to directions, severely anxious, and more stuporous. The nurse interprets these findings to indicate that the client needs which intervention?

- ☐ 1. a sleep aid
- ☐ 2. a clinic appointment
- ☐ 3. an increase in medication
- ☐ 4. immediate medical evaluation

56. A client admitted with a diagnosis of schizoaffective disorder, manic phase, who is currently taking fluoxetine, valproic acid, and olanzapine as prescribed, has had an increase in manic symptoms in the past week. The healthcare provider (HCP) prescribes a valproic acid blood level to be drawn at once. What does the nurse understand is the rationale for this prescription?

- ☐ 1. All clients taking valproic acid need periodic valproic acid levels drawn.
- ☐ 2. Fluoxetine can decrease the effectiveness of the valproic acid.
- ☐ 3. A decrease in the level of valproic acid could explain the increase in manic symptoms.
- ☐ 4. The valproic acid level is needed before a short course of lorazepam for agitation can be prescribed.

57. A 22-year-old client is being admitted with a diagnosis of brief psychotic disorder. Which finding would the nurse expect to find during the admission interview that is consistent with the client's diagnosis?

- ☐ 1. current treatment for pneumonia
- ☐ 2. regular use of alcohol or marijuana
- ☐ 3. evidence of delusions or hallucinations
- ☐ 4. a history of chronic depression

58. A successful real estate agent brought to the clinic after being arrested for harassing and stalking his ex-wife denies any other symptoms or problems except anger about being arrested. The ex-wife reports to the police, "He is fine except for this irrational belief that we will remarry." When collaborating with the healthcare provider (HCP) about a plan of care, which intervention would be most effective for the client at this time?

- ☐ 1. a prescription for olanzapine 10 mg daily
- ☐ 2. a joint session with the client and his ex-wife
- ☐ 3. a prescription for fluoxetine 20 mg every morning
- ☐ 4. referral to an outpatient counselor

Clients and Families Affected by Chronic Mental Illnesses

59. A nurse working at an outpatient mental health center primarily with

chronically mentally ill clients receives a telephone call from the mother of a client who lives at home. The mother reports that the client has not been taking her medication and now is refusing to go to the work center where she has worked for the past year. What should the nurse do **first**?

- ☐ 1. Call the director of the work center for information about the client.
- ☐ 2. Reserve an inpatient bed in preparation for the client's admission.
- ☐ 3. Ask to speak to the client directly on the phone.
- ☐ 4. Make an appointment for the client to see the healthcare provider (HCP).

60. A nurse is teaching the families of clients with chronic mental illnesses about causes of relapse and rehospitalization. What should the nurse include as the **primary** cause?

- ☐ 1. loss of family support
- ☐ 2. noncompliance with medications
- ☐ 3. sudden changes in medications
- ☐ 4. nonattendance at treatment programs

61. The director of an outpatient rehab program tells the nurse that the client with schizophrenia had done well for 6 months until last week, when a new person started the program. This new person worked faster than the client did and took his place as leader of the group. Based on this information, which intervention is **most** appropriate?

- ☐ 1. Make a home visit, and tell the client that if he does not return to the program, he will lose his place there.
- ☐ 2. Ask the director to assign the client to another group when he returns to the program.
- ☐ 3. Make an appointment to meet the client at the mental health center, and ask him about the situation.
- ☐ 4. Arrange for the placement of the client in a skill training program.

62. A 25-year-old client diagnosed with chronic schizophrenia states, "I stopped my medications a week ago. I was just tired of not being able to drink with my friends. Besides, I feel fine without them." Which response by the nurse is **most** appropriate?

- ☐ 1. “It is important for you to go back on your medicines.”
- ☐ 2. “I hear how difficult it must be to live with the changes caused by your illness.”
- ☐ 3. “You will have to talk to your healthcare provider (HCP) about stopping your medications.”
- ☐ 4. “Your buddies will understand that you cannot drink anymore.”

63. A 23-year-old client diagnosed with schizophrenia cheerfully announces, “My mom and I are so excited that I am pregnant. She is willing to help us take care of the baby too.” Which reason should cause the nurse to be concerned about this situation?

- ☐ 1. The client did not say that the father of the baby was excited about this.
- ☐ 2. The mother is not likely to provide enough help for what the client needs.
- ☐ 3. Symptom management will be difficult in early pregnancy without medications.
- ☐ 4. The client will have difficulty financially supporting the baby.

64. The nurse is reviewing laboratory values of a client receiving clozapine. Which of the following laboratory values does the nurse **immediately** report to the healthcare provider (HCP)?

- ☐ 1. WBC of 3,500
- ☐ 2. hemoglobin of 11.9 g/dL (119 g/L)
- ☐ 3. sodium level of 136 mEq/L (136 mmol/L)
- ☐ 4. hyaline casts in the urinalysis

65. A client is being discharged before complete stabilization of symptoms. When developing a discharge plan for this client, the nurse should ensure that the client will have:

- ☐ 1. more medical consultations after discharge.
- ☐ 2. monthly outpatient visits.
- ☐ 3. many coordinated services.
- ☐ 4. a caring and supportive family.

66. Which facility would the nurse rank as the lowest **priority** to expand when developing a community-based service program for clients with

chronic mental illnesses?

- ☐ 1. partial hospitalization programs
- ☐ 2. psychiatric home care
- ☐ 3. residential services
- ☐ 4. long-term hospitals

67. Crisis intervention plays a major role in the management of care for clients with chronic mental illnesses. Although the safety of the client and others is always a priority, these clients typically need crisis intervention in which situations? Select all that apply.

- ☐ 1. inability to keep outpatient appointments
- ☐ 2. signs of relapse and decompensation
- ☐ 3. threat of eviction from housing
- ☐ 4. unpaid bills and lack of food
- ☐ 5. occasionally missing a dose of medication

68. The most common reason given by mentally ill clients for noncompliance with medications is their uncomfortable adverse effects. When teaching the families, what need should the nurse identify as the **greatest**?

- ☐ 1. alternative ways to manage the adverse effects
- ☐ 2. home visits to set up a week's supply of medications
- ☐ 3. family monitoring of the administration of medication
- ☐ 4. outpatient monitoring of medication compliance

69. The stigma related to having a mental illness, especially a chronic illness, persists despite improvements in the management of illnesses and an increase in public education. Which view **most** perpetuates the stigma?

- ☐ 1. Mental illness is hereditary.
- ☐ 2. Mental illnesses have biochemical bases.
- ☐ 3. Clients cannot prevent mental illness if they want to do so.
- ☐ 4. Clients can recover from mental illness if they have willpower.

The Client with Cognitive Disorders

70. An elderly woman experiences short-term memory problems and occasional disorientation a few weeks after her husband's death. She also is not sleeping, has urinary frequency and burning, and sees rats in the kitchen. The home care nurse calls the woman's healthcare provider (HCP) to discuss the client's situation and background, assess, and give recommendations. The nurse concludes that the woman:

- ☐ 1. is experiencing the onset of Alzheimer's disease.
- ☐ 2. is having trouble adjusting to living alone without her husband.
- ☐ 3. is having delayed grieving related to her Alzheimer's disease.
- ☐ 4. is experiencing delirium and a urinary tract infection (UTI).

71. An elderly client was prescribed lorazepam 1 mg three times a day to help calm her anxiety after her husband's death. The next day, the client calls her daughter asking when she is picking her up to go to the graveside. The client says she has been walking up and down the driveway for the past hour waiting for her daughter. Noting the client's agitation, hyperactivity, and insistence, the daughter calls the nurse to report her mother's behavior. Which finding would the nurse suspect as the cause of the mother's behavior, and what action would she suggest?

- ☐ 1. The client is manic and may need a sleeping pill.
- ☐ 2. The client is experiencing a medication interaction and should go to the emergency department.
- ☐ 3. The client is experiencing a paradoxical reaction to the lorazepam and should stop the new medication immediately.
- ☐ 4. The client is overcome by grief and probably needs an antidepressant.

72. The son of an elderly client who has cognitive impairments approaches the nurse and says, "I'm so upset. The healthcare provider (HCP) says I have 4 days to decide on where my dad is going to live." The nurse responds to the son's concerns, gives him a list of types of living arrangements, and discusses the needs, abilities, and limitations of the client. The nurse should intervene further if the son makes which comment?

- ☐ 1. "Boy, I have a lot to think about before I see the social worker tomorrow."
- ☐ 2. "I think I can handle most of Dad's needs with the help of some home

health care.”

- ☐ 3. “I am so afraid of making the wrong decision, but I can move him later if I need to.”
- ☐ 4. “I want the social worker to make this decision so Dad will not blame me.”

73. A client has been transferred to the hospital’s psychiatric unit from a nursing home for increasing confusion. The client’s behavior is found to be the result of cerebral arteriosclerosis. Which nursing staff actions should positively influence the client’s behavior? Select all that apply.

- ☐ 1. limiting the client’s choices
- ☐ 2. accepting the client as he is
- ☐ 3. allowing the client to do as he wishes
- ☐ 4. acting nonchalantly
- ☐ 5. explaining to the client what he needs to do step-by-step

74. The nurse observes a client in a group who is reminiscing about his past. Which effect should the nurse expect reminiscing to have on the client’s functioning in the hospital?

- ☐ 1. Increase the client’s confusion and disorientation.
- ☐ 2. Cause the client to become sad.
- ☐ 3. Decrease the client’s feelings of isolation and loneliness.
- ☐ 4. Keep the client from participating in therapeutic activities.

The Client with Delirium

75. A 69-year-old client is admitted and diagnosed with delirium. Later in the day, he tries to get out of the locked unit. He yells, “Unlock this door. I have got to go see my doctor. I just cannot miss my monthly Friday appointment.” Which of the following responses by the nurse is **most** appropriate?

- ☐ 1. “Please come away from the door. I will show you your room.”
- ☐ 2. “It is 5 o’clock Tuesday, and you are in the hospital. I am Anne, a nurse.”
- ☐ 3. “The door is locked to keep you from getting lost.”

- ☐ 4. “I want you to come eat your lunch before you go for your appointment.”

76. An 83-year-old woman is admitted to the unit after being examined in the emergency department (ED) and diagnosed with delirium. After the admission interviews with the client and her grandson, the nurse explains that there will be more laboratory tests and x-rays done that day. The grandson says, “She has already been stuck several times and had a brain scan or something. Just give her some medicine and let her rest.” What should the nurse tell the grandson? Select all that apply.

1. “I agree she needs to rest, but there is no one specific medicine for your grandmother’s condition.”
2. “The healthcare provider will look at the results of those tests in the ED and decide what other tests are needed.”
3. “Delirium commonly results from underlying medical causes that we need to identify and correct.”
4. “Tell me about your grandmother’s behaviors, and maybe I could figure out what medicine she needs.”
5. “I will ask the healthcare provider to postpone more tests until tomorrow.”

77. The nurse is attempting to draw blood from a client with a diagnosis of delirium who was admitted last evening. The client yells out, “Stop; leave me alone. What are you trying to do to me? What is happening to me?” Which response by the nurse is **most** appropriate?

- ☐ 1. “The tests of your blood will help us figure out what is happening to you.”
- ☐ 2. “Please hold still so I do not have to stick you a second time.”
- ☐ 3. “After I get your blood, I will get some medicine to help you calm down.”
- ☐ 4. “I will tell you everything after I get your blood tests to the laboratory.”

78. A 90-year-old client diagnosed with major depression is suddenly experiencing sleep disturbances, inability to focus, poor recent memory, altered perceptions, and disorientation to time and place. Lab results indicate the client has a urinary tract infection (UTI) and dehydration. After

explaining the situation and giving the background and assessment data, the nurse should make which recommendation to the client's healthcare provider (HCP)?

- ☐ 1. a prescription to place the client in restraints
- ☐ 2. a reevaluation of the client's mental status
- ☐ 3. the transfer of the client to a medical unit
- ☐ 4. a transfer of the client to a nursing home

79. When caring for the client diagnosed with delirium, which condition is the **most** important for the nurse to investigate?

- ☐ 1. cancer of any kind
- ☐ 2. impaired hearing
- ☐ 3. prescription drug intoxication
- ☐ 4. heart failure

80. Which characteristic would make the nurse suspect that a client with changes in cognition has delirium?

- ☐ 1. disturbances in cognition and consciousness that fluctuate during the day
- ☐ 2. the failure to identify objects despite intact sensory functions
- ☐ 3. significant impairment in social or occupational functioning over time
- ☐ 4. memory impairment to the degree of being called amnesia

81. What intervention is essential when caring for a client who is experiencing delirium?

- ☐ 1. controlling behavioral symptoms with low-dose psychotropics
- ☐ 2. identifying the underlying causative condition or illness
- ☐ 3. manipulating the environment to increase orientation
- ☐ 4. decreasing or discontinuing all previously prescribed medications

82. What is a realistic short-term goal to be accomplished in 2 to 3 days for a client with delirium?

- ☐ 1. Explain the experience of having delirium.
- ☐ 2. Resume a normal sleep-wake cycle.
- ☐ 3. Regain orientation to time and place.

- ☐ 4. Establish normal bowel and bladder function.

83. What should the nurse expect to include as a **priority** in the plan of care for a client with delirium based on the nurse's understanding of the disturbances in orientation associated with this disorder?

- ☐ 1. identifying self and making sure that the nurse has the client's attention
- ☐ 2. eliminating the client's napping in the daytime as much as possible
- ☐ 3. engaging the client in reminiscing with relatives or visitors
- ☐ 4. avoiding arguing with a suspicious client about his perceptions of reality

84. A client has been in the critical care unit for 3 days following a severe myocardial infarction. Although he is medically stable, he has begun to have fluctuating episodes of consciousness, illogical thinking, and anxiety. He is picking at the air to "catch these baby angels flying around my head." While waiting for medical and psychiatric consults, which needs have the highest **priority**? Select all that apply.

- ☐ 1. decreasing as much "foreign" stimuli as possible
- ☐ 2. avoiding challenging the client's perceptions about "baby angels"
- ☐ 3. orienting the client about his medical condition
- ☐ 4. gently presenting reality as needed
- ☐ 5. calling the client's family to report his onset of dementia

The Client with Dementia

85. The nurse is assessing an older adult for signs of dementia using the Mini Mental Status Exam. The nurse gives the client three words to remember: "cat," "crackers," and "toys." After having the client perform a short task, the nurse asks the client to repeat the words. The client says "toys," "boys," and "joys." The nurse should **next**:

- ☐ 1. ask the client to repeat the original words one more time.
- ☐ 2. note on the medical record that the client has echolalia.
- ☐ 3. refer the client to a healthcare provider (HCP) for further follow-up.
- ☐ 4. repeat the test when a family member is present.

86. The nurse is caring for a hospitalized client who has a disorder of the

amygdala. Which of symptoms can the nurse anticipate that the client will have?

- ☐ 1. impulsive acts of aggression
- ☐ 2. sleep disturbance
- ☐ 3. unable to recognize objects by touch
- ☐ 4. difficulties with speech

87. A client has been admitted to the emergency department. The client's family tells the nurse that the client has suddenly become lethargic and is "not making sense." The client has not had anything to eat or drink for the last 8 hours. The nurse further assesses the client using the Confusion Assessment Method (CAM). The client's responses to questions are rambling, and the client is not able to focus clearly to answer the nurse's questions. Based on these findings, the nurse should report that the client has:

- ☐ 1. dementia.
- ☐ 2. depression.
- ☐ 3. delirium.
- ☐ 4. dehydration.

88. A nurse on the geropsychiatric unit receives a call from the son of a recently discharged client. He reports that his father just got a prescription for memantine to take "on top of his donepezil." The son then asks, "Why does he have to take extra medicines?" The nurse should tell the son:

- ☐ 1. "Maybe the donepezil alone is not improving his dementia fast enough or well enough."
- ☐ 2. "Memantine and donepezil are commonly used together to slow the progression of dementia."
- ☐ 3. "Memantine is more effective than donepezil. Your father will be tapered off the donepezil."
- ☐ 4. "Donepezil has a short half-life, and memantine has a long half-life. They work well together."

89. An elderly client diagnosed with dementia wanders the halls of the locked nursing unit during the day. To ensure the client's safety while walking in the halls, what should the nurse do?

- ☐ 1. Administer PRN haloperidol to decrease the need to walk.
- ☐ 2. Assess the client's gait for steadiness.
- ☐ 3. Restrain the client in a geriatric chair.
- ☐ 4. Administer PRN lorazepam to provide sedation.

90. A client with dementia who prefers to stay in his room has been brought to the dayroom. After 10 minutes, the client becomes agitated and retreats to his room again. The nurse decides to assess the conditions in the dayroom. Which is the **most** likely occurrence that is disturbing to this client?

- ☐ 1. There is only one other client in the dayroom; the rest are in a group session in another room.
- ☐ 2. There are three staff members and one healthcare provider (HCP) in the nurse's station working on charting.
- ☐ 3. A relaxation tape is playing in one corner of the room, and a television airing a special on crime is playing in the opposite corner.
- ☐ 4. A housekeeping staff member is washing off the countertops in the kitchen, which is on the far side of the dayroom.

91. Nursing staff are trying to provide for the safety of an elderly client with moderate dementia. The client is wandering at night and has trouble keeping her balance. She has fallen twice but has had no resulting injuries. The nurse should:

- ☐ 1. move the client to a room near the nurse's station and install a bed alarm.
- ☐ 2. have the client sleep in a reclining chair across from the nurse's station.
- ☐ 3. help the client to bed and raise all four bedrails.
- ☐ 4. ask a family member to stay with the client at night.

92. During a home visit to an elderly client with mild dementia, the client's daughter reports that she has one major problem with her mother. She says, "She sleeps most of the day and is up most of the night. I cannot get a decent night's sleep anymore." Which suggestions should the nurse make to the daughter? Select all that apply.

- ☐ 1. Ask the client's healthcare provider (HCP) for a strong sleep medicine.
- ☐ 2. Establish a set routine for rising, hygiene, meals, short rest periods, and bedtime.

- ☐ 3. Engage the client in simple, brief exercises or a short walk when she gets drowsy during the day.
- ☐ 4. Promote relaxation before bedtime with a warm bath or relaxing music.
- ☐ 5. Have the daughter encourage the use of caffeinated beverages during the day to keep her mother awake.

93. A client with agnosia as a result of vascular dementia is staring at dinner and utensils without trying to eat. Which intervention should the nurse attempt **first**?

- ☐ 1. Pick up the fork and feed the client slowly.
- ☐ 2. Say, "It is time for you to start eating your dinner."
- ☐ 3. Hand the fork to the client and say, "Use this fork to eat your green beans."
- ☐ 4. Save the client's dinner until her family comes in to feed her.

94. A client with early dementia exhibits disturbances in mental awareness and orientation to reality. The nurse should expect to assess a loss of ability in what other areas?

- ☐ 1. speech
- ☐ 2. judgment
- ☐ 3. endurance
- ☐ 4. balance

95. The client with dementia states to the nurse, "I know you. You are Margaret, the girl who lives down the street from me." Which response by the nurse is **most** therapeutic?

- ☐ 1. "Mrs. Jones, I am Rachel, a nurse here at the hospital."
- ☐ 2. "Now Mrs. Jones, you know who I am."
- ☐ 3. "Mrs. Jones, I told you already, I am Rachel, and I do not live down the street."
- ☐ 4. "I think you forgot that I am Rachel, Mrs. Jones."

96. While assessing a client diagnosed with dementia, the nurse notes that her husband is concerned about what he should do when she uses vulgar language with him. The nurse should:

- ☐ 1. tell her that she is very rude.

- ☐ 2. ignore the vulgarity and distract her.
- ☐ 3. tell her to stop swearing immediately.
- ☐ 4. say nothing and leave the room.

97. The nurse understands that the client with severe dementia and motor apraxia may be able to perform which action?

- ☐ 1. Balance a checkbook accurately.
- ☐ 2. Brush the teeth when handed a toothbrush.
- ☐ 3. Use confabulation when telling a story.
- ☐ 4. Find misplaced car keys.

98. When communicating with the client who is experiencing dementia and exhibiting decreased attention and increased confusion, which intervention should the nurse employ as the **first** step?

- ☐ 1. using gentle touch to convey empathy
- ☐ 2. rephrasing questions the client does not understand
- ☐ 3. eliminating distracting stimuli such as turning off the television
- ☐ 4. asking the client to go for a walk while talking

99. During family teaching, the daughter of a client with dementia mentions to the nurse that her mother distorts things. The nurse understands that the daughter needs further teaching about dementia when she makes which statement?

- ☐ 1. "I tell her reality, such as 'That noise is the wind in the trees.'"
- ☐ 2. "I understand the misperceptions are part of the disease."
- ☐ 3. "I turn off the radio when we are in another room."
- ☐ 4. "I tell her she is wrong, and then I tell her what is right."

The Client with Alzheimer's Disease

100. The client in the early stage of Alzheimer's disease and his adult son attend an appointment at the community mental health center. While conversing with the nurse, the son states, "I am tired of hearing about how things were 30 years ago. Why does Dad always talk about the past?" The nurse should tell the son:

- ☐ 1. "Your dad lost his short-term memory, but he still has his long-term

memory.”

- ☐ 2. “You need to be more accepting of your dad’s behavior.”
- ☐ 3. “I want you to understand your dad’s level of anxiety.”
- ☐ 4. “Reminding your dad that you have heard that story will help him stop.”

101. The nurse discusses the possibility of a client’s attending day treatment for clients with early Alzheimer’s disease. What is the **best** rationale for encouraging day treatment?

- ☐ 1. The client would have more structure to his day.
- ☐ 2. The staff are excellent in the treatment they offer clients.
- ☐ 3. The client would benefit from increased social interaction.
- ☐ 4. The family would have more time to engage in their daily activities.

102. The nurse is planning care for a client admitted for vascular dementia. Which action is **most** appropriate in assisting the client with activities of daily living?

- ☐ 1. Perform activities for the client during hospitalization.
- ☐ 2. Document all activities the nurse expects the client to complete during the shift.
- ☐ 3. Inform the client that if morning care is not completed by 0830 hours, the UAP will complete it.
- ☐ 4. Encourage the client to complete as many activities as possible, and provide ample time to complete them.

103. The family of a client diagnosed with Alzheimer’s disease wants to keep the client at home. They say that they have the most difficulty in managing his wandering. What should the nurse instruct the family to do? Select all that apply.

- ☐ 1. Ask the healthcare provider (HCP) for a sleeping medication.
- ☐ 2. Install motion and sound detectors.
- ☐ 3. Have a relative sit with the client all night.
- ☐ 4. Have the client wear a Medical Alert bracelet.
- ☐ 5. Install door alarms and high door locks.

104. What is a **priority** to include in the plan of care for a client with

Alzheimer's disease who is experiencing difficulty processing and completing complex tasks?

- ☐ 1. repeating the directions until the client follows them
- ☐ 2. asking the client to do one step of the task at a time
- ☐ 3. demonstrating for the client how to do the task
- ☐ 4. maintaining routine and structure for the client

105. During a home visit, a client who is 75 years of age tells the community health nurse, "Lately I am getting forgetful about things. For one thing, I cannot remember names. Do you think I am getting Alzheimer's disease?" Which response by the nurse is the most therapeutic?

- ☐ 1. "It is normal for people your age to forget things such as names."
- ☐ 2. "I do the same thing. Sometimes, I cannot remember someone's name either."
- ☐ 3. "Tell me more about your forgetfulness. It is not unusual for forgetfulness to occur."
- ☐ 4. "Most people your age have this problem. It is not Alzheimer's disease."

106. When helping the families of clients with Alzheimer's disease cope with vulgar or sexual behaviors, which suggestion is most helpful?

- ☐ 1. Ignore the behaviors, but try to identify the underlying need for the behaviors.
- ☐ 2. Give feedback on the inappropriateness of the behaviors.
- ☐ 3. Employ anger management strategies.
- ☐ 4. Administer the prescribed risperidone.

107. The nurse determines that the son of a client with Alzheimer's disease needs further education about the disease when he makes which statement?

- ☐ 1. "I did not realize the deterioration would be so incapacitating."
- ☐ 2. "The Alzheimer's support group has so much good information."
- ☐ 3. "I get tired of the same old stories, but I know it is important for Dad."
- ☐ 4. "I woke up this morning expecting that my old Dad would be back."

108. The husband of a client who was diagnosed 6 years ago with

Alzheimer's disease approaches the nurse and says, "I am so excited that my wife is starting to use donepezil for her illness." The nurse should tell the husband:

- ☐ 1. The medication is effective mostly in the early stages of the illness.
- ☐ 2. The adverse effects of the drug are numerous.
- ☐ 3. The client will attain a functional level equal to that of that of 6 years ago.
- ☐ 4. Effectiveness in the terminal phase of the illness is scientifically proven.

109. The healthcare provider (HCP) prescribes risperidone for a client with Alzheimer's disease. The nurse anticipates administering this medication to help decrease which behavior?

- ☐ 1. sleep disturbances
- ☐ 2. concomitant depression
- ☐ 3. agitation and assaultiveness
- ☐ 4. confusion and withdrawal

110. The nurse is making a home visit with a client diagnosed with Alzheimer's disease. The client is recently started on lorazepam due to increased anxiety. The nurse is cautioning the family about the use of lorazepam. The nurse should instruct the family to report which significant side effect to the healthcare provider (HCP)?

- ☐ 1. paradoxical excitement
- ☐ 2. headache
- ☐ 3. slowing of reflexes
- ☐ 4. fatigue

111. When providing family education for those who have a relative with Alzheimer's disease about minimizing stress, which suggestion is **most** - relevant?

- ☐ 1. Allow the client to go to bed four to five times during the day.
- ☐ 2. Test the cognitive functioning of the client several times a day.
- ☐ 3. Provide reality orientation even if the memory loss is severe.
- ☐ 4. Maintain consistency in environment, routine, and caregivers.

Managing Care, Quality, and Safety of Clients with Schizophrenia, Other Psychoses, and Cognitive Disorders

112. An elderly client who has been diagnosed with delusional disorder for many years is exhibiting early symptoms of dementia. His daughter lives with him to help him manage daily activities, and he attends a day care program for seniors during the week while she works. A nurse at the day care center hears him say, “If my neighbor puts up a fence, I will blow him away with my shotgun. He has never respected my property line, and I have had it!” Which action should the nurse take?

- ☐ **1.** Observe the client more closely, but do not report his threat since he will likely not be able to follow through with it because of his dementia.
- ☐ **2.** Report the comment to the client’s daughter so she can observe him more closely, but refrain from telling the neighbor due to privacy regulations.
- ☐ **3.** Report the comment to the neighbor, the intended victim, but refrain from telling the daughter since she will just worry about actions of her father she cannot control.
- ☐ **4.** Report the comment to the neighbor, the daughter, and the police since there is the potential for a criminal act.

113. A client reports having blurred vision after 4 days of taking haloperidol 1 mg twice a day and benztropine 2 mg twice a day. The nurse contacts the healthcare provider (HCP) to explain the situation, background, and assessment and make a recommendation. Which information reported to the HCP is the assessment of the situation?

- ☐ **1.** “Mr. Roberts is taking 1 mg of haloperidol twice a day and benztropine 2 mg twice a day.”
- ☐ **2.** “I think Mr. Roberts might need a lower dose of benztropine.”
- ☐ **3.** “Mr. Roberts reports having blurred vision since this morning.”
- ☐ **4.** “The higher dose of benztropine could be causing Mr. Roberts’ blurred vision.”

114. What should be charted by the nurse when the client has an involuntary commitment or formal admission status?

- ☐ **1.** Nothing should be charted. The forms are in the chart; there is no need

to duplicate.

- ☐ 2. The client's receipt of information about status and rights should be charted.
- ☐ 3. The client's willingness to cooperate with seclusion should be charted.
- ☐ 4. The name of the physician officially signing the certificates should be charted.

115. When assessing an aggressive client, which behavior warrants the nurse's prompt reporting and use of safety precautions?

- ☐ 1. crying when talking about his divorce
- ☐ 2. starting a petition to delay bedtime
- ☐ 3. declining attendance at a daily group therapy session
- ☐ 4. naming another client as his adversary

116. A nurse is planning care for an elderly client with cognitive impairment who is still living at home. Which action should the nurse identify as a **priority** for safety in planning care for this client?

- ☐ 1. having two people accompany the client whenever the client is up and about
- ☐ 2. ensuring the removal of objects in the client's path that may cause him to trip
- ☐ 3. putting the client's favorite belongings in a safe place so that he will not lose them
- ☐ 4. giving the client his medications in liquid form to make certain that he swallows them

117. The nurse manager of a psychiatric unit notices that one of the nurses commonly avoids a 75-year-old client's company. Which factor should the nurse manager identify as being the **most** likely cause of this nurse's discomfort with older clients?

- ☐ 1. fears and conflicts about aging
- ☐ 2. dislike of physical contact with older people
- ☐ 3. a desire to be surrounded by beauty and youth
- ☐ 4. recent experiences with her mother's elderly friends

Answers, Rationales, and Test-Taking Strategies

*The answers and rationales for each question follow below, along with keys (🔑) to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon (📖) highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in part 1 of this book.*

The Client with Schizophrenia or a Psychotic Disorder

1. 4. It is critical for the nurse to ensure the safety of others by knowing who the client might think needs elimination. Asking the client to explain what she means and discussing her concerns at the group session are possible interventions for later in the client's hospital stay. Wearing appropriate clothing while hospitalized is generally a unit expectation for all clients.

🔑 CN: Psychosocial integrity; CL: Synthesize

2. 2. Knowing the client's interests is the best place to begin to help the client resocialize. Knowing with whom the client wishes to socialize, what transportation she has, or how much spending money she has may be relevant questions, but these questions should be asked after the question concerning what activities the client enjoyed in the past.

🔑 CN: Psychosocial integrity; CL: Synthesize

3. 3. Demonstrating empathy is an effective means of beginning an effective therapeutic relationship. Challenging the client's beliefs or thoughts is not the most effective in establishing a trusting relationship. Determining what supports are needed is done after an initial assessment.

🔑 CN: Management of care; CL: Apply

4. 2. The nurse's nonverbal behavior, moving away from the window as the client requests, indicates agreement with the client's false ideas. The

client's behavior is likely to be reinforced if the nurse takes steps to agree with the false ideas the client holds.

CN: Psychosocial integrity; CL: Synthesize

5. 2. The client's disturbed thought process likely reflects this client's paranoid delusions. The nurse should acknowledge that the thoughts are frightening the client. Telling the client the nurse does not see any foreign agents is an appropriate nursing response if the client is having disturbed visual sensory perception and is having visual hallucinations. Telling the client the nurse does not understand what the client means is an appropriate response if the client has impaired verbal communication. Suggesting that a client participate in group activities would be appropriate if the client had a nursing diagnosis of social isolation and was staying in his room.

CN: Psychosocial integrity; CL: Synthesize

6. 2,4,3,1. The nurse should first assess the client's risk for harm, especially because the client could direct her anger toward her ex-husband or the nurse. Then it is important to know more about her current situation and her immediate needs. Obtaining information from the ex-husband's case manager might help clarify the risk of harm to the client. Problems leading to the divorce are less important than the situation following the divorce.

CN: Management of care; CL: Synthesize

7. 1,3,4,2. The nurse should first walk with the client to reduce her anxiety because the client must be at a mild level of anxiety before learning can occur. Sharing observations with the client conveys a sense of caring. Later, the nurse can help the client connect the anxiety-related behaviors to her feelings of anxiety. Once the client can identify the source of her anxiety, she can talk about solutions.

CN: Management of care; CL: Synthesize

8. 2. The reported symptoms are signs of extrapyramidal side effects. The medication of choice is benztropine, an antiparkinson medicine. Lorazepam is an antianxiety agent. Trazodone is an antidepressant used to enhance sleep. Olanzapine is an antipsychotic medication that could aggravate the extrapyramidal side effects.

 CN: Pharmacological and parental therapies; CL: Synthesize

9. 2. Clients with paranoid schizophrenia experience alterations in thought resulting in introspection, confusion, and distraction from external reality. Simple tasks that require concentration and effort, including activities involving self-care, may be difficult for the client, especially during the acute phase of the illness. However, the mother should not need to do everything for her daughter. Rather, the mother should encourage the daughter to do things for herself with guidance. Visits from friends should be discussed with the client, and the client should be encouraged to visit with friends to minimize the risk of social isolation. Although relapse typically occurs with medication noncompliance, vulnerability to stress, a low threshold for stress, the number of stresses, and the client's lack of adaptive coping behaviors contribute to relapse.

 CN: Safety and infection control; CL: Evaluate

10. 1. The nurse recognizes the mother's feelings of being overwhelmed with the issues concerning the management of her daughter at home as caregiver role strain. Anxiety, fear, and sleep disturbances all contribute to caregiver role strain. The nurse should help the mother elicit the support of other family members or friends, continue with psychoeducation, and help the family connect with a support group.

 CN: Psychosocial integrity; CL: Analyze

11. 1. The client is voicing paranoid delusions of being followed and monitored. Presence of delusions is described in the area of thought content in the mental status examination. The speech section would typically include documentation of disturbances in speech or pressured speech. In the insight section, the nurse would document information reflecting a lack of insight—for example, statements such as “I do not have a problem.” In the judgment section, the nurse would document information reflecting a lack of judgment—for example, poor choices such as buying a gun for self-protection.

 CN: Psychosocial integrity; CL: Analyze

12. 2. For the client with paranoid schizophrenia, 2 days on medication is too short a time for improvement to be seen. Therefore, the nurse evaluates

the client's wife as needing education or knowledge about paranoid schizophrenia, the course of the illness, and medications. Expecting an absence of delusions by the end of the client's 2nd day of hospitalization is unrealistic. Rather, the nurse would reasonably expect delusions to decrease, disappearing by 5 to 9 days of hospitalization. The wife's inquiry is not reasonable because not enough time has elapsed to evaluate the effectiveness of treatment. An increase in the client's medication would be unreasonable because not enough time has elapsed to evaluate the effectiveness of the medication. Generally, a time frame of 5 to 7 days is needed before the effectiveness of medications can be determined.

CN: Pharmacological and parenteral therapies; CL: Analyze

13. 2. The client is at risk for harming herself because of the command auditory hallucinations. It is most important for the staff to know if she currently thinks she needs to punish herself. Then it is important to know how she thinks she might punish herself. Knowing what she thinks she has done is relevant for changing her negative thinking. Focusing on her strengths would help improve her self-esteem.

CN: Psychosocial integrity; CL: Synthesize

14. 4. The client is exhibiting suspiciousness of and a lack of trust in the staff, not aggression. Seeking out staff indicates the development of trust and decreased suspiciousness. Although completing activities of daily living and participating in recreation with other clients are important, the major problem presented is related to the client's isolation and perception of being harmed—not, for example, showering, hygiene, or other clients.

CN: Psychosocial integrity; CL: Synthesize

15. 1. Fluphenazine is most effective with the positive symptoms of schizophrenia. The client's symptoms reflect the negative symptoms. Fluphenazine generally is effective in 3 to 7 days for the positive symptoms. An increased dose or longer time on fluphenazine will not help the negative symptoms of being withdrawn and unmotivated.

CN: Pharmacological and parental therapies; CL: Apply

16. 2. Chlorpromazine is a low-potency antipsychotic that is likely to

cause sun-sensitive skin. Therefore, the client needs instructions about using sunscreen with a sun protection factor of 30 or higher. Typically, chlorpromazine is not associated with an increased risk of seizures. Although constipation is a common adverse effect of this drug, it can be managed with diet, fluids, and exercise. The drug does not need to be discontinued. Chlorpromazine is associated with postural hypotension, not hypertension. Additionally, if postural hypotension occurs, safety measures, such as changing positions slowly and dangling the feet before arising, not stopping the drug, are instituted.

CN: Pharmacological and parenteral therapies; CL: Create

17. 1. The nurse needs to present the reality of the situation. By explaining that the men are groundskeepers and probably talking about work, the nurse is reinforcing reality to counter the client's illusion (misinterpretation of reality). Additionally, this response voices doubt in the client's paranoid interpretation. Telling the client not to take things personally is flippant and judgmental. Telling the client to not pay attention to the men fails to address the client's misinterpretations and misperceptions. Closing the drapes so that the client does not see the men ignores the client's misperceptions and misinterpretation.

CN: Psychosocial integrity; CL: Synthesize

18. 4. Clozapine is associated with agranulocytosis. Therefore, the nurse must instruct the client about the need for weekly blood tests to monitor for this adverse effect. Akathisia and drug-induced parkinsonism are associated with high-potency antipsychotics. These effects are not common with this atypical antipsychotic agent. Constipation and sedation may occur with this drug.

CN: Pharmacological and parenteral therapies; CL: Synthesize

19. 2. Before intervening with the client experiencing hallucinations, the nurse must validate what the client is experiencing. Asking the client what he hears right now accomplishes this. Asking about seeing someone near the client would be appropriate to validate visual hallucinations. Asking the client about what is going on may be helpful. However, the question is too general to validate that the client is experiencing auditory hallucinations.

Asking the client if he wants to go to the recreation room might be appropriate after the nurse has validated what the client is experiencing.

 CN: Psychosocial integrity; CL: Synthesize

20. 3. The client may act on command hallucinations and harm himself or others. Therefore, the staff needs to know when the client is hearing such commands, to ensure safety first. Telling the client that the voices are real but that the nurse does not hear them would be an appropriate response later in the client's hospitalization when the client's safety is no longer an issue because antipsychotics are beginning to take effect. Telling the client that the hallucinations are part of the illness or that medications will help control the voices would be appropriate once the client has developed some insight into the symptoms of the illness.

 CN: Safety and infection control; CL: Synthesize

21. 3. Tactile hallucinations are more common in alcohol withdrawal than in schizophrenia. Therefore, the nurse should explain that these hallucinations are the result of withdrawal from alcohol. Because the client stopped drinking 4 days ago, the client is not intoxicated. Risperidone has little effect on symptoms of alcohol withdrawal. It is prescribed for symptoms of schizophrenia. Alcohol and risperidone have an additive effect, not one of causing hallucinations.

 CN: Physiological adaptation; CL: Analyze

22. 1,3,4,5. Documentation provided in option 2 is the most factual and without conclusions or assumptions. Stating that the client was noncompliant with medications is not the only cause of decreased sleep and activities of daily living or increased delusions and hallucinations. Also, the client did not say that his parents wanted to harm him directly. Stating that the client's relationship with his parents is strained is an assumption, even if he did indeed state that they wanted him dead. The client does not state a wish to be dead or harm others, although further assessment would be necessary. Documenting that his parents may be abusing him makes an assumption, although the nurse should further assess for this possibility.

 CN: Management of care; CL: Evaluate

23. 1. The client's anxiety as reflected in rapid pacing and clang associations is rising as a result of his paranoid delusions. Administering the lorazepam and haloperidol will help the anxiety and delusions. The client is not threatening others at this point, so seclusion, restraints, and asking clients to leave the area are not necessary.

CN: Pharmacological and parenteral therapies; CL: Synthesize

24. 2. Pushing a suspicious client into social situations is likely to increase anxiety, which increases, not decreases, the hallucinations. The statement about spending some time alone if the client is overwhelmed indicates awareness and understanding of how to intervene when the client is exposed to stress. The statement about lack of motivation indicates awareness and understanding of avolition. The statement about reminding the client that the family does not hear the voices indicates awareness and understanding of the client's hallucinations.

CN: Psychosocial integrity; CL: Evaluate

25. 1. Clozapine is the one atypical antipsychotic associated with severe anticholinergic adverse effects such as constipation. Consuming fruits would not be the cause of the client's constipation. The client should take clozapine with food to avoid nausea. Getting up slowly indicates that the client understands that postural hypotension may occur with clozapine. The statement about sleepiness indicates that the client understands that sedation may occur with this drug.

CN: Pharmacological and parenteral therapies; CL: Evaluate

26. 4. The statement about the voices occurring if the client is nervous reflects awareness that stress and anxiety can increase the positive symptoms of schizophrenia. Decreasing the medications because the voices are gone reveals a lack of awareness about the need for the medications to control the client's symptoms. Stating that there is still poison in her food demonstrates a lack of insight into the client's delusions. Restarting school in a week reflects an unrealistic expectation for a client who is newly diagnosed and being stabilized on medications.

CN: Psychosocial integrity; CL: Evaluate

27. 1. The initial priority for this client is to help her overcome suspiciousness of others, including staff, and thereby feel safe and accepted. Introducing the client to others, giving the client information about the program, and providing clean clothes are important, but these are of lower priority than helping the client feel safe and accepted.

 CN: Psychosocial integrity; CL: Create

28. 2. Constipation caused by medication is best managed by diet, fluids, and exercise. Benztropine can increase constipation. However, it may be prescribed for restlessness and stiffness. Restlessness and stiffness should be reported to the **HCP**. Drowsiness and dizziness are adverse effects of ziprasidone. Clients should not drive if they are experiencing dizziness. Ziprasidone does help improve the negative symptoms of schizophrenia such as avolition.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

The Client with Other Types of Schizophrenia and Psychotic Disorders

29. 4. When the client is listening to the voices, it is most likely an auditory hallucination. Somatic delusions are false beliefs about the functioning of the client's own body. Pseudoparkinsonism is another name for the extrapyramidal symptoms of the medications. Delusions of reference involve events within the environment.

☐ CN: Psychosocial Integrity; CL: Analyze

30. 1. Most clients experience less weight gain when taking ziprasidone. Although ziprasidone can be administered intramuscularly, it can be used only on an as-needed basis by this route. Ziprasidone has fewer extrapyramidal side effects, but that is not this client's major concern. Ziprasidone is better absorbed when taken with food, so a bedtime snack is needed.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

31. 2,4. Safety issues, including protection of the client and others, are the priorities for admission. Acute psychosis commonly involves issues of safety.

Living alone is not a sufficient reason to be admitted to a healthcare facility. Depression, insomnia, lack of appetite, and noncompliance are important issues but not sufficient for admission unless combined with one of the other criteria.

 CN: Management of care; CL: Analyze

32. 3. Elderly clients are typically on lower dosages of antipsychotic medications due to the metabolic changes of aging. Comparing dosages is not relevant. Each client is unique in metabolizing medications. Changing medication dosages is based on an assessment of illness symptoms and the adverse effect profile, not on family preferences. Urging the daughter to wait discounts her concerns and gives no rationale for waiting.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

33. 2. Helping the client control his weight is the most appropriate approach. The nurse's contradiction of the client's statement is inappropriate. Most atypical antipsychotics cause weight gain and are not a solution to the weight gain. There is little evidence that weight gain from taking olanzapine decreases with time.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

34. 4. Achieving a therapeutic blood level is a slower process with risperidone long-acting injection. Oral fluphenazine does not decrease the effectiveness of the intramuscular version and might increase the incidence of adverse effects. There is no evidence that the potency of the two medications is significantly different. Blaming the client for noncompliance with these two medications is inappropriate.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

35. 1,2,4,5. Ziprasidone can cause somnolence, drowsiness, weight gain (can be excessive), constipation, and headache; these side effects may preclude noncompliance with this medication. Urticaria is not a common side effect of ziprasidone.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

36. 1. Recognition by the client that there is a difference between the

stuffed animal and her live dog indicates that the client perceives the reality of the situation. Stating that the stuffed animal and the client's dog could be twins reflects the client's continued misperception of reality, thinking that the stuffed animal and her dog are one and the same. Stating that she wishes her dog had not been stuffed reflects her continued misperception of reality. Stating that the roommate needs a dog as much as she does is unrelated to the client's perception or misperception of reality.

CN: Psychosocial integrity; CL: Evaluate

37. 3. The nurse must be objective in documenting the client's behavior, recording exactly what the client did or did not say or do in a particular - situation. Recording that the client could not answer any questions, was uncooperative and refused to answer questions, or was disoriented and incoherent is not described and is a subjective interpretation on the nurse's part.

CN: Management of care; CL: Create

38. 4. By the end of 4 days, the client should be able to perform showering and dressing for herself. The client with schizophrenia commonly appears to be apathetic and lack initiative. Therefore, demonstrating the ability to complete the tasks indicates improvement. Although the client may be able to recognize, verbalize, or explain the need to shower and dress herself, she may be unable to do so because of the ambivalence associated with schizophrenia that impedes the client's ability to initiate and complete self-care. Therefore, evidence of improvement would be lacking.

CN: Management of care; CL: Create

39. 1. When determining the effectiveness of risperidone, the nurse would expect improvement in the client's negative symptoms of apathy, flat affect, and social withdrawal. Delusions, hallucinations, illusions, and ideas of reference are positive symptoms of schizophrenia. Agitation, hostility, and aggression are also the result of the positive symptoms.

CN: Pharmacological and parenteral therapies; CL: Evaluate

40. 2,3,4. The client's symptoms are likely to be adverse effects of aripiprazole, especially at the reported dose. The normal adult dose is 5 to 10

mg. The elderly client commonly needs a lower dose compared with other adults. The anxiety and sleep disturbance could be symptoms of schizophrenia or medication adverse effects. A holistic approach would include assessing the client's heart failure. Questioning the qualifications of the family HCP is unproductive. There are no indications of problems in the client's relationship with her son.

CN: Pharmacological and parenteral therapies; CL: Analyze

41. 3. Excessive salivation, or sialorrhea, is commonly associated with clozapine therapy. The client can use a washcloth to wipe the saliva instead of spitting. It is an expected adverse effect of the drug, not a delusion, an unusual reaction, or an unresolved symptom of schizophrenia.

CN: Pharmacological and parenteral therapies; CL: Analyze

42. 3. Stating that God is important in the client's life recognizes the client's cognitive and perceptual disturbances and level of anxiety and acknowledges the client's message in a respectful and neutral manner, while adding that the medicine also will help clearly and directly states the need for medication. Stating "God helps those who help themselves" challenges the client. Stating "God wants you to take your medicine" is deceitful. Stating "Medicine will help clear your thinking and decrease anxiety" would be helpful to the client later when she is less acutely psychotic and anxious.

CN: Psychosocial integrity; CL: Apply

43. 1. The nurse instructs the client clearly and directly to put the medication in the mouth and then to swallow it with some water. Clear, step-by-step directions assist the client to process what the nurse is saying. Telling the client to sit in the dayroom and wait, asking another staff member to stay with the client, or saying nothing is not helpful.

CN: Pharmacological and parenteral therapies; CL: Synthesize

44. 2. Whispering and laughing with another person where the client can see or observe the nurse but not hear the conversation increases the client's anxiety and suspiciousness. Therefore, this action should be avoided. Informing the client of schedule changes, telling the client gently that the nurse does not share the client's interpretation of an event, and inviting the

client to participate in leisure activities help the client to decrease anxiety and suspiciousness and to focus on actual or realistic events.

 CN: Psychosocial integrity; CL: Synthesize

45. 4. Because the client can live in an apartment setting, further development of independent functioning and the skills to gain as much independence as he is capable of need to be fostered, including getting out and developing new friendships. Arranging for participation in day treatment is most beneficial at this time. Family visits and daily nursing visits do not encourage the client to do this. Making an appointment for 2 weeks later puts the client's needs off. Lack of social relationships is not a sufficient reason for rehospitalization.

 CN: Psychosocial integrity; CL: Synthesize

46. 2. One advantage of using risperidone is that it is not associated with agranulocytosis like clozapine and does not require the same lab monitoring. In schizophrenia negative symptoms are more prominent than positive. Negative symptoms do not respond to typical antipsychotics such as haloperidol. Agranulocytosis is commonly associated with clozapine. Because it is a newer drug, risperidone usually is more expensive than typical antipsychotics.

 CN: Pharmacological and parenteral therapies; CL: Apply

47. 1,2,3. Headaches, transient anxiety, and insomnia are the most common adverse effects of aripiprazole. Torticollis and pill rolling are more common with the older antipsychotics.

 CN: Pharmacological and parenteral therapies; CL: Create

48. 2. The client is in an acute psychotic state and cannot process complex decisions or explain complex situations. Therefore, the nurse would focus on decision making involving simple choices. Listing the pros and cons of each housing option and identifying why the client cannot live in an unsupervised apartment involve complex decision-making skills. Deciding which staff member to have today is a difficult and threatening decision for a client who is psychotic.

 CN: Management of care; CL: Synthesize

49. 1. The client is exhibiting hallmark signs and symptoms of life-threatening neuroleptic malignant syndrome induced by the haloperidol. Tardive dyskinesia usually occurs later in treatment, typically months to years later. Extrapyramidal adverse effects (dystonia, akathisia) and drug-induced parkinsonism, although common, are not life threatening.

CN: Reduction of risk potential; CL: Analyze

50. 3. The client with schizophrenia needs more structure every day to improve functioning. Therefore, helping the client to set up a daily activity schedule is most appropriate. However, a group home is not necessary. The client is already eating. Having meals brought in would increase the client's dependence, not his activity level. Asking a relative to call the client 10 times per day is unrealistic given the typical daily responsibilities of a healthy relative.

CN: Psychosocial integrity; CL: Synthesize

51. 2. The client is exhibiting catatonic behavior, an acutely serious result of severe anxiety and psychosis. In this situation, the nurse needs to administer the PRN-prescribed doses of haloperidol and lorazepam; they can be given together safely. Assisting the client out of the chair to go back to bed or sitting quietly until the client responds ignores the seriousness of the client's condition. It is unlikely that the client can describe what is being experienced.

CN: Psychosocial integrity; CL: Synthesize

52. 2. Attending day therapy three times per week is a long-term goal that will show the most progress in overcoming withdrawal. The client's calling his or her mother is a first step in getting out of a severe withdrawal. Allowing two friends to visit every day would be appropriate if the client is successful with calling his or her mother once a day. Insufficient information is presented in the scenario to indicate that excessive sleep is a problem.

CN: Psychosocial integrity; CL: Synthesize

53. 4. Although all the actions indicate improvement, the ability to initiate simple activities without directions indicates the most improvement in the catatonic behaviors. Moving all extremities occasionally, walking with the

nurse to the client's room, and responding to verbal directions to eat represent single steps toward the client initiating his or her own actions.

CN: Pharmacological and parenteral therapies; CL: Evaluate

54. 2. Noncompliance with medications is common in the client with schizophrenia. The nurse has the responsibility to assess this situation. Asking the mother if they've argued or if the client is mad at the mother or telling the mother to go over to the apartment and see what's going on places the blame and responsibility on the mother and therefore is inappropriate. Telling the mother not to worry ignores the seriousness of the client's symptoms.

CN: Management of care; CL: Synthesize

55. 4. The client is exhibiting symptoms of becoming catatonic and unable to care for himself and needs immediate evaluation and possible hospitalization. A sleep aid is not sufficient to treat this client. The client's worsening condition dictates action without waiting for a clinic appointment. An increase in medication may be indicated, but hospitalization is required first for safety.

CN: Management of care; CL: Analyze

56. 3. Valproic acid is commonly used to treat manic symptoms. Therefore, a decrease in the valproic acid level could explain the increase in manic symptoms. Periodic determinations of the valproic acid level are necessary to determine the effectiveness of the drug. However, the stat nature of the specimen to be drawn indicates an immediate problem. Fluoxetine is not known to decrease the effectiveness of valproic acid. The valproic acid level is not needed before beginning a short course of therapy with lorazepam.

CN: Pharmacological and parenteral therapies; CL: Apply

57. 3. A diagnosis of brief psychotic disorder is made when the client exhibits delusions, hallucinations, and disorganized speech or behaviors in the absence of a mood disorder, substance-induced disorder, or general medical condition.

CN: Reduction of risk potential; CL: Analyze

58. 4. Follow-up counseling is appropriate because of the client's anger and inappropriate behaviors. The goal is to help the client deal with the end of his marriage. A joint session might have been useful before the divorce and arrest, but not after. The client is exhibiting no signs or symptoms of schizophrenia or psychosis, so olanzapine is not indicated. The client is not exhibiting signs of depression, so fluoxetine is not indicated.

CN: Management of care; CL: Synthesize

Clients and Families Affected by Chronic Mental Illnesses

59. 3. The first thing that the nurse should do is to speak with the client on the phone and question her about perceptions or reasons that are interfering with her going to the sheltered workshop. This conveys that the nurse is interested and willing to help the client. The nurse should call the director of the work center for information only if the nurse receives the client's permission. Making preparations for the client's admission is inappropriate and would not be done until the client's needs have been assessed and it is determined that the client requires hospitalization. Making an appointment with the **healthcare provider (HCP)**  is inappropriate until the nurse has assessed the client's needs.

CN: Management of care; CL: Synthesize

60. 2. Noncompliance with medications is documented as the primary cause of relapse. Although loss of family support, sudden changes in medications, and nonattendance at treatment programs may contribute to relapse, these factors are not as significant as medication noncompliance as causes of relapse.

CN: Psychosocial integrity; CL: Analyze

61. 3. The most therapeutic action at this time is for the nurse to make an appointment with the client at the mental health center to explore his feelings and behavior. Doing so acknowledges the client's importance and makes him a partner in resolving the problem. The nurse needs to determine what is going on in the situation first, and then plan accordingly. Threatening the client with loss of the position, asking for a new assignment for the client, or arranging for the placement of the client in a skill training program is

inappropriate and premature.

CN: Management of care; CL: Synthesize

62. 2. By acknowledging the difficulties of living with the illness, the nurse conveys empathy for the client's feelings and opens up the lines of communication. Although it is important for the client to maintain compliance with medication therapy, telling the client that it is important to start taking them again or to talk with the **HCP**  about stopping the medications ignores the underlying feelings of the client's initial statements. Stating that the client's buddies will understand may or may not be true. Additionally, this statement ignores the underlying feelings.

CN: Psychosocial integrity; CL: Synthesize

63. 3. Because antipsychotic agents cross the placental barrier and can be teratogenic, they are to be avoided during pregnancy, especially during the first trimester. Later in the pregnancy, low doses of medications may be given if necessary. Although the degree of excitement by the father, the mother's ability to provide help, and the client's financial situation may or may not be of concern, the priority in this situation is the safety of the fetus and risks associated with the need for antipsychotic therapy.

CN: Reduction of risk potential; CL: Analyze

64. 1. A side effect of clozapine is leukopenia. A WBC count is drawn every week, and if it starts to drop, the **HCP**  is notified. Slightly low hemoglobin levels or a normal sodium level is not significant. Hyaline casts occur because of protein in the urine, and a small amount is normally found in the urine, especially after exercise.

CN: Reduction of risk potential; CL: Analyze

65. 3. Many coordinated services are needed, including medication management, more frequent outpatient visits, day treatment, or some combination of these, to decrease the risk of relapse, which is common among chronically ill clients. Medical consultations (if needed) would be included in the coordinated services provided. Chronically mentally ill clients, who are discharged early before becoming truly stable, typically require more than monthly outpatient visits because of the high risk of

relapse. A caring and supportive family is ideal for all clients but not always available.

 CN: Management of care; CL: Create

66. 4. For a community-based program, the need for long-term hospitalization is least needed if the other services, such as partial hospitalization programs, psychiatric home care, and residential services, are available and accessible.

 CN: Management of care; CL: Apply

67. 2,3,4. Although all of the situations require immediate attention, the inability to keep outpatient appointments is less critical than signs of relapse and decompensation, threat of eviction, and unpaid bills and lack of food. Occasionally missing a dose of medication usually will not precipitate a crisis for a client.

 CN: Psychosocial integrity; CL: Analyze

68. 1. Providing ways to decrease or manage adverse effects without additional medications is crucial. Although home visits, family monitoring, and outpatient monitoring may help, if the adverse effects are not controlled, the client is less likely to take the drug, which would interfere with its effectiveness.

 CN: Pharmacological and parenteral therapies; CL: Analyze

69. 4. Many still believe that recovery from mental illness is a matter of willpower—for example, “pull yourself up by your bootstraps” or “just get over it.” This belief persists despite awareness that mental illness can be hereditary and has a biochemical basis. Mental illness can be prevented only if there is early intervention. Clients cannot prevent it just by the desire to do so.

 CN: Psychosocial integrity; CL: Evaluate

The Client with Cognitive Disorders

70. 4. Delirium is commonly due to a medical condition such as a UTI in the elderly. Delirium often involves memory problems, disorientation, and

hallucinations. It develops rather quickly. There are not enough data to suggest Alzheimer's disease especially given the quick onset of symptoms. Delayed grieving and adjusting to being alone are unlikely to cause hallucinations.

CN: Reduction of risk potential; CL: Analyze

71. 3. Paradoxical responses to benzodiazepines are more common in children and the elderly than other age groups and generally occur at the beginning of treatment. Grief and depression in the elderly is more likely to result in fatigue and withdrawal than hyperactivity and agitation. Treatment with a sleeping medication chemically related to the benzodiazepines is likely to result in an increase rather than decrease in agitation symptoms in elderly clients. A medication interaction is possible, but less likely since most pharmacies screen for drug interactions when filling prescriptions.

CN: Pharmacological and parenteral therapies; CL: Analyze

72. 4. Expecting the social worker to make the decision indicates that the son is avoiding participating in decisions about his father. The other responses convey that the son understands the importance of a careful decision, the availability of resources, and the ability to make new plans if needed.

CN: Management of care; CL: Synthesize

73. 1,2,5. Confused clients need fewer choices, acceptance as a person, and step-by-step directions. Allowing the client to do as he wishes can lead to substandard care and the risk of harm. Acting nonchalantly conveys a lack of caring.

CN: Psychosocial integrity; CL: Synthesize

74. 3. Reminiscing can help reduce depression in an elderly client and lessens feelings of isolation and loneliness. Reminiscing encourages a focus on positive memories and accomplishments as well as shared memories with other clients. An increase in confusion and disorientation is most likely the result of other cognitive and situational factors, such as loss of short-term memory, not reminiscing. The client will not likely become sad because reminiscing helps the client connect with positive memories. Keeping the

client from participating in therapeutic activities is less likely with reminiscing.

CN: Psychosocial integrity; CL: Evaluate

The Client with Delirium

75. 2. Loss of orientation, especially for time and place, is common in delirium. The nurse should orient the client by telling him the time, date, place, and who the client is with. Taking the client to his room and telling him why the door is locked do not address his disorientation. Telling the client to eat before going to his medical appointment reinforces his disorientation.

CN: Psychosocial integrity; CL: Synthesize

76. 1,2,3. The client does need rest and it is true that there is no specific medicine for delirium, but it is crucial to identify and treat the underlying causes of delirium. Other tests will be based on the results of already completed tests. Although some medications may be prescribed to help the client with her behaviors, this is not the primary basis for medication prescriptions. Because the underlying medical causes of delirium could be fatal, treatment must be initiated as soon as possible. It is not the nurse's role to determine medications for this client. Postponing tests until the next day is inappropriate.

CN: Psychosocial integrity; CL: Apply

77. 1. Explaining why blood is being taken responds to the client's concerns or fears about what is happening. Threatening more pain or promising to explain later ignores or postpones meeting the client's need for information. The client's statements do not reflect loss of self-control requiring medication intervention.

CN: Psychosocial integrity; CL: Synthesize

78. 3. The client is showing symptoms of delirium, a common outcome of UTI in older adults. The nurse can request a transfer to a medical unit for acute medical intervention. The client's symptoms are not just due to a worsening of the depression. There are not indications that the client needs

restraints or a transfer to a nursing home at this point.

 CN: Management of care; CL: Synthesize

79. 3. Polypharmacy is much more common in the elderly. Drug interactions increase the incidence of intoxication from prescribed medications, especially with combinations of analgesics, digoxin, diuretics, and anticholinergics. With drug intoxication, the onset of the delirium typically is quick. Although cancer, impaired hearing, and heart failure could lead to delirium in the elderly, the onset would be more gradual.

 CN: Reduction of risk potential; CL: Analyze

80. 1. In addition to developing over a period of hours or days, fluctuating symptoms are characteristic of delirium. The failure to identify objects despite intact sensory functions, significant impairment in social or occupational functioning over time, and memory impairment to the degree of being called amnesia all indicate dementia.

 CN: Physiological adaptation; CL: Analyze

81. 2. The most critical aspect of caring for the client with delirium is to institute measures to correct the underlying causative condition or illness. Controlling behavioral symptoms with low-dose psychotropics, manipulating the environment, and decreasing or discontinuing all medications may be dangerous to the client's health.

 CN: Reduction of risk potential; CL: Apply

82. 3. In approximately 2 to 3 days, the client should be able to regain orientation and thus become oriented to time and place. Being able to explain the experience of having delirium is something that the client is expected to achieve later in the course of the illness, but ultimately before discharge. Resuming a normal sleep-wake cycle and establishing normal bowel and bladder function probably will take longer, depending on how long it takes to resolve the underlying condition.

 CN: Psychosocial integrity; CL: Synthesize

83. 1. Identifying oneself and making sure that the nurse has the client's attention address the difficulties with focusing, orientation, and maintaining

attention. Eliminating daytime napping is unrealistic until the cause of the delirium is determined and the client's ability to focus and maintain attention improves. Engaging the client in reminiscing and avoiding arguing are also unrealistic at this time.

CN: Psychosocial integrity; CL: Apply

84. 1,2,4. The abnormal stimuli of the critical care unit can aggravate the symptoms of delirium. Arguing with hallucinations is inappropriate. When a client has illogical thinking, gently presenting reality is appropriate, but orienting the client to his condition is unlikely to be helpful. Dementia is not the likely cause of the client's symptoms. The client is experiencing delirium, not dementia.

CN: Psychosocial integrity; CL: Synthesize

The Client with Dementia

85. 3. That the client is not able to recall the three words is a likely indicator of dementia; the nurse should make a referral for further testing. It is recommended not to repeat the test a second time if the client is not able to recall the words. Although the client repeated rhyming words, echolalia refers to repetition of the same word. It is not necessary to have a family member present when conducting the test, but the nurse should communicate the findings to the family and encourage them to seek follow-up assessment.

CN: Reduction of risk potential; CL: Analyze

86. 1. Impulsive acts of aggression and violence have been linked to dysregulation of the amygdala. The hypothalamus regulates basic human activities such as sleep-rest patterns. The parietal lobe contains the primary somatosensory area. The temporal lobes contain the primary auditory areas.

CN: Management of care; CL: Analyze

87. 3. Based on CAM's assessment tool, the client has an acute onset of behaviors, is inattentive, has disorganized thinking, and is lethargic (decreased level of consciousness). This cluster of behaviors constitutes delirium. Dementia has a slow onset, the client's level of consciousness is usually normal, and the client can focus attention. Clients who are depressed

are alert and oriented and able to focus attention, although they may be easily distracted. Further assessment is needed to determine if the client also is dehydrated.

 CN: Reduction of risk potential; CL: Analyze

88. 2. Memantine and donepezil are commonly given together. Neither medicine will improve dementia, but they may slow the progression. Neither medicine is more effective than the other; they act differently in the brain. Both medicines have a half-life of 60 or more hours.

 CN: Pharmacological and parenteral therapies; CL: Apply

89. 2. Elderly clients with dementia have increased risk for falls due to balance problems, medication use, and decreased eyesight. Haloperidol may cause extrapyramidal side effects, which increase the risk for falls. The client is not agitated, so restraints are not indicated. Lorazepam may increase fall risk and cause paradoxical excitement.

 CN: Reduction of risk potential; CL: Synthesize

90. 3. The tape and television are competing, even conflicting, stimuli. Crime events portrayed on television could be misperceived as a real threat to the client. A low number of clients and the presence of a few staff members quietly working are less intense stimuli for the client and not likely to be disturbing.

 CN: Management of care; CL: Analyze

91. 1. Using a bed alarm enables the staff to respond immediately if the client tries to get out of bed. Sleeping in a chair at the nurse's station interferes with the client's restful sleep and privacy. Using all four bedrails is considered a restraint and unsafe practice. It is not appropriate to expect a family member to stay all night with the client.

 CN: Safety and infection control; CL: Synthesize

92. 2,3,4. A set routine and brief exercises help decrease daytime sleeping. Decreasing caffeine and fluids and promoting relaxation at bedtime promote nighttime sleeping. A strong sleep medicine for an elderly client is contraindicated due to changes in metabolism, increased adverse effects, and

the risk of falls. Using caffeinated beverages may stimulate metabolism but can also have long-lasting adverse effects and may prevent sleep at bedtime.

CN: Management of care; CL: Synthesize

93. 3. Agnosia is the lack of recognition of objects and their purpose. The nurse should inform the client about the fork and what to do with it. Feeding the client does not address the agnosia or give the client specific directions. It should only be attempted if identifying the fork and explaining what to do with it is ineffective. Waiting for the family to care for the client is not appropriate unless identifying the fork and explaining or feeding the client is not successful.

CN: Management of care; CL: Synthesize

94. 2. Clients with chronic cognitive disorders experience defects in memory orientation and intellectual functions, such as judgment and discrimination. Loss of other abilities, such as speech, endurance, and balance, is less typical.

CN: Psychosocial integrity; CL: Analyze

95. 1. Because of the client's short-term memory impairment, the nurse gently corrects the client by stating her name and who she is. This approach decreases anxiety, embarrassment, and shame and maintains the client's self-esteem. Telling the client that she knows who the nurse is or that she forgot can elicit feelings of embarrassment and shame. Saying "I told you already" sounds condescending, as if blaming the client for not remembering.

CN: Psychosocial integrity; CL: Synthesize

96. 2. Vulgar language is common in clients with dementia when they are having trouble communicating about a topic. Ignoring the vulgarity and distracting her is appropriate. Telling the client she is rude or to stop swearing will have no lasting effect and may cause agitation. Just leaving the room is abandonment that the client will not understand.

CN: Psychosocial integrity; CL: Synthesize

97. 2. Highly conditioned motor skills, such as brushing teeth, may be retained by the client who has dementia and motor apraxia. Balancing a

checkbook involves calculations, a complex skill that is lost with severe dementia. Confabulation is fabrication of details to fill a memory gap. This is more common when the client is aware of a memory problem, not when dementia is severe. Finding keys is a memory factor, not a motor function.

CN: Psychosocial integrity; CL: Analyze

98. 3. Competing and excessive stimuli lead to sensory overload and confusion. Therefore, the nurse should first eliminate any distracting stimuli. After this is accomplished, then using touch and rephrasing questions are appropriate. Going for a walk while talking has little benefit on attention and confusion.

CN: Psychosocial integrity; CL: Synthesize

99. 4. Telling the client that she is wrong and then telling her what is right is argumentative and challenging. Arguing with or challenging distortions is least effective because it increases defensiveness. Telling the client about reality indicates awareness of the issues and is appropriate. Acknowledging that misperceptions are part of the disease indicates an understanding of the disease and an awareness of the issues. Turning off the radio helps to limit environmental stimuli and indicates an awareness of the issues.

CN: Psychosocial integrity; CL: Evaluate

The Client with Alzheimer's Disease

100. 1. The son's statements regarding his father's recalling past events is typical for family members of clients in the early stage of Alzheimer's disease, when recent memory is impaired. Telling the son to be more accepting is being critical and not an attempt to educate. Understanding the client's level of anxiety is unrelated to the memory loss of Alzheimer's disease. The client cannot stop reminiscing at will.

CN: Psychosocial integrity; CL: Apply

101. 3. The best rationale for day treatment for the client with Alzheimer's disease is the enhancement of social interactions. More daily structure, excellent staff, and allowing caregivers more time for themselves are all positive aspects, but they are less focused on the client's needs.

 CN: Psychosocial integrity; CL: Apply

102. 4. By fostering independence and providing as much time as possible, the nurse is helping the client to continue to complete as many tasks as possible. Performing activities for the client is counterproductive. A list may cause the client to become frustrated if the list is not completed or if it becomes lost. Informing the client that the **UAP**  will complete activities may be perceived as a threat.

 CN: Basic care and comfort; CL: Apply

103. 2,4,5. Motion and sound detectors, a Medical Alert bracelet, and door alarms and locks are all appropriate interventions for wandering. Sleep medications do not prevent wandering before and after the client is asleep and may have negative effects. Having a relative sit with the client is usually an unrealistic burden.

 CN: Psychosocial integrity; CL: Synthesize

104. 2. Because the client is experiencing difficulty processing and completing complex tasks, the priority is to provide the client with only one step at a time, thereby breaking the task up into simple steps, ones that the client can process. Repeating the directions until the client follows them or demonstrating how to do the task is still too overwhelming to the client because of the multiple steps involved. Although maintaining structure and routine is important, it is unrelated to task completion.

 CN: Psychosocial integrity; CL: Synthesize

105. 3. The therapeutic communication technique of asking the client to describe the forgetfulness seeks clarification and provides the client an opportunity to tell more about the problem. A client who is 75 years of age may take a prolonged time to remember as a result of normal cognitive changes of aging, but telling the client it is normal to forget is diminishing the importance of the comment. Referring to the nurse's self is also diminishing the importance of the client's concern. It is not the nurse's role to indicate that the client does or does not have Alzheimer's disease; the nurse uses communication techniques that obtain sufficient information to determine if a referral is needed.

 CN: Psychosocial integrity; CL: Apply

106. 1. The vulgar or sexual behaviors are commonly expressions of anger or more sensual needs that can be addressed directly. Therefore, the families should be encouraged to ignore the behaviors but attempt to identify their purpose. Then the purpose can be addressed, possibly leading to a decrease in the behaviors. Because of impaired cognitive function, the client is not likely to be able to process the inappropriateness of the behaviors if given feedback. Likewise, anger management strategies would be ineffective because the client would probably be unable to process the inappropriateness of the behaviors. Risperidone may decrease agitation, but it does not improve social behaviors.

 CN: Psychosocial integrity; CL: Apply

107. 4. The statement about expecting that the old Dad would be back conveys a lack of acceptance of the irreversible nature of the disease. The statement about not realizing that the deterioration would be so incapacitating is based in reality. The statement about the Alzheimer's group is based in reality and demonstrates the son's involvement with managing the disease. Stating that reminiscing is important reflects a realistic interpretation on the son's part.

 CN: Psychosocial integrity; CL: Evaluate

108. 1. When compared with other similar medications, donepezil has fewer adverse effects. Donepezil is effective primarily in the early stages of the disease. The drug helps to slow the progression of the disease if started in the early stages. After the client has been diagnosed for 6 years, improvement to the level seen 6 years ago is highly unlikely. Data are not available to support the drug's effectiveness for clients in the terminal phase of the disease.

 CN: Pharmacological and parenteral therapies; CL: Apply

109. 3. Antipsychotics are most effective with agitation and assaultiveness. Antipsychotics have little effect on sleep disturbances, concomitant depression, or confusion and withdrawal.

 CN: Pharmacological and parenteral therapies; CL: Apply

110. 1. Although all of the side effects listed are possible with lorazepam, paradoxical excitement is cause for immediate discontinuation of the medication. (Paradoxical excitement is the opposite reaction to lorazepam than is expected.) The other side effects tend to be minor and usually are transient.

CN: Pharmacology and parental therapies; CL: Apply

111. 4. Change increases stress. Therefore, the most important and relevant suggestion is to maintain consistency in the client's environment, routine, and caregivers. Although rest periods are important, going to bed interferes with the sleep-wake cycle. Rest in a recliner chair is more useful. Testing cognitive functioning and reality orientation are not likely to be successful and may increase stress if memory loss is severe.

CN: Psychosocial integrity; CL: Apply

Managing Care, Quality, and Safety of Clients with Schizophrenia, Other Psychoses, and Cognitive Disorders

112. 4. The neighbor could be harmed as well as the daughter if she should try to stop her father from using the gun, so both should be notified. Any use of firearms against another person requires the involvement of the police. The nurse has a legal/ethical responsibility to warn potential victims and other involved parties as well as law enforcement authorities when one person makes a threat against another person. This duty supersedes confidentiality statutes. Failure to do so and to document it can result in civil penalties. The client's early dementia would likely not prevent him from carrying through his threat.

CN: Management of care; CL: Analyze

113. 4. Benztropine has a common side effect of blurred vision. After evaluating the relative doses of haloperidol and benztropine, the *assessment* would be that the higher dose of benztropine compared to the dose of haloperidol is responsible for the blurred vision. (High doses of haloperidol can cause blurred vision at times.) Reporting that Mr. Roberts has blurred vision is the *situation*. Listing the medications and doses is describing the *background*. The *recommendation* would be a lower dose of benztropine.

 CN: Management of care; CL: Synthesize

114. 2. Nurses are required to document that clients have been given information about their status and rights. Seclusion is not related to people becoming involuntary or certified clients. Including details contained within the certificates, such as a **healthcare provider (HCP)**  signing the certificates, is not required.

 CN: Management of care; CL: Apply

115. 4. The client exhibits aggression against his perceived adversary when he names another client as his adversary. The staff will need to watch him carefully for signs of impending violent behavior that may injure others. Crying about a divorce would be appropriate, not pathologic, behavior demonstrating grief over a loss. A petition to delay bedtime would be a positive, direct action aimed at a bothersome situation. Although declining to attend group therapy needs follow-up, there may be any number of unknown reasons for this action.

 CN: Safety and infection control; CL: Synthesize

116. 2. When caring for a client with cognitive impairment, the priority is to ensure that all objects in the client's path are removed to prevent the client from falling. Additional measures, such as having two people accompany the client when he ambulates, placing his favorite things in safekeeping, and giving medications in a liquid form to be sure he swallows them, are less crucial.

 CN: Safety and infection control; CL: Synthesize

117. 1. The most common reason for the nurse's discomfort with elderly clients is that she has not examined her own fears and conflicts about aging. Until nurses resolve their fears, it is unlikely that they will feel comfortable with elderly clients. A dislike of physical contact with older people, a desire to be surrounded by beauty and youth, and recent experiences with a parent's elderly friends are possible explanations, but not common or likely.

 CN: Management of care; CL: Analyze

Personality Disorders, Substance-Related Disorders, Anxiety Disorders, and Anxiety-Related Disorders

- The Client with a Personality Disorder
- The Client with an Alcohol-Related Disorder
- The Client with Disorders Related to Other Addictive Substances
- The Client with Anxiety Disorders and Anxiety-Related Disorders
- The Client with a Somatoform Disorder
- Managing Care, Quality, and Safety of Clients with Personality Disorders, Substance-Related Disorders, Anxiety Disorders, and Anxiety-Related Disorders
- Answers, Rationales, and Test-Taking Strategies

The Client with a Personality Disorder

1. A client has been diagnosed with avoidant personality disorder. He reports loneliness, but has fears about making friends. He also reports anxiety about being rejected by others. In a long-term treatment plan, in what order, from first to last, should the nurse list her goals for the client? All options must be used.

1. Teach the client anxiety management and social skills.

2. Ask the client to join one of his chosen activities with the nurse and two other clients.

3. Talk with the client about his self-esteem and his fears.

4. Help the client make a list of small group activities at the center he would find interesting.

2. A client diagnosed with borderline personality disorder has self-inflicted cuts on her arms. The nurse is assessing the client for the risk of suicide. What should the nurse ask the client **first**?

- ☐ 1. about medications she has taken recently
- ☐ 2. if she is taking antidepressants
- ☐ 3. if she has a suicide plan
- ☐ 4. why she cut herself

3. When developing the plan of care for a client diagnosed with a personality disorder, the nurse plans to assist the client **primarily** with what factor?

- ☐ 1. specific dysfunctional behaviors
- ☐ 2. psychopharmacologic compliance
- ☐ 3. examination of developmental conflicts
- ☐ 4. manipulation of the environment

4. A client diagnosed with paranoid personality disorder is hospitalized for physically threatening his wife because he suspects her of having an affair with a coworker. What approach should the nurse employ with this client?

- ☐ 1. authoritarian
- ☐ 2. parental
- ☐ 3. matter of fact
- ☐ 4. controlling

5. When planning care for a client diagnosed with schizotypal personality disorder, which intervention helps the client become involved with others?

- ☐ 1. participating solely in group activities
- ☐ 2. being involved with primarily one-to-one activities
- ☐ 3. leading a sing-along in the afternoon
- ☐ 4. attending an activity with the nurse

6. A client is complaining to other clients about not being allowed by staff to keep food in her room. The nurse should:

- ☐ 1. ignore the client's behavior.
- ☐ 2. set limits on the behavior.
- ☐ 3. reprimand the client.
- ☐ 4. allow the snack to be kept in her room.

7. A client with a diagnosis of antisocial personality disorder has a potential for violence and aggressive behavior. Which short-term client outcome is **most** appropriate for the nurse to include in the plan of care?

- ☐ 1. Use humor when expressing anger.
- ☐ 2. Discuss feelings of anger with staff.
- ☐ 3. Ask the nurse for medication when upset.
- ☐ 4. Use indirect behaviors to express anger.

8. A new client on the psychiatric unit has been diagnosed with depression and obsessive-compulsive personality disorder (OCPD). During visiting hours, her husband states to the nurse that he does not understand this OCPD and what can be done about it. What information should the nurse share with the client and her husband? Select all that apply.

- ☐ 1. Perfectionism and overemphasis on tasks usually interfere with friendships and leisure time.
- ☐ 2. It will help to interrupt her tasks and tell her you are going out for the evening.
- ☐ 3. There are medicines, such as clomipramine or fluoxetine, that may help.
- ☐ 4. Remind your wife that it is "OK" to be human and make mistakes.
- ☐ 5. Reinforce with her that she is not allowed to expect the whole family to

be perfect too.

☐ 6. This disorder typically involves inflexibility and a need to be in control.

9. A client diagnosed with paranoid personality disorder is being admitted on an involuntary 24-hour hold after a physical altercation with a police officer who was investigating the client's threatening phone calls to his neighbors. He states that his neighbors are spying on him for the government, saying, "I want them to stop and leave me alone. Now they have you nurses and doctors involved in their conspiracy." Which nursing approaches are **most** appropriate? Select all that apply.

☐ 1. Approach the client in a professional, matter-of-fact manner.

☐ 2. Avoid intrusive interactions with the client.

☐ 3. Gently present reality to counteract the client's current paranoid beliefs.

☐ 4. Develop trust consistently with the client.

☐ 5. Do not pressure the client to attend any groups.

10. A 28-year-old client with a diagnosis of major depression and dependent personality disorder has been living at home with very supportive parents. The client is thinking about independent living on the recommendation of the treatment team. The client states to the nurse, "I do not know if I can make it in an apartment without my parents." The nurse should respond by saying to the client:

☐ 1. "You are a 28-year-old adult now, not a child who needs to be cared for."

☐ 2. "Your parents will not be around forever. After all, they are getting older."

☐ 3. "Your parents need a break, and you need a break from them."

☐ 4. "Your parents have been supportive and will continue to be even if you live apart."

11. A client moves in with her family after her boyfriend of 4 weeks told her to leave. She is admitted to the subacute unit after reporting feeling empty and lonely, being unable to sleep, and eating very little for the last week. Her arms are scarred from frequent self-mutilation. What should the nurse do in order of priority from first to last? All options must be used.

1. Monitor for suicide and self-mutilation.

2. Discuss the issues of loneliness and emptiness.

3. Monitor sleeping and eating behaviors.

4. Discuss her housing options for after discharge.

12. The client approaches various staff with numerous requests and needs to the point of disrupting the staff's work with other clients. The nurse meets with the staff to decide on a consistent, therapeutic approach for this client. Which approach will be **most** effective?

- ☐ 1. telling the client to stay in his room until staff approach him
- ☐ 2. limiting the client to the dayroom and dining area
- ☐ 3. giving the client a list of permissible requests
- ☐ 4. having the client discuss needs with the staff person assigned

13. The client with diagnosed borderline personality disorder tells the nurse, "You are the best nurse here. I can talk to you and you listen. You are the only one here that can help me." Which response by the nurse is **most** therapeutic?

- ☐ 1. "Thank you; you are a good person."
- ☐ 2. "All of the nurses here provide good care."
- ☐ 3. "Other clients have told me that too."
- ☐ 4. "Mary and Sam are good nurses too."

14. The nurse assesses a client to be at risk for self-mutilation and implements a safety contract with the client. Which client behavior indicates that the contract is working?

- ☐ 1. The client withdraws to his room when feeling overwhelmed.
- ☐ 2. The client notifies staff when anxiety is increasing.
- ☐ 3. The client suppresses his feelings when angry.
- ☐ 4. The client displaces his feelings onto the healthcare provider (HCP).

15. The client diagnosed with borderline personality disorder who is to be discharged soon threatens to “do something” to herself if discharged. The nurse should **first**:

- ☐ 1. request that the client’s discharge be canceled.
- ☐ 2. ignore the client’s statement because it is a sign of manipulation.
- ☐ 3. ask a family member to stay with the client at home temporarily.
- ☐ 4. discuss the meaning of the client’s statement with her.

16. A 19-year-old client is admitted to a psychiatric unit with a diagnosis of alcohol abuse and personality disorder. The client’s mother states, “He is always in trouble, just like when he was a boy. Now he is just a bigger prankster and out of control.” In view of the client’s history, which intervention is **most** important initially?

- ☐ 1. letting the client know the staff has the authority to subdue him if he gets unruly
- ☐ 2. keeping the client isolated from other clients until he is better known by the staff
- ☐ 3. emphasizing to the client that he will have to pay for any damage he causes
- ☐ 4. closely observing the client’s behavior to establish a baseline pattern of functioning

17. The client tells the nurse at the outpatient clinic that she does not need to attend groups because she is “not a regular like these other people here.” The nurse should respond to the client by saying:

- ☐ 1. “Because you are not a regular client, sit in the hall when the others are in group.”

- ☐ 2. “Your family wants you to attend, and they will be very disappointed if you do not.”
- ☐ 3. “I will have to mark you absent from the clinic today and speak to the healthcare provider (HCP) about it.”
- ☐ 4. “You say you are not a regular here, but you are experiencing what others are experiencing.”

18. The client who has a history of angry outbursts when frustrated begins to curse at the nurse during an appointment after being informed that she will have to wait to have her medication refilled. Which response by the nurse is **most** appropriate?

- ☐ 1. “You are being very childish.”
- ☐ 2. “I am sorry if you cannot wait.”
- ☐ 3. “I will not continue to talk with you if you curse.”
- ☐ 4. “Come back tomorrow and your medication will be ready.”

19. Which behavior indicates to the nurse that the client diagnosed with avoidant personality disorder is improving?

- ☐ 1. interacting with two other clients
- ☐ 2. listening to music with headphones
- ☐ 3. sitting at a table and painting
- ☐ 4. talking on the telephone

20. One evening, the client takes the nurse aside and whispers, “Do not tell anybody, but I am going to call in a bomb threat to this hospital tonight.” Which action is the **priority**?

- ☐ 1. warning the client that his telephone privileges will be taken away if he abuses them
- ☐ 2. offering to disregard the client’s plan if he does not go through with it
- ☐ 3. notifying the proper authorities after saying nothing until the client has actually completed the call
- ☐ 4. explaining to the client that this information will have to be shared immediately with the staff and the healthcare provider (HCP)

21. When teaching an unlicensed assistive personnel (UAP) new to the unit about the principles for the care of a client diagnosed with a personality

disorder, the nurse should explain that:

- ☐ 1. the clients are accepted, although their behavior may not be.
- ☐ 2. the clients need limits on their behavior.
- ☐ 3. the staff members are the primary ones left to care about these clients.
- ☐ 4. the staff should use minimal humor when working with these clients.

22. The nurse is talking with a client who has been diagnosed with antisocial personality disorder about how to socialize during activities without being seductive. The nurse should focus the discussion on which area?

- ☐ 1. explaining the negative reactions of others toward his behavior
- ☐ 2. suggesting he apologize to others for his behavior
- ☐ 3. asking him to explain the reasons for his seductive behavior
- ☐ 4. discussing his relationship with his mother

23. Which approach is **most** appropriate to use with a client diagnosed with a narcissistic personality disorder when discrepancies exist between what the client states and what actually exists?

- ☐ 1. limit setting
- ☐ 2. supportive confrontation
- ☐ 3. consistency
- ☐ 4. rationalization

24. The client with histrionic personality disorder is melodramatic and responds to others and situations in an exaggerated manner. The nurse should recommend which activity for this client?

- ☐ 1. party planning
- ☐ 2. music group
- ☐ 3. cooking class
- ☐ 4. role-playing

The Client with an Alcohol-Related Disorder

25. A client has been diagnosed with dementia related to chronic and heavy alcohol consumption. In a family meeting with the client, discharge plans are being discussed. Which points should the nurse share with the

family and client? Select all that apply.

- ☐ 1. Even after all alcohol has been removed from the home, clients frequently find ways to get more.
- ☐ 2. Without continued alcohol intake, the client will gradually get better.
- ☐ 3. With the memory loss, answer the client's question once, and then ignore that question when asked again.
- ☐ 4. Safety alarms on the doors will help to keep the client from wandering off.
- ☐ 5. As the need for supervision increases, it may be necessary for the client to be placed in an extended care facility.

26. In an outpatient addiction group, a recovering client said that before her treatment, her husband drank on social occasions. "Now he drinks at home, from the time he comes home from work and drinks until he goes to bed. He says that he does not like me anymore and that I expect him to do more work on the house and yard. I use to ignore that stuff. I do not know what to do." In which order of priority from first to last would the nurse make the comments? All options must be used.

27. For the client who has difficulty falling asleep at night because of withdrawal symptoms from alcohol, which are abating, which nursing intervention is likely to be **most** effective?

- ☐ 1. inviting the client to play a board game with the nurse
- ☐ 2. allowing the client to sit in the community room until the client feels sleepy
- ☐ 3. advising the client to take multiple short naps during the day until symptoms improve
- ☐ 4. teaching the client relaxation exercises to use before bedtime

28. Which symptoms are expected indications that a client has alcohol withdrawal delirium? Select all that apply.

- ☐ 1. tachycardia
- ☐ 2. tachypnea
- ☐ 3. dry, flushed skin
- ☐ 4. thirst

- ☐ 5. hypertension
- ☐ 6. abdominal cramping

29. A client known to have alcohol dependence is admitted to the emergency department with a temperature of 99°F (37.2°C), a pulse of 110 beats/min, respirations of 26 breaths/min, and blood pressure of 150/98 mm Hg. The blood alcohol level is 0.25%. Now, the client is becoming belligerent and uncooperative. In which order, from first to last, should the nursing and medical prescriptions be implemented? All options must be used.

1. “What do you think you could do to have your husband come in for an evaluation?”

2. “I hear how confused and frustrated you are.”

3. “It can happen that as one person sobers up, the spouse deteriorates.”

4. “What have you tried to do about your husband’s behaviors?”

30. A client has been admitted to the emergency department with alcohol withdrawal delirium. The nurse is assessing the client for signs of withdrawal. At 0900 hours on 10/25, the nurse notes that the client is confused. Vital signs are T = 99°F (37.2°C), P = 50, R = 10, and BP = 100/60. The nurse compares these findings to the nurses’ progress notes from admission 24 hours ago (see exhibit). What should the nurse do **first**?

- ☐ 1. Contact the healthcare provider (HCP).

- ☐ 2. Increase the rate of the IV infusion.
- ☐ 3. Attempt to arouse the client.
- ☐ 4. Administer magnesium sulfate.

1. Administer lorazepam 2 mg IM.

2. Draw blood for a magnesium level.

3. Take vital signs every 15 minutes.

4. Place the client in a quiet room with dimmed lights.

31. An intoxicated client is admitted to the hospital for alcohol withdrawal. What should the nurse do to help the client become sober?

- ☐ 1. Give the client black coffee to drink.
- ☐ 2. Walk the client around the unit.
- ☐ 3. Have the client take a cold shower.
- ☐ 4. Provide the client with a quiet room to sleep in.

32. The client is admitted to the hospital for alcohol detoxification. Which interventions should the nurse use? Select all that apply.

- ☐ 1. taking vital signs
- ☐ 2. monitoring intake and output
- ☐ 3. placing the client in restraints as a safety measure
- ☐ 4. reinforcing reality if the client is disoriented or hallucinating

- ☐ 5. explaining to the client that the symptoms of withdrawal are temporary

33. The nurse is assessing a client who has fallen twice in the last 2 days. The client has been diagnosed with delirium tremens (DTs) following withdrawal from alcohol use. The nurse should further evaluate the client for which complications? Select all that apply.

- ☐ 1. disorientation
- ☐ 2. paralysis
- ☐ 3. elevated temperature
- ☐ 4. diaphoresis
- ☐ 5. visual or auditory hallucinations

34. A client was discharged from an alcohol rehabilitation program on clonazepam 0.5 mg three times a day. Several months later, he reports having insomnia, shakiness, sweating, and one seizure. The nurse should **first** ask the client if he:

- ☐ 1. has been drinking alcohol with the clonazepam.
- ☐ 2. has developed tolerance to the clonazepam and needs to increase the dose.
- ☐ 3. has stopped taking the clonazepam suddenly.
- ☐ 4. has increased his clonazepam without consulting his healthcare provider (HCP).

35. A client is entering the chemical dependency unit for treatment of alcohol dependency. Which of the client's possessions should the nurse place in a locked area?

- ☐ 1. toothpaste
- ☐ 2. dental floss
- ☐ 3. shaving cream
- ☐ 4. antiseptic mouthwash

36. A client is entering rehabilitation for alcohol dependency as an alternative to going to jail for multiple DUIs (driving under the influence). While obtaining the client's history, the nurse asks about the amount of alcohol he consumes daily. He responds, "I just have a few drinks with the guys after work." Which response by the nurse is **most** therapeutic?

- ☐ 1. "That is what all the clients here say at first."
- ☐ 2. "Then you should have had a designated driver for yourself."
- ☐ 3. "I guess you just cannot handle a few drinks."
- ☐ 4. "You say you have a few drinks, but you have multiple arrests."

37. While admitting a client to the alcohol treatment program, the nurse asks the client how long she has been drinking, how much she has been drinking, and when she had her last drink. The client replies that she has been drinking about a liter of vodka a day for the past week and her last drink was about an hour ago. This information helps the nurse to determine which factor?

- ☐ 1. the severity of the disease
- ☐ 2. the severity of withdrawal symptoms
- ☐ 3. the possibility of alcoholic hallucinosis
- ☐ 4. the occurrence of delirium tremens

38. A client who is experiencing alcohol withdrawal exhibits tremors, diaphoresis, and hyperactivity. Blood pressure is 190/87 mm Hg and pulse is 92 bpm. Which medication should the nurse expect to administer?

- ☐ 1. haloperidol
- ☐ 2. lorazepam
- ☐ 3. benztropine
- ☐ 4. naloxone

39. Which assessment provides the **best** information about the client's physiologic response and the effectiveness of the medication prescribed specifically for alcohol withdrawal?

- ☐ 1. nutritional status
- ☐ 2. evidence of tremors
- ☐ 3. vital signs
- ☐ 4. sleep pattern

40. A client who had been drinking heavily over the weekend could not remember specific events of where he had been or what he had done. The nurse interprets this information as indicating that the client experienced which condition?

- ☐ 1. blackout
- ☐ 2. hangover
- ☐ 3. tolerance
- ☐ 4. delirium tremens

41. A client is entering the alcohol treatment program for the fourth time in 5 years. Which statement by the nurse will be **most** helpful to the client?

- ☐ 1. "I hope you are serious about maintaining your sobriety this time."
- ☐ 2. "I am Maria, a nurse here. I do not know you from past attempts, but you will get it right this time."
- ☐ 3. "I know someone who was successful after the fifth program."
- ☐ 4. "I am Maria, a nurse in the program. The staff and I will help you through the program."

42. The wife of a client with alcohol dependency tells the nurse, "I am tired of making excuses for him to his boss and coworkers when he cannot make it into work. I believe him every time he says he is going to quit." The nurse recognizes the wife's statement as indicating which behavior?

- ☐ 1. helpfulness
- ☐ 2. self-defeat
- ☐ 3. enabling
- ☐ 4. masochism

43. Which statement by the nurse participating in a group confrontation of a coworker is **most** helpful in reducing the coworker's denial about alcohol being a problem?

- ☐ 1. "Your behavior is unprofessional."
- ☐ 2. "As a nurse, you should have sought help earlier."
- ☐ 3. "Nurses are the worst when it comes to asking for help."
- ☐ 4. "You have alcohol on your breath."

44. A nurse working in an alcohol rehabilitation program is teaching staff how to give clients constructive feedback. Which statement given as an example illustrates that the staff member understands the nurse's teaching regarding the use of constructive feedback?

- ☐ 1. "I think you are a real con artist."

- ☐ 2. "You are dominating the conversation."
- ☐ 3. "You interrupted Terry twice in 4 minutes."
- ☐ 4. "You do not give anyone a chance to finish talking."

45. A client ashamedly tells the nurse that he hit his wife while intoxicated and asks the nurse if his wife will ever forgive him. The nurse should reply to the client by saying:

- ☐ 1. "Perhaps you could ask her and find out."
- ☐ 2. "That is something you can explore in family therapy."
- ☐ 3. "It would depend on how much she really cares for you."
- ☐ 4. "You seem to have some feelings about hitting your wife."

46. While meeting with the nurse, a client's wife states, "I do not know what else to do to make him stop drinking." The nurse should refer the wife to which organization?

- ☐ 1. Alateen
- ☐ 2. Al-Anon
- ☐ 3. employee assistance program
- ☐ 4. Alcoholics Anonymous

47. Which nursing action is contraindicated for the client who is experiencing severe symptoms of alcohol withdrawal?

- ☐ 1. helping the client walk
- ☐ 2. monitoring intake and output
- ☐ 3. assessing vital signs
- ☐ 4. using short, concrete statements

48. Which client statement indicates to the nurse that the client needs further teaching about disulfiram?

- ☐ 1. "I can drink one or two beers and not get sick while on disulfiram."
- ☐ 2. "I can take disulfiram at bedtime if it makes me sleepy."
- ☐ 3. "A metallic or garlic taste in my mouth is normal when starting on disulfiram."
- ☐ 4. "I will read the labels on cough syrup and mouthwash for possible alcohol content."

49. While receiving disulfiram therapy, the client becomes nauseated and vomits severely. Which question should the nurse ask **first**?

- ☐ 1. "How long have you been taking disulfiram?"
- ☐ 2. "Do you feel like you have the flu?"
- ☐ 3. "How much alcohol did you drink today?"
- ☐ 4. "Have you eaten any foods cooked in wine?"

50. The expected outcome for using thiamine for a client being treated for an alcohol addiction is to:

- ☐ 1. prevent the development of Wernicke's encephalopathy.
- ☐ 2. decrease client's withdrawal symptoms.
- ☐ 3. aid the client in regaining strength sooner.
- ☐ 4. promote elimination of alcohol from the body faster.

51. Which client statement indicates an understanding of the risk of alcohol relapse?

- ☐ 1. "I know I can stay dry if my wife keeps alcohol out of the house."
- ☐ 2. "Stopping Alcoholics Anonymous (AA) and not expressing feelings can lead to relapse."
- ☐ 3. "I will have my sponsor at AA keep the list of symptoms for me."
- ☐ 4. "If someone tells me I am about to relapse, I will be sure to do something about it."

52. The client sees no connection between her liver disorder and her alcohol intake. She believes that she drinks very little and that her family is making something out of nothing. The nurse interprets these behaviors as indicative of the client's use of which defense mechanisms?

- ☐ 1. denial
- ☐ 2. displacement
- ☐ 3. rationalization
- ☐ 4. reaction formation

53. Which food should the nurse eliminate from the diet of a client in alcohol withdrawal?

- ☐ 1. milk

- ☐ 2. regular coffee
- ☐ 3. orange juice
- ☐ 4. eggs

54. A client with alcohol dependency has peripheral neuropathy. The nurse should develop a teaching plan that emphasizes:

- ☐ 1. washing and drying the feet daily.
- ☐ 2. massaging the feet with lotion.
- ☐ 3. trimming the toenails carefully.
- ☐ 4. avoiding use of an electric blanket.

55. A client is experiencing alcohol withdrawal. He wakes up and screams “There is something crawling under my skin. Help me.” What should the nurse do in order of priority from first to last? All options must be used.

1. Remind the client that he is having withdrawal symptoms and that these will be treated.

2. Administer a dose of lorazepam depending on the severity of the withdrawal symptoms.

3. Assess the client for other withdrawal symptoms.

4. Take the client’s vital signs.

5. Chart the details of the episode in the medical record.

56. Which measure should the nurse include in the plan of care for a client with alcohol withdrawal delirium?

- ☐ 1. using restraints continuously
- ☐ 2. touching the client before saying anything
- ☐ 3. remaining with the client when she is confused or disoriented
- ☐ 4. informing the client about alcohol treatment programs

57. What is an accurate response when a client asks the nurse about requirements to become a member of Alcoholics Anonymous (AA)?

- ☐ 1. "You must be sober for at least a month before joining."
- ☐ 2. "AA is open to anyone who wants sobriety."
- ☐ 3. "The members will interview you and decide if you can join the group."
- ☐ 4. "AA requires daily attendance at meetings."

58. A client is to be discharged from an alcohol rehabilitation program. What should the nurse emphasize in the discharge plan as a **priority**?

- ☐ 1. supportive friends
- ☐ 2. a list of goals
- ☐ 3. returning to work
- ☐ 4. follow-up care

59. The client is to be discharged from the hospital after a safe, medically supervised withdrawal from alcohol. Which outcomes indicate client readiness for an outpatient alcohol treatment program? Select all that apply.

- ☐ 1. The client states the need to cut down on his alcohol intake.
- ☐ 2. The client verbalizes the damaging effects of alcohol on his body.
- ☐ 3. The client plans to attend Alcoholics Anonymous meetings.
- ☐ 4. The client takes naltrexone daily.
- ☐ 5. The client says he is indestructible.

60. A client diagnosed with major depression and substance dependence is being admitted to the concurrent disorder treatment unit. In explaining the

focus of this program, the nurse should tell what information to the client?

- ☐ 1. The addiction will be treated first, then the depression.
- ☐ 2. The depression will be treated first, then the addiction.
- ☐ 3. There will be simultaneous treatment of the addiction and depression.
- ☐ 4. As the addiction is treated, the depression will clear up on its own.

61. While caring for a client who has a bipolar disorder and alcohol dependency, which area is the **priority** for daily assessment?

- ☐ 1. sleep pattern
- ☐ 2. mental status
- ☐ 3. eating habits
- ☐ 4. self-care ability

62. The nurse is caring for a client admitted to the emergency department after being found lying on the bathroom floor with several empty pill bottles around her. While waiting for a psychiatric consult, the nurse discovers that the client's boyfriend has recently broken up with her. Which response is **most** likely to build and maintain a therapeutic relationship within the emergency department?

- ☐ 1. "You will have other boyfriends."
- ☐ 2. "I know that this hurts."
- ☐ 3. "Why did you try to kill yourself?"
- ☐ 4. "What can I do to help while you are here?"

The Client with Disorders Related to Other Addictive Substances

63. A client is being admitted to the hospital following an inadvertent overdose with oxycodone. He reveals that he has chronic back pain that resulted from an injury on a construction site. He states, "I know I took too much oxycodone at once, but I cannot live with this pain without them. You cannot take them away from me." Which response by the nurse is **most** appropriate?

- ☐ 1. "Once you are tapered off the oxycodone, you will find that nonaddictive pain medicines will be enough to control your pain."

- ☐ 2. “You are going to be switched from the oxycodone to methadone for long-term pain management.
- ☐ 3. “The oxycodone will be stopped tomorrow, but you will have lorazepam to help you with the withdrawal symptoms.”
- ☐ 4. “Your pain will be controlled by tapering doses of oxycodone, with other pain management strategies and medicines.”

64. A school nurse is planning a program for parents on “Drugs Commonly Abused by Teenagers.” Which information should be included about inhalants? Select all that apply.

- ☐ 1. Monitor for paper bags and rags that may have been used for breathing inhalants.
- ☐ 2. Brain damage is unlikely with the use of inhalants.
- ☐ 3. Use of inhalants by teens is on the decline.
- ☐ 4. Deaths from inhalants occur from asphyxiation, suffocation, and aspiration of vomit.
- ☐ 5. Inhalants usually cause depression of the central nervous system.
- ☐ 6. The basic groups of inhalants are hydrocarbon solvents such as glue, aerosol propellants from spray cans, and anesthetics/gases.

65. The friend of a client brought to the emergency department states, “I guess she had some bad junk (heroin) today.” The client is drowsy and verbally nonresponsive. Which finding is of **immediate** concern to the nurse?

- ☐ 1. respiratory rate of 9 breaths/min
- ☐ 2. urinary retention
- ☐ 3. hypotension
- ☐ 4. reduced pupil size

66. A client is brought to the emergency department by a friend who states, “He was using a lot of heroin until he ran out of money about 2 days ago.” The nurse judges the client to be in opioid withdrawal if he exhibits which sign or symptom? Select all that apply.

- ☐ 1. rhinorrhea
- ☐ 2. diaphoresis
- ☐ 3. piloerection

- ☐ 4. synesthesia
- ☐ 5. formication

67. An unconscious client in the emergency department is given IV naloxone due to an overdose of heroin. Which findings would indicate a therapeutic response to the naloxone? Select all that apply.

- ☐ 1. decreased pulse rate
- ☐ 2. warm moist skin
- ☐ 3. dilated pupils
- ☐ 4. increased respirations
- ☐ 5. consciousness

68. Which findings should the nurse expect to assess for a client who is exhibiting late signs of heroin withdrawal?

- ☐ 1. vomiting and diarrhea
- ☐ 2. yawning and diaphoresis
- ☐ 3. lacrimation and rhinorrhea
- ☐ 4. restlessness and irritability

69. After administering naloxone, an opioid antagonist, the nurse should monitor the client carefully for which problem?

- ☐ 1. cerebral edema
- ☐ 2. kidney failure
- ☐ 3. seizure activity
- ☐ 4. respiratory depression

70. When teaching a client who is to receive methadone therapy for opioid addiction, the nurse should instruct the client that methadone is useful primarily for what reason?

- ☐ 1. It is not an addictive substance.
- ☐ 2. A maintenance dose is taken twice a day.
- ☐ 3. The client will no longer be addicted to opioids.
- ☐ 4. The client may work and live normally.

71. A client states to the nurse, "I am not going anymore to Narcotics Anonymous meetings. I felt out of place there." Which response by the nurse

is **best**?

- ☐ 1. "Try attending a meeting at a different location; you may feel more comfortable there."
- ☐ 2. "Maybe it just was not a good day for you. Everybody has bad days now and then."
- ☐ 3. "Perhaps you were not paying close enough attention to what they were saying."
- ☐ 4. "Sometimes the meetings can seem like a waste of time, but you need to attend to stay clean."

72. Which outcome should the nurse use as the **best** measure to determine a client's progress in rehabilitation?

- ☐ 1. The kinds of friends he makes.
- ☐ 2. The number of drug-free days he has.
- ☐ 3. The way he gets along with his parents.
- ☐ 4. The amount of responsibility his job entails.

73. Which finding would lead the nurse to suspect that a client is addicted to heroin?

- ☐ 1. hilarity
- ☐ 2. aggression
- ☐ 3. labile mood
- ☐ 4. hypoactivity

74. A client brought by ambulance to the emergency department after taking an overdose of barbiturates is comatose. The nurse should assess the client for:

- ☐ 1. kidney failure.
- ☐ 2. cerebrovascular accident.
- ☐ 3. status epilepticus.
- ☐ 4. respiratory failure.

75. The client's spouse reports that the client has been taking about eight "reds" or 800 mg of secobarbital daily, besides drinking more alcohol than usual. The spouse asks anxiously, "Do you think she will live?" Which response by the nurse is **most** appropriate?

- ☐ 1. "We can only wait and see. It is too soon to tell."
- ☐ 2. "This must be quite a shock. How long have you been married?"
- ☐ 3. "She is very ill and may not live. Some do not pull through."
- ☐ 4. "Her condition is serious. You sound very worried about her."

76. Before his hospitalization, a client needed increasingly larger doses of barbiturates to achieve the same euphoric effect he initially realized from their use. From this information, the nurse develops a plan of care that takes into account that the client is likely suffering from what problem?

- ☐ 1. tolerance
- ☐ 2. addiction
- ☐ 3. abuse
- ☐ 4. dependence

77. Which statement by the nurse is **most** appropriate when addressing a client with a barbiturate overdose who awakens in a confused state and exhibits stable vital signs?

- ☐ 1. "I am here to help you beat your drug habit. But it is you who will need to work hard."
- ☐ 2. "It is time to get straight and stay clean and put an end to your torture."
- ☐ 3. "I am glad you pulled through; it was touch and go with you for a while."
- ☐ 4. "You are in the hospital because of a drug problem; I am one of the nurses who will help you."

78. A client states that her "life has gone down the tubes" since her divorce 6 months ago. Then, after she lost her job and apartment, she took an overdose of barbiturates so she "could go to sleep and never wake up." Which statement by the nurse should be made **first**?

- ☐ 1. "It seems as if your self-esteem has been affected by all your losses."
- ☐ 2. "I know you took an overdose of barbiturates. Are you thinking of suicide now?"
- ☐ 3. "Helplessness is common after losing a job. Are you having trouble making decisions?"
- ☐ 4. "You sound hopeless about the future since your divorce."

79. A client who has experienced the loss of her husband through divorce, the loss of her job and apartment, and the development of drug dependency is suffering situational low self-esteem. Which outcome is **most** appropriate initially?

- ☐ 1. The client will discuss her feelings related to her losses.
- ☐ 2. The client will identify two positive qualities.
- ☐ 3. The client will explore her strengths.
- ☐ 4. The client will prioritize problems.

80. The nurse notices that a client recovering from a barbiturate overdose spends most of his time with other young adults who have substance-related problems. This group of clients is a dominant force on the unit, keeping the nondrug users entertained with stories of their “highs.” Which method is **best** to use when dealing with this problem?

- ☐ 1. providing additional recreation
- ☐ 2. breaking up drug-oriented discussions
- ☐ 3. speaking with the clients individually about their behavior
- ☐ 4. discussing the behavior at the daily community meeting

81. A client recovering from a drug overdose is interacting with the nurse and recounting her exploits at numerous parties she has attended. Which action is **most** therapeutic?

- ☐ 1. allowing the client to continue with her stories
- ☐ 2. telling the client you’ve heard the stories before
- ☐ 3. questioning the client further about her exploits
- ☐ 4. directing the conversation to realistic concerns

82. The nurse is speaking to a sixth grade class about drugs. A student states, “I know someone who smokes marijuana, and he says it is safe.” The nurse should tell the student:

- ☐ 1. “Marijuana is not safe, and it is illegal in many places.”
- ☐ 2. “Do you really believe him?”
- ☐ 3. “That drug impairs short-term memory and judgment and distorts perception.”
- ☐ 4. “Marijuana usage can lead to using other chemicals.”

83. When developing a teaching plan for a group of middle school children about the drug 3,4-methylenedioxymethamphetamine (Ecstasy), what information should the nurse expect to include? Select all that apply.

- ☐ 1. Using Ecstasy is similar to using speed.
- ☐ 2. Ecstasy is used at all-night parties.
- ☐ 3. Teeth grinding is seen with cocaine, not Ecstasy use.
- ☐ 4. It can cause death.
- ☐ 5. It reduces self-consciousness.

84. A young client is being admitted to the psychiatric unit after her obstetrician's staff suspected she was experiencing a postpartum psychosis. Her husband said she was doing fine for 2 weeks after the birth of the baby, except for pain from the C-section and trouble sleeping. These symptoms subsided over the next 4 weeks. Three days ago, however, the client started having anxiety, irritability, vomiting, diarrhea, and delirium, resulting in her inability to care for the baby. The husband says, "I saw that my bottles of alprazolam and oxycodone were empty even though I have not been taking them." What should the nurse do in order of priority from first to last? All options must be used.

1. Call the healthcare provider (HCP) for prescriptions for appropriate treatment for opiate and benzodiazepine withdrawal.

2. Immediately place the client on withdrawal precautions.

3. Confirm with the client that she has in fact been using her husband's medications.

4. Assess the client for prior and current use of any other substances.

85. A 68-year-old client is admitted to the addiction unit after treatment in the emergency department for an overdose of oxycodone. Her son calls the unit and expresses intense anger that his mother is being treated as a “common street addict.” He says she has severe back pain and was given that prescription by her healthcare provider (HCP). “She just accidentally took a few too many pills last night.” Which reply by the nurse is **most** therapeutic?

- ☐ 1. “I understand that your mother may not have intentionally taken too many pills. This medication can cause one to forget how many have been taken.”
- ☐ 2. “It may be appropriate for your mother to be referred to a pain management program.”
- ☐ 3. “Unfortunately, it is fairly common for clients with pain to increase their use of pain pills over time.”
- ☐ 4. “I can hear how upset you are. You sound very concerned about your mother.”

86. A client is being admitted to the addiction unit for a confirmed and long-term addiction to alprazolam. She continues to strongly deny her addiction, stating she was prescribed the alprazolam to control her “panic attacks.” Which procedures would be the **most** important during the admission process? Select all that apply.

- ☐ 1. Assess the client for suicide, escape, and aggression risks.
- ☐ 2. With the client present, search the client’s clothes and belongings for contraband and restricted items.
- ☐ 3. Initiate withdrawal precautions.
- ☐ 4. Explain the unit routine and types of groups.
- ☐ 5. Obtain a urine specimen for a urine drug screen.

87. A client is returning to the healthcare provider’s (HCP’s) office for follow-up on his diagnosis of coronary artery disease. After all the appropriate exams and assessments are completed, the nurse asks the client about how well he is sleeping. The client states, “Oh, that is not a problem

anymore. I take a couple of my wife's diazepam and sleep like a baby.” Which information should the nurse obtain? Select all that apply.

- ☐ 1. the reason the client's wife is taking diazepam
- ☐ 2. the dose of the diazepam he is taking and how long he has been taking it
- ☐ 3. exactly how much diazepam he takes at night and during the day
- ☐ 4. whether he intends to stop the diazepam use
- ☐ 5. what was interfering with his sleep prior to starting the diazepam

88. A client is admitted to the emergency department having just used cocaine. The nurse should assess this client for which factors? Select all that apply.

- ☐ 1. mood swings
- ☐ 2. feeling of euphoria
- ☐ 3. constricted pupils
- ☐ 4. increased blood pressure
- ☐ 5. tachycardia

89. A client who chronically snorts cocaine is brought to the emergency department due to a cocaine overdose. The client is experiencing delusions, hallucinations, mild respiratory distress, and mild tachycardia initially. What should the nurse do? Select all that apply.

- ☐ 1. induce vomiting
- ☐ 2. place seizure pads on the bed
- ☐ 3. administer PRN haloperidol as prescribed
- ☐ 4. monitor for respiratory acidosis
- ☐ 5. encourage deep breathing
- ☐ 6. monitor for metabolic acidosis

90. A client walks into the clinic and tells the nurse she has run out of money for crack, has crashed, and wants something to help her feel better. Which factor is **most** important for the nurse to assess?

- ☐ 1. suspiciousness
- ☐ 2. loss of appetite
- ☐ 3. drug craving

☐ 4. suicidal ideation

91. A client in the emergency department is diagnosed as having amphetamine psychosis. What should the nurse do in order of priority from first to last? All options must be used.

1. Transfer the client to the psychiatric unit.

2. Monitor cardiac and respiratory status.

3. Place seizure pads on the bed.

4. Administer IM haloperidol as prescribed.

92. A client has been taking increased amounts of alprazolam for about 6 months for anxiety. She asks the nurse how she can “get off the alprazolam.” What is the nurse’s **best** response?

☐ 1. “There will be an immediate discontinuation of the alprazolam, and haloperidol will be available if needed.”

☐ 2. “Instead of alprazolam, you will take lorazepam in decreasing doses and frequency over a period of 3 to 4 days.”

☐ 3. “The alprazolam will be tapered down over a period of 48 hours.”

☐ 4. “Alprazolam will be available on an as-needed basis for 4 to 5 days.”

93. The client is fidgeting and has trouble sitting still. He has difficulty concentrating and is tangential. Which intervention should help decrease this

client's level of anxiety? Select all that apply.

- ☐ 1. refocusing attention
- ☐ 2. allowing ventilation
- ☐ 3. suggesting a time-out
- ☐ 4. giving intramuscular medication
- ☐ 5. assisting with problem solving

94. When caring for a client who has overdosed on phencyclidine (PCP), the nurse should be especially cautious about which client behavior?

- ☐ 1. visual hallucinations
- ☐ 2. violent behavior
- ☐ 3. bizarre behavior
- ☐ 4. loud screaming

95. Which liquid should the nurse administer to a client who is intoxicated on phencyclidine (PCP) to hasten excretion of the chemical?

- ☐ 1. water
- ☐ 2. milk
- ☐ 3. cranberry juice
- ☐ 4. grape juice

96. When assessing a client with possible alcohol poisoning, the nurse should investigate the client's use of which substance while drinking alcohol?

- ☐ 1. marijuana
- ☐ 2. lysergic acid diethylamide
- ☐ 3. peyote
- ☐ 4. psilocybin

97. A client with a cocaine dependency is irritable, anxious, highly sensitive to stimuli, and over reactive to clients and staff on the unit. Which action is **most** therapeutic for this client?

- ☐ 1. secluding and restraining the client as needed
- ☐ 2. telling the client to stay in his room until he can control himself
- ☐ 3. providing the client with frequent "time-outs"
- ☐ 4. confronting the client about his behaviors

98. A client with symptoms of amphetamine psychosis that are improving is anxious and still experiencing some delusions. When developing the client's plan of care, which measure should the nurse include?

- ☐ 1. Assign the client to a group meeting about the physiologic effects of drugs.
- ☐ 2. Advise the client to watch television.
- ☐ 3. Wait for the client to approach the nurse.
- ☐ 4. Invite the client to play a game of ping-pong with the nurse.

99. In consultation with his outpatient psychiatrist, a client is admitted for detoxification from methadone. He states, "I got addicted to morphine for my chronic knee pain. Methadone worked for a long time. Since I had my knee replacement surgery 3 months ago and physical therapy, I do not think I need methadone anymore." It is important to discuss which information with this client? Select all that apply.

- ☐ 1. "Detoxification will likely occur with slowly decreasing doses of methadone."
- ☐ 2. "Oxycodone will be available if needed for breakthrough pain."
- ☐ 3. "You will be monitored closely for withdrawal symptoms and treated as needed."
- ☐ 4. "Physical therapy and nonchemical pain management techniques can be prescribed if needed."
- ☐ 5. "If you have knee stiffness or pain, it is likely to be managed by nonnarcotic pain medicines."

100. A client approaches the medication nurse and states, "I cannot believe you are NOT helping me with my cravings for my fentanyl patches! When I got off alcohol 2 years ago, they gave me naltrexone for my cravings, and it really helped. I cannot stand the cravings and back pain anymore, and I am getting angry." Which responses by the nurse would be helpful for this client? Select all that apply.

- ☐ 1. "Naltrexone does help decrease the cravings for alcohol."
- ☐ 2. "Naltrexone can interfere with opiate cravings in some clients."
- ☐ 3. "Cravings are hard to deal with, especially when you are in pain too."
- ☐ 4. "I hear your frustration about how your detoxification is going."

- ☐ 5. “I am positive naltrexone can help with your cravings for fentanyl.”
- ☐ 6. “I can ask your healthcare provider (HCP) if he thinks naltrexone might help you.”

The Client with Anxiety Disorders and Anxiety-Related Disorders

101. A 17-year-old female client who has been treated for an anxiety disorder since middle school with behavioral treatment and as-needed (PRN) anxiety medication is preparing to go to college. The parents are concerned that she will experience an exacerbation of symptoms if she attends college out of town and want their daughter to attend the local community college and live at home. The girl believes she can handle the challenge of leaving home for college. How should the nurse in the outpatient clinic respond to the family’s concerns?

- ☐ 1. “Your parents have a point; transitions have been hard for you in the past.”
- ☐ 2. “There are many pros and cons here that we all need to discuss together.”
- ☐ 3. “Every high school graduate deserves the chance to take on new challenges.”
- ☐ 4. “It may be premature for you to think of college at this point in time.”

102. A 16-year-old boy who is academically gifted is about to graduate from high school early since he has completed all courses needed to earn a diploma. Within the last 3 months, he has begun to experience panic attacks that have forced him to leave classes early and occasionally miss a day of school. He is concerned that these attacks may hinder his ability to pursue a college degree. What would be the **best** response by the school nurse who has been helping him deal with his panic attacks?

- ☐ 1. “It is natural to be worried about going into a new environment. I am sure with your abilities you will do well once you get settled.”
- ☐ 2. “You are putting too much pressure on yourself. You just need to relax more, and things will be alright.”
- ☐ 3. “It might be best for you to postpone going to college. You need to get

these panic attacks controlled first.”

☐ 4. “It sounds like you have real concern about transitioning to college. I can refer you to a healthcare provider (HCP) for assessment and treatment.”

103. A client has been diagnosed with posttraumatic stress disorder (PTSD) because he experienced childhood sexual abuse (CSA) by his babysitter and her boyfriend from ages 4 to 10. He is admitted for the second time after physically assaulting a woman he said was a prostitute. “She is no better than my babysitter and deserves to be dead. I would like to kill the sitter too.” With the knowledge of PTSD and CSA, which nursing interventions should be implemented at admission? Select all that apply.

- ☐ 1. Institute precautions for suicide, assault, and escape.
- ☐ 2. Ask him to sign a no-harm contract.
- ☐ 3. Provide safe outlets for his anger and rage.
- ☐ 4. Encourage him to express his attitude toward prostitutes during unit group sessions.
- ☐ 5. In one-to-one staff talks, encourage him to safely verbalize his anger toward his babysitter and her boyfriend.

104. A client is taking diazepam while establishing a therapeutic dose of antidepressants for generalized anxiety disorder. Which instruction should the nurse give to this client? Select all that apply.

- ☐ 1. to consult with his healthcare provider (HCP) before he stops taking the drug
- ☐ 2. to avoid eating cheese and other tyramine-rich foods
- ☐ 3. to take the medication on an empty stomach
- ☐ 4. not to use alcohol while taking the drug
- ☐ 5. to stop taking the drug if he experiences swelling of the lips and face and difficulty breathing

105. An adult client diagnosed with anxiety disorder becomes anxious when she touches fruits and vegetables. What should the nurse do?

- ☐ 1. Instruct the woman to avoid touching these foods.
- ☐ 2. Ask the woman why she becomes anxious in these situations.
- ☐ 3. Assist the woman to make a plan for her family to do the food

shopping and preparation.

- ☐ 4. Teach the woman to use cognitive-behavioral approaches to manage her anxiety.

106. A client who is pacing and wringing his hands states, “I just need to walk” when questioned by the nurse about what he is feeling. Which response by the nurse is **most** therapeutic?

- ☐ 1. “You need to sit down and relax.”
- ☐ 2. “Are you feeling anxious?”
- ☐ 3. “Is something bothering you?”
- ☐ 4. “You must be experiencing a problem now.”

107. A client brought to the emergency department is perspiring profusely, breathing rapidly, and having dizziness and palpitations. Problems of a cardiovascular nature are ruled out, and the client’s diagnosis is tentatively listed as a panic attack. After the symptoms pass, the client states, “I thought I was going to die.” Which is the nurse’s **best** response?

- ☐ 1. “It was very frightening for you.”
- ☐ 2. “We would not have let you die.”
- ☐ 3. “I would have felt the same way.”
- ☐ 4. “But you are okay now.”

108. A client commonly jumps when spoken to and reports feeling uneasy. The client says, “It is as though something bad is going to happen.” In which order, from first to last, should the nursing actions be done? All options must be used.

1. Teach problem-solving strategies.

2. Ask the client to deep breathe for 2 minutes.

3. Discuss the client’s feelings in more depth.

4. Reduce environmental stimuli.

109. A client with panic disorder is taking alprazolam 1 mg PO three times daily. The nurse understands that this medication is effective in blocking the symptoms of panic because of its specific action on which neurotransmitters?

- ☐ 1. gamma-aminobutyrate
- ☐ 2. serotonin
- ☐ 3. dopamine
- ☐ 4. norepinephrine

110. A client is diagnosed with generalized anxiety disorder (GAD) and given a prescription for venlafaxine. Which information should the nurse include in a teaching plan for this client? Select all that apply.

- ☐ 1. various strategies for reducing anxiety
- ☐ 2. the benefits and mechanisms of actions of venlafaxine in treating GAD
- ☐ 3. how venlafaxine will eliminate his anxiety at home and work
- ☐ 4. the management of the common side effects of venlafaxine
- ☐ 5. substituting adaptive coping strategies for maladaptive ones
- ☐ 6. the positive effects of venlafaxine being evident in 4 to 5 days

111. While a client is taking alprazolam, which food should the nurse instruct the client to avoid?

- ☐ 1. chocolate
- ☐ 2. cheese
- ☐ 3. alcohol
- ☐ 4. shellfish

112. Which statement by a client who has been taking buspirone as

prescribed for 2 days indicates the need for further teaching?

- ☐ 1. "This medication will help my tight, aching muscles."
- ☐ 2. "I may not feel better for 7 to 10 days."
- ☐ 3. "The drug does not cause physical dependence."
- ☐ 4. "I can take the medication with food."

113. A week ago, a tornado destroyed the client's home and seriously injured her husband. The client has been walking around the hospital in a daze without any outward display of emotions. She tells the nurse that she feels like she is going crazy. Which intervention should the nurse use **first**?

- ☐ 1. Explain the effects of stress on the mind and body.
- ☐ 2. Reassure the client that her feelings are typical reactions to serious trauma.
- ☐ 3. Reassure the client that her symptoms are temporary.
- ☐ 4. Acknowledge the unfairness of the client's situation.

114. After being discharged from the hospital with acute stress disorder, a client is referred to the outpatient clinic for follow-up. What is **most** important for the client to use for continued alleviation of anxiety?

- ☐ 1. recognizing when she is feeling anxious
- ☐ 2. understanding reasons for her anxiety
- ☐ 3. using adaptive and palliative methods to reduce anxiety
- ☐ 4. describing the situations preceding her feelings of anxiety

115. A client with acute stress disorder states to the nurse, "I keep having horrible nightmares about the car accident that killed my daughter. I should not have taken her with me to the store." Which response by the nurse is **most** therapeutic?

- ☐ 1. "Do not keep torturing yourself with such horrible thoughts."
- ☐ 2. "Stop blaming yourself. It is only hurting you."
- ☐ 3. "Let us talk about something that is a bit more pleasant."
- ☐ 4. "The accident just happened and could not have been predicted."

116. The client, who is a veteran and has posttraumatic stress disorder, tells the nurse about the horror and mass destruction of war. He states, "I killed all of those people for nothing." Which response by the nurse is

appropriate?

- ☐ 1. “You did what you had to do at that time.”
- ☐ 2. “Maybe you did not kill as many people as you think.”
- ☐ 3. “How many people did you kill?”
- ☐ 4. “War is a terrible thing.”

117. A client with acute stress disorder has avoided feelings of anger toward her rapist and cannot verbally express them. The nurse suggests which activity to assist the client with expressing her feelings?

- ☐ 1. working on a puzzle
- ☐ 2. writing in a journal
- ☐ 3. meditating
- ☐ 4. listening to music

118. When developing the plan of care for a client with acute stress disorder who lost her sister in a boating accident, which intervention should the nurse initiate?

- ☐ 1. helping the client to evaluate her sister’s behavior
- ☐ 2. telling the client to avoid details of the accident
- ☐ 3. facilitating progressive review of the accident and its consequences
- ☐ 4. postponing discussion of the accident until the client brings it up

119. A soldier on his second tour of duty was notified of the date that he will be redeployed. As this date approaches, he is showing signs of excess anxiety and irritability and inability to sleep at night because of nightmares of IED (improvised explosive devices) tragedies, all leading to poor work performance. His commanding officer refers him to the base hospital for an evaluation. What should the nurse do in order of priority from first to last? All options must be used.

1. Remind him that any feelings and problems he is having are typical in his current situation.

2. Ask him to talk about his upsetting experiences.

3. Remove any weapons and dangerous items he has in his possession.

4. Acknowledge any injustices/unfairness related to his experiences, and offer empathy and support.

120. A newly admitted 20-year-old client, diagnosed with posttraumatic stress disorder (PTSD), reluctantly reveals that she escaped from a cult 2 years ago. The client says, “Nobody will ever believe the horrible things the men did to me, and no one never stopped them.” Which response is appropriate for the nurse to make?

- ☐ 1. “I will believe anything you tell me. You can trust me.”
- ☐ 2. “I cannot understand why members did not protect you. It is not right.”
- ☐ 3. “Tell me about the cult. I did not know there were any near here.”
- ☐ 4. “It must be difficult to talk about what happened. I am willing to listen.”

121. A 15-year-old client diagnosed with posttraumatic stress disorder (PTSD) is admitted to the unit after slicing both arms with a razor blade. He says, “Maybe my mother will listen to me now. She tells me I am just crazy when I say I am screwed up because my stepdad had sex with me for years.” What should the nurse do in order of priority from first to last? All options must be used.

1. Ask the client about the stepdad possibly abusing younger children in the family.

2. Ask the client to be specific about what he means by “screwed up.”

3. Ask the client to sign a no-harm contract related to suicide and self-mutilation.

4. Ask the client to talk about appropriate ways to express anger toward his mother.

122. A client diagnosed with posttraumatic stress disorder is readmitted for suicidal thoughts and continued trouble sleeping. She states that when she closes her eyes, she has vivid memories about being awakened at night. “My dad would be on top of me trying to have sex with me. I could not breathe.” Which suggestions would be appropriate for the nurse to make for the insomnia? Select all that apply.

- ☐ 1. trying relaxation techniques to help decrease her anxiety before bedtime
- ☐ 2. taking the quetiapine 25 mg as needed as prescribed by the healthcare provider (HCP)
- ☐ 3. staying in the dayroom and trying to sleep in the recliner chair near staff
- ☐ 4. listening to calming music as she tries to fall asleep
- ☐ 5. processing the content of her flashbacks no less than an hour before bedtime
- ☐ 6. leaving her door slightly open to decrease noise during the nightly checks

123. A client with posttraumatic stress disorder needs to find new housing and wants to wait for a month before setting another appointment to see the nurse. How should the nurse interpret this action?

- ☐ 1. a method of avoidance
- ☐ 2. a detriment to progress
- ☐ 3. the end of treatment
- ☐ 4. a necessary break in treatment

124. The nurse should warn a client who is taking a benzodiazepine about using which medication in combination with his current medication?

- ☐ 1. antacids
- ☐ 2. acetaminophen
- ☐ 3. vitamins
- ☐ 4. aspirin

125. Which client statement indicates the need for additional teaching about benzodiazepines?

- ☐ 1. "I cannot drink alcohol while taking diazepam."
- ☐ 2. "I can stop taking the drug anytime I want."
- ☐ 3. "Diazepam can make me drowsy, so I should not drive for a while."
- ☐ 4. "Diazepam will help my tight muscles feel better."

126. A client is diagnosed with agoraphobia without panic disorder. Which type of therapy would **most** the nurse expect to see included in the plan of care?

- ☐ 1. insight therapy
- ☐ 2. group therapy
- ☐ 3. behavior therapy
- ☐ 4. psychoanalysis

127. The client diagnosed with a fear of eating in public places or in front of other people has finished eating lunch in the dining area in the nurse's presence. Which statement by the nurse should reinforce the client's positive action?

- ☐ 1. "It was not so hard, now was it?"

- ☐ 2. "At supper, I hope to see you eat with a group of people."
- ☐ 3. "You must have been hungry today."
- ☐ 4. "It is progress for you to eat in the dining room with me."

128. The client diagnosed with agoraphobia refuses to walk down the hall to the group room. Which response by the nurse is **most** appropriate?

- ☐ 1. "I know you can do it."
- ☐ 2. "Try holding onto the wall as you walk."
- ☐ 3. "You can miss group this one time."
- ☐ 4. "I will walk with you."

129. A client diagnosed with obsessive-compulsive disorder has been taking sertraline but would like to have more energy every day. At his monthly checkup, he reports that his massage therapist recommended he take St. John's wort to help his depression. The nurse should tell the client:

- ☐ 1. "St. John's wort is a harmless herb that might be helpful in this instance."
- ☐ 2. "Combining St. John's wort with the sertraline can cause a serious reaction called serotonin syndrome."
- ☐ 3. "If you take St. John's wort, we will have to decrease the dose of your sertraline."
- ☐ 4. "St. John's wort is not very effective for depression, but we can increase your sertraline dose."

130. A client diagnosed with obsessive-compulsive disorder arrives late for an appointment with the nurse at the outpatient clinic. During the interview, he fidgets restlessly, has trouble remembering what topic is being discussed, and says he thinks he is going crazy. Which statement by the nurse **best** deals with the client's feelings of "going crazy?"

- ☐ 1. "What do you mean when you say you think you are going crazy?"
- ☐ 2. "Most people feel that way occasionally."
- ☐ 3. "I do not know you well enough to judge your mental state."
- ☐ 4. "I have not heard you make a crazy statement."

131. A client with obsessive-compulsive disorder reveals that he was late for his appointment "because of my dumb habit. I have to take off my socks

and put them back on 41 times! I cannot stop until I do it just right.” The nurse interprets the client’s behavior as **most** likely representing an effort to obtain:

- ☐ 1. relief from anxiety.
- ☐ 2. control of his thoughts.
- ☐ 3. attention from others.
- ☐ 4. safe expression of hostility.

132. A client with obsessive-compulsive disorder, who was admitted early yesterday morning, must make his bed 22 times before he can have breakfast. Because of his behavior, the client missed having breakfast yesterday with the other clients. Which action should the nurse institute to help the client be on time for breakfast?

- ☐ 1. Tell the client to make his bed one time only.
- ☐ 2. Wake the client an hour earlier to perform his ritual.
- ☐ 3. Insist that the client stop his activity when it is time for breakfast.
- ☐ 4. Advise the client to have breakfast first before making his bed.

133. The nurse notices that a client diagnosed with major depression and social phobia must get up and move to another area when someone sits next to her. Which action by the nurse is appropriate?

- ☐ 1. Ignore the client’s behavior.
- ☐ 2. Question the client about her avoidance of others.
- ☐ 3. Convey awareness of the client’s anxiety about being around others.
- ☐ 4. Have nursing staff follow the client as moves away.

134. The nurse is developing a long-term care plan for an outpatient client diagnosed with dissociative identity disorder. Which interventions should be included in this plan? Select all that apply.

- ☐ 1. learning how to manage feelings, especially anger and rage
- ☐ 2. joining several outpatient support groups that are process oriented
- ☐ 3. identifying resources to call when there is a risk of suicide or self-mutilation
- ☐ 4. selecting a method for alter personalities to communicate with each other, such as journaling

- ☐ 5. trying different medicines to find one that eliminates the dissociative process
- ☐ 6. helping each alter accept the goal of sharing and integrating all their memories

135. A client with a long history of experiencing dissociative identity disorder is admitted to the unit after the cuts on her legs were sutured in the emergency department. During the admission interview, the client tearfully states that she does not know what happened to her legs. Then, a stronger, alter personality states that the client is useless, weak, and needs to be eliminated completely. The nurse should do which action **first**?

- ☐ 1. Explore the alter personalities' attitudes toward the client more thoroughly.
- ☐ 2. Place the client in restraints when the alter personality emerges.
- ☐ 3. Contract with the alter personality to tell the nurse when he has the urge to harm the client and the body they both share.
- ☐ 4. Keep the client in a stress-free environment so that the stronger alter personality does not get a chance to emerge.

The Client with a Somatoform Disorder

136. At 1000 hours, a client with a diagnosis of pain disorder demands that the nurse call the healthcare provider (HCP) for more pain medication because she is still in pain after the 0900 analgesic. What should the nurse do **next**?

- ☐ 1. Call the HCP as the client requests.
- ☐ 2. Suggest the client lie down while she is waiting for her next dose.
- ☐ 3. Tell the client that the HCP will be in later to talk to her about it.
- ☐ 4. Inform the client that the nurse cannot give her additional medication at this time.

137. The unlicensed assistive personnel (UAP) tells the nurse that the client with a somatoform disorder is sick and is not coming to the dining room for lunch. The nurse should direct the UAP to do which intervention?

- ☐ 1. Take the client a lunch tray, and let him eat in his room.
- ☐ 2. Tell the client he will need to wait until supper to eat if he misses

lunch.

- ☐ 3. Invite the client to lunch and accompany him to the dining room.
- ☐ 4. Inform the client that he has 10 minutes to get to the dining room for lunch.

138. The client diagnosed with conversion disorder has a paralyzed arm. A staff member states, “I would just tell the client her arm is paralyzed because she had an affair and neglected her baby’s care to the point where the baby had to be hospitalized for dehydration.” Which response by the nurse is **best**?

- ☐ 1. “Ignore the client’s behaviors and treat her with respect.”
- ☐ 2. “Pushing insight will increase the client’s anxiety and the need for physical symptoms.”
- ☐ 3. “Pushing awareness will be helpful and further the client’s recovery.”
- ☐ 4. “We will meet with the client and confront her with her behavior.”

139. The healthcare provider (HCP) refers a client diagnosed with somatization disorder to the outpatient clinic because of problems with nausea. The client’s past symptoms involved back pain, chest pain, and problems with urination. The client tells the nurse that the nausea began when his wife asked him for a divorce. Which intervention is **most** appropriate?

- ☐ 1. asking the client to describe his problem with nausea
- ☐ 2. directing the client to describe his feelings about his impending divorce
- ☐ 3. allowing the client to talk about the HCPs he has seen and the medications he has taken
- ☐ 4. informing the client about a different medication for his nausea

140. A client diagnosed with pain disorder is talking with the nurse about fishing when he suddenly reverts to talking about the pain in his arm. What should the nurse do next?

- ☐ 1. Allow the client to talk about his pain.
- ☐ 2. Ask the client if he needs more pain medication.
- ☐ 3. Get up and leave the client.
- ☐ 4. Redirect the interaction back to fishing.

141. Which statement indicates to the nurse that the client is progressing

toward recovery from a somatoform disorder?

- ☐ 1. “I understand my pain will feel worse when I am worried about my divorce.”
- ☐ 2. “My stomach pain will go away once I get properly diagnosed.”
- ☐ 3. “My headache feels better when I time my medication dose.”
- ☐ 4. “I need to find a healthcare provider (HCP) who understands what my pain is like.”

Managing Care, Quality, and Safety of Clients with Personality Disorders, Substance-Related Disorders, Anxiety Disorders, and Anxiety-Related Disorders

142. A client is brought to the emergency department (ED) by a friend who states that the client recently ran out of his lorazepam and has been having a grand mal seizure for the last 10 minutes. The nurse observes that the client is still seizing. What should the nurse do in order of priority from first to last? All options must be used.

1. Monitor the client’s safety, and place seizure pads on the cart rails.

2. Record the time, duration, and nature of the seizures.

3. Page the ED healthcare provider (HCP), and prepare to give diazepam intravenously.

4. Ask the friend about the client’s medical history and current medications.

143. The client is in the emergency department with her boyfriend. She is just recovering from a “bad trip” from lysergic acid diethylamide (LSD). She is still frightened and a little suspicious. Which nursing action is **most** appropriate?

- ☐ 1. having an unlicensed assistive personnel (UAP) stay with the client to decrease her fear
- ☐ 2. placing the client next to the nursing desk
- ☐ 3. leaving the client alone until the “trip” is over
- ☐ 4. having the boyfriend check on the client frequently

144. A client on a stretcher in the emergency department begins to thrash around, slap the sheets, and yell, “Get these bugs off of me.” She is disoriented and has a blood pressure of 189/75 mm Hg and a pulse of 96 bpm. The friend who is with her says, “She was drinking *a lot* 3 days ago and asked me for money to get more vodka, but I did not have any.” What should the nurse do in order of priority from first to last? All options must be used.

1. Obtain a prescription to place the client in restraints, if needed.

2. Implement constant observation.

3. Monitor vital signs every 15 minutes.

4. Administer haloperidol and lorazepam IM as prescribed.

5. Remind the client that she is in the hospital and the nurse is with her.

6. Chart the client’s response to the interventions.

145. The nurse is teaching unlicensed staff about caring for the client with alcohol dependency. Which statement by the staff indicates the need for additional teaching?

- ☐ 1. “Alcohol dependency affects the entire family.”
- ☐ 2. “The client is a weak individual and could stop if he desires.”
- ☐ 3. “Alcohol is a problem when it interferes with the client’s daily life.”
- ☐ 4. “The client who cannot stop drinking, even though he wants to, is alcohol dependent.”

146. The nurse is serving on the hospital ethics committee that is considering the ethics of a proposal for the nursing staff to search the room of a client diagnosed with substance abuse while he is off the unit and without his knowledge. What should be considered concerning the relationship of ethical and legal standards of behavior?

- ☐ 1. Ethical standards are generally higher than those required by law.
- ☐ 2. Ethical standards are equal to those required by law.
- ☐ 3. Ethical standards bear no relationship to legal standards for behavior.
- ☐ 4. Ethical standards are irrelevant when the health of a client is at risk.

147. A client with a history of cocaine abuse is receiving intravenous therapy and exits the hospital “to visit a friend.” The client returns to the nursing unit 1 hour later, agitated, aggressive, combative, and reporting “chest pain.” Place the nurse’s actions in priority order from first to last. All options must be used.

1. Contact the security department.

2. Obtain an ECG.

3. Initiate a referral to obtain drug rehabilitation counseling.

4. Obtain a urine sample.

148. During a unit meeting attended by clients and staff, several clients are criticizing their primary nurses. These clients have also been intimidating two other clients who have recently been admitted to the unit, and now, the new clients have stopped sharing their opinions during the meeting. What is the **first** action for the nurse to take?

- ☐ 1. Help the new clients express the reasons they have stopped sharing their ideas.
- ☐ 2. Ask the clients criticizing their nurses to suggest some possible solutions for the practices they are criticizing.
- ☐ 3. Give the clients who are publically criticizing the nurses a verbal warning that this behavior is not acceptable.
- ☐ 4. Use the next unit meeting to discuss respect and the importance of collaboration with the treatment team.

149. Two nurses disagree on what is the **most** important information for the client with addictions to have during a discharge teaching session. How should the nurse assigned to provide the discharge teaching proceed?

- ☐ 1. Share all the information that both nurses thought was important.
- ☐ 2. Review the policies related to required discharge teaching.
- ☐ 3. Be aware of different interpretations and personal biases held by

nurses.

- 4. Ask the client what is most important for her as she prepares for discharge.

Answers, Rationales, and Test-Taking Strategies

*The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in Part 1 of this book.*

The Client with a Personality Disorder

1. 3,1,4,2. The client needs a stepwise plan for developing a social life. He needs to first work on his self-esteem and reduce his fears of rejection before talking about how to decrease his anxiety and learning new social skills. Helping him choose interesting activities is important before suggesting an activity for him. Then, he will be ready to try a structured activity with the nurse present for support and role modeling.

 CN: Psychosocial integrity; CL: Synthesize

2. 3. The client is at risk for suicide, and the nurse should determine how serious the client is, including if she has a plan and the means to implement the plan. While medication history may be important, the nurse should first attempt to determine suicide risk. Asking the client why she cut herself will likely cause the client to respond with insufficient information to determine suicide risk.

 CN: Reduction of risk potential; CL: Synthesize

3. 1. The nurse should plan to assist the client who has a personality disorder primarily with specific dysfunctional behaviors that are distressing

to the client or others. The client with a personality disorder has lifelong, inflexible, and dysfunctional patterns of relating and behaving. The client commonly does not view his behavior as distressful to himself. The client becomes distressed because of others' reactions and behaviors toward him, which cause the client emotional pain and discomfort. Psychopharmacologic compliance is not a primary need because medication does not cure a personality disorder. Medication is prescribed if the client has a severe symptom that interferes with functioning, such as severe anxiety or depression. Examination of developmental conflicts usually is not helpful because of the ingrained dysfunctional ways of thinking and behaving. It is more useful to help the client with changing dysfunctional behaviors. Although milieu management is a component of care, the client usually is proficient enough in the manipulation of the environment to meet his needs.

CN: Psychosocial integrity; CL: Synthesize

4. 3. For this client, the nurse needs to use a calm, matter-of-fact approach to create a nonthreatening and secure environment because the client is experiencing problems with suspiciousness and trust. Use of “I” statements and responses would be therapeutic to reduce the client’s suspiciousness and increase his trust in the staff and the environment. An authoritarian approach is nontherapeutic and inappropriate because the client may perceive this approach as an attack, subsequently responding with anger and threatening behavior. A parental or controlling approach may be perceived as authoritarian, and the client may become defensive and angry.

CN: Safety and infection control; CL: Synthesize

5. 4. Attending an activity with the nurse assists the client to become involved with others slowly. The client with a schizotypal personality disorder needs support, kindness, and gentle suggestion to improve social skills and interpersonal relationships. The client commonly has problems in thinking, perceiving, and communicating and appears similar to clients with schizophrenia except that psychotic episodes are infrequent and less severe. Participation solely in group activities or leading a sing-along would be too overwhelming for the client, subsequently increasing the client’s anxiety and withdrawal. Engaging primarily in one-to-one activities would not be helpful because of the client’s difficulty with social skills and interpersonal

relationships. However, activities with the nurse could be used to establish trust. Then, the client could proceed to activities with others.

CN: Psychosocial integrity; CL: Synthesize

6. 2. The nurse needs to set limits on the client's manipulative behavior to help the client control dysfunctional behavior. The manipulative client bends rules to have her needs met without regard for rules or the needs or rights of others. A consistent approach by the staff is necessary to decrease manipulation. Ignoring the client's behavior reinforces or promotes the continuation of the client's manipulative behavior. Reprimanding the client may be perceived as a threat, resulting in aggressive behavior. Allowing the client to keep a snack in her room reinforces the dysfunctional behavior.

CN: Psychosocial integrity; CL: Synthesize

7. 2. The nurse assists the client with identifying and putting feelings into words during one-to-one interactions. This helps the client express her feelings in a nonthreatening setting and avoid directing anger toward other clients. A client with an antisocial personality disorder needs to understand how others feel and react to her behaviors and why they react the way they do. The client also needs to understand the consequences of her behaviors. Using humor or indirect behaviors to express anger is a passive-aggressive method that will not help the client learn how to express her anger appropriately. Asking the nurse for medication when upset is a way to avoid dealing with feelings and is not helpful. However, medication may be necessary if talking, and engaging in a physical activity has not been effective in lowering anxiety or if the client is about to lose control of her behavior.

CN: Psychosocial integrity; CL: Synthesize

8. 1,3,4,6. Inflexibility, need to be in control, perfectionism, overemphasis on work or tasks, and a fear of making mistakes are common symptoms of OCPD. Clomipramine and fluoxetine may help with the obsessive symptoms. Interrupting the client's tasks is likely to increase her anxiety even more. Telling her that she cannot expect the family to be perfect is likely to create a power struggle.

CN: Psychosocial integrity; CL: Apply

9. 1,2,4,5. A professional, matter-of-fact approach and developing trust are the most effective with this client. A friendly approach, intrusiveness, and attempting to counteract the client's beliefs will increase the client's paranoia; he will present more false beliefs to prove he is right about the conspiracy. Placing the client in group settings may be counterproductive because questions and emotionality from peers, as well as confrontations with reality, will increase the client's anxiety.

CN: Management of care; CL: Analyze

10. 4. Some characteristics of a client with a dependent personality are an inability to make daily decisions without advice and reassurance and the preoccupation with fear of being alone to care for oneself. The client needs others to be responsible for important areas of his life. The nurse should respond "Your parents have been supportive of you and will continue to be supportive even if you live apart" to gently challenge the client's fears and suggest that they may be unwarranted. Stating "You are a 28-year-old adult now, not a child who needs to be cared for" or "Your parents need a break, and you need a break from them" is reprimanding and would diminish the client's self-worth. Stating "Your parents will not be around forever; after all, they are getting older" may be true, but it is an insensitive response that may increase the client's anxiety.

CN: Psychosocial integrity; CL: Apply

11. 1,3,2,4. Safety is the priority concern, and then, eating and sleeping patterns need to be reestablished. After intervening to meet basic needs, delving into the loneliness and emptiness are important for determining underlying issues that need to be followed up in outpatient counseling. Although the client is living with her family currently, other options might be appropriate for her to consider.

CN: Safety and infection control; CL: Synthesize

12. 4. For the client with attention-seeking behaviors, the nurse would institute a behavioral contract with the client to help decrease dysfunctional behaviors and promote self-sufficiency. Having the client approach only his assigned staff person sets limits on his attention-seeking behavior. Telling the client to stay in his room until staff approach him, limiting the client to a

certain area, or giving the client a list of permissible requests is punitive and does nothing to help the client gain control over the dysfunctional behavior.

CN: Management of care; CL: Synthesize

13. 2. The most therapeutic response is “All of the nurses here provide good care.” This statement corrects the client’s unrealistic and exaggerated perception. “Splitting,” defined as the inability to integrate good and bad aspects of an individual and the self, is a hallmark behavior of a client with borderline personality disorder. The client sees himself and others as all good or all bad. Components of “splitting” include behaviors that idealize and devalue others. It is a defense that allows the client to avoid pain and feelings associated with past abuse or a current situation involving the threat of rejection or abandonment. The other statements promote the client’s idealistic view and do nothing to help correct the client’s distortion.

CN: Psychosocial integrity; CL: Apply

14. 2. For the client who is at risk for self-mutilation, the nurse develops a contract to assist the client with assuming responsibility for his behavior and to help the client develop adaptive methods of coping with feelings. Self-mutilation is usually an expression of intense anxiety, anger, helplessness, or guilt or a means to block psychological pain by inducing physical pain. A typical contract helpful to the client would have the client notify staff when anxiety is increasing. Withdrawing to his room when feeling overwhelmed, suppressing feelings when angry, or displacing feelings onto the HCP  is not an adaptive method to help the client deal with his feelings and could still result in self-mutilation.

CN: Safety and infection control; CL: Evaluate

15. 4. Any suicidal statement must be assessed by the nurse. The nurse should discuss the client’s statement with her to determine its meaning in terms of suicide, overwhelming feelings of anxiety, abandonment, or other need that the client cannot express appropriately. It is not uncommon for a client with borderline personality disorder to make threatening comments before discharge. Extending the hospital stay is inappropriate because it would encourage dependency and manipulation. Ignoring the client’s statement on the assumption that it is a sign of manipulation is an error in

judgment. Asking a family member to stay with the client temporarily at home is not appropriate and places the responsibility for the client on the family instead of the client.

CN: Psychosocial integrity; CL: Synthesize

16. 4. The best initial course of action when admitting a client is to observe him to establish baseline information. This assessment provides valuable information about the client's behavior and forms the basis for the plan of care. Telling the client that the staff has authority to subdue him if he gets unruly or that he will have to pay for any damage he causes is threatening and may incite or provoke trouble. Isolating a client is not recommended unless there is a very good reason for it, such as a very active, combative client who is dangerous to himself and others.

CN: Psychosocial integrity; CL: Synthesize

17. 4. The best response is “You say you are not a regular here, but you are experiencing what others are experiencing.” This statement helps the client to identify factors that precipitate denial by helping her to confront that which inhibits compliance. Denial is used to help a client feel better and more secure when a situation provokes a high level of anxiety and is threatening to the client. The statement “Because you are not a regular client, sit in the hall when the others are in group” agrees with and promotes denial in the client and interferes with treatment. The statement “Your family wants you to attend and they will be disappointed if you do not” causes the client to feel guilty and decreases her self-esteem. The statement “I will have to mark you absent from the clinic today and speak to the **healthcare provider** about it” is punitive and threatening to the client, subsequently decreasing her self-esteem.

CN: Psychosocial integrity; CL: Synthesize

18. 3. Stating “I will not continue to talk with you if you curse” sets limits on the client's behavior and points out the negative effects of her behavior. Therefore, this response is most appropriate and therapeutic. The statement “You are being very childish” reprimands the client, possibly causing the anger to escalate. The statement “I am sorry if you cannot wait” fails to provide feedback to the client about her behavior. The statement “Come back

tomorrow and your medication will be ready” ignores the client’s behavior, failing to provide feedback to the client about the behavior. It also shows poor nursing judgment because the client may need her medication before tomorrow or may not return to the clinic the following day.

CN: Psychosocial integrity; CL: Synthesize

19. 1. The client with avoidant personality disorder is showing signs of improvement when interacting with two other clients. A client with avoidant personality disorder is timid, socially uncomfortable, withdrawn, and hypersensitive to criticism. Social contact with others decreases isolation and withdrawal. Listening to music with headphones, sitting at a table and painting, and talking on the telephone are solitary activities and therefore do not indicate improvement, which is evidenced by social contact.

CN: Psychosocial integrity; CL: Analyze

20. 4. The priority is to explain to the client that this information has to be shared immediately with the staff and the **HCP**  because of its serious nature. Safety of all is crucial regardless of whether the client follows through on his plan. It is possible that the client is asking to be stopped and that he is indirectly pleading for help in a dysfunctional manner. Bargaining with the client, such as warning him that his telephone privileges will be taken away if he abuses them, or offering to disregard his plan if he does not go through with it, is inappropriate. Saying nothing to anyone until the client has actually completed the call and then notifying the proper authorities represent serious negligence on the part of the nurse.

CN: Safety and infection control; CL: Synthesize

21. 1. The most basic and important idea to convey to a client is that, as a person, he or she is accepted, although his or her behavior may not be. Empathy is conveyed for emotional pain regardless of the client’s behavior. Although some clients need limits placed on their behavior, not all clients require limit setting. That the staff members are the primary ones left to care about these clients is not necessarily true, nor is it true that the staff should use very little humor with these clients. Clients who are rigid and perfectionists and who have a restricted affect may need help with displaying humor.

CN: Management of care; CL: Apply

22. 1. The nurse should explain the negative reactions of others toward the client's behaviors to make him aware of the impact of his seductive behaviors on others. Suggesting that the client apologize to others for his behavior is futile because the client cannot feel remorse for wrongdoing. Asking him to explain reasons for his seductive behavior is not helpful because this client is skillful at using projection and rationalization. Discussing his relationship with his mother is not helpful because the focus should be oriented to the present situation and managing his behavior at the present time.

CN: Psychosocial integrity; CL: Synthesize

23. 2. The nurse would specifically use supportive confrontation with the client to point out discrepancies between what the client states and what actually exists to increase responsibility for self. Limit setting and consistency also may be used. However, limit setting helps the client control unacceptable behavior, and consistency helps reduce the frequency of negative behaviors; they do not point out discrepancies. Rationalization is typically used by the client, not the nurse, to blame others, make excuses, and provide alibis for self-centered behaviors.

CN: Psychosocial integrity; CL: Synthesize

24. 4. The nurse should use role-playing to teach the client appropriate responses to others in various situations. This client dramatizes events, draws attention to self, and is unaware of and does not deal with feelings. The nurse works to help the client clarify true feelings and learn to express them appropriately. Party planning, music group, and cooking class are therapeutic activities but will not help the client specifically learn how to respond appropriately to others.

CN: Psychosocial integrity; CL: Synthesize

The Client with an Alcohol-Related Disorder

25. 1,4,5. As with any dementia, there is a need to protect the client from wandering off and risking harm to self. Dementia is progressive and eventually requires 24-hour supervision. The client will find a way to get

more alcohol if quitting is not a personal goal. Not answering the client's question will generally increase the client's anger. Once the dementia is evident, lack of alcohol intake will not reverse the condition.

CN: Psychosocial integrity; CL: Synthesize

26. 2,3,4,1. The client's feelings and concerns need to be validated so she will open up more. She also should know that the changes in her husband are not unusual. It helps to know the client has tried with her husband to determine if they are appropriate or not. Then, there can be a discussion about getting help for her husband so that her efforts to stay sober are not compromised.

CN: Reduction of risk potential; CL: Synthesize

27. 4. The best action by the nurse to help a client who has difficulty falling asleep would be to teach the client relaxation exercises to use before bedtime to reduce anxiety and promote relaxation. This activity will also be useful for the client when out of the hospital. Inviting the client to play a board game is inappropriate because this activity can be competitive and thus stimulate the client. Allowing the client to sit in the community room until she feels sleepy is inappropriate because it does nothing to help the client relax. Taking frequent naps can worsen the ability to fall asleep at night.

CN: Basic care and comfort; CL: Synthesize

28. 1,2,5. When a client is developing impending alcohol withdrawal delirium, the initial symptoms are a fast pulse and respiratory rate, and an elevated blood pressure. Red, flushed, dry skin and complaints of thirst occur with diabetic ketoacidosis. Abdominal cramping and severe diarrhea are symptoms of opiate withdrawal.

CN: Reduction of risk potential; CL: Analyze

29. 4,1,2,3. The nurse should first place the client in a quieter, darkened room with dimmer lights to decrease the stimuli from the busy emergency department (ED) and create a more calming environment. Next, the nurse should administer the lorazepam to help decrease agitation and reduce the risk of seizures. Drawing the blood will be easier as the client becomes less agitated. Depending on the magnesium blood level, the client may need an

intramuscular (IM) dose of magnesium sulfate to prevent seizures. The nurse can then obtain the vital sign every 15 minutes to determine if the client is becoming stabilized and if the client needs further doses of lorazepam.

CN: Management of care; CL: Synthesize

30. 1. The nurse should first contact the **HCP** . The client's vital signs and level of consciousness are deteriorating, indicating complications of withdrawal, which can be life threatening. Increasing the rate of the infusion may cause fluid overload and has not been prescribed by the HCP. Arousing the client will not address the underlying problems. Magnesium sulfate is used to treat seizures precipitated by alcohol withdrawal, but the client is not demonstrating signs of actual or impending seizures.

CN: Safety and infection control; CL: Synthesize

31. 4. The nurse should provide the client with a quiet room to sleep in. Alcohol is destroyed and oxidized in the body at a slow, steady rate. The rate of alcohol metabolism is not influenced by drinking black coffee, walking around the unit, or taking a cold shower. Therefore, it is best to have the client sleep off the effects of the alcohol.

CN: Reduction of risk potential; CL: Synthesize

32. 1,2,4,5. For the client experiencing symptoms of alcohol withdrawal, the nurse monitors vital signs and intake and output; reinforces reality for the client who is confused, disoriented, or hallucinating; explains that the symptoms of withdrawal are temporary; reduces stimulation; and stays with the client if he is confused or agitated. The nurse administers medications to prevent the progression of symptoms, such as seizures and delirium tremens, and to ensure the client's safety. Restraints are not used as a precautionary measure. Restraints are used only as a least restrictive measure to protect the client and others when the client is a danger to himself or others.

CN: Psychosocial integrity; CL: Synthesize

33. 1,3,4,5. Two or three days after cessation of alcohol, clients may experience delirium tremens (DTs), as evidenced by disorientation, nightmares, abdominal pain, nausea, and diaphoresis, as well as elevated temperature, pulse, and blood pressure, and visual and auditory

hallucinations. If the client had a traumatic brain injury after falling, the client might have paralysis, but there is no association of paralysis from DTs.

CN: Physiologic adaptation; CL: Synthesize

34. 3. The nurse should first confirm that the client has stopped taking the clonazepam because the client is reporting symptoms of benzodiazepine withdrawal from stopping the clonazepam abruptly. The client would report symptoms of being sedated if he took alcohol with the clonazepam. Tolerance symptoms would be increased anxiety, not these physical symptoms. The client symptoms are consistent with clonazepam withdrawal not excess; thus, asking about increased use is not relevant.

CN: Pharmacological and parenteral therapies; CL: Analyze

35. 4. Antiseptic mouthwash commonly contains alcohol and should be kept in a locked area unless labeling clearly indicates that the product does not contain alcohol. A client with an intense craving for alcohol may drink mouthwash that contains alcohol. Personal care items, such as toothpaste, dental floss, and shaving cream, do not contain alcohol, and the client would be allowed to keep them in the room.

CN: Safety and infection control; CL: Synthesize

36. 4. The best way to intervene with a client's minimization or denial of alcohol problems is to point out the consequences of the drinking—the multiple arrests. The other responses are superficial and discount the seriousness of the client's problem.

CN: Psychosocial integrity; CL: Synthesize

37. 2. The client's response helps the nurse determine the severity of withdrawal symptoms because the length and extent of drinking alcohol has an effect on the severity of symptoms the client experiences during withdrawal. Decreased use of alcohol can also result in withdrawal symptoms in the client who has developed a high tolerance to alcohol and is physically dependent. The severity of the disease, the possibility of hallucinations, and the occurrence of delirium tremens are not determined by the information given. The diagnosis of alcohol dependency is just that—it is not classified as mild, moderate, or severe. Alcoholic hallucinosis is a state of auditory

hallucinations that develops about 48 hours after the client has stopped drinking. The client hears voices or noises within the context of a clear sensorium, meaning that the auditory hallucination is the only symptom the client experiences. Severe withdrawal symptoms that are not managed medically can progress to delirium tremens or a severe abstinence syndrome. Delirium tremens occurs about 3 to 5 days after the client's last drink and is characterized by confusion, agitation, severe psychomotor activity, hallucinations, sleeplessness, tachycardia, elevated blood pressure, elevated temperature, and possibly seizures.

CN: Reduction of risk potential; CL: Analyze

38. 2. The nurse would most likely administer a benzodiazepine, such as lorazepam, to the client who is experiencing symptoms of alcohol withdrawal. The benzodiazepine substitutes for the alcohol to suppress withdrawal symptoms. The client experiences symptoms of withdrawal because of the “rebound phenomenon” when sedation of the central nervous system (CNS) from alcohol begins to decrease. Haloperidol is an antipsychotic and is not indicated for alcohol withdrawal symptoms. Benztropine is used to treat extrapyramidal symptoms associated with antipsychotic therapy. Naloxone is used in opioid overdose to reverse the CNS depression caused by the opioid.

CN: Pharmacological and parenteral therapies; CL: Apply

39. 3. Monitoring vital signs provides the best information about the client's overall physiologic status during alcohol withdrawal and the - physiologic response to the medication used. Vital signs reflect the degree of central nervous system irritability and indicate the effectiveness of the medication in easing withdrawal symptoms. Although assessment of nutritional status and sleep pattern and assessment for evidence of tremors are important, they provide only indirect information about single aspects of the client's physiologic status.

CN: Reduction of risk potential; CL: Analyze

40. 1. A client is suffering from a blackout when he cannot recall what he did while under the influence of alcohol. A hangover refers to symptoms experienced the day after a bout of heavy drinking. Common symptoms

include headaches and gastrointestinal distress, typically after heavy alcohol consumption. Tolerance refers to the need to increase the amount of the substance or to ingest the substance more often to achieve the same effects. Delirium tremens refers to severe alcohol withdrawal or abstinence syndrome with confusion, psychomotor agitation, sleeplessness, hallucinations, and elevated vital signs.

CN: Physiological adaptation; CL: Analyze

41. 4. Stating “I am Maria, a nurse in the program; the staff and I will help you” is a nonjudgmental, caring approach that promotes trust and a therapeutic relationship. The statement “I hope you are serious about maintaining your sobriety this time” blames the client, subsequently decreasing the client’s self-worth. Saying “You will get it right this time” is threatening to the client, possibly leading to decreased self-worth by reinforcing the client’s past failures at maintaining sobriety. The statement “I know someone who was successful after the fifth program” is impersonal and irrelevant to the client’s situation.

CN: Psychosocial integrity; CL: Synthesize

42. 3. The wife of the man with alcohol dependency is exhibiting enabling behavior when she makes excuses for her husband’s absenteeism. Enabling behavior is not helpful to the client but rescues him from adverse consequences in relation to his employment. Self-defeating behavior would be evidenced by putting oneself in a position that will lead to failure. Masochistic behavior would be evidenced by the need to experience emotional or physical pain to become sexually aroused.

CN: Psychosocial integrity; CL: Analyze

43. 4. To be most helpful, the nurse should calmly and objectively present facts by saying “You have alcohol on your breath” to help the coworker overcome denial and resistance. This statement also helps to reinforce the coworker’s awareness of the problem. The other statements blame the coworker and may reinforce denial. Blaming, nagging, and yelling diminish self-esteem in the individual with a substance abuse problem who has low frustration tolerance.

CN: Psychosocial integrity; CL: Synthesize

44. 3. The statement “You interrupted Terry twice in 4 minutes” indicates an understanding of the use of constructive feedback by describing specifically what was seen and heard in an objective manner. The other statements are judgmental and blame the client without specifying what the objectionable behavior is.

CN: Psychosocial integrity; CL: Evaluate

45. 4. The client is feeling remorse about hitting his wife. It is best to make a comment that will help him focus on his feelings and express them. Reflecting what the client has said is a good technique to accomplish these goals. Suggesting the client ask his wife or explore the issue in family therapy is inappropriate because it gives advice and ignores the client’s underlying feelings. Saying “It would depend on how much she really cares for you” is inappropriate because it ignores the client’s feelings and reinforces the negative aspects such as the shamefulness of the behavior.

CN: Psychosocial integrity; CL: Synthesize

46. 2. Al-Anon is a self-help group for spouses and significant others that provides education and support and helps participants learn to lead their own life without feeling responsible for the individual with an alcohol problem. Alateen provides support for teenaged children of a person with an alcohol problem. Employee assistance programs help employees recover from alcohol or drug dependence while retaining their positions or jobs. Alcoholics Anonymous provides support for the individual with alcohol problems to attain and maintain sobriety.

CN: Management of care; CL: Apply

47. 1. Having the client who is experiencing severe symptoms of alcohol withdrawal walk is contraindicated because increased activity and stimulation may confuse the client and promote hallucinations. The client may also sustain an injury if he has a seizure as part of the alcohol withdrawal process. The nurse should monitor intake and output to ensure fluid and electrolyte balance and hydration. The nurse should assess vital signs to assess the physiologic status of the client and the response to medications. The nurse should use short, concrete statements to decrease confusion and ambiguity.

CN: Reduction of risk potential; CL: Apply

48. 1. Any amount of alcohol consumed while taking disulfiram can cause an alcohol-disulfiram reaction. The reaction experienced is in proportion to the amount of alcohol ingested. The alcohol-disulfiram reaction can begin 5 to 10 minutes after alcohol is ingested. Symptoms can be mild, as in flushing, throbbing in the head and neck, nausea, and diaphoresis. Other symptoms include vomiting, respiratory difficulty, hypotension, vertigo, syncope, and confusion. Severe reactions involve respiratory depression, convulsions, coma, and even death. Disulfiram can be taken at bedtime if the client feels sleepy from the medication. Some clients experience a metallic or garlic taste when initiating disulfiram treatment. Anything containing alcohol, such as cough medicine, aftershave lotion, and mouthwash, can cause a reaction. Therefore, the client needs to check the labels of these items for his or her alcohol content.

CN: Pharmacological and parenteral therapies; CL: Evaluate

49. 3. The first question should be to ask the client how much alcohol she has had today because nausea with severe vomiting is a sign of an alcohol-disulfiram reaction. Asking the client whether she feels like she has flu symptoms is important after inquiring about alcohol intake. Foods cooked in an alcoholic beverage, such as wine, could also cause a reaction, but the reaction would be less severe because the alcohol dissipates with cooking. Asking how long the client has been taking disulfiram would be least important at this time.

CN: Pharmacological and parenteral therapies; CL: Synthesize

50. 1. Thiamine specifically prevents the development of Wernicke's encephalopathy, a reversible amnestic disorder caused by a diet deficient in thiamine secondary to poor nutritional intake that commonly accompanies chronic alcoholism. It is characterized by nystagmus, ataxia, and mental status changes. Because the client would rather drink alcohol than eat, the client is depleted of vitamins and nutrients. Alcohol also is an irritant that causes a "malabsorption syndrome" in which vitamins and nutrients are not absorbed properly in the gastrointestinal tract. Thiamine is not associated with decreasing withdrawal symptoms, helping clients regain their strength,

or promoting elimination of alcohol from the body.

CN: Pharmacological and parenteral therapies; CL: Apply

51. 2. The statement “Stopping AA and not expressing feelings can lead to relapse” indicates the client’s understanding of risk of relapse. The client is responsible for sobriety and must understand the risk and signs of relapse. Other antecedents to relapse include severe craving, being around users, and severe emotional crises. The other statements place the responsibility for the client’s sobriety on someone else.

CN: Reduction of risk potential; CL: Evaluate

52. 1. The client is using denial, an unconscious defense mechanism, when she refuses to acknowledge that she has a problem with alcohol. This is further evidenced by the client’s inability to connect the liver disorder with alcohol ingestion. Displacement involves transfer of a feeling to someone else or to an object. Rationalization involves an attempt to make or prove that one’s feeling or behavior is justifiable. Reaction formation is a conscious behavior that is the exact opposite of an unconscious feeling.

CN: Psychosocial integrity; CL: Analyze

53. 2. Regular coffee contains caffeine, which acts as a psychomotor stimulant and leads to feelings of anxiety and agitation. Serving coffee to the client may add to tremors and wakefulness. Milk, orange juice, and eggs are part of a well-balanced, high-protein diet needed by the client in alcohol withdrawal, who is nutritionally depleted.

CN: Reduction of risk potential; CL: Apply

54. 4. The nurse should teach the client with peripheral neuropathy to avoid using an electric blanket because the client is likely to have decreased sensitivity in the extremities owing to the damaging effects of alcohol on the nerve endings. It is particularly important to guard against burns because the client may not be able to discern the appropriate degree of heat on the feet. Daily washing and drying, massaging with lotion, and trimming the toenails are appropriate foot care measures for any client.

CN: Reduction of risk potential; CL: Synthesize

55. 1,4,3,2,5. After the nurse reminds the client about this withdrawal symptom, the nurse should take the client's vital signs and then assess for other symptoms, such as visual and auditory disturbances, tremors, anxiety, nausea, and excess perspiration. The elevation of the vital signs also helps to determine the amount of lorazepam needed to control the withdrawal symptoms. The nurse should then chart the details of the episode and outcomes of the interventions.

CN: Physiological adaptation; CL: Synthesize

56. 3. The client with alcohol withdrawal delirium should not be left unattended when confused, disoriented, or hallucinating. Injury or unintentional suicide is a possibility when the client attempts to get away from hallucinations. Restraints are used only when the client loses control and is a danger to herself or others. Touching the client before saying anything is an additional stimulus that would most likely add to the client's agitation. Informing the client about the alcohol treatment program while the client is delirious is inappropriate and shows poor nursing judgment. The client should be given information about alcohol treatment when the - withdrawal symptoms are lessening, and the client can comprehend the information.

CN: Safety and infection control; CL: Synthesize

57. 2. Alcoholics Anonymous (AA), a self-help program based on 12 steps, is open to anyone whose goal is sobriety. The first step requires that the individual admit that he is powerless over alcohol and needs help. Members are in various stages of recovery, and the individual does not have to be sober for at least a month before joining. Potential members are not interviewed. The individual decides how many meetings to attend each week. AA does not require attendance at meetings daily, but some individuals choose to do so, especially at the beginning of recovery.

CN: Management of care; CL: Apply

58. 4. Follow-up care is essential to prevent relapse. Recovery has just begun when the treatment program ends. The first few months after program completion can be difficult and dangerous for the chemically dependent client. The nurse is responsible for discharge plans that include arrangements

for counseling, self-help group meetings, and other forms of aftercare. Supportive friends, a list of goals, and returning to work may be important and helpful to the client, but follow-up care is essential.

 CN: Management of care; CL: Synthesize

59. 2,3,4. The client who plans to attend Alcoholics Anonymous meetings, verbalizes the damaging effects of alcohol on his body, and takes naltrexone daily may be ready for alcohol rehabilitation. Other key outcomes include admitting that a problem with alcohol exists and realizing the negative effects of alcohol on his life. Stating that he needs to cut down on his alcohol intake and that he is indestructible are signs of denial of an alcohol problem.

 CN: Management of care; CL: Evaluate

60. 3. The best approach is to treat both illnesses simultaneously. Treating one and not the other is ineffective. The depression will not clear just by becoming sober or clean.

 CN: Management of care; CL: Synthesize

61. 2. The nurse should assess the client's mental status daily to note changes that could occur from exacerbation of the mental illness or withdrawal from alcohol. Changes in mental status are important for treatment issues such as medication and participation in groups. Assessment of mental status takes priority because mental status affects the client's ability to sleep, eat, and care for himself. Flexibility is necessary on the part of nurses and staff members who are working with a heterogeneous client population.

 CN: Management of care; CL: Analyze

62. 4. Using a client-centered approach to care will most effectively establish a therapeutic relationship. Minimizing the pain the client experiences because of the breakup does not acknowledge that at the present time, the client is in significant distress. Asking "why" suggests that the nurse is judging the appropriateness of the actions and does not demonstrate empathy.

 CN: Psychosocial integrity CL: Apply

The Client with Disorders Related to Other Addictive Substances

63. 4. Tapering doses of oxycodone, pain management strategies, and other pain control medicines are found to be the most helpful with opiate addictions resulting from chronic pain. Nonaddictive (over-the-counter) medicines alone are generally insufficient for chronic pain management. Methadone is an addictive opioid that involves substituting one addiction with another, so now clients are being detoxed off methadone as well. Lorazepam may help with anxiety during withdrawal from opiates, but it does not control the other symptoms of opiate withdrawal.

CN: Pharmacological and parenteral therapies; CL: Synthesize

64. 1,4,5,6. The nurse should instruct the parents to monitor their children for use of paper bags or rags. The nurse should present information about brain damage from inhalants including damage to the frontal lobe, cerebellum, and hippocampus, and that death is possible. Rather than use being on the decline, teenagers are experimenting even more with many types of inhalants, such as Freon, ground-up candy disks, and spray cleaners for computer and TV screens.

CN: Health promotion and maintenance; CL: Create

65. 1. A respiratory rate of <12 breaths/min is cause for concern because it indicates central nervous system depression. Respiratory depression and arrest is the primary cause of death among clients who abuse opioids. Peripheral nervous system effects associated with opioid abuse include urinary retention, hypotension, reduced pupil size, constipation, and decreased gastric, biliary, and pancreatic secretions. Pinpoint pupils are a sign of opioid overdose. However, respiratory depression is the immediate concern.

CN: Reduction of risk potential; CL: Analyze

66. 1,2,3. Symptoms of opioid withdrawal include yawning, rhinorrhea, sweating, chills, piloerection (goose bumps), tremors, restlessness, irritability, leg spasms, bone pain, diarrhea, and vomiting. Symptoms of withdrawal occur within 36 to 72 hours of usage and subside within a week. Withdrawal

from heroin is seldom fatal and usually does not necessitate medical intervention. Synesthesia (a blending of senses) is associated with lysergic acid diethylamide use, and formication (feeling of bugs crawling beneath the skin) is associated with cocaine use.

CN: Physiological adaptation; CL: Analyze

67. 4,5. Naloxone is an opioid antagonist used to treat an opioid overdose. Within a few minutes, the client should have an increase of respirations to near normal and become conscious. With a heroin overdose, the pulse is not significantly affected, the skin becomes warm and wet, and the pupils are dilated. With naloxone, the skin would return to a normal temperature and become dry. The pupils also would react normally, and the pulse would not be decreased.

CN: Pharmacological and parenteral therapies; CL: Analyze

68. 1. Vomiting and diarrhea are usually late signs of heroin withdrawal, along with muscle spasm, fever, nausea, repetitive sneezing, abdominal cramps, and backache. Early signs of heroin withdrawal include yawning, tearing (lacrimation), rhinorrhea, and sweating. Intermediate signs of heroin withdrawal are flushing, piloerection, tachycardia, tremor, restlessness, and irritability.

CN: Reduction of risk potential; CL: Analyze

69. 4. After administering naloxone, the nurse should monitor the client's respiratory status carefully because the drug is short acting and respiratory depression may recur after its effects wear off. Cerebral edema, kidney failure, and seizure activity are not directly related to opioid overdose or naloxone therapy.

CN: Pharmacological and parenteral therapies; CL: Analyze

70. 4. The client takes methadone primarily to be able to work, live normally, and function productively without the mental and physical deterioration caused by opioid addiction. Methadone lessens physiologic dependence on opioids and is used to prevent withdrawal symptoms. Methadone, a substance similar to morphine, is an addictive substance; the client is still considered addicted to opioids. Because methadone has a long

half-life of 15 to 30 hours, it can be taken once a day on an outpatient basis.

 CN: Psychosocial integrity; CL: Apply

71. 1. Suggesting that the client try attending a meeting at a different location is a supportive, positive response and encourages the client to continue participating in treatment. Saying “Maybe it just was not a good day for you” or “Perhaps you were not paying close enough attention” places blame on the client and is not helpful. The statement “Sometimes the meetings can seem like a waste of time, but you need to attend to stay clean” diminishes the importance of the self-help group and offers little support to the client.

 CN: Management of care; CL: Synthesize

72. 2. The best measure to determine a client’s progress in rehabilitation is the number of drug-free days he has. The longer the client abstains, the better the prognosis is. Although the kinds of friends the client makes, the way he gets along with his parents, and the degree of responsibility his job requires could influence his decision to stay clean, the number of drug-free days is the best indicator of progress.

 CN: Management of care; CL: Evaluate

73. 4. The client who is addicted to heroin is most likely to exhibit hypoactivity. Initially, the client feels euphoric. This is followed by drowsiness, hypoactivity, anorexia, and a decreased sex drive. Hilarity, aggression, and a labile mood usually are not associated with heroin addiction.

 CN: Psychosocial integrity; CL: Analyze

74. 4. Because barbiturates are central nervous system depressants, the nurse should be especially alert for the possibility of respiratory failure. Respiratory failure is the most likely cause of death from barbiturate overdose. Kidney failure, cerebrovascular accident, and status epilepticus are not associated with barbiturate overdose.

 CN: Reduction of risk potential; CL: Analyze

75. 4. When a spouse asks whether a seriously ill client will live, it is best

for the nurse to respond by explaining the seriousness of the client's condition and acknowledging the spouse's concern. This type of comment does not offer false hope. Telling the spouse to wait and see and that it is too soon to tell is a stereotypical statement that offers no support. Asking the spouse to describe the length of his or her relationship with the client ignores the spouse's concern and does not focus on the problem. Simply saying that the client is very ill and may not live and that some do not pull through is harsh and not supportive.

CN: Psychosocial integrity; CL: Synthesize

76. 1. Tolerance for a drug occurs when a client requires increasingly larger doses to obtain the desired effect. Therefore, the plan of care would address the client's state of tolerance. The term addiction refers to psychological and physiologic symptoms indicating that an individual cannot control his or her use of psychoactive substances. This term has been replaced with the term dependence. Abuse refers to the excessive use of a substance that differs from societal norms. Drug dependence occurs when the client must take a usual or increasing amount of the drug to prevent the onset of abstinence symptoms, cannot keep drug intake under control, and continues to use even though physical, social, and emotional processes are compromised.

CN: Physiological adaptation; CL: Analyze

77. 4. For a client who is confused when awakening after taking a large dose of barbiturates, the nurse should speak in concrete terms using simple statements in a calm, nonjudgmental, gentle manner to assist the client with cognitive-perceptual impairment, enhance understanding, and decrease anxiety. The other statements contain abstract information and some slang terms that may further confuse the client and thus increase the client's anxiety.

CN: Psychosocial integrity; CL: Synthesize

78. 2. The highest priority is assessing for suicide risk. When the client is safe, then the self-esteem, helplessness, and hopelessness issues can be addressed.

CN: Psychosocial integrity; CL: Synthesize

79. 1. The most appropriate initial outcome for the client is to discuss thoughts and feelings related to her losses. The nurse should help the client identify and verbalize her feelings so that she can externalize her thoughts and emotions and begin to deal with them. This prevents the client from internalizing feelings, which leads to depression and self-harm. The ability to identify two positive qualities, explore strengths, and prioritize problems would be appropriate after the client has explored her thoughts and feelings, gained awareness of the issues, and then can participate in the treatment plan.

CN: Psychosocial integrity; CL: Evaluate

80. 4. The best method to deal with the problem is to discuss observations with clients at the daily community meeting because the problem involves all of the clients, and this provides them with the opportunity to offer their views. Peer pressure is valuable in confronting self-defeating and destructive behaviors. Providing additional recreation avoids or ignores the problem and is damaging to all clients because it decreases trust in the nurse. Breaking up drug-oriented discussions would not be sufficient to stop the behavior. Speaking with the clients individually about their behavior is not as effective as dealing with the problem openly and directly with everyone.

CN: Psychosocial integrity; CL: Synthesize

81. 4. The nurse directs the conversation to realistic concerns or issues to decrease denial and focus on rebuilding a substance-free life. Allowing the client to continue with the stories or questioning the client further about her exploits reinforces the denial. Telling the client you have heard the stories before is nondirective. Additionally, these actions do nothing to help the client focus on rebuilding a substance-free life.

CN: Psychosocial integrity; CL: Synthesize

82. 3. The statement that marijuana impairs short-term memory and judgment and distorts perceptions is a direct, correct, educational response to the student's statement that does not decrease the student's or the friend's self-worth. Telling the student that marijuana is unsafe and illegal, or that using marijuana leads to using other chemicals, does not provide the student with factual information to answer the student's question. Asking whether the student really believes the friend challenges the student and may lead to

defensive behavior.

CN: Psychosocial integrity; CL: Apply

83. 1,2,4,5. Ecstasy is chemically related to methamphetamine (speed) and is used at all-night parties (also known as “raves”) to enhance dancing, closeness to others, affection, and the ability to communicate. Euphoria, heightened sexuality, disinhibition, and diminished self-consciousness can occur. Adverse effects include tachycardia, elevated blood pressure, anorexia, dry mouth, and teeth grinding. Pacifiers, including candy-shaped pacifiers and lollipops, are used to ease the discomfort associated with teeth grinding and jaw clenching. Hyperthermia, dehydration, renal failure, and death can occur.

CN: Reduction of risk potential; CL: Create

84. 3,4,2,1. It is crucial to confirm that the client was taking her husband’s opiates and benzodiazepines and that her symptoms are due to the sudden withdrawal from these medications. It is also important to know if she has been using other substances (such as alcohol) that may cause other withdrawal symptoms. Even before calling for prescriptions, the nurse can initiate withdrawal precautions for client safety.

CN: Safety and infection control; CL: Apply

85. 4. Acknowledging the client’s son’s feelings is the most therapeutic intervention because he is not likely to hear the nurse’s information until his anger and other feelings are addressed and subside. Then, it is important to acknowledge that oxycodone, especially in older clients, can interfere with remembering how many pills were taken. It is common for clients with chronic pain to inadvertently overuse or become addicted to pain medications. Pain management programs help clients to withdraw from the offending medication and start on a multifaceted system for controlling the pain.

CN: Psychosocial integrity; CL: Synthesize

86. 1,2,3,5. Clients who deny an addiction and the need for treatment can be at risk for a suicide attempt, efforts to escape the unit, and aggression directed at staff. A contraband search is a safety measure to look for

concealed drugs and dangerous items. Depending on the last use of the substance, withdrawal symptoms can begin quickly. A urine drug screen is crucial to determine what other substances the client may be using that may cause other withdrawal symptoms. Explaining the unit routines and groups can wait until the client is calmer and more receptive.

CN: Safety and infection control; CL: Analyze

87. 2,3,5. The dose, length of use, and the number of diazepam taken per day are important for assessing the severity of the substance abuse and potential withdrawal. Determining sleep interferences is necessary for treating the underlying causes of the insomnia. The reason his wife takes diazepam is confidential information and is not critical to his situation. Getting off the diazepam is essential for the client and is not an option, especially with his cardiac issues. This needs to be done safely if he has been taking diazepam for more than a week or two.

CN: Psychosocial integrity; CL: Analyze

88. 1,2,4,5. The client who has used cocaine experiences mood swings, a feeling of euphoria, and an elevation in heart rate and blood pressure. The client with cocaine use will have dilated pupils.

CN: Reduction of risk potential; CL: Synthesize

89. 2,3,4,5,6. The cocaine was not swallowed, so inducing vomiting is not indicated. A cocaine overdose can produce seizures, paranoia, and respiratory and/or metabolic acidosis. Deep breathing will help decrease the respiratory distress and pulse rate.

CN: Pharmacological and parenteral therapies; CL: Synthesize

90. 4. The nurse assesses the client for feelings of depression and suicidal ideation. After experiencing an instantaneous high from crack, a crash immediately follows, and the client has an intense craving for more crack. A crash commonly leads to a cocaine-induced depression when additional crack is unavailable. At times, the depression is so severe that users attempt suicide. Although suspiciousness, loss of appetite, and drug craving are also associated with cocaine use, they are less of a priority than suicidal ideation.

CN: Psychosocial integrity; CL: Analyze

91. 3,2,4,1. The risk of seizures is an immediate safety issue, and the nurse should first place seizure pads on the bed. Amphetamine overdose can produce cardiac arrhythmias and respiratory collapse; the nurse should next monitor the client. After monitoring is initiated, the haloperidol is indicated to antagonize the amphetamine affects. When the client is medically stable, the nurse can transfer the client to a psychiatric unit. Haloperidol would be stopped as the psychotic symptoms subside.

CN: Reduction of risk potential; CL: Synthesize

92. 2. Lorazepam, as opposed to alprazolam, is available in dosage ranges that allow more gradual tapering down of doses over 3 to 4 days. Haloperidol is not effective for benzodiazepine withdrawal. Tapering alprazolam in 48 hours is too rapid. Offering alprazolam as a PRN does not deal with the need to gradually reduce the dose and frequency over time.

CN: Pharmacological and parenteral therapies; CL: Synthesize

93. 1,2,5. The client is exhibiting symptoms of moderate anxiety. At this level of anxiety, the nurse should help the client to decrease anxiety by allowing ventilation, crying, exercise, and relaxation techniques. The nurse would further assist the client by refocusing his attention, relating behaviors and feelings to anxiety, and then assisting with problem solving. Oral medication may be needed if the client's anxiety is prolonged or does not decrease with the nurse's interventions. Suggesting a time-out and giving intramuscular medication are possible interventions for a client whose anxiety level is severe.

CN: Psychosocial integrity; CL: Synthesize

94. 2. The nurse must be especially cautious when providing care to a client who has taken phencyclidine (PCP) because of unpredictable, violent behavior. The client can appear to be in a calm state or even in a coma, then become violent, and then return to a calm or comatose state. Visual hallucinations, bizarre behavior, and loud screaming are associated with PCP-intoxicated clients. However, the unpredictable, violent behavior presents a major issue of safety for clients and staff.

CN: Safety and infection control; CL: Analyze

95. 3. An acid environment aids in the excretion of PCP. Therefore, the nurse should give the client with PCP intoxication cranberry juice to acidify the urine to a pH of 5.5 and accelerate excretion. Water, milk, or grape juice will not acidify the urine.

CN: Reduction of risk potential; CL: Synthesize

96. 1. Smoking marijuana while using alcohol can lead to alcohol poisoning because marijuana masks the nausea and vomiting associated with excessive alcohol consumption. Marijuana contains tetrahydrocannabinol (THC), which is responsible for suppressing nausea. With dangerous levels of alcohol in the body, respiratory depression, coma, and death can occur. Lysergic acid diethylamide, peyote, and psilocybin do not contain THC.

CN: Reduction of risk potential; CL: Analyze

97. 3. Providing frequent “time-outs” when the client is highly anxious, sensitive, irritable, and over reactive is needed to calm the client and reduce the possibility of escalating behaviors and violence. Secluding and restraining the client is not appropriate and would only be used if the client was threatening others and other alternative actions had been unsuccessful. Telling the client to stay in his room until he can control himself is unrealistic and futile because the client cannot eliminate behaviors induced by chemicals. Confronting the client about his behaviors would most likely lead to aggression and possibly violent behavior.

CN: Safety and infection control; CL: Synthesize

98. 4. The nurse should invite the client who is anxious to participate in an activity that involves gross motor movements. Doing so helps to direct energy toward a therapeutic activity. Appropriate activities include walking, riding a stationary bicycle, or playing volleyball. Assigning the client to an educational group is not helpful because the anxious client would be unable to sit in a group setting and concentrate on what was occurring in the group. Watching television may be too stimulating for the client, possibly increasing anxiety. Additionally, the client may be too anxious to sit and focus. Waiting for the client to approach the nurse is not helpful or appropriate. The nurse is responsible for initiating contact with the client.

 CN: Psychosocial integrity; CL: Synthesize

99. 1,3,4,5. Since methadone is an addictive medication, the client will be gradually tapered off of it, while being monitored for withdrawal symptoms. Any residual pain is likely to be controlled with other pain management techniques and nonnarcotic pain medication. It is very unlikely that oxycodone would be prescribed PRN since it is a very addictive medication.

 CN: Reduction of risk potential; CL: Apply

100. 1,2,3,4,6. Acknowledgment of the client's frustration, pain, and cravings is important to decrease the client's anger. Naltrexone can help with detoxification from alcohol and opiates. Asking the **healthcare provider (HCP)**  about the possibility of adding naltrexone is appropriate. The nurse can never promise that a medication will help this client, since naltrexone is effective with only 20% to 30% of clients with opiate cravings.

 CN: Pharmacological and parental therapies; CL: Analyze

The Client with Anxiety Disorders and Anxiety-Related Disorders

101. 2. The nurse cannot appear to take the side of either the student or her parent, so discussing the situation together where all points of view can be presented and evaluated is the best option. To avoid college altogether is likely to only escalate both parties' anxiety.

 CN: Psychosocial integrity; CL: Apply

102. 4. The client's concerns are real and serious enough to warrant assessment by an **HCP**  rather than being dismissed as trivial. Though he is very intelligent, his intelligence cannot overcome his anxiety, and in fact, his anxiety is likely to interfere with his ability to perform in college if no assessment and treatment is received. Just postponing college is likely to increase the client's anxiety rather than lower it since it does not address the panic he is experiencing.

 CN: Psychosocial integrity; CL: Analyze

103. 1,2,3,5. Anger and rage could be directed at self and others. He

implies that he did nothing wrong in assaulting the woman (denial) and may try to leave without treatment. A no-harm contract is essential for everyone's safety. He needs safe outlets, including staff talks, for his anger. Talking about his views of prostitutes in unit groups may be upsetting to female clients who have sexual abuse issues as well, so this needs to occur in private.

CN: Safety and infection control; CL: Create

104. 1,4,5. The nurse should instruct the client who is taking diazepam to take the medication as prescribed; stopping the medication suddenly can cause withdrawal symptoms. This medication is used for a short term only. The drug dose can be potentiated by alcohol, and the client should not drink alcoholic beverages while taking this drug. Swelling of the lips and face and difficulty breathing are signs and symptoms of an allergic reaction. The client should stop taking the drug and seek medical assistance immediately. The client does not need to avoid eating foods containing tyramine because it interacts with monoamine oxidase inhibitors, not benzodiazepines. The client can take the medication with food.

CN: Health promotion and maintenance; CL: Synthesize

105. 4. Cognitive-behavioral therapy is effective in treating anxiety disorders. The nurse can assist the client in identifying the onset of the fears that cause the anxiety and develop strategies to modify the behavior associated with the fears. Avoiding touching foods, asking about reasons for the anxiety, and providing ways to work around touching the foods do not deal with the anxiety and are not interventions that will help this client.

CN: Psychosocial integrity; CL: Synthesize

106. 2. Asking “Are you feeling anxious?” helps the client to specifically label the feeling as anxiety so that he can begin to understand and manage it. Some clients need assistance with identifying what they are feeling so they can recognize what is happening to them. Stating “You need to sit down and relax” is not appropriate because the client needs to continue his pacing to feel better. Asking if something is bothering the client or saying that he must be experiencing a problem is vague and does not help the client identify his feelings as anxiety.

CN: Psychosocial integrity; CL: Synthesize

107. 1. The nurse responds with the statement “It was very frightening for you” to express empathy, thus acknowledging the client’s discomfort and accepting his feelings. The nurse conveys respect and validates the client’s self-worth. The other statements do not focus on the client’s underlying feelings, convey active listening, or promote trust.

CN: Psychosocial integrity; CL: Synthesize

108. 4,2,3,1. Immediate anxiety-reducing strategies are decrease stimuli and perform deep breathing. Once the anxiety is lessened, the client’s feelings can be explored for triggers and underlying issues. Then, problem-solving strategies can be discussed to handle the triggers and issues appropriately.

CN: Psychosocial integrity; CL: Synthesize

109. 1. Alprazolam, a benzodiazepine used on a short-term or temporary basis to treat symptoms of anxiety, increases gamma-aminobutyrate (GABA), a major inhibitory neurotransmitter. Because GABA is increased and the reticular activating system is depressed, incoming stimuli are muted, and the effects of anxiety are blocked. Alprazolam does not directly target serotonin, dopamine, or norepinephrine.

CN: Pharmacological and parenteral therapies; CL: Apply

110. 1,2,4,5. It is appropriate to provide education on medication mechanisms, benefits, and managing side effects. No medication will eliminate all anxiety, so teaching about anxiety reduction and adaptive coping is needed. Venlafaxine is a serotonin-norepinephrine reuptake inhibitor antidepressant, and it will take 2 to 4 weeks to feel the effects.

CN: Pharmacological and parenteral therapies; CL: Create

111. 3. Using alcohol or any central nervous system depressant while taking a benzodiazepine, such as alprazolam, is contraindicated because of additive depressant effects. Ingestion of chocolate, cheese, or shellfish is not problematic.

CN: Pharmacological and parenteral therapies; CL: Apply

112. 1. Buspirone, a nonbenzodiazepine anxiolytic, is particularly

effective in treating the cognitive symptoms of anxiety, such as worry, apprehension, difficulty with concentration, and irritability. Buspirone is not effective for the somatic symptoms of anxiety (muscle tension). Therapeutic effects may be experienced in 7 to 10 days, with full effects occurring in 3 to 4 weeks. This drug is not known to cause physical or psychological - dependence. It can be taken with food or small meals to reduce gastrointestinal upset.

CN: Pharmacological and parenteral therapies; CL: Evaluate

113. 2. The nurse initially reassures the client that her feelings and behaviors are typical reactions to serious trauma to help decrease anxiety and maintain self-esteem. Explaining the effects of stress on the body may be helpful later. Telling the client that her symptoms are temporary is less helpful. Acknowledging the unfairness of the client's situation does not address the client's needs at this time.

CN: Psychosocial integrity; CL: Synthesize

114. 3. The client with anxiety may be able to learn to recognize when she is feeling anxious, understand the reasons for her anxiety, and be able to describe situations that preceded her feelings of anxiety. However, she is likely to continue to experience symptoms unless she has also learned to use adaptive and palliative methods to reduce anxiety.

CN: Psychosocial integrity; CL: Synthesize

115. 4. Saying "The accident just happened and could not have been predicted" provides the client with an objective perception of the event instead of the client's perceived role. This type of statement reflects active listening and helps to reduce feelings of blame and guilt. Saying "Do not keep torturing yourself" or "Stop blaming yourself" is inappropriate because it tells the client what to do, subsequently delaying the therapeutic process. The statement "Let us talk about something that is a bit more pleasant" ignores the client's feelings and changes the subject. The client needs to verbalize feelings and decrease feelings of isolation.

CN: Psychosocial integrity; CL: Synthesize

116. 1. The nurse states "You did what you had to do at that time" to help

the client evaluate past behavior in the context of the trauma. Clients commonly feel guilty about past behaviors when viewing them in the context of current values. The other statements are inappropriate because they do not help the client to evaluate past behavior in the context of the trauma.

CN: Psychosocial integrity; CL: Synthesize

117. 2. Writing in a journal can help the client safely express feelings, particularly anger, when the client cannot verbalize them. Listening to music, meditating, and working on a puzzle may be relaxing, but will not help the client express their feelings. Safely externalizing anger by writing in a journal helps the client to maintain control over her feelings.

CN: Psychosocial integrity; CL: Synthesize

118. 3. The nurse should facilitate progressive review of the accident and its consequences to help the client integrate feelings and memories and to begin the grieving process. Helping the client to evaluate her sister's behavior, telling the client to avoid details of the accident, or postponing the discussion of the accident until the client brings it up is not therapeutic and does not facilitate the development of trust in the nurse. Such actions do not facilitate review of the accident, which is necessary to help the client integrate feelings and memories and begin the grieving process.

CN: Management of care; CL: Create

119. 3,1,4,2. Safety is the first priority in clients experiencing acute stress disorder (ASD). ASD symptoms are typical reactions to an abnormal situation that are not being handled effectively. When the client believes he is “normal,” being accepted, understood, and supported, then he will be able to discuss his thoughts and feelings related to the traumas of the war.

CN: Safety and infection control; CL: Synthesize

120. 4. Survivors of trauma/torture have a lot of difficulty with trust and do not readily talk about the horrible events. Therefore, empathy and a willingness to listen without pressuring the client are crucial. Believing everything may or may not be possible and does not convey the empathy. It is sometimes difficult to believe what satanic cults can do to children. Saying that it was not right that members did not help diverts attention from the

client to the member. Asking to hear about the cult shows more interest in the cult than the client.

CN: Psychosocial integrity; CL: Synthesize

121. 3,1,2,4. The nurse should first assure the client's safety after the client's self-mutilation. Another safety issue is whether the stepdad possibly may be abusing younger children; if so, a police report may need to be filed. Then, it is important to know what the client means exactly by "screwed up" to identify other emotions and behaviors that need attention. It is very common for survivors of childhood sexual abuse to have intense anger at those who did not stop or prevent the abuse, and once the other steps have been taken, the nurse can begin to help the client manage his anger.

CN: Reduction of risk potential; CL: Synthesize

122. 1,2,4,6. Relaxation techniques and listening to calming music decrease anxiety and promote sleep. Quetiapine is often effective in decreasing nightmare and flashbacks and has a beneficial side effect of drowsiness. Leaving her door slightly open will decrease the noise of making 15-minute checks at night. Staying in the dayroom in a recliner with all the noise and lights is not likely to help. Processing memories an hour or two before bedtime does not allow enough time to calm down before sleep.

CN: Psychosocial integrity; CL: Synthesize

123. 4. The nurse judges the client's request for an interruption in treatment as a necessary break in treatment. A "time-out" is common and necessary to enable the client to focus on pressing problems and solutions. It is not necessarily a method of avoidance, a detriment to progress, or the end of treatment. A problem like housing can be very stressful and require all of the client's energy and attention, with none left for the emotional stress of treatment.

CN: Management of care; CL: Analyze

124. 1. Combining a benzodiazepine with an antacid impairs the absorption rate of the benzodiazepine. Acetaminophen, vitamins, and aspirin are safe to take with a benzodiazepine because no major drug interactions occur.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

125. 2. Diazepam, like any benzodiazepine, cannot be stopped abruptly. The client must be slowly tapered off of the medication to decrease withdrawal symptoms, which would be similar to withdrawal from alcohol. Alcohol in combination with a benzodiazepine produces an increased central nervous system depressant effect and therefore should be avoided. Diazepam can cause drowsiness, and the client should be warned about driving until tolerance develops. Diazepam has muscle relaxant properties and will help tight, tense muscles feel better.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

126. 3. The nurse should suggest behavior therapy, which is most successful for clients with phobias. Systematic desensitization, flooding, exposure, and self-exposure treatments are most therapeutic for clients with phobias. Self-exposure treatment is being increasingly used to avoid frequent therapy sessions. Insight therapy, exploration of the dynamics of the client's personality, is not helpful because the process of anxiety underlies the disorder. Group therapy or psychoanalysis, which deals with repressed, intrapsychic conflicts, is not helpful for the client with phobias because it does not help to manage the underlying anxiety or disorder.

 CN: Psychosocial integrity; CL: Apply

127. 4. Saying "It is a sign of progress to eat in the dining area with me" conveys positive reinforcement and gives the client hope and confidence, thus reinforcing the adaptive behavior. Stating "It was not so hard, now was it" decreases the client's self-worth and minimizes his accomplishment. Stating "At supper, I hope to see you eat with a group of people" will overwhelm the client and increase anxiety. Stating "You must have been hungry today" ignores the client's positive behavior and shows the nurse's lack of understanding of the dynamics of the disorder.

 CN: Psychosocial integrity; CL: Synthesize

128. 4. The nurse should walk with the client to activate adaptive coping for the client experiencing high anxiety and decreased motivation and energy. Stating "I know you can do it," "Try holding on to the wall," or "You can

miss group this one time” maintains the client’s avoidance, thus reinforcing the client’s behavior, and does not help the client begin to cope with the problem.

CN: Psychosocial integrity; CL: Synthesize

129. 2. The effectiveness of St. John’s wort with depression is unconfirmed. The critical issue is that the combination of St. John’s wort and sertraline (an SSRI antidepressant) can produce serotonin syndrome, which can be fatal. The client should not take the St. John’s wort while taking sertraline.

CN: Pharmacological and parenteral therapies; CL: Apply

130. 1. When the client says he thinks he is “going crazy,” it is best for the nurse to ask him what “crazy” means to him. The nurse must have a clear idea of what the client means by his words and actions. Using an open-ended question facilitates client description to help the nurse assess his meaning. The other statements minimize and dismiss the client’s concern and do not give him the opportunity to openly discuss his feelings, possibly leading to increased anxiety.

CN: Psychosocial integrity; CL: Synthesize

131. 1. A client who is exhibiting compulsive behavior is attempting to control his anxiety. The compulsive behavior is performed to relieve discomfort and to bind or neutralize anxiety. The client must perform the ritual to avoid an extreme increase in tension or anxiety even though the client is aware that the actions are absurd. The repetitive behavior is not an attempt to control thoughts; the obsession or thinking component cannot be controlled. It is not an attention-seeking mechanism or an attempt to express hostility.

CN: Psychosocial integrity; CL: Analyze

132. 2. The nurse should wake the client an hour earlier to perform his ritual so that he can be on time for breakfast with the other clients. The nurse provides the client with time needed to perform rituals because the client needs to keep his anxiety in check. The nurse should never take away a ritual, because panic will ensue. The nurse should work with the client later to

slowly set limits on the frequency of the action.

CN: Pharmacological and parenteral therapies; CL: Synthesize

133. 3. The nurse conveys empathy and awareness of the client's need to reduce anxiety by showing acceptance and understanding to the client, thereby promoting trust. Ignoring the behavior, questioning the client about her avoidance of others, or telling other clients to follow her when she moves is not therapeutic or appropriate.

CN: Psychosocial integrity; CL: Synthesize

134. 1,3,4,6. Managing suicidal thought, urges to self-mutilate, and the intense anger are critical safety issues. Then, the focus can switch to communication methods for each alter and the integration issues. Process groups can be overwhelming when too much is revealed or when child alters are unable to understand the group content. There are no known medicines to stop the process of dissociating.

CN: Management of care; CL: Create

135. 3. The no-harm contract with any destructive alters is essential along with the reminder that the alters share the same body. Later, the alter's attitudes about the client can be explored in more depth. When alter personalities emerge, their behaviors are not predictable. Restraints could not be placed on the client soon enough. There are no behaviors to justify restraints at this point. Creating a stress-free environment is not possible.

CN: Safety and infection control; CL: Synthesize

The Client with a Somatoform Disorder

136. 4. The nurse sets limits by informing the client in a matter-of-fact manner that the nurse cannot give her additional pain medication at this time. The nurse can then invite the client to participate in another activity, such as a card game, to decrease rumination about pain by directing the client's attention to an activity. By telling the client the nurse will call the **HCP**  as requested, the nurse is manipulated to do what the client demands. Suggesting that the client lie down because she has to wait for the next dosage or telling the client that the HCP will be in later ignores the client and

her needs and is not helpful in decreasing rumination about her pain.

CN: Psychosocial integrity; CL: Synthesize

137. 3. The nurse instructs the **UAP**  to invite the client to lunch and accompany him to the dining room to decrease manipulation, secondary gain, dependency, and reinforcement of negative behavior while maintaining the client's self-worth. Taking the client a lunch tray and allowing him to eat in his room reinforces negative behaviors and secondary gain. Telling the client he will need to wait until supper to eat if he misses lunch or informing the client that he has 10 minutes to get to the dining room challenges the client and may increase feelings of anger and the need for physical complaints.

CN: Management of care; CL: Synthesize

138. 2. Pushing insight or awareness into conflicts or problems increases anxiety and the need for physical symptoms to handle or take care of the anxiety. Awareness or insight must be developed slowly as the client's need for symptoms diminishes. Saying "Ignore the client's behavior and treat her with respect" is not helpful to the staff member or the client. This statement fails to educate the staff member about the client's disorder and simply dismisses the needs of both. It is not true that pushing awareness will be helpful and further the client's recovery; this is the opposite of what is needed. Meeting with the client to confront her behavior is not therapeutic and will greatly increase the client's anxiety and the need for the conversion symptoms.

CN: Management of care; CL: Synthesize

139. 2. The nurse helps the client to focus on his feelings about his impending divorce to decrease the client's anxiety and decrease his focus on physical ailments. The client with a somatoform disorder typically has problems with identifying, describing, and dealing with feelings. Internalizing feelings leads to increased anxiety and the need for protective mechanisms. Asking the client to describe his problem with nausea, allowing the client to talk about the many **HCP**  he has seen and the medications he has taken, and informing the client about a different medication for nausea are counterproductive toward recovery because they reinforce the focus on the symptoms.

CN: Psychosocial integrity; CL: Synthesize

140. 4. The nurse should redirect the interaction back to fishing or another focus whenever the client begins to ruminate about physical symptoms or impairment. Doing so helps the client talk about topics that are more therapeutic and beneficial to recovery. Allowing the client to talk about his pain or asking if he needs additional pain medication is not therapeutic because it reinforces the client's need for the symptom. Getting up and leaving the client is not appropriate unless the nurse has set limits previously by saying "I will get up and leave if you continue to talk about your pain."

CN: Psychosocial integrity; CL: Synthesize

141. 1. The client who states "I understand my pain will feel worse when I am worried about my divorce" recognizes the connection between his pain and the divorce and indicates developing insight into his problem. The nurse should then be able to assist the client with developing adaptive coping strategies. The other statements indicate a lack of insight into his disorder and lack of progress toward recovery. The client is still searching for the "right" diagnosis, medication, and **HCP** .

CN: Psychosocial integrity; CL: Evaluate

Managing Care, Quality, and Safety of Clients with Personality Disorders, Substance-Related Disorders, Anxiety Disorders, and Anxiety-Related Disorders

142. 3,1,2,4. The nurse should first obtain a prescription for and administer diazepam to stop the status epilepticus. The nurse should next prevent injury by using seizure pads. Recording the time, duration, and nature of the seizures will be important for ongoing treatment. Finally, the nurse can attempt to obtain information about medication use and abuse history from the friend until the client is able to do so for himself.

CN: Safety and infection control; CL: Synthesize

143. 1. Having a **UAP**  stay with the client provides for reassurance and safety. Being next to the nursing desk will increase stimuli and confusion. Being alone will increase the client's fears and anxiety. It is inappropriate to

ask the boyfriend to provide client supervision for the nurse.

CN: Safety and infection control; CL: Synthesize

144. 5,2,4,3,1,6. After orienting the client to time and place, the nurse should assure constant observation of the client to prevent the client from getting hurt. The administration of the haloperidol and lorazepam is needed to quickly decrease the symptoms of delirium tremens (DTs) and lower the vital signs. Monitoring vital signs assesses the client's stability and need for additional medications. The nurse can ask another staff to contact the **healthcare provider (HCP)**  to request a prescription for restraints in case the client becomes violent toward self or others. After the DT symptoms subside, the haloperidol would be stopped due to the decrease in the seizure threshold. Other detoxification protocols would then begin. Last, chart the client's response.

CN: Safety and infection control; CL: Synthesize

145. 2. The statement "The client is a weak individual and could stop if he desires" is false and indicates a lack of understanding regarding alcohol dependency. Criteria for substance dependency include the inability to stop using even when wanting to do so. The client cannot stop or control the amount used when dependent on a substance. Alcohol dependency affects individuals from every culture and socioeconomic background and has nothing to do with being a "weak" individual. The devastating effects of alcohol dependency are felt by every member of the family and not just the individual with the alcohol problem. Family members need education about the physical, physiologic, and psychological effects of alcohol and referrals to self-help groups for support. They have felt and lived with the devastating effects of the disease. A simple and commonly held view of alcoholism is that alcohol is a problem when it interferes with life or disrupts family, work, or social relationships.

CN: Management of care; CL: Evaluate

146. 1. Some behavior that is legally allowed might not be considered ethically appropriate. Legal and ethical standards are often linked, such as in the commandment "Thou shalt not kill." Ethical standards are never irrelevant, though a client's safety or the safety of others may pose an ethical

dilemma for healthcare personnel. Searching a client's room when he or she is not there is a violation of privacy. Room searches can be done with an HCP's  prescription and generally are done with the client present.

 CN: Management of care; CL: Apply

147. 1,2,4,3. The nurse should first provide for safety of the client and the staff by requesting assistance from the security department. Next, the nurse should obtain an ECG because the client reports having chest pain. The nurse should then obtain a urine sample to identify if the client has been using illegal drugs. When the client is stabilized, the nurse can develop a care plan that includes treatment goals to support the respiratory and cardiovascular functions and enhance clearance of the agent and initiate a referral for treatment where access to the drug is eliminated and drug rehabilitation is provided as part of therapeutic management of clients with substance abuse and/or a drug overdose.

 CN: Reduction of risk potential; CL: Analyze

148. 2. Recognizing that the clients are part of the solution to the issues they are presenting demonstrates a client-centered approach to care. Having the new clients challenge the behaviors of other clients does not facilitate the development of a therapeutic milieu. Warning clients that behaviors are unacceptable reinforces a sense of client powerlessness and does not build a therapeutic relationship. Discussing respect and collaboration would happen after the criticisms have been acknowledged and the clients have been asked for their opinions.

 CN: Management of care; CL: Synthesize

149. 4. The discharge teaching session will be most effective if the nurse uses a client-centered approach to better assess what the client needs and, therefore, what information to share. Sharing all the information does not respect the knowledge that the client already has. Reviewing the policies is one area to help identify important areas for teaching, but in order to ensure that client needs are met, further assessment is required. Awareness of personal biases should not be used to determine what is important for the client.

CN: Management of care; CL: Synthesize

TEST

Stress, Crisis, Anger, and Violence

- The Client Managing Stress
- The Client Coping with Physical Illness
- The Client in Crisis
- The Client with Problems Expressing Anger
- The Client with Interpersonal Violence
- Managing Care, Quality, and Safety of Clients with Stress, Crisis, Anger, and Violence
- Answers, Rationales, and Test-Taking Strategies

The Client Managing Stress

1. The nurse cares for a middle-aged client with a below-the-knee amputation. Which statement indicates the need for further assessment of the client's body image?

- ☐ **1.** "When I get my prosthesis, I want to learn to walk so I can participate in walkathons."
- ☐ **2.** "I hope to get skilled enough at using my prosthesis to help others like me adjust."
- ☐ **3.** "Whenever I start to feel sorry for myself, I remember that my buddy died in that accident."
- ☐ **4.** "I hope I can handle having a prosthesis, but I am really wondering what my wife will think."

2. A 75-year-old client is newly diagnosed with diabetes. The nurse is instructing him about blood glucose testing. After the session, the client states, "I cannot be expected to remember all this stuff." The nurse should recognize this response as **most** likely related to which factor?

- ☐ 1. moderate to severe anxiety
- ☐ 2. disinterest in the illness
- ☐ 3. early-onset dementia
- ☐ 4. normal reaction to learning a new skill

3. A client in a general hospital is to undergo surgery in 2 days. He is experiencing moderate anxiety about the procedure and its outcome. To help the client reduce his anxiety, the nurse should:

- ☐ 1. tell the client to distract himself with games and television.
- ☐ 2. reassure the client that he will come through surgery without incident.
- ☐ 3. explain the surgical procedure to the client and what happens before and after surgery.
- ☐ 4. ask the surgeon to refer the client to a psychiatrist who can work with the client to diminish his anxiety.

4. Anxiety occurs in degrees, from a level that stimulates productive problem solving to a level that is severely debilitating. At a mild, productive level of anxiety, the nurse should expect to see what cognitive characteristic of mild anxiety?

- ☐ 1. slight muscle tension
- ☐ 2. occasional irritability
- ☐ 3. accurate perceptions
- ☐ 4. loss of contact with reality

5. As a client's level of anxiety increases to a debilitating degree, the nurse should expect which psychomotor behavior as indicating a panic level of anxiety?

- ☐ 1. suicide attempts and violence
- ☐ 2. desperation and rage
- ☐ 3. disorganized reasoning
- ☐ 4. loss of contact with reality

6. Nursing interventions with an anxious client change as the anxiety level increases. At a low level of anxiety, what is the primary focus of - intervention?

- ☐ 1. taking control of the situation for the client

- ☐ 2. learning and problem solving
- ☐ 3. reducing stimuli and pressure
- ☐ 4. using tension reduction activities

7. When coping becomes dysfunctional enough to require the client to be admitted to the hospital, the nurse expects that the client would be exhibiting what behaviors?

- ☐ 1. objective and rational problem solving
- ☐ 2. tension reduction activities and then problem solving
- ☐ 3. anger management strategies with no problem solving
- ☐ 4. minimal functioning with new problems developing

8. In addition to teaching assertiveness and problem-solving skills when helping the client cope effectively with stress and anxiety, the nurse should also address the client's ability to:

- ☐ 1. suppress anger.
- ☐ 2. balance a checkbook.
- ☐ 3. follow step-by-step directions.
- ☐ 4. use conflict resolution skills.

9. Which client statement indicates that the client has coped effectively with a relationship problem?

- ☐ 1. "My wife will be happy to know that I can spend less time at work now."
- ☐ 2. "My wife and I are talking about our likes and dislikes in activities."
- ☐ 3. "I can understand how my wife and I see things differently."
- ☐ 4. "We are really listening to each other about our different views on issues."

10. In an ongoing assessment, the nurse should identify the client's thoughts and feelings about a situation in addition to what other factors?

- ☐ 1. whether the client's behavior is appropriate in the context of the current situation
- ☐ 2. whether the client is motivated to decrease dysfunctional behaviors
- ☐ 3. which of the client's problems have the highest priority
- ☐ 4. which of the client's behaviors necessitates a no-harm contract

11. What short-term goal for a client hospitalized with a stress-related disorder is **most** realistic?

- ☐ 1. The client will demonstrate a positive self-image.
- ☐ 2. The client will describe plans for how to get back into school.
- ☐ 3. The client will write a list of strengths and needs.
- ☐ 4. The client will practice assertiveness skills in confronting his mother.

12. A nurse is counseling a client with cancer who is experiencing anxiety. Which goal will provide the **best** long-term client outcome?

- ☐ 1. Keep follow-up appointments with mental health providers.
- ☐ 2. Understand medication effects and adverse effects.
- ☐ 3. Take medication as prescribed.
- ☐ 4. Solve problems independently.

13. When integrating the concepts underlying the cognitive-behavioral model into a client's plan of care, the nurse should focus on what area?

- ☐ 1. substitution of rational beliefs for self-defeating thinking and behaving
- ☐ 2. insight into unconscious conflicts and processes
- ☐ 3. analysis of fears and barriers to growth
- ☐ 4. reduction of bodily tensions and stress management

14. Which client statement indicates that the client has gained insight into his use of the defense mechanism of displacement?

- ☐ 1. "I cannot think about the weekend right now. I have got to study for the exam."
- ☐ 2. "I know I am not good in sports, but I feel good about my grades."
- ☐ 3. "Now when I am mad at my wife, I talk to her instead of taking it out on the kids."
- ☐ 4. "For years I could not remember being molested; now I know I have to face it."

15. In which situation can a client's confidentiality be breached legally?

- ☐ 1. to answer a request from a client's spouse about the client's medication
- ☐ 2. in a student nurse's clinical paper about a client
- ☐ 3. when a client near discharge is threatening to harm an ex-partner

- ☐ 4. when a client's employer requests the client's diagnosis to initiate medical claims

16. A client is admitted after the police found he had been sleeping in his car for three nights. The client says, "My wife kicked me out and is divorcing me. It was not my fault I was fired from work. My wife and boss are plotting against me because I am smarter than they are." He then pounds the table and says, "I am not staying here, and you cannot stop me." What should be included in the client's **immediate** plan of care? Select all that apply.

- ☐ 1. collateral information from his wife and boss
- ☐ 2. anxiety and anger management
- ☐ 3. appropriate housing
- ☐ 4. divorce counseling
- ☐ 5. assault and escape precautions
- ☐ 6. suspiciousness and grandiosity issues

17. What is a crucial goal of therapeutic communication when helping the client deal with personal issues and painful feelings?

- ☐ 1. communicating empathy through gentle touch
- ☐ 2. conveying client respect and acceptance even if not all of the client's behaviors are tolerated
- ☐ 3. mutual sharing of information, spontaneity, emotions, and intimacy
- ☐ 4. guaranteeing total confidentiality and anonymity for the client

18. An 18-year-old pregnant college student presented at the prenatal clinic for an initial visit at 14 weeks' gestation. The client's history revealed that when she was 12, she and her mother survived a plane crash that killed her father and sister. Since that time, she has taken fluoxetine 20 mg orally daily for posttraumatic stress disorder (PTSD) and depression. Her medication was recently increased to 40 mg daily because of reports of increased stress and suicide ideation. Which side effect of fluoxetine would the nurse judge to be the greatest risk for the client and her developing fetus at this stage in her pregnancy?

- ☐ 1. insomnia
- ☐ 2. nausea/anorexia
- ☐ 3. headache

- ☐ 4. decreased libido

19. Which probe should the nurse use to encourage client evaluation of his or her own behavior?

- ☐ 1. “I can hear that it is still hard for you to talk about this.”
- ☐ 2. “So what does this all mean to you now?”
- ☐ 3. “What did you do differently with your coworker this time?”
- ☐ 4. “What will it take to carry out your new plans?”

20. Even when the client understands problems and is motivated to change, the client may have fears about failing. Which intervention is **most** likely to facilitate change?

- ☐ 1. reality testing about the need for change
- ☐ 2. asking the client about fears that need to be overcome
- ☐ 3. teaching new communication skills
- ☐ 4. having client practicing new behaviors

The Client Coping with Physical Illness

21. A mastectomy is recommended for a 68-year-old client diagnosed with breast cancer a week ago. When approached about giving consent for the mastectomy, the client says, “What is the use in trying to get rid of the cancer? It will just come back! I cannot handle another thing—having diabetes is enough. Besides, I am getting old. It would be different if I were younger and had more energy.” What should the nurse do?

- ☐ 1. Accept the client’s decision since it is her right to choose to obtain treatment or not.
- ☐ 2. Give the client information about the 5- and 10-year survival rates for breast cancer clients who underwent mastectomies.
- ☐ 3. Call the chaplain to speak with the client about her hopeless attitude about the future.
- ☐ 4. Explore with the client her feelings about her health problems and proposed surgery.

22. An 18-year-old client is recently diagnosed with leukemia. What is the **most** appropriate short-term goal for the nurse and client to establish?

- ☐ 1. accepting the client's death as imminent
- ☐ 2. expressing the client's angry feelings to the nurse
- ☐ 3. decreasing interaction with peers to conserve energy
- ☐ 4. gaining an intellectual understanding of the illness

23. The nurse has been asked to develop a medication education program for clients with chronic mental illness in the rehabilitation program. When developing the course outline, which topic is **most** important to include?

- ☐ 1. a categorization of many psychotropic drugs
- ☐ 2. interventions for common side effects of psychotropic drugs
- ☐ 3. the role of medication in the treatment of acute illness
- ☐ 4. effects of combining common street drugs with psychotropic medication

24. The healthcare provider (HCP) recommends that a client have a partial bowel resection and an ileostomy. Later, the client says to the nurse, "That doctor of mine surely likes to play big. I will bet the more he can cut, the better he likes it." Which reply by the nurse is **most** therapeutic?

- ☐ 1. "I can tell you more about the surgery if you like."
- ☐ 2. "What do you mean by that statement?"
- ☐ 3. "Why do you not think about getting a second opinion?"
- ☐ 4. "Does that remark have something to do with the operation he wants you to have?"

25. A client becomes increasingly irritable after being told that she has cancer. She is rude to visitors and pushes nurses away when they attempt to give her medications and treatments. What should the nurse do when the client has a hostile outburst?

- ☐ 1. Offer the client positive reinforcement each time she cooperates.
- ☐ 2. Encourage the client to discuss her immediate concerns and feelings.
- ☐ 3. Continue with the assigned tasks and duties as though nothing has happened.
- ☐ 4. Limit visitation until the client is less irritable.

26. Arrangements are made for a member of the colostomy support group to meet with a client before bowel surgery. What is accomplished by having a

representative from the group meet the client preoperatively?

- ☐ 1. letting the client know that he has resources in the community to help him
- ☐ 2. providing support for the healthcare provider's (HCP's) plan of therapy for the client
- ☐ 3. providing the client with support and realistic information on the colostomy
- ☐ 4. convincing the client that he will not be disfigured and can lead a full life

27. The client hospitalized for diagnosis and treatment of atrial fibrillation states to the nurse, "Please hand me the telephone. I need to check on my stocks and bonds." Which response by the nurse is **most** therapeutic?

- ☐ 1. "You will get more upset if you make that call."
- ☐ 2. "You have atrial fibrillations. Let us talk about what that means."
- ☐ 3. "You really do not care about the fact that you are sick, do you?"
- ☐ 4. "Do you realize you have a life-threatening condition?"

28. Which statement would lead the nurse to determine that a client lacks understanding of her acute cardiac illness and the ability to make changes in her lifestyle?

- ☐ 1. "I already have my airline ticket, so I will not miss my meeting tomorrow."
- ☐ 2. "These relaxation tapes sound okay; I will see if they help me."
- ☐ 3. "No more working 10 hours a day for me unless it is an emergency."
- ☐ 4. "I talked with my husband yesterday about working on a new budget together."

29. A client has been rehospitalized with a severe exacerbation of lupus. Her husband approaches the nurse and says, "My wife is scaring me. She says she does not want to live with this illness anymore. Our kids are grown, and she feels useless as a mother and a wife." Which statements are the **most** appropriate responses to the husband? Select all that apply.

- ☐ 1. "I will have a talk with your wife to see if she is suicidal."
- ☐ 2. "You need to be strong and optimistic when you are with her."

- ☐ 3. "I am glad you shared this with me. I can imagine that this is scary for you."
- ☐ 4. "I am sure she will feel differently when we get this episode under control."
- ☐ 5. "We can talk about what you can say to her that may help."

30. The client with kidney stones refuses to eat lunch and rudely tells the nurse to get out of his room. Which response by the nurse is **most** appropriate?

- ☐ 1. "I will leave, but you need to eat."
- ☐ 2. "I will get you something for your pain."
- ☐ 3. "Your anger does not bother me. I will be back later."
- ☐ 4. "You sound angry. What is upsetting you?"

31. A client diagnosed with ulcerative colitis also experiences obsessive-compulsive anxiety disorder (OCD). In helping the client understand her illness, the nurse should respond with which statement?

- ☐ 1. "Your ulcerative colitis has made you perfectionistic, and it has caused your OCD."
- ☐ 2. "There is no relationship at all between your colitis and your OCD. They are separate disorders."
- ☐ 3. "The perfectionism and anxiety related to your obsessions and compulsions have led to your colitis."
- ☐ 4. "It is possible that your desire to have everything be perfect has caused stress that may have worsened your colitis, but there is no proof that either disorder caused the other."

32. A client receiving dialysis directs profanities at the nurse and then abruptly hangs his head and pleads, "Please forgive me. Something just came over me. Why do I say those things?" The nurse interprets this as which finding?

- ☐ 1. neologism
- ☐ 2. confabulation
- ☐ 3. flight of ideas
- ☐ 4. emotional lability

33. On an oncology unit, the nurse hears noises coming from a client's room. The client is found throwing objects at the walls and has just picked up the phone and is screaming, "How can God do this to me? It is the third type of cancer I have had. I have gone through all the treatment for nothing." In what order of priority from first to last should the nurse make the interventions? All options must be used.

1. "Tell me what you are feeling right now."

2. "Please put the telephone down so we can talk."

3. "I can hear how upset you are about the cancer."

4. "I wonder if you would like to talk to a clergyman."

34. A client who has had AIDS for years is being treated for a serious episode of pneumonia. A psychiatric nurse consult was arranged after the client stated that he was tired of being in and out of the hospital. "I am not coming in here anymore. I have other options." The nurse would evaluate the psychiatric nurse consult as helpful if the client makes which statements?

☐ 1. "Nobody wants me to commit suicide."

☐ 2. "If I talk about suicide, I will be transferred to the psychiatric unit."

☐ 3. "I realize that I really do have more time to enjoy my family and friends."

☐ 4. "I would probably screw up suicide anyway."

The Client in Crisis

35. The nurse's overall goal in planning to assist the client responding to a loss is to:

- ☐ 1. make sure the client progresses through all of the stages of the grief process.
- ☐ 2. encourage the client to work to resolve lingering family conflicts.
- ☐ 3. assist the client to engage in the work associated with the normal grieving process.
- ☐ 4. allow the client to express anger.

36. The nurse working at the site of a severe flood sees a woman, standing in knee-deep water, staring at an empty lot. The woman states, "I keep thinking that this is a nightmare and that I will wake up and see that my house is still there." Which crisis intervention strategies are **most** needed at this time? Select all that apply.

- ☐ 1. Ask the client about any physical injuries she may have.
- ☐ 2. Determine if any of her family are injured or missing.
- ☐ 3. Allow the client to talk about her fears, anger, and other feelings.
- ☐ 4. Tell her that groups are being formed at the shelter for flood survivors.
- ☐ 5. Refer her to the shelter for dry clothes and food.
- ☐ 6. Assess her for risk of suicide and other signs of decompensation.

37. The nurse is assessing a client who has just experienced a crisis. The nurse should **first** assess this client for which behavior?

- ☐ 1. effective problem solving
- ☐ 2. level of anxiety
- ☐ 3. attention span
- ☐ 4. help seeking

38. The nurse is working with a family in crisis. What should the nurse do in order of priority from first to last? All options must be used.

1. Make a plan for managing the crisis.

2. Develop strategies to reduce symptoms.

3. Assess the family's resources.

4. Identify the family member in crisis.

39. An anxious young adult is brought to the interviewing room of a crisis shelter, sobbing and saying that she thinks she is pregnant but does not know what to do. Which nursing intervention is **most** appropriate at this time?

- ☐ 1. Ask the client about the type of things that she had thought of doing.
- ☐ 2. Give the client some ideas about what to expect to happen next.
- ☐ 3. Recommend a pregnancy test after acknowledging the client's distress.
- ☐ 4. Question the client about her feelings and possible parental reactions.

40. A potentially pregnant 16-year-old client says that she has been "hooking up" with a boy she considers to be her boyfriend. Which response should the nurse make **first**?

- ☐ 1. "You mean you have had sexual intercourse?"
- ☐ 2. "Describe what you mean by hooking up."
- ☐ 3. "I think we need to talk about what is involved in sexual intercourse."
- ☐ 4. "All you have been doing with your boyfriend is hooking up?"

41. A 40-year-old client who is quite anxious says that she would "rather die than be pregnant." Which response by the nurse is **most** helpful?

- ☐ 1. "Try not to worry until after the pregnancy test."
- ☐ 2. "You know, pregnancy is a normal event."

- ☐ 3. "You are only 40 years old and not too old to have a baby."
- ☐ 4. "I see you are upset. Take some deep breaths to relax a little."

42. On a crisis shelter hotline, the nurse talks to two 11-year-old boys who think a friend sniffs glue. They say his breath sometimes smells like glue and he acts drunk. They say they are afraid to tell their parents about the friend. When formulating a reply, what is **most** important factor for the nurse to consider?

- ☐ 1. The boys probably fear punishment.
- ☐ 2. Sniffing glue is illegal.
- ☐ 3. The boys' observations could be wrong.
- ☐ 4. Glue sniffing is a minor form of substance abuse.

43. While the nurse is teaching a group of volunteers for a crisis hotline, a volunteer asks, "What if I am not sure why someone is calling?" Which statement by the nurse is **most** helpful?

- ☐ 1. "Ask the caller to tell you why he or she is calling you today."
- ☐ 2. "Tell the caller to make an appointment at the walk-in crisis clinic."
- ☐ 3. "Instruct the caller to go to the nearest emergency department."
- ☐ 4. "Tell the caller to let you speak to anyone else in the house."

44. After teaching a group of students who are volunteering for a local crisis hotline, the nurse judges that further education about crisis and intervention is needed when a student makes which statement?

- ☐ 1. "Callers to a crisis line use this service when they are overwhelmed and exhausted."
- ☐ 2. "People use crisis hotlines when they are in the most pain and nothing is working for them."
- ☐ 3. "Most people in crisis will be calling the line once every day for at least a year."
- ☐ 4. "One benefit is that a person will know how to handle stressful situations better in the future."

45. An adolescent woman, whose family is living in a cult, ran away from the group's compound to her aunt's house. The aunt brought the girl to the emergency department after finding multiple knife cuts in various stages of

healing on the girl's body. She is admitted to the unit because of many - trauma-related symptoms. What actions should the nurse take? Select all that apply.

- ☐ 1. Ask her to describe her experiences in a discussion group with other teens.
- ☐ 2. Teach her emotion management skills to help her deal with her "normal reactions to an abnormal situation."
- ☐ 3. Assess her for other possible injuries, pregnancy, and sexually transmitted infections.
- ☐ 4. Teach her ways to control self-destructive behaviors such as suicide attempts, self-mutilation, and rage outbursts.
- ☐ 5. Obtain a sample for a urine drug screen and routine urinalysis.
- ☐ 6. Help her process her emotions and memories as she is willing to share these.

46. A true crisis state, involving a period of severe disorganization, is difficult to endure emotionally and physically. The nurse recognizes that a client will only be able to tolerate being in crisis for how long?

- ☐ 1. 1 to 2 weeks
- ☐ 2. 4 to 6 weeks
- ☐ 3. 12 to 14 weeks
- ☐ 4. 24 to 26 weeks

47. The nurse incorporates the underlying premise of crisis intervention, about providing "the right kind of help at the right time," to achieve which initial goal?

- ☐ 1. regaining emotional security and equilibrium
- ☐ 2. resolution of underlying emotional problems
- ☐ 3. development of insight and personal growth
- ☐ 4. formulation of more effective support systems

48. The nurse understands that with the right help at the right time, a client can successfully resolve a crisis and function better than before the crisis, based primarily on which factor?

- ☐ 1. relinquishment of dysfunctional coping

- ☐ 2. reestablishment of lost support systems
- ☐ 3. acquisition of new coping skills
- ☐ 4. gain of crisis prevention knowledge

49. A client is being discharged after 3 days of hospitalization for a suicide attempt that followed the receipt of a divorce notice. Which client finding indicates to the nurse that the client is ready for discharge?

- ☐ 1. Expresses a readiness for discharge.
- ☐ 2. Has the names and phone numbers of two divorce lawyers.
- ☐ 3. Has a list of support persons and community resources.
- ☐ 4. Displays emotional stability.

50. A distraught father is waiting for his son to come out of surgery. He accidentally backed the car into his son, causing multiple fractures and a serious head injury. Which statement by the father would **most** alert the nurse to the need for a psychiatric consultation?

- ☐ 1. "My son will be fine, but I may be charged with reckless driving."
- ☐ 2. "This accident will probably cost me my marriage."
- ☐ 3. "I just did not see him run behind the car."
- ☐ 4. "If he dies, there will be nothing for me to do but join him."

51. A grandson calls the crisis center expressing concern about his grandmother, who lost her husband a month ago. He states, "She has been in bed for a week and is not eating or showering. She told me that she did not want to kill herself, but it is not like her to do nothing for herself. She will not even talk to me when I visit her." The nurse encourages the grandson to bring his grandmother to the center for evaluation based on which reason?

- ☐ 1. The behaviors may reflect passive suicidal thoughts.
- ☐ 2. The behaviors reflect altered role performance.
- ☐ 3. Seeing the grandson and grandmother together will be helpful.
- ☐ 4. Refusing to talk to the grandson alone indicates a major problem.

52. A 16-year-old client who is being seen by the crisis nurse after making several superficial cuts on her wrist states that all her friends are siding with her ex-boyfriend and will not talk to her anymore. She says she knows that the relationship is over, but "If I cannot have him, no one else will." Which

client problem takes the **highest priority**?

- ☐ 1. situational low self-esteem
- ☐ 2. risk for other-directed violence
- ☐ 3. risk for suicide
- ☐ 4. risk-prone health behavior

53. A client who comes to the crisis center in a very distressed state tells the nurse, “I just cannot get over being fired last week. I have asked for help. I have talked to friends. I have tried everything to get through this, but nothing is working. Help me!” Which initial crisis intervention strategy should the nurse use?

- ☐ 1. referral for counseling
- ☐ 2. support system assessment
- ☐ 3. emotion management
- ☐ 4. unemployment assistance

54. A major role in crisis intervention is getting a client’s family and friends involved in helping with the immediate crisis as soon as possible. The nurse should determine that the support persons are prepared to help when they verbalize what information?

- ☐ 1. the name and phone number of the client’s healthcare provider (HCP)
- ☐ 2. emergency resources and when to use them
- ☐ 3. the coping strategies they are using
- ☐ 4. long-term solutions they plan to tell the client to use

55. During the interview at a crisis center, a newly widowed client reveals the wish “to join my husband in Heaven.” After the nurse asks the client to sign a no-harm contract, which question is appropriate to use **next**?

- ☐ 1. “What feelings you have been experiencing?”
- ☐ 2. “Have you considered taking antidepressants?”
- ☐ 3. “What was the cause of your husband’s death?”
- ☐ 4. “Do you have children who are willing to help you?”

56. A nurse manager of the crisis access center of a psychiatric facility in a major city notices a sudden increase in the number of incoming calls one afternoon. After quickly surveying the call sheets, the nurse finds that most

callers are very anxious after military aircraft flew very low over the city. Which strategies would be **most** appropriate in this situation? Select all that apply.

- ☐ 1. Instruct the crisis workers to additionally screen callers about where they were on 9/11/01 and their memories of that event.
- ☐ 2. Give the crisis workers a list of symptoms of posttraumatic stress disorder (PTSD) and techniques for dealing with these symptoms.
- ☐ 3. Ask for an emergency meeting with the managers of the inpatient and outpatient services to formulate a contingency plan for increased services if needed.
- ☐ 4. Ask the major media outlets in the city to make a scripted public service announcement about the possible recurrence of symptoms experienced after the events of 9/11/01.
- ☐ 5. Prepare for a scripted interview with the local media about PTSD symptoms and techniques for dealing with these symptoms.
- ☐ 6. Ask the director of psychiatric services to call the military to issue an apology for the flyover.

The Client with Problems Expressing Anger

57. A 35-year-old man was experiencing marital discord with his wife of 4 years. When his wife walked out, he became angry, throwing things, and breaking dishes. A friend talked him into seeking help at the local mental health center. Which of these questions should the nurse ask **initially** to begin to assess this man's immediate problem?

- ☐ 1. "Do you feel in control of yourself at this time?"
- ☐ 2. "What did you do to cause your wife to leave?"
- ☐ 3. "In hindsight, how might you have managed this situation differently?"
- ☐ 4. "What led you to come in for help today?"

58. A client is being admitted to a psychiatric outpatient program for counseling for his ongoing emotional symptoms. He is asked to rate the severity of his depression, anxiety, and anger. He states, "I do not have any anger any more. I lost my temper once and nearly hurt my wife. I never got angry again." In which order of priority from first to last should the principles

related to anger be shared with this client? All options must be used.

1. “You can learn effective ways to discuss anger with others and still maintain control.”

2. “Anger is a natural emotion occurring in all human relationships.”

3. “Holding your anger inside contributes to your depression.”

4. “Unexpressed anger has a negative effect on the human body and mind.”

59. The father of a soldier who was killed 2 days ago is admitted after a serious suicide attempt. He is medically stable and has signed a no-harm contract. During a talk with the nurse, he says, “Terrorism and war are holding me and the whole world hostage. It is so unfair. I would rather be dead than live alone in constant fear.” Which nursing interventions are important in the next few days? Select all that apply.

- ☐ 1. discussing effective ways to express justifiable anger
- ☐ 2. teaching stress management and relaxation techniques
- ☐ 3. identifying community groups for relatives of military personnel
- ☐ 4. recommending an antiwar advocacy group
- ☐ 5. strategizing about ways to increase a personal sense of security

60. In developing a plan of care for a client who has had previous episodes of angry verbal outbursts, the nurse plans to take an educational approach to

the problem. Arrange the steps the nurse should take from first to last. All options must be used.

1. Assist the client to recognize the early cues that he is angry.

2. Help the client identify triggers for his anger.

3. Practice with the client appropriate ways to express his anger.

4. Identify alternate ways to express his anger.

61. The treatment team recommends that a client take an assertiveness training class offered in the hospital. Which behavior indicates that the client is becoming more assertive?

- ☐ 1. The client arrives late for unit activities, and when asked why he is late, he says, “Because I feel like it!”
- ☐ 2. The client asks the nurse to call his employer about his insurance.
- ☐ 3. The client asks his roommate to put away his dirty clothes because the untidiness bothers him.
- ☐ 4. The client follows the nurse’s advice of asking his healthcare provider (HCP) about being passive aggressive.

62. Which physiologic response should the nurse expect as **unlikely** to occur when a client is angry?

- ☐ 1. increased respiratory rate
- ☐ 2. decreased blood pressure

- ☐ 3. increased muscle tension
- ☐ 4. decreased peristalsis

63. When planning the care of a client experiencing aggression, the nurse incorporates the principle of “least restrictive alternative,” meaning that less restrictive interventions must be tried before more restrictive measures are employed. What measures should the nurse consider to be the **most** restrictive?

- ☐ 1. tension reduction strategies
- ☐ 2. haloperidol given orally
- ☐ 3. voluntary seclusion or time-out
- ☐ 4. haloperidol given intramuscularly

64. As an angry client becomes more agitated while talking about his problems, the nurse decides to ask for staff assistance in taking control of the situation when the client demonstrates which behavior?

- ☐ 1. swearing about his wife’s behaviors when discussing marital problems
- ☐ 2. picking up a pool cue stick and telling the nurse to get out of his way
- ☐ 3. making a fist and pounding loudly on the table
- ☐ 4. coming out of his room instead of staying in time-out

65. The nurse is advising a client with schizophrenia about what to do when she begins to get agitated. The client has been compliant with taking her medications and has worked with clinic staff on dealing with her illness and recognizing when she is becoming agitated. Indicate the order from first to last in which the nurse should suggest the actions be taken. All options must be used.

1. “Take your oral lorazepam.”

2. “Take your oral haloperidol.”

3. “Go to a quiet place.”

4. “Tell trusted people that you are becoming upset.”

66. When a client is about to lose control, the extra staff who come to help commonly stay at a distance from the client unless asked to move closer by the nurse who is talking to the client. What **best** explains the primary rationale for staying at a distance initially?

- ☐ 1. The client is more likely to act out if there is an audience, even additional staff.
- ☐ 2. The nurse talking to the client makes the decisions about other staff actions.
- ☐ 3. The client is likely to perceive others as being closer than they are and feel threatened.
- ☐ 4. When the extra staff is visible, the client is less likely to regain self-control.

67. When preparing to use seclusion as an alternative to restraint for a client who has not yet lost control, the nurse expects to use a room with limited furniture and no access to dangerous articles. What should the nurse also consider as critical for the safety of the client?

- ☐ 1. a security window in the door or a room camera
- ☐ 2. lights that can be dimmed from outside the room
- ☐ 3. a staff member to stay in the room with the client
- ☐ 4. a prescription for the seclusion before it is initiated

68. The nurse is required initially to restrain all four of a client’s extremities. For what reason would the nurse anticipate the need to add a full-length restraint blanket?

- ☐ 1. The client states that restraints are tight and uncomfortable.

- ☐ 2. The staff want extra protection for themselves.
- ☐ 3. The client is at risk for injury from fighting the restraints.
- ☐ 4. Staff assessment reveals that the client will feel more secure under the blanket.

69. Which nursing intervention is the **highest priority** when a client is placed in restraints?

- ☐ 1. monitoring the client every 15 minutes
- ☐ 2. assisting with nutrition and elimination
- ☐ 3. performing range-of-motion exercise for each limb, one at a time
- ☐ 4. changing the client's position every 2 hours

70. According to hospital protocol, after a client is restrained, the staff meet and discuss the restraint situation. In addition to sharing feelings and offering support, what should the nurse identify as the long-term goal for the debriefing?

- ☐ 1. providing feedback to each other on how procedures were handled
- ☐ 2. comparing the perceptions of the various staff members
- ☐ 3. deciding when to release the client from restraints
- ☐ 4. improving the staff's use of restraint procedures

The Client with Interpersonal Violence

71. A client was brought to the unit and admitted involuntarily. During visiting the next day, the client's brother demands that the client be released immediately. The brother says he might have to hurt staff if the unit door is not opened. In which order of priority from first to last should the nursing actions be implemented? All options must be used.

1. Call security officers to the unit for the protection of all on the unit.

2. Calmly restate to the client and his brother that the client cannot be released without a healthcare provider's (HCP's) prescription.

3. Quietly ask the other clients and visitors to move to another area of the unit with a staff member.

4. Ask the client's brother to leave the unit quietly when he repeats his demands.

72. Based on a client's history of violence toward others and inability to cope with anger, what should the nurse use as the **most** important indicator of goal achievement before discharge?

- ☐ 1. acknowledgment of the client's angry feelings
- ☐ 2. ability to describe situations that provoke angry feelings
- ☐ 3. development of a list of how anger has been handled in the past
- ☐ 4. verbalization of her feelings in an appropriate manner

73. A client is admitted to the psychiatric hospital for evaluation after numerous incidents of threatening others, angry outbursts, and two episodes of hitting a coworker at the grocery store where he works. The client is very anxious and tells the nurse who admits him, "I did not mean to hit him. He made me so mad that I just could not help it. I hope I do not hit anyone here." To ensure a safe environment, the nurse should **first**:

- ☐ 1. let other clients know that he has a history of hitting others so that they will not provoke him.
- ☐ 2. put him in a private room, and limit his time out of the room to when staff can be with him.
- ☐ 3. tell him that hitting others is unacceptable behavior, and ask him to tell a staff member when he begins feeling angry.
- ☐ 4. obtain a prescription for a medication to be administered to decrease

his anxiety and threatening behavior.

74. A client loses control and throws two chairs toward another client. What should the nurse do **next**?

- ☐ 1. Ask the client to go to the quiet area and talk about the behavior.
- ☐ 2. Administer an oral PRN tranquilizer, and prepare for a show of determination.
- ☐ 3. Process the incident with the client and discuss alternative behaviors.
- ☐ 4. Call for assistance to restrain the client and administer a PRN intramuscular tranquilizer.

75. A woman who was raped in her home was brought to the emergency department by her husband. After being interviewed by the police, the husband talks to the nurse. “I do not know why she did not keep the doors locked like I told her. I cannot believe she has had sex with another man now.” The nurse should respond by saying:

- ☐ 1. “Let us talk about how you feel. Maybe it would help to talk to other men who have been through this.”
- ☐ 2. “Maybe the doors were locked, but the man broke in anyway.”
- ☐ 3. “Your wife needs your support right now, not your criticism.”
- ☐ 4. “It was not consensual sex. Let us see if your wife was physically injured.”

76. A young man makes an appointment to see the psychiatric nurse at the employee assistance program of a large corporation because his boss is sending him provocative emails and making seductive remarks on his voice mail at home. The nurse informs him about corporate workplace violence guidelines, and he agrees to work with corporate security on the issue. What should the nurse do **next**?

- ☐ 1. Refer the client to his boss’s supervisor to file a report.
- ☐ 2. Suggest the client to contact human resources to request a job transfer.
- ☐ 3. Ask the client about his reactions to this situation.
- ☐ 4. Report the incident to the client’s coworkers who are at risk for similar harassment.

77. A 75-year-old woman was brought to the crisis center by her husband.

The husband reports that his wife has been in shock and anxious since her purse was stolen outside of their home. The woman blames herself for being robbed, is worried about her stolen wallet and credit cards, and is afraid to go home. What nursing actions are indicated? Select all that apply.

- ☐ 1. Request a prescription for lorazepam to decrease her anxiety.
- ☐ 2. Encourage her to talk about the robbery and her feelings.
- ☐ 3. Discuss what changes at home would help her feel safe.
- ☐ 4. Investigate if she has physical injuries from the robbery.
- ☐ 5. Ask her what she thinks she could have done to prevent the robbery.

78. A 35-year-old has been killed as a result of a terrorist attack. What should the nurse advise the friends and relatives of the victim to do during the early stages of the recovery process? Select all that apply.

- ☐ 1. Keep in contact with other family and friends.
- ☐ 2. Attend memorial or religious services.
- ☐ 3. Use relaxation techniques and physical activities.
- ☐ 4. Speak out publicly about the impact of the loss.
- ☐ 5. Attend community meetings with others who have lost loved ones.

Managing Care, Quality, and Safety of Clients with Stress, Crisis, Anger, and Violence

79. When the client is involuntarily committed to a hospital because he is assessed as being dangerous to himself or others, which client rights are lost?

- ☐ 1. the right to access health care
- ☐ 2. the right to send and receive uncensored mail
- ☐ 3. freedom from seclusion and restraints
- ☐ 4. the right to leave the hospital against medical advice

80. The nurse manager on a psychiatric unit is reviewing the outcomes of staff participation in an aggression management program. What indicator would the nurse use to evaluate the effectiveness of such a program?

- ☐ 1. fewer client injuries during restraint procedures
- ☐ 2. a reduction of complaints by clients' relatives
- ☐ 3. fewer staff injuries during restraint procedures

- ☐ 4. a reduction in the total number of restraint procedures

81. A young woman has been stalked and then beaten by an ex-boyfriend. Treatment of her injuries is complete, and she is ready for discharge. What should the nurse do to ensure the woman's safety and security prior to discharge? Select all that apply.

- ☐ 1. Determine if the client knows the location of the ex-boyfriend.
- ☐ 2. Ask if she plans to see the ex-boyfriend again.
- ☐ 3. Provide information on resources and a safety plan.
- ☐ 4. Ensure that she has a safe place to stay after discharge.
- ☐ 5. Obtain consent to send her emergency department records to her family healthcare provider (HCP).

82. Detention center staff asked for a mental health evaluation of a 21-year-old woman after she stabbed herself with a fork and woke from nightmares in fits of rage. The evaluation revealed that she was kidnapped and held from ages 8 to 16 by a convicted child pornographer. She said she never contacted her family after her release from captivity. In what order of priority from first to last should the nurse implement the steps? All options must be used.

1. Initiate suicide precautions and a no-harm contract.

2. Ask the client if she wishes to contact her family while hospitalized.

3. Offer empathy and support, and be nonjudgmental and honest with her.

4. Encourage safe verbalizations of her emotions, especially anger.

83. The nurse is planning care for a group of clients. Which client should the nurse identify as needing the **most** assistance in accepting being ill?

- ☐ 1. an 8-year-old boy who alternately cries for his mother and is angry with the nurse about being hospitalized after a bike accident
- ☐ 2. a 32-year-old woman diagnosed with depression related to lupus erythematosus who discusses her medication's adverse effects with the nurse
- ☐ 3. a 45-year-old man who just suffered a severe myocardial infarction and talks to the nurse about concerns regarding resuming sexual relations with his wife
- ☐ 4. a 60-year-old woman diagnosed with chronic obstructive pulmonary disease who refuses to wear an oxygen mask even though poor oxygenation makes her confused

84. The nurse is managing the care for a client in a disaster shelter who broke a femur and has lost her family home in a hurricane. What measures should the nurse take? Select all that apply.

- ☐ 1. Supervise the care provided to the client during the crisis.
- ☐ 2. Obtain an order for antipsychotic medications for the client.
- ☐ 3. Act as a client advocate for the client in crisis.
- ☐ 4. Discuss with the interdisciplinary team available community resources for the client.
- ☐ 5. Obtain accurate identification including name, age, address, contact information, and names of relatives.

85 Which client outcome **best** indicates effective mental healthcare coordination when the nurse uses a client-centered approach?

- ☐ 1. The level of client engagement is based on agency mandate and policy.
- ☐ 2. There are no further admissions to an acute care hospital.
- ☐ 3. The client is compliant with the treatment plan.
- ☐ 4. Preferred client outcomes vary from client to client.

86. How does participation in self-help groups benefit the client? Select all that apply.

- ☐ 1. It increases knowledge about mental illness.
- ☐ 2. It develops stronger social networks and support.
- ☐ 3. It is more cost-effective than in-client treatment.
- ☐ 4. It increases the client's sense of well-being.
- ☐ 5. It facilitates the development of advocacy skills.

87. During a unit meeting attended by clients and staff, several clients are criticizing their primary nurses. These clients have also been intimidating two other clients who have recently been admitted to the unit, and now, the new clients have stopped sharing their opinions during the meeting. What is the **first** action for the nurse to take?

- ☐ 1. Help the new clients express the reasons they have stopped sharing their ideas.
- ☐ 2. Ask the clients criticizing their nurses to suggest some possible solutions for the practices they are criticizing.
- ☐ 3. Give the clients who are publically criticizing the nurses a verbal warning that this behavior is not acceptable.
- ☐ 4. Use the next unit meeting to discuss respect and the importance of collaboration with the treatment team.

88. Two nurses disagree on what is the most important information for the client with a stress-related illness to have during a discharge teaching session. How should the nurse assigned to provide the discharge teaching proceed?

- ☐ 1. Share all the information that both nurses thought was important.
- ☐ 2. Review the policies related to required discharge teaching.
- ☐ 3. Be aware of different interpretations and personal biases held by nurses.
- ☐ 4. Ask the client what is most important for them as they prepare for discharge.

89. Despite education and role-play practice of restraint procedures, a staff member is injured when actually restraining a client. When helping the uninjured staff deal with the incident, the nurse should address which factor?

- ☐ 1. The emotional responses may be similar to those of other crime victims.

- ☐ 2. The member is likely to resign after experiencing such an injury.
- ☐ 3. Legal action against the client will take time and energy.
- ☐ 4. The member must debrief with the assaultive client before returning.

90. A nurse calls the unit manager to report that her purse has been stolen from the locked break room. The nurse says she thinks she knows which of the staff stole the purse. Which actions by the nurse manager would be appropriate? Select all that apply.

- ☐ 1. Confront the person the nurse suspects stole the purse.
- ☐ 2. Call hospital security to initiate an investigation.
- ☐ 3. Ask the nurse to document all the facts related to the stolen purse.
- ☐ 4. Alert nursing administration that a staff's purse has been stolen.
- ☐ 5. Ask other staff to report any suspicious activity they may have observed.

91. A nurse's ex-boyfriend enters the unit and states, "If I cannot have her, then no one will." Hospital security escorts him out of the building and warned him not to return. The unit manager holds a staff meeting to confirm that which workplace violence policies and procedures will be implemented? Select all that apply.

- ☐ 1. Give a quick overview of the hospital's workplace violence policies and procedures.
- ☐ 2. Offer counseling for the nurse and any other staff threatened by her ex-boyfriend.
- ☐ 3. Work with security and the nurse to initiate workplace precautions related to the ex-boyfriend.
- ☐ 4. Ask security to help the nurse understand how to initiate a protective order against her ex-boyfriend.
- ☐ 5. Ask the nurse to take a leave of absence until her ex-boyfriend is notified of the protective order.

Answers, Rationales, and Test-Taking Strategies

The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In

addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in Part 1 of this book.

The Client Managing Stress

1. 4. The client expressing doubts about his wife's response to his amputation as well as possible doubt on his part is still struggling with body image issues. Looking forward to participating in walkathons and helping others indicate plans for the future that imply an acceptance of his amputee status. Remembering that his friend died in the accident that caused his amputation indicates that the client is aware that there was a worse end result to the accident than his amputation.

CN: Psychosocial integrity; CL: Evaluate

2. 1. Anxiety, especially at higher levels, interferes with learning and memory retention. After the client's anxiety lessens, it will be easier for him to learn the steps of the blood glucose monitoring. Because the client's illness is a chronic, lifelong illness that severely changes his lifestyle, it is unlikely that he is uninterested in the illness or how to treat it. It is also unlikely that dementia would be the cause of the client's frustration and lack of memory. The client's response indicates anxiety. Client responses that would indicate lessening anxiety would be questions to the nurse or requests to repeat part of the instruction.

CN: Psychosocial integrity; CL: Analyze

3. 3. An explanation of what to expect decreases anxiety about upcoming events that could be seen as traumatic by the client. Distraction, such as with games or television, only decreases anxiety temporarily and does not fulfill the client's need for information about the procedure. Reassurance about an uncomplicated outcome is not appropriate; the nurse cannot guarantee that the client will come through surgery without problems. Referring the client to

a psychiatrist is not indicated for moderate, expected preoperative anxiety.

CN: Psychosocial integrity; CL: Synthesize

4. 3. With mild anxiety, perceptions are accurate. Slight muscle tension reflects a motor response. Occasional irritability is an emotional response. Loss of contact with reality is a cognitive characteristic of severe anxiety.

CN: Psychosocial integrity; CL: Analyze

5. 1. Suicide attempts and violence are psychomotor responses to a panic level of anxiety. Desperation and rage are emotional responses. Disorganized reasoning and loss of contact with reality are cognitive responses.

CN: Psychosocial integrity; CL: Analyze

6. 2. Mild anxiety motivates the client to focus on issues and resolve them. Therefore, learning and problem solving can occur at a mild level of anxiety. Taking control for the client is reserved for a near-panic level of anxiety. Severe anxiety interferes with reasoning and functioning. Therefore, reducing stimuli and pressure is crucial at a severe level. Tension reduction is appropriate at a moderate level to help the client think more clearly and engage in problem solving.

CN: Psychosocial integrity; CL: Analyze

7. 4. Minimal functioning, which can cause new problems to develop, is a reflection of dysfunctional coping. The ability to objectively and rationally solve problems demonstrates adaptive coping. Tension reduction activities demonstrate palliative coping. However, such activities alone do not solve problems; they must be followed by problem solving. Anger management alone may prevent new problems, such as violence toward oneself or others, but it does not solve problems directly. It is considered maladaptive coping.

CN: Psychosocial integrity; CL: Analyze

8. 4. Because relationships inherently lead to stress and anxiety, conflict resolution skills are essential for solving relationship problems. Dealing with anger is more effective than suppressing it. Suppression is a mechanism that avoids the issue rather than solving it. Balancing a checkbook involves calculations, not coping skills. Following directions is a passive activity that

reflects a lack of problem solving by the client.

CN: Psychosocial integrity; CL: Analyze

9. 4. The client's statement that he and his wife listen to each other reflects improved efforts at communicating about issues. The other statements provide some insight into the need for better communication. However, they are but steps along the way to coping effectively with the problem.

CN: Psychosocial integrity; CL: Evaluate

10. 1. Assessment examines the client's thoughts, feelings, and behaviors within a context. Whether the client's behavior is appropriate for the situation is important assessment data. Setting priorities is part of making nursing diagnoses and planning; motivation to change and identifying the need for a no-harm contract are part of the planning stage.

CN: Psychosocial integrity; CL: Analyze

11. 3. Writing a list of strengths and needs is short term, achievable, and measurable. Achieving positive self-esteem would occur over the long term. Going to school involves complex future steps to a long-term goal. Using skills is likely to be stressful and is best attempted after the client has done a self-assessment.

CN: Psychosocial integrity; CL: Synthesize

12. 4. The ultimate outcome is to have the client solve problems by himself, collaborating in his own care. Client follow-up with the mental health providers, while desirable, does not ensure that the client will fully comply with treatment or medication. Knowledge of the medication's effects and adverse effects and compliance can help the client but alone will not ensure success unless the client knows how to address and solve problems independently.

CN: Health promotion and maintenance; CL: Synthesize

13. 1. Substituting rational beliefs is a major goal when using cognitive-behavioral models, which focus more on thinking and behaviors than feelings. Unconscious processes are the focus of psychoanalytic models. Analysis of fears and barriers to growth is the focus of developmental

models. Tension and stress are targets of the stress models.

 CN: Psychosocial integrity; CL: Apply

14. 3. Displacement refers to a defense mechanism that involves taking feelings out on a less-threatening object or person instead of tackling the issue or problem directly. Talking to his wife directly reflects insight into the client's use of the defense mechanism and his ability to overcome it. Not thinking about the weekend is suppression. Here, the client is focusing on the issue with the highest priority. Focusing on academic rather than athletic achievement is compensation, highlighting one's strengths instead of weaknesses. Not remembering the molestation is repression.

 CN: Psychosocial integrity; CL: Evaluate

15. 3. Legally, there is a duty to warn a potential victim of a client's intent to harm. Staff can be held accountable if the client injures the ex-partner and the staff failed to warn that person. The client's permission is needed to share information with a spouse. Student papers should not contain identifying information. Release of information is made directly to the client's insurance company, not to the employer.

 CN: Management of care; CL: Apply

16. 2,5. The client is showing increased anxiety and anger as well as refusing to stay in the hospital, which are immediate and crucial concerns at admission. The client is not likely to give permission to talk to his wife and boss at this point. Housing issues and divorce counseling may be relevant before discharge, but not initially. Suspiciousness and grandiosity may be relevant after the client's anxiety and anger are under control.

 CN: Management of care; CL: Synthesize

17. 2. The nurse is required to set limits on inappropriate behavior while conveying respect and acceptance of that person. Doing so conveys to the client that he is worthy without posing any harm or embarrassment to the client. Touch is a complex issue that must be used cautiously. Touch may be misinterpreted or misperceived by a client who has been abused or who has perceptual or thought disturbances. Mutual sharing reflects a social friendship, not a therapeutic one. Total confidentiality is not desirable. For

example, treatment team members and insurance companies need selected information to ensure quality services.

 CN: Psychosocial integrity; CL: Apply

18. 2. Growth of the fetus is important, so nausea and anorexia that would interfere with the young woman's nutrition would cause the most harm to the developing fetus. It could also lead to electrolyte imbalance if she did not take in enough fluid. While insomnia could cause problems long term, this side effect could be mitigated through adjustment of the dosing time (earlier in the day), by decreasing the dosage to her former 20 mg daily, or by changing to every other day dosing of 40 mg, since fluoxetine has a long half-life. Headaches are uncomfortable but can be treated with mild analgesics or other treatments, such as cold cloths, that would not harm the fetus. Decreased libido, while not enjoyable for the client or her sexual partner, does not pose any risks for the fetus.

 CN: Pharmacological and parenteral therapy; CL: Analyze

19. 3. Asking for descriptions of changes in behavior (what the client did differently) encourages evaluation. Conveying empathy, such as stating that it is still hard for the client to talk about it, encourages data collection. Asking for meaning helps with the nursing diagnosis. Asking the client about what it will take to follow out a plan is part of planning.

 CN: Psychosocial integrity; CL: Apply

20. 4. Practicing new behaviors builds confidence and reinforces appropriate behaviors. Reality testing, asking about fears, and teaching new communication skills are some of the many steps when trying out new behaviors.

 CN: Psychosocial integrity; CL: Apply

The Client Coping with Physical Illness

21. 4. While the client does have a right to accept or reject treatment, she has not explored her feelings, her possible mastectomy, or the future. The nurse should assist the client in exploring her feelings and moving toward a fuller understanding of her options. Giving the client survival rates indicates

that the nurse feels she should have the surgery and negates her fears and concerns. While the chaplain might be helpful, this step should be done after the client has explored her feelings.

 CN: Management of care; CL: Synthesize

22. 2. Diagnosis of a serious illness would be a shock to anyone but particularly a young person. Feelings of anger are normal and should be expressed. Gaining an intellectual understanding of his illness would also be necessary, but such learning will not take place if the client's feelings have not been addressed. There is no indication that the client needs to conserve energy because of his condition, nor is it clear that death is imminent. Neither situation is likely at the point of first diagnosis unless the disease is well advanced, which is not indicated here.

 CN: Management of care; CL: Apply

23. 2. The psychotropic drugs used to treat chronic mental illnesses have side effects that can lead to noncompliance. Therefore, teaching the clients measures to deal with the common side effects would be most important. Teaching should be focused on the need for compliance and the specific interests of the target audience. Teaching should concentrate on the medications commonly used to treat chronic mental illness, not on many psychotropic drugs or those used in acute illness. Such topics as the role of medication in the treatment of chronic mental illness and the effects of using common street drugs with psychotropic medication should be discussed after the issue of compliance is addressed.

 CN: Health promotion and maintenance; CL: Create

24. 2. When the client seems to be questioning the HCP's  goals, it is best for the nurse to present an open statement and ask the client what he means. This technique helps the client express his feelings. Telling the client about the surgery is less therapeutic when he is upset. While it is the client's right to get a second opinion, this suggestion does not address the client's feelings. Making assumptions can also interfere with communication, especially if the assumption is incorrect.

 CN: Psychosocial integrity; CL: Synthesize

25. 2. When the client has hostile outbursts, it is best for the nurse to help her express her feelings. This serves as a release valve for the client. Offering positive reinforcement for cooperation does not help the client express herself appropriately. Continuing with assigned tasks ignores the client's feelings and may lead to further escalation. Limiting visitation reduces the client's support systems and does not address the underlying problem.

 CN: Psychosocial integrity; CL: Synthesize

26. 3. Preoperative visits and talks with others who have made successful adjustments to colostomies are helpful and tend to make the client less fearful of the operation and its consequences. Knowing about resources in the community will be helpful as the client approaches discharge. Supporting the **HCP**  is less important than supporting the client and giving him information. The client will have a change in body image, with disfigurement due to the creation of a colostomy. However, the client should be able to lead a full life.

 CN: Management of care; CL: Apply

27. 2. The nurse must present reality to the client about his condition to help decrease his denial about his physical status. By stating the name of the condition and talking about what it means, the nurse provides the client with information and conveys concerns about him and a willingness to help him understand his illness. It may not be true that the client would be made more upset by the call; the news might be good. However, this statement does not provide the client with the reality of his condition. Telling the client that he really does not care or asking the client if he realizes that he has a life-threatening condition is belittling and may make the client defensive.

 CN: Psychosocial integrity; CL: Synthesize

28. 1. Leaving the hospital and immediately flying to a meeting indicate poor judgment by the client and little understanding of what she needs to change regarding her lifestyle. The other statements show that the client understands some of the changes she needs to make to decrease her stress and lead a healthier lifestyle.

 CN: Psychosocial integrity; CL: Evaluate

29. 1,3,5. Suicide is a risk with chronic illnesses. The husband needs validation of his feelings and support as well as suggestions for helping his wife with her concerns. Telling him to be strong and optimistic ignores the client's needs. It is false to assume that the client will no longer be suicidal when the lupus is under control.

CN: Safety and infection control; CL: Synthesize

30. 4. The nurse's best response is one that directly expresses the nurse's observations to the client and offers the client the opportunity to talk about his feelings or concerns to decrease somatization (the need to express feelings through physical symptoms). Leaving, offering to provide pain medication, and stating that anger does not bother the nurse ignore the client's needs.

CN: Psychosocial integrity; CL: Synthesize

31. 4. Though ulcerative colitis and OCD have some features in common, and stress can make both illnesses worse; there is no definitive cause-effect relationship between ulcerative colitis and OCD. Therefore, the only appropriate nursing response would be to acknowledge the effect of stress on both illnesses and indicate there is no proof that either illness causes the other.

CN: Physiological adaptation; CL: Synthesize

32. 4. This type of behavior illustrates *emotional lability*, which is a readily changeable or unstable emotional affect. *Neologism* is using a word when it can have two or more meanings, or a play on words. *Confabulation* involves replacing memory loss by fantasy to hide confusion; it is unconscious behavior. *Flight of ideas* refers to a rapid succession of verbal expressions that jump from one topic to another and are only superficially related.

CN: Psychosocial integrity; CL: Analyze

33. 2,3,1,4. The first priority is a safe environment so the client and nurse are not hurt by the phone. Then, it is important to acknowledge the client's anger to help diffuse it. As the client calms down, the nurse can explore the client's feeling in more depth. Since the client implies anger at God, a clergy consult may be appropriate.

 CN: Safety and infection control; CL: Analyze

34. 3. Focusing on enjoying time with family and friends conveys a renewal of hope for the future and a decreased risk of suicide. Simply saying that no one wants him to commit suicide does not say he does not want to do it. Avoiding a transfer to a psychiatric unit does not mean he is no longer suicidal. Fear of not being successful with suicide usually is not a deterrent.

 CN: Reduction of risk potential; CL: Evaluate

The Client in Crisis

35. 3. Individuals progress through the stages of loss at their own pace. Not everyone experiences each phase, and no one can be forced to advance to the next stage until ready. The overall goal for helping the client to work through the pain of loss is to assist the client in processing and engaging in the pain of loss. This process may involve working on family conflicts and/or anger issues but is not the primary goal.

 CN: Health promotion and maintenance; CL: Synthesize

36. 1,2,3,6. The immediate needs for this client are for safety and security, so it is important to assess for injuries, safety of her family, suicide risk, and signs of emotional decompensation. Needs for food, clothing, and support are important later, after safety and security are addressed.

 CN: Reduction of risk potential; CL: Analyze

37. 2. During the first phase of crisis, the client exhibits elevated anxiety. A client who can use problem-solving capabilities is not in crisis. A shortened attention span is characteristic of the fourth phase of crisis. Reaching out to others for help is indicative of the third phase of crisis.

 CN: Management of care; CL: Synthesize

38. 4,2,3,1. The nurse must first identify which member is exhibiting crisis symptoms. Next, the nurse identifies strategies to reduce the most severe symptoms. The nurse then assesses the family's resources. The family member in crisis may have such overwhelming feelings that he or she is unable to identify or describe the feelings.

 CN: Psychosocial integrity; CL: Synthesize

39. 3. Before any interventions can occur, knowing whether the client is pregnant is crucial in formulating a plan of care. Asking the client about what things she had thought about doing, giving the client some ideas about what to expect next, and questioning the client about her feelings and possible parental reactions would be appropriate after it is determined that the client is pregnant.

 CN: Psychosocial integrity; CL: Synthesize

40. 2. Because of the client's potential pregnancy, the nurse needs to determine exactly what the client means by the term "hooking up" by asking the client to describe what she has been doing in sexual encounters with her boyfriend. Asking the client if she means sexual intercourse or telling the client that they need to talk about sexual intercourse makes an assumption that may or may not be appropriate. The nurse needs to determine exactly what the client means by the terms used. Repeating the client's statement does not elicit the necessary information to interpret the client's statement. Additionally, this type of response assumes an understanding of what the client has said.

 CN: Psychosocial integrity; CL: Synthesize

41. 4. Because people in an emotional crisis find it difficult to focus their thinking, the goal is to return the client to noncrisis functioning. Pointing out and decreasing the client's level of anxiety is the first step in attaining this goal. Telling an obviously distressed person not to worry is ineffective because it ignores the client's distress and concerns. Although pregnancy is a normal event, and 40 years of age may not be too old for a pregnancy, these responses also ignore the client's distress and feelings.

 CN: Psychosocial integrity; CL: Synthesize

42. 1. Telephoning the crisis shelter indicates that the boys are alarmed but are reluctant to talk with their parents. The boys may fear that their parents will assume that they have been sniffing glue and punish them. The nurse should focus on helping the boys talk with their parents. The legality of sniffing glue varies, but crisis hotlines are geared at providing supportive

services. To prove that the observations are incorrect requires an intervention beginning with the boys' parents. Sniffing glue is classified as inhalant abuse, a very dangerous, not minor, form of substance abuse.

CN: Management of care; CL: Synthesize

43. 1. The crisis worker needs to use active focusing techniques to determine the crisis-precipitating event or the immediate problem. Asking the caller, “Why are you calling today?” or “What is the immediate problem?” will assist the caller to focus on the specific need or event. Telling the client to make an appointment is inappropriate because the problem might be life threatening. Telling the caller to go to the nearest emergency department is precipitous and may be unnecessary. Asking to speak to someone else in the home may be futile because the caller might be alone. This action also ignores the caller and his or her feelings.

CN: Management of care; CL: Synthesize

44. 3. The concern that someone may call the crisis hotline every day for a year indicates that further understanding about crisis and crisis intervention is needed. A crisis situation is time limited, typically resolving in 4 to 6 weeks if handled effectively. If a person calls the line daily for a year, that person has not been properly dealt with or is probably in a highly disorganized state requiring an alternative intervention. The nurse needs to further review and clarify the material presented. Callers are typically in pain, overwhelmed, and exhausted when they call. A crisis can help an individual cope better in the future if he learns to handle the situation.

CN: Management of care; CL: Evaluate

45. 2,3,4,5,6. Controlling self-destructive behaviors is a priority, but developing emotion management skills and processing emotions and memories are also important. Assessing for injuries, pregnancy, sexually transmitted infections, and drugs in her system is important due to the fact that most cults foster sex and pregnancy in young teens and often use drugs to achieve compliance from the girls. It is not appropriate to ask the client to share her experiences in a group of teens. It could be more damaging to the client unless the other teens are also trauma/torture survivors.

CN: Psychosocial integrity; CL: Synthesize

46. 2. Generally, 4 to 6 weeks is viewed as the length of time a client can tolerate the severe level of disturbance of a true crisis. In the first week or two, the client usually is still trying to use normal coping skills and support systems. After 6 weeks of continuous crisis, a client is probably becoming so physically and emotionally drained that he has sought or has been brought by others for medical or psychiatric care.

CN: Management of care; CL: Apply

47. 1. The initial goal in crisis intervention is helping the client regain emotional security and equilibrium. Resolution of the underlying emotional problems, development of insight and personal growth, and formulation of more effective support systems are goals to address as the crisis subsides.

CN: Psychosocial integrity; CL: Apply

48. 3. Learning new coping skills is the major factor necessary for higher functioning. Better coping is likely to lead to regaining support systems, giving up dysfunctional coping, and awareness of how to prevent future crises.

CN: Psychosocial integrity; CL: Apply

49. 3. The risk of suicide can persist for 2 to 3 months even after a crisis has abated. Therefore, it is important for the client to be able to verbalize information about appropriate support persons and community resources and to have this information readily available. Although the client may state that she is ready to be discharged, this is not the most reliable indicator. A divorce lawyer may not be appropriate at this point. At 3 days after a suicide attempt, emotional stability is not likely.

CN: Management of care; CL: Evaluate

50. 4. The statement about joining the son if he dies indicates potential for self-harm and subsequent suicide, always a risk during crisis. Although the father may be charged with reckless driving, this is not an indication for a psychiatric consultation. Verbalizing that the accident may lead to divorce may or may not be a real risk; however, this situation is not urgent. The statement about not seeing the son run behind the car illustrates the father's attempts at trying to process the situation.

 CN: Psychosocial integrity; CL: Evaluate

51. 1. Passive suicidal thoughts, such as a wish to die or giving up on self-care, can be as much of a risk as active suicidal ideation (the idea of killing one's self directly), especially for older clients because they commonly lack the means, energy, and motivation for an active suicide attempt. Seeing the grandson and grandmother together may help later. Not talking to the grandson and experiencing altered role performance may be real issues, but these are not as critical as the risk of indirect (passive) suicide.

 CN: Psychosocial integrity; CL: Analyze

52. 2. The threat toward the ex-boyfriend is the most immediate concern now, as the client turns her anger toward him instead of herself. Although situational low self-esteem, risk for suicide, and risk-prone health behavior are evident, these problems are less of a concern at this time.

 CN: Safety and infection control; CL: Analyze

53. 3. Letting the client express his feelings (emotion management) is essential before trying to solve the problem or deciding what kind of referral is appropriate. A referral for counseling, assessment of the client's support system, and unemployment assistance may be appropriate after the client's anxiety is reduced.

 CN: Psychosocial integrity; CL: Apply

54. 2. During a crisis, support persons demonstrate preparedness to help the client by verbalizing the emergency resources available and knowing when to use them. Follow-up medical care may be helpful as the crisis subsides. The coping strategies used by the support persons may or may not be relevant to the client's needs and situation. Long-term solutions and advice may or may not be appropriate. The focus needs to be on the client's immediate needs and situation.

 CN: Psychosocial integrity; CL: Analyze

55. 1. The nurse needs to focus on the client and address her feelings. Talking about her feelings helps to decrease the risk of self-harm. Doing so takes precedence over questions about the cause of death and her children's

support. Antidepressant medications may be indicated, but more information is needed about the client's emotional state.

CN: Psychosocial integrity; CL: Synthesize

56. 1,2,3,4,5. All of the options are correct and in an appropriate sequence of actions except for option 6. The flyover is likely to trigger vivid memories and emotions in those living near the city related to the tragedy of the Twin Towers on 9/11/01. The severity of the flashbacks will vary in degree, just as they did after the original event. Asking the military for an apology will not address the caller's symptoms.

CN: Management of care; CL: Synthesize

The Client with Problems Expressing Anger

57. 4. Beginning with an open-ended question that brings out the client's view of his situation and reasons for seeking treatment is the most neutral beginning and helps to gain the client's perception of events. Blaming the client for his problems is accusatory and nonproductive. A time for reviewing what could be done differently will come later.

CN: Psychosocial integrity; CL: Apply

58. 2,4,3,1. The clients need to understand that anger is a normal emotion, but if not expressed can have negative effects on the body and mind. Then, the nurse begins to focus on the client's personal situation and help the client understand that holding anger can aggravate his depressive symptoms as well. One focus of outpatient counseling will be learning safe, effective ways to express anger.

CN: Reduction of risk potential; CL: Analyze

59. 1,2,3,5. Dealing with anger, stress, and anxiety; identifying resources and support groups; and increasing a sense of safety and security are appropriate interventions at this time. However, recommending an antiwar advocacy group may or may not be appropriate, even much later in the client's recovery.

CN: Psychosocial integrity; CL: Synthesize

60. 2,1,4,3. Angry clients may not realize what makes them angry and the cues that their behavior is becoming out of control. The nurse should first help the client identify what triggered the anger. Once the cause of the anger and cues to the loss of control are discovered, the nurse should assist the client in identifying safe and appropriate alternative expressions of anger and then practice those techniques prior to facing a real anger-producing situation.

CN: Psychosocial integrity; CL: Synthesize

61. 3. By requesting that the roommate respect his rights (asking the roommate to put the dirty clothes on the floor away after telling him that this bothers him), the client is asserting himself. Arriving late is commonly passive resistance and thus not an indicator that the client is becoming assertive. Asking the nurse to call is dependent behavior. Although asking the HCP is more assertive, the client is relying on the nurse's direction to do so.

CN: Psychosocial integrity; CL: Analyze

62. 2. Blood pressure, as well as respiratory rate and muscle tension, increases during anger because of the autonomic nervous system response to epinephrine secretion. Peristalsis decreases.

CN: Physiological adaptation; CL: Apply

63. 4. When given intramuscularly, haloperidol is considered most restrictive because it is intrusive and a client usually does not receive the drug voluntarily. Oral haloperidol is considered less restrictive because the client usually accepts the pill voluntarily. Tension reduction strategies and voluntary seclusion are considered less restrictive because they are not intrusive and the client usually **consents** to their use.

CN: Safety and infection control; CL: Apply

64. 2. Asking the staff for assistance is appropriate when the client demonstrates behaviors that involve the direct threat of violence. Holding a stick and telling the nurse to move is the most direct threat of violence. Swearing and pounding on a table may be disturbing, but these actions are less of a threat. Coming out of his room may indicate noncompliance with directions. However, further assessment is needed to determine whether this

behavior was a direct threat of violence.

CN: Management of care; CL: Analyze

65. 3,4,1,2. Since external stimuli can greatly contribute to agitation, the nurse should teach the client that the first step is to go to a quiet area, then enlist the help of others, and finally take medication. Taking the lorazepam first would help decrease anxiety quickly, thus diminishing agitation. If the lorazepam is not successful, the client could take the oral haloperidol to help clear the client's thoughts and decrease agitation.

CN: Management of care; CL: Synthesize

66. 3. The client who is about to lose control is experiencing a high degree of anxiety or agitation, which alters the client's ability to perceive reality. Initially, the client may feel threatened by the presence of others. A client who is out of control is not thinking about having an audience. Although the nurse with the client who is about to lose control is generally the one giving directions, this is not a rationale for staying at a distance. When seeing extra staff, the client may or may not be able to gain self-control.

CN: Safety and infection control; CL: Apply

67. 1. When using seclusion, the safety of the client is paramount. Therefore, staff must be able to see the client in seclusion at all times, such as through a security window in the door or with a room camera. Although outside access for dimming the lights to decrease stimuli may be appropriate, it is not critical for the client's safety. Having one staff member stay in a room alone with a potentially violent client is unsafe. A prescription for seclusion can be obtained before or after it is initiated.

CN: Safety and infection control; CL: Synthesize

68. 3. A full-length restraint blanket is added when the client is at risk for injury from fighting the restraints. The increased degree of restriction is justified only when the risk of client injury increases. Feeling more secure is not a sufficient cause for using a more restrictive measure. Client statements that restraints are tight and uncomfortable require the nurse to assess the situation and adjust the restraints if necessary to ensure adequate circulation. Four-way restraints already provide adequate protection for the staff.

 CN: Safety and infection control; CL: Apply

69. 1. Safety of the client and staff is the utmost priority. Therefore, the client must be monitored closely and frequently, such as every 15 minutes, to ensure that the client is safe and free from injury. Assisting with nutrition and elimination, performing range-of-motion exercises on each limb, and changing the client's position every 2 hours are important after the safety of the client and staff is ensured by close, frequent monitoring.

 CN: Safety and infection control; CL: Synthesize

70. 4. The long-term goal of the debriefing after restraining a client is to improve aggression management procedures so that prevention of aggression improves and the frequency of restraint use decreases. Providing feedback and comparing perceptions are single aspects that would eventually lead to the ultimate goal of improving aggression management procedures. When a client can be released from restraints is not immediately predictable.

 CN: Management of care; CL: Synthesize

The Client with Interpersonal Violence

71. 2,4,3,1. The first step is to calmly present the reality that the client cannot be released at this time. Next, the brother should be asked to leave the unit quietly. When he does not, protecting the other clients and visitors is essential for their safety. (The staff member can help them process what is happening on the unit.) Calling security to the unit is a last resort when less restrictive measures have not worked. Calling them before setting limits with the brother and giving him a choice of actions will likely escalate the situation. Security can legally escort the brother off the unit and hospital grounds.

 CN: Safety and infection control; CL: Synthesize

72. 4. Verbalizing feelings, especially feelings of anger, in an appropriate manner is an adaptive method of coping that reduces the chance that the client will act out these feelings toward others. The client's ability to verbalize feelings indicates a change in behavior, a crucial indicator of goal achievement. Although acknowledging feelings of anger and describing

situations that precipitate angry feelings are important in helping the client reach her goal, they are not appropriate indicators that behavior has changed. Asking the client to list how anger has been handled in the past is helpful if the nurse discusses coping methods with the client. However, based on this client's history, this would not be helpful because the nurse and client are already aware of the client's aggression toward others.

CN: Safety and infection control; CL: Evaluate

73. 3. The nurse must clearly address behavioral expectations, such as telling the client that hitting is unacceptable, and also provide alternatives for the client, such as letting staff members know when he begins to feel angry. Making others responsible for the client's behavior or isolating the client in his room is inappropriate because it does not include the client in managing his behavior. Although medication may be helpful, this action does not give the client responsibility for his behavior and is not warranted at this time.

CN: Safety and infection control; CL: Synthesize

74. 4. The client is in the crisis phase of the assault cycle. Therefore, the nurse must act immediately, using restraints and an intramuscular tranquilizer to prevent injury to others or further property damage. It is too late to ask the client to go to a quiet area to talk because the client's behavior is past the triggering phase. Giving the client an oral tranquilizer and preparing for a show of determination are nursing interventions used in the escalation phase. Processing the incident with the client and discussing alternative behaviors are interventions used in the postcrisis phase.

CN: Safety and infection control; CL: Synthesize

75. 1. The nurse should respond to the husband's needs and concerns and should offer support. Protecting or defending the wife against his criticism ignores the husband's needs.

CN: Psychosocial integrity; CL: Synthesize

76. 3. It is important to know the client's reactions in order to plan appropriate interventions. Until the client's reactions are known, it is premature to suggest a job transfer, file a report to his boss's supervisor, or alert his coworkers.

 CN: Management of care; CL: Synthesize

77. 2,3,4. After the impact of a crime, the client's most important needs are for physical safety and emotional security. There is no indication that the client has a severe level of anxiety; therefore, lorazepam is not indicated. Asking her how she could have prevented the robbery implies that she could be at fault.

 CN: Psychosocial integrity; CL: Synthesize

78. 1,2,3,5. Receiving support from family, friends, other survivors, and community services is generally helpful after such events. Relaxation and participation in activities help manage stress reactions. Speaking out publicly may or may not be helpful later in the recovery process but may actually hinder recovery in the early stages.

 CN: Psychosocial integrity; CL: Synthesize

Managing Care, Quality, and Safety of Clients with Stress, Crisis, Anger, and Violence

79. 4. When a client is committed involuntarily, the right to leave against medical advice is forfeited. All the other rights are preserved unless there is further court action or a case of imminent danger to self or others (hitting staff, cutting self).

 CN: Management of care; CL: Apply

80. 4. The primary goal of an aggression management program is to prevent violence. This goal is evidenced by a reduction in the total number of restraint procedures used or needed. Although fewer client and staff injuries are important, these goals are secondary to prevention. Reduction in the number of complaints by clients' relatives is affected by more variables than just restraint procedures.

 CN: Management of care; CL: Evaluate

81. 1,2,3,4. The crucial interventions involve safety and support. Asking for **consent**  is a health privacy issue, not a safety issue, and is not essential to the discharge process.

 CN: Safety and infection control; CL: Synthesize

82. 1,3,4,2. Safety is a priority after the client stabbed herself. A survivor of trauma/torture needs empathy, support, honesty, and a nonjudgmental stance from the nurse. Then, the client is more willing to learn safe ways to express feeling, especially anger. It will be the client's decision if she wants to contact her family and, if so, under what conditions. She would need extensive preparation before any contact with her family.

 CN: Safety and infection control; CL: Synthesize

83. 4. The 60-year-old woman is acting in a way that worsens her physical and mental condition because she does not want to be sick. The 8-year-old child is acting normally for someone his age who is unexpectedly hospitalized. The cooperation demonstrated by the client with lupus and the client who had a myocardial infarction indicates a level of acceptance of their illnesses and of their role as being ill.

 CN: Management of care; CL: Analyze

84. 1,3,4,5. The nurse who is managing the care of the client in a disaster shelter provides for the management of care by supervising the care for the client in crisis. In a disaster, the nurse also must be sure that the client is identified and contact information about the client is documented. The nurse also acts as a client advocate for the client in crisis and discusses available community resources for the client with the interdisciplinary team assigned to this client. There are no data to indicate that antipsychotic medications are needed for this client at this time.

 CN: Management of Care; CL: Apply

85. 4. In order to be effective in the role of case manager or care coordinator, the nurse must practice with the philosophy that recovery is defined by the client, not the service provider. Using a predefined outcome measure to determine effectiveness or recovery does not demonstrate the belief that well-being is possible for all people living with a mental illness.

 CN: Management of care; CL: Evaluate

86. 1,2,4. Participation in self-help groups has been shown to increase

knowledge, coping skills, self-esteem, confidence, sense of well-being, and a sense of being in control. Improving social and support networks is also a common outcome of client engagement in self-help groups. If symptoms are severe and/or life threatening, in-client treatment may be the most appropriate and as a result potentially more cost-effective. Development of personal advocacy skills is not a primary outcome of client participation in self-help groups.

 CN: Management of care; CL: Analyze

87. 2. Recognizing that the clients are part of the solution to the issues they are presenting demonstrates a client-centered approach to care. Having the new clients challenge the behaviors of other clients does not facilitate the development of a therapeutic milieu. Warning clients that behaviors are unacceptable reinforces a sense of client powerlessness and does not build a therapeutic relationship. Discussing respect and collaboration would happen after the criticisms have been acknowledged and the clients have been asked for their opinions.

 CN: Management of care; CL: Synthesize

88. 4. The discharge teaching session will be most effective if the nurse uses a client-centered approach to better assess what the client needs and, therefore, what information to share. Sharing all the information does not respect the knowledge that the client already has. Reviewing the policies is one area to help identify important areas for teaching, but in order to ensure that client needs are met, further assessment is required. Awareness of personal biases should not be used to determine what is important for the client.

 CN: Management of care; CL: Synthesize

89. 1. Being injured by a client can result in emotional responses similar to those of other crime victims. A resignation after being injured is relatively rare. Legal action against the client is sometimes discussed but rarely initiated. Debriefing with the client may be inappropriate or unnecessary to resolve the situation.

 CN: Management of care; CL: Synthesize

90. 2,3,4,5. It is appropriate for the nurse manager to initiate a security investigation and ask the nurse to document all the facts about the missing purse. Alerting nursing administration is required. Seeking information from other staff will help with the investigation. It is inappropriate to confront any possible suspects while the investigation is ongoing.

CN: Management of care; CL: Analyze

91. 1,2,3,4. National guidelines exist for managing workplace violence. Unit staff, hospital administration, and hospital security personnel develop and enforce the resulting policies. These include training all staff about workplace violence, processes for reporting of such violence, and counseling for the staff victim. Protecting staff and clients may include posting the ex-boyfriend's picture at employee entrances and a protective order initiated by the nurse. With these policies and procedures in place, it is counterproductive to ask the nurse to take a leave of absence.

Abuse and Mental Health Problems of Children, Adolescents, and Families

- The Client Experiencing Abuse
- The Adolescent with Eating Disorders
- Children and Adolescents with Behavioral Problems
- The Child and Adolescent with Adjustment Disorders
- Managing Care-Clients with Abuse and Mental Health Problems
- Answers, Rationales, and Test-Taking Strategies

The Client Experiencing Abuse

1. A married female client has been referred to the mental health center because she is depressed. The nurse notices bruises on her upper arms and asks about them. After denying any problems, the client starts to cry and says, “He did not really mean to hurt me, but I hate for the kids to see this. I am so worried about them.” What is the **most** crucial information for the nurse to determine?

- ☐ 1. the type and extent of abuse occurring in the family
- ☐ 2. the potential of immediate danger to the client and her children
- ☐ 3. the resources available to the client
- ☐ 4. whether the client wants to be separated from her husband

2. A client with suspected abuse describes her husband as a good man who works hard and provides well for his family. She does not work outside the home and states that she is proud to be a wife and mother just like her own mother. The nurse interprets the family pattern described by the client as **best** illustrating which characteristic of abusive families?

- ☐ 1. tight, impermeable boundaries

- ☐ 2. unbalanced power ratio
- ☐ 3. role stereotyping
- ☐ 4. dysfunctional feeling tone

3. When planning the care for a client who is being abused, which measure is **most** important to include?

- ☐ 1. being compassionate and empathetic
- ☐ 2. teaching the client about abuse and the cycle of violence
- ☐ 3. explaining to the client about the client's personal and legal rights
- ☐ 4. helping the client develop a safety plan

4. A nurse is assessing a client who is being abused. The nurse should assess the client for which characteristic(s)? Select all that apply.

- ☐ 1. assertiveness
- ☐ 2. self-blame
- ☐ 3. alcohol abuse
- ☐ 4. suicidal thoughts
- ☐ 5. guilt

5. After months of counseling, a client abused by her husband tells the nurse that she has decided to stop treatment. There has been no abuse during this time, and she feels better able to cope with the needs of her husband and children. In discussing this decision with the client, the nurse should:

- ☐ 1. tell the client that this is a bad decision that she will regret in the future.
- ☐ 2. find out more about the client's rationale for her decision to stop treatment.
- ☐ 3. warn the client that abuse commonly stops when one partner is in treatment, only to begin again later.
- ☐ 4. remind the client of her duty to protect her children by continuing treatment.

6. A third-grade child is referred to the mental health clinic by the school nurse because he is fearful, anxious, and socially isolated. After meeting with the client, the nurse talks with his mother, who says, "It is that school nurse again. She has done nothing but try to make trouble for our family since my son started school. And now you are in on it." The nurse should respond by

saying:

- ☐ 1. “The school nurse is concerned about your son and is only doing her job.”
- ☐ 2. “You do not need to feel singled out. We see a number of children who go to your son’s school.”
- ☐ 3. “You sound pretty angry with the school nurse. Tell me what has happened.”
- ☐ 4. “Let me tell you why your son was referred, and then you can tell me about your concerns.”

7. The parent of a school-aged child tells the nurse that, “For most of the past year, my husband was unemployed and I worked a second job. Twice during the year I spanked my son repeatedly when he refused to obey. It has not happened again. Our family is back to normal.” After assessing the family, the nurse decides that the child is still at risk for abuse. Which observation **best** supports this conclusion?

- ☐ 1. The parents say they are taking away privileges when their son refuses to obey.
- ☐ 2. The child has talked about family activities with the nurse.
- ☐ 3. The parents are less negative toward the nurse.
- ☐ 4. The child wears long-sleeved shirts and long pants, even in warm weather.

8. When caring for a client who was a victim of a crime, the nurse is aware that recovery from any crime can be a long and difficult process depending on the meaning it has for the client. What should the nurse establish as a victim’s ultimate goal in reconstructing his or her life?

- ☐ 1. getting through the shock and confusion
- ☐ 2. carrying out home and work routines
- ☐ 3. resolving grief over any losses
- ☐ 4. regaining a sense of security and safety

9. A client tells the nurse that she has been raped but has not reported it to the police. After determining whether the client was injured, whether it is still possible to collect evidence, and whether the client wants to file a report, the nurse’s **next priority** is to offer which intervention to the client?

- ☐ 1. legal assistance
- ☐ 2. crisis intervention
- ☐ 3. a rape support group
- ☐ 4. medication for disturbed sleep

10. In working with a rape victim, which intervention is **most** important?

- ☐ 1. continuing to encourage the client to report the rape to the legal authorities
- ☐ 2. recommending that the client resume sexual relations with her partner as soon as possible
- ☐ 3. periodically reminding the client that she did not deserve and did not cause the rape
- ☐ 4. telling the client that the rapist will eventually be caught, put on trial, and jailed

11. In the process of dealing with intense feelings about being raped, victims commonly verbalize that they were afraid they would be killed during the rape and wish that they had been. The nurse should decide that further counseling is needed if the client makes which statement?

- ☐ 1. "I did not fight him, but I guess I did the right thing because I am alive."
- ☐ 2. "Suicide would be an easy escape from all this pain, but I could not do it to myself."
- ☐ 3. "I wish they gave the death penalty to all rapists and other sexual predators."
- ☐ 4. "I get so angry at times that I have to have a couple of drinks before I sleep."

12. One of the myths about sexual abuse of young children is that it usually involves physically violent acts. Which behavior is more likely to be used by the abusers?

- ☐ 1. tying the child down
- ☐ 2. bribery with money
- ☐ 3. coercion as a result of the trusting relationship
- ☐ 4. asking for the child's consent for sex

13. A preadolescent child is suspected of being sexually abused because he demonstrates the self-destructive behaviors of self-mutilation and attempted suicide. Which common behavior should the nurse also expect to assess?

- ☐ 1. inability to play
- ☐ 2. truancy and running away
- ☐ 3. head banging
- ☐ 4. overcontrol of anger

14. Adolescents and adults who were sexually abused as children commonly mutilate themselves. The nurse interprets this behavior as:

- ☐ 1. the need to make themselves less sexually attractive.
- ☐ 2. an alternative to bingeing and purging.
- ☐ 3. use of physical pain to avoid dealing with emotional pain.
- ☐ 4. an alternative to getting high on drugs.

15. A young child who has been sexually abused has difficulty putting feelings into words. Which approach should the nurse employ with the child?

- ☐ 1. engaging in play therapy
- ☐ 2. role-playing
- ☐ 3. giving the child's drawings to the abuser
- ☐ 4. reporting the abuse to a prosecutor

16. When working with a group of adult survivors of childhood sexual abuse, dealing with anger and rage is a major focus. Which strategies should the nurse expect to be successful? Select all that apply.

- ☐ 1. directly confronting the abuser
- ☐ 2. using a foam bat while symbolically confronting the abuser
- ☐ 3. keeping a journal of memories and feelings
- ☐ 4. writing letters to the abusers but not sending them
- ☐ 5. writing letters to the adults who did not protect them but not sending them

17. After a client reveals a history of childhood sexual abuse, what question should the nurse ask **first**?

- ☐ 1. "What other forms of abuse did you experience?"
- ☐ 2. "How long did the abuse go on?"
- ☐ 3. "Was there a time when you did not remember the abuse?"
- ☐ 4. "Does your abuser still have contact with young children?"

18. Which parental characteristic is **least** likely to be a risk factor for child abuse?

- ☐ 1. low self-esteem
- ☐ 2. history of substance abuse
- ☐ 3. inadequate knowledge of normal growth and development patterns
- ☐ 4. being a member of a large family

19. When obtaining a nursing history from parents who are suspected of abusing their child, which characteristic about the parents should the nurse particularly assess?

- ☐ 1. attentiveness to the child's needs
- ☐ 2. self-blame for the injury to the child
- ☐ 3. ability to relate the child's developmental achievements
- ☐ 4. difficulty with controlling aggression

20. A 3-year-old child with a history of being abused has blood drawn. The child lies very still and makes no sound during the procedure. Which comment by the nurse would be **most** appropriate?

- ☐ 1. "It is okay to cry when something hurts."
- ☐ 2. "That really did not hurt, did it?"
- ☐ 3. "We must seem mean to hurt you that way."
- ☐ 4. "You were very good not to cry with the needle."

21. While interviewing a 3-year-old girl who has been sexually abused about the event, which approach would be **most** effective?

- ☐ 1. Describe what happened during the abusive act.
- ☐ 2. Draw a picture and explain what it means.
- ☐ 3. "Play out" the event using anatomically correct dolls.
- ☐ 4. Name the perpetrator.

22. Which observation by the nurse should suggest that a 15-month-old

toddler has been abused?

- ☐ 1. The child appears happy when personnel work with him.
- ☐ 2. The child plays alongside others contentedly.
- ☐ 3. The child is underdeveloped for his age.
- ☐ 4. The child sucks his thumb.

23. When planning interventions for parents who are abusive, the nurse should incorporate knowledge of which factor as a common parental indicator?

- ☐ 1. lower socioeconomic group
- ☐ 2. unemployment
- ☐ 3. low self-esteem
- ☐ 4. loss of emotional family attachments

24. A 15-year-old boy has been shy and quiet throughout his schooling. In the past, he has been teased about being “big” and “fat,” leading him to get angry and fight those who called him names. This school year, he joined the wrestling team and showed some promise, though he had to lose weight to compete in a lower weight class. This spring, his mother called the nurse and said she had noticed that her son was wearing long-sleeved shirts all the time and spending a lot of time in the bathroom at home. She has seen scars on his wrists that the boy attributes to wrestling although the season has been over for several weeks. She and the boy’s father are going through a contentious divorce that she thinks may be upsetting her son. In what order of priority from first to last should the nurse initiate the actions? All options must be used.

1. Interview the teen about how he is handling the divorce, any bullying he may be experiencing, and his current grades.

2. Interview the mother further about the child’s early childhood and any potential antecedents to his current behavior.

3. Interview the father about his awareness of his son’s behavior and

perspective concerning it as well as the relationship between him and his son.

4. Ask the boy about self-injury, depression, and suicidality in connection with the scars on his wrists.

25. A shy middle school student set up a social network site. A popular student sent a message that included a suggestive picture of himself and suggested the student send a similar picture. When the student sent back a picture of himself dressed only in his boxers, the popular student sent it to all his friends and encouraged them to pass it along. Soon, the whole school had seen the picture identified as “Joe’s Crotch.” The student was so humiliated that he tried to hang himself but was found by his parent before he succeeded. Which outcomes would be **most** realistic and appropriate with regard to this situation? Select all that apply.

- ☐ 1. The social network privileges of all those who forwarded the message are revoked for a year.
- ☐ 2. All students in the school are educated about the risks of cyberbullying and how to respond to it.
- ☐ 3. The popular student who sent the message to his friends is disciplined by the school authorities.
- ☐ 4. The student can use the Internet safely after being educated about cyberbullying and completing a safety plan.
- ☐ 5. Through therapy, the student learns social skills to improve his confidence level and help him relate to peers more easily.

The Adolescent with Eating Disorders

26. The nurse is planning an eating disorder protocol for hospitalized clients experiencing bulimia and anorexia. Which elements should be included in the protocol? Select all that apply.

- ☐ 1. Clients must eat within view of a staff member.
- ☐ 2. Clients are not told their weight and cannot see their weight while being weighed.
- ☐ 3. Clients are not allowed to discuss food or eating in groups or informal conversation with peers.
- ☐ 4. Clients must rest within view of a staff member for one-half hour to an hour after eating.
- ☐ 5. Clients may not go to the bathroom for one-half hour to an hour after eating.
- ☐ 6. Clients cannot participate in any groups after admission until they gain 1 lb (0.5 kg).

27. A hospitalized adolescent diagnosed with anorexia nervosa refuses to comply with her daily before-breakfast weigh-in. She states that she just drank a glass of water, which she feels will unfairly increase her weight. What is the nurse's **best** response to the client?

- ☐ 1. "You are here to gain weight so that will work in your favor."
- ☐ 2. "Do not drink or eat for 2 hours, and then I will weigh you."
- ☐ 3. "You must weigh in every day at this time. Please step on the scale."
- ☐ 4. "If you do not get on the scale, I will be forced to call your healthcare provider."

28. The nurse discovers that an adolescent client with anorexia nervosa is taking diet pills rather than complying with the diet. What should the nurse do **first**?

- ☐ 1. Explain to the client how diet pills can jeopardize health.
- ☐ 2. Listen to the client discuss fears of losing control of eating while being treated.
- ☐ 3. Talk with the client about how weight loss and emaciation worry the healthcare providers (HCPs).
- ☐ 4. Inquire about worries of the client's family concerning the client's physical and emotional health.

29. When teaching a group of adolescents about anorexia nervosa, the nurse should describe this disorder as being characterized by which factors?

- ☐ **1.** excessive fear of becoming obese, near-normal weight, and a self-critical body image
- ☐ **2.** obsession with the weight of others, chronic dieting, and an altered body image
- ☐ **3.** extreme concern about dieting, calorie counting, and an unrealistic body image
- ☐ **4.** intense fear of becoming obese, emaciation, and a disturbed body image

30. The nurse reviews laboratory work for a client who is admitted to the acute psychiatric unit for an eating disorder.

History	Physical	Labs	Prescriptions
Test	Result Traditional Units	Result SI Units	
Albumin level	2.8 g/dl	28 g/L	
Sodium level	145 mEq/L	145 mmol/L	
Hemoglobin level	10.8 g/dL	108 g/L	
Potassium level	2.7 mEq/L	2.7 mmol/L	
Hematocrit level	37%	0.37	

Which finding does the nurse report to the healthcare provider (HCP)? Select all that apply.

- ☐ **1.** albumin level
- ☐ **2.** sodium level
- ☐ **3.** hemoglobin level

- ☐ 4. potassium level
- ☐ 5. hematocrit level

31. The parents of a 15-year-old newly diagnosed with anorexia nervosa are meeting with the nurse during the admission process. Which remarks should the nurse interpret as typical for parents of a client with anorexia nervosa?

- ☐ 1. “We have given her everything, and look how she repays us!”
- ☐ 2. “She has had behavior problems for the past year both at home and at school.”
- ☐ 3. “She has been a model child. We have never had any problems with her.”
- ☐ 4. “We have five children, all normal kids with some problems at times.”

32. A young adult female client is brought to the emergency department by her roommate to seek treatment for gastrointestinal problems. The client reveals that she attends college and works at a coffee shop each evening. A diet history indicates that the client has unhealthy eating habits, commonly eating large amounts of carbohydrates and junk food with few fruits and vegetables. “Her stomach is upset a lot,” the roommate says. She further reports that the client is “in the bathroom all the time.” The nurse should refer the client to:

- ☐ 1. a mental health clinic.
- ☐ 2. a weight loss program.
- ☐ 3. an overeating support group.
- ☐ 4. the client’s family healthcare provider (HCP).

33. A nurse is working with a client with bulimia. Which goals should be included in the care plan? Select all that apply.

- ☐ 1. The client will maintain normal weight.
- ☐ 2. The client will comply with medication therapy.
- ☐ 3. The client will achieve a positive self-concept.
- ☐ 4. The client will acknowledge the disorder.
- ☐ 5. The client will never have the desire to purge again.

34. A nurse works with a client diagnosed with bulimia. What is the **most**

appropriate long-term client goal for this client?

- ☐ 1. Eat meals at home without bingeing or purging.
- ☐ 2. Be able to eat out without bingeing or purging.
- ☐ 3. Manage stresses in life without bingeing or purging.
- ☐ 4. Be able to attend college without bingeing or purging.

35. A client newly diagnosed with bulimia is attending the nurse-led group at the mental health center. She tells the group that she came only because her husband said he would divorce her if she did not get help. Which response by the nurse is appropriate?

- ☐ 1. "You sound angry with your husband. Is that correct?"
- ☐ 2. "You will find that you like coming to group. These people are a lot of fun."
- ☐ 3. "Tell me more about why you are here and how you feel about that."
- ☐ 4. "Tell me something about what has caused you to be bulimic."

36. A client diagnosed with bulimia tells the nurse she only eats excessively when upset with her best friend, and then she vomits to avoid gaining a lot of weight. The nurse should **next**:

- ☐ 1. schedule daily family therapy sessions.
- ☐ 2. enroll client in a coping skills group.
- ☐ 3. work with the client to limit her purging.
- ☐ 4. have client take lorazepam 1 mg as needed whenever she feels the urge to binge.

37. A community health nurse working with a group of fifth-grade girls is planning a primary prevention to help the girls avoid developing eating disorders during their teen years. The nurse should focus on which factor?

- ☐ 1. working with the school nurse to closely monitor the girls' weight during middle school
- ☐ 2. limiting the girls' access to media images of very thin models and celebrities
- ☐ 3. telling the girls' parents to monitor their daughter's weight and media access
- ☐ 4. helping the girls accept and appreciate their bodies and feel good about

themselves

Children and Adolescents with Behavioral Problems

38. A 17-year-old client who has been taking an antidepressant for 6 weeks has returned to the clinic for a medication check. When the nurse talks with the client and her parent, the mother reports that she has to remind the client to take her antidepressant every day. The client says, “Yeah, I am pretty bad about remembering to take my meds, but I never miss a dose because Mom always bugs me about taking it.” Which response would be effective for the nurse to make to the client?

- ☐ 1. “It is a good thing your mom takes care of you by reminding you to take your meds.”
- ☐ 2. “It seems there are some difficulties with being responsible for your medications that we need to address.”
- ☐ 3. “You will never be able to handle your medication administration at college next year if you are so dependent on her.”
- ☐ 4. “I am surprised your mother allows you to be so irresponsible.”

39. The nurse assesses a 10-year-old girl who excessively cleans and categorizes. Her parents report that she has always been orderly, but since her brother died of cancer 6 months ago, her cleaning and categorizing have escalated. In school, she reads instead of playing with other children. These behaviors are now interfering with homework and leisure activities. To bolster her self-esteem, the nurse should encourage the child to:

- ☐ 1. be a library helper.
- ☐ 2. organize a party for the class.
- ☐ 3. be in charge of a group project with four peers.
- ☐ 4. be captain of the kickball team.

40. A 15-year-old is a heavy user of marijuana and alcohol. When the nurse confronts the client about his drug and alcohol use, he admits previous heavy use in order to feel more comfortable around peers and achieve social acceptance. He says he has been trying to stay clean since his parents found out and had him seek treatment. When the nurse develops a plan of care with the client, what should be the **highest priority** to help him maintain sobriety?

- ☐ 1. peer recognition that does not involve substance use
- ☐ 2. support and guidance from his parents
- ☐ 3. a strict no drug policy at his high school
- ☐ 4. the threat of legal charges if caught drinking or smoking marijuana

41. A 17-year-old is admitted to a psychiatric day treatment program due to severe lower back pain since her mother's death 3 years ago. Medical examinations have not discovered a physical cause for her pain. She cares for her four younger siblings after school and on weekends because of her father's long work hours. Which predischarge statement indicates that treatment for her condition has been successful?

- ☐ 1. "I understand now why my father spends so much time away from home."
- ☐ 2. "My back pain is worse on weekends with more responsibility and homework."
- ☐ 3. "I do not want to talk about my family. It is my back that is hurting."
- ☐ 4. "I just need more rest and relaxation and then my back will feel fine."

42. When collaborating with the healthcare provider (HCP) to develop the plan of care for a child diagnosed with attention deficit hyperactivity disorder (ADHD), the treatment plan will likely include which treatments?

- ☐ 1. antianxiety medications, such as buspirone, and homeschooling
- ☐ 2. antidepressant medications, such as imipramine, and family therapy
- ☐ 3. anticonvulsant medications, such as carbamazepine, and monthly blood levels
- ☐ 4. psychostimulant medications, such as methylphenidate, and behavior modification

43. The nurse meets with the mother of a child diagnosed with attention deficit hyperactivity disorder. The mother states, "I feel so guilty that he has this disease, like I did something wrong. I feel like I need to be with him constantly in order for him to get better. But still sometimes I feel like I am going to lose control and hurt him." The nurse should suggest which intervention to the mother?

- ☐ 1. arranging for respite care to watch her child and give herself a regular break

- ☐ 2. taking a job to allow herself to feel some success because her child will not ever improve
- ☐ 3. arranging to have coffee with friends daily as a way to begin a support group
- ☐ 4. considering foster care if she feels that she cannot handle her child's problems

44. The nurse is with the parents of a 16-year-old boy who recently attempted suicide. The nurse cautions the parents to be especially alert for which changes in their son?

- ☐ 1. expression of a desire to date
- ☐ 2. decision to try out for an extracurricular activity
- ☐ 3. giving away valued personal items
- ☐ 4. desire to spend more time with friends

45. A 19-year-old has struggled academically throughout high school and realizes during her last semester in school that she is not going to graduate with her class, which will delay her admission to college. In the past, she has intermittently used drugs and alcohol to deal with her anxiety, but now, her involvement with substances escalates to daily use. In what order of priority from first to last should the nurse, who has become aware of the problem, take the actions? All options must be used.

1. Refer her to the school authorities to address her academic issues so she can graduate next semester.

2. Refer her to a program at the local community college to improve the client's readiness for college and decrease her anxiety.

3. Refer her to an outpatient program that treats clients with chemical dependency issues.

4. Refer her to a psychiatric clinic so she can get an appropriate diagnosis

and medication for her anxiety.

46. A mother states to the nurse in her healthcare provider's (HCP's) office that she is frustrated regarding her 7-year-old son's nightly enuresis for the past 3 years. She says she has limited his evening fluids, eliminated all caffeine and soft drinks from his diet, and has had him wash his own sheets, but he still wets the bed almost every night. Her husband has told her he was a bed wetter as a child. He thinks the son will "get over it." The mother is worried that it could negatively affect the son's peer relationships as he grows older. Which action should the nurse take?

- ☐ **1.** Tell the mother her husband is correct and she should be patient since her husband's enuresis stopped without intervention.
- ☐ **2.** Suggest asking the HCP about medication treatment to deal with the enuresis.
- ☐ **3.** Discuss a behavioral treatment plan for the child focusing on the improvement of his social skills.
- ☐ **4.** Suggest the mother ask the HCP about hospitalization for a complete renal workup since the enuresis has gone on a long time.

47. A parent of a 7-year-old diagnosed with attention deficit hyperactivity disorder (ADHD) since he was 5 years old is talking to the nurse about her concerns about the son's physical condition. The parent states that his medication, methylphenidate, extended release, controls his symptoms well but is causing him to lose weight. It is difficult to get him up and ready for school in the morning unless he is given the medication as soon as he awakens. He does not eat breakfast or very much of his lunch at school; he eats dinner, but only an average amount of food. He has lost 3 lb (1.4 kg) in the last 2 weeks. Which action should the nurse suggest the parent do **first**?

- ☐ 1. Have the child eat a breakfast bar, banana, and a glass of milk at his bedside at the same time he takes his medication every morning.
- ☐ 2. Monitor the child's weight closely for a month since he is likely to stop losing weight when the school year ends in 2 weeks.
- ☐ 3. Suggest a change of medication to a nonstimulant drug that will treat his ADHD without causing the appetite decrease.
- ☐ 4. Suggest that the parent supplement the child's dinner with a high-protein drink or other food that will increase his caloric intake.

48. An adolescent is brought to the emergency department (ED) after accidentally taking an overdose of heroin. The adolescent is semiconscious, unable to respond appropriately to questions, slurs his words, and has constricted pupils; his vital signs are blood pressure 60/50 mm Hg, pulse 50 beats/min, and respirations 8 breaths/min. Naloxone is administered to temporarily reverse the effects of the heroin. Which finding would **first** indicate that the naloxone administration has been effective?

- ☐ 1. The client's blood opiate level drops to a nontoxic level.
- ☐ 2. The client becomes talkative and physically active.
- ☐ 3. The client's memory and attention become normal.
- ☐ 4. The client's respirations improve to 12/min.

49. Assessment of suicidal risk in children and adolescents requires the nurse to know what information?

- ☐ 1. Children rarely commit suicide unless one of their parents has already committed suicide, especially in the past year.
- ☐ 2. The risk of suicide increases during adolescence, with those who have recently suffered a loss, abuse, or family discord being most at risk.
- ☐ 3. Children do have a suicidal risk that coincides with some significant event such as a recent gun purchase in the family.
- ☐ 4. Adolescents typically do not choose suicide unless they live in certain geographical regions of the United States and Canada.

50. A child is being seen at the clinic for an attention deficit hyperactivity disorder (ADHD) assessment. What symptoms the nurse would expect to find? Select all that apply.

- ☐ 1. excessive climbing and running

- ☐ 2. excessive fidgeting
- ☐ 3. pouting behaviors
- ☐ 4. cannot wait to take turns
- ☐ 5. easily distracted

51. The mother of a 14-year-old girl who is diagnosed with oppositional defiant disorder tells the nurse that she has read extensively on this disorder and does not believe the diagnosis is correct for her daughter. Which response by the nurse is appropriate?

- ☐ 1. “It sounds like you are very interested in your daughter. Let us focus on what is best for her.”
- ☐ 2. “Tell me what you have found in your reading that is leading you to that conclusion.”
- ☐ 3. “Your healthcare provider (HCP) has had many years of education and experience, so you can believe he is right.”
- ☐ 4. “That does not matter now because we just need to help her get better.”

52. The parents of a preschool child diagnosed with autism must take their child on a plane flight and are concerned about how they can make the experience less stressful for her and their fellow travelers. The nurse suggests a dry run to the airport in which they simulate going through security and boarding a plane. In addition, the nurse suggests taking items to help the child be calm during the flight. In what order of priority from first to last should the parents employ the items listed below? All options must be used.

1. a DVD player with headphones and favorite games, cartoons, and child films

2. a favorite stuffed toy animal or other soft toy

3. a favorite nonelectronic game

4. medication that can be given as needed to calm the child

53. A young school-age girl whose mother and aunt have been diagnosed as having bipolar disorder and whose father is diagnosed with depression is brought to the clinic because of problems with behavior and attention in school and inability to sleep at night. The child says, “My brain does not turn off at night.” The child is diagnosed as experiencing attention deficit hyperactivity disorder (ADHD) with a possibility of bipolar disorder as well. What should the nurse say to the father to explain what the provider said? Select all that apply.

- ☐ 1. “Your child was diagnosed as having ADHD because of her attention and behavior problems at school.”
- ☐ 2. “ADHD involves difficulty with attention, impulse control, and hyperactivity at school, home, or in both settings.”
- ☐ 3. “Your provider does not know how to diagnose your child’s illness since she has symptoms of both bipolar disorder and ADHD.”
- ☐ 4. “The child’s description of her inability to sleep is irrelevant to diagnosing her condition since she stays up late.”
- ☐ 5. “Your provider is considering a bipolar diagnosis because of your child’s family history of bipolar disorder and her sleep issues.”

54. At the admission interview, the father of a 4-year-old boy with attention deficit hyperactivity disorder (ADHD) says to the nurse, “I know that my wife or I must have caused this disease.” What is the nurse’s **best** response?

- ☐ 1. “ADHD is more common within families, but there is no evidence that problems with parenting cause this disorder.”
- ☐ 2. “What do you think you might have done that could have led to causing this disorder to develop in your son?”
- ☐ 3. “Many parents feel this way, but I doubt there is anything that you did

that caused ADHD to develop in your child.”

☐ 4. “Let us not focus on the cause but rather on what needs to be done to help your son get better. I know that you and your wife are very interested in helping him to improve his behavior.”

55. A member of a nurse-led group for depressed adolescents tells the group that she is not coming back because she is taking medication and no longer needs to talk about her problems. Which response by the nurse is **most** appropriate?

☐ 1. “I am glad that you are taking your medication, but how can we know that you will continue to take it? After all, you have not been on it for very long, and you might decide to stop taking it.”

☐ 2. “I think that it is important to let everyone respond to what you said, so let us go around the group and let everyone give their thoughts about what you have decided.”

☐ 3. “The purpose of the group is to provide each of you with a place to discuss the problems of being a teenager with depression with others who also are experiencing a similar situation.”

☐ 4. “You do not have to stay in the group if you do not want to, but if you choose to leave, then you will not be able to change your mind later and return to the group.”

56. Which question is **most** appropriate to use when assessing a 17-year-old client with depression for suicide risk?

☐ 1. “What movies about death have you watched lately?”

☐ 2. “Can you tell me what you think about suicide?”

☐ 3. “Has anyone in your family ever committed suicide?”

☐ 4. “Are you thinking about killing yourself?”

57. A teacher is talking to the nurse about a child in her classroom who has a tic disorder. The teacher mentions that the boy frequently trips other children although no one has ever been hurt. The teacher then further states that she ignores him when that happens because it is part of his disorder. The nurse should tell the teacher:

☐ 1. “Tripping other children is not a tic, so you can respond to that as you would in any other child.”

- ☐ 2. "I cannot believe that you actually allow him to get away with that!"
- ☐ 3. "I think that is the best choice unless some parents of the other children start to protest about it."
- ☐ 4. "If no one else is getting hurt, then it seems harmless and might prevent the development of a worse behavior."

58. A 15-year-old boy being successfully treated for Tourette's syndrome tells the nurse, "I am not going to take this medication anymore. Anyone who is really my friend will accept me as I am, tics and all!" What is the nurse's **best** response?

- ☐ 1. "You and your family came to the clinic for treatment, so you can terminate it whenever you wish."
- ☐ 2. "Will your lack of medication cause more tics and make you less attractive to girls?"
- ☐ 3. "Let us talk about what brought you into treatment and why you now want to stop taking medication."
- ☐ 4. "I think that is a very unwise decision, but you are entitled to do whatever you wish."

59. The nurse is leading a group session for parents of children diagnosed with oppositional defiant disorder. The nurse should give which - recommendation for discipline?

- ☐ 1. Avoid limiting the child's use of the television and computer for punishment.
- ☐ 2. Be consistent with discipline while assisting with ways for the child to more positively express anger and frustration.
- ☐ 3. Use primarily positive reinforcement for good behavior while ignoring any demonstrated bad behavior.
- ☐ 4. Use time-out as the primary means of punishment for the child regardless of what the child has done.

60. A 15-year-old girl is sent to the school nurse with dizziness and nausea. While assessing the girl, who denies any health problems, the nurse smells alcohol on her breath. Which response by the nurse is **most** appropriate?

- ☐ 1. "Do not tell me that you have been drinking alcohol before you came

to school this morning!”

- ☐ 2. “What is the real reason that you are feeling sick this morning?”
- ☐ 3. “Tell me everything that you have had to eat and drink yesterday and today.”
- ☐ 4. “I know that high school is stressful, but drinking alcohol is not the best way to handle it.”

61. What should the nurse include in the teaching plan for the parents of a child who is receiving methylphenidate?

- ☐ 1. Give the medication at the same time every evening.
- ☐ 2. Have the child take two doses at the same time if the last dose was missed.
- ☐ 3. Give the single-dose form of the medication early in the day.
- ☐ 4. Allow concurrent use of any over-the-counter medications with this drug.

62. An 8-year-old child was recently hospitalized at a child psychiatric unit for inattention and acting out behavior at school and home. His provider prescribed the methylphenidate patch to control his attention deficit hyperactivity disorder symptoms, and inpatient unit staff worked with him on behavioral control measures. During his first office visit after his discharge from the hospital, the office nurse discovers that the boy has been taking off his patch during the day, which is causing problems at school and at home. In which order of priority from first to last should the nurse take the actions? All options must be used.

1. Explain to the family, in terms the child can understand, the benefits of his medication in dealing with school and home problems he is experiencing.

2. Explore the parents’ attitudes about medication administration in general and their child’s medication in particular.

3. Explore the child’s reasons for removing the patch during the day rather

than at the end of the day.

4. Have the provider discuss with the child and parents a trial of a different medication.

63. A 7-year-old client is diagnosed with conduct disorder. After admission, the nurse identifies his problematic behaviors as cruelty to animals, stealing, truancy, aggression with peers, lying, and explosive angry outbursts resulting in destruction of property. The nurse is now talking with the client about his behavioral contract, which should include which crucial components? Select all that apply.

- ☐ 1. taking prescribed medications
- ☐ 2. acceptable methods for expressing anger
- ☐ 3. consequences for unacceptable behaviors
- ☐ 4. rules for interacting with staff and other clients
- ☐ 5. personal possessions allowed on the unit

64. The nurse is meeting weekly with an adolescent recently diagnosed with depression to monitor progress with therapy and antidepressant medication. The nurse should be **most** concerned when the client reports what information?

- ☐ 1. An acquaintance hanged herself 2 days ago.
- ☐ 2. She is experiencing intermittent headaches as a side effect of taking the antidepressant.
- ☐ 3. She received a low score on her last history test.
- ☐ 4. Her younger brother has been starting fights with her for the last week.

The Child and Adolescent with Adjustment Disorders

65. A 19-year-old male with cystic fibrosis (CF) is hospitalized for a serious lung infection and is in need of a lung transplant. However, he has a rare blood type that complicates the process of obtaining a donor organ. He has also been diagnosed with bipolar disorder and treated successfully since midadolescence with medication and therapy. The client requests to see a chaplain to help him make plans for a funeral and donation of his body to science after death. How should the nurse interpret the client's request?

- ☐ **1.** It is a signal of the depressive side of his bipolar disorder, and he should be checked for suicidal thoughts/plans.
- ☐ **2.** It is a signal of an exacerbation of the client's CF and warrants further assessment by his lung specialist.
- ☐ **3.** It is a signal of the client's awareness he is likely to have a shortened life span and should be supported by unit staff.
- ☐ **4.** It is a signal of delirium as a result of the many medications he is taking and requires further assessment by the pharmacist or healthcare provider (HCP).

66. A 6-year-old boy has experienced the death of his mother in the last 3 months. He and his father are involved in a grief support program that has sessions for all ages. A nurse is educating the parents in the group about the normal grief reactions of children to help them distinguish normal behavior from behavior that is unusual and possibly indicative of depression or other psychological issues. Which represents normal grief behavior for this young child after the death of his mother? Select all that apply.

- ☐ **1.** talking to his mother as if she were present in the room
- ☐ **2.** crying followed in a few minutes by laughing
- ☐ **3.** playing with a rope, saying he is going to be with his mother
- ☐ **4.** yelling and being angry at his mother for leaving him
- ☐ **5.** playing with a friend right after saying he misses his mother

67. When counseling a 5-year-old girl who recently suffered the loss of her mother, which statement reflects the typical understanding about death at this age?

- ☐ **1.** "My mommy died last week, but I am going to see her again."

- ☐ 2. “My daddy said mommy went to heaven, and I am glad God took her there.”
- ☐ 3. “My dog died and now we got another one.”
- ☐ 4. “I think Mommy went to heaven and I will get to see her someday when I die.”

68. A shy 12-year-old girl who must change school systems just before she begins junior high school begins cutting her arms to relieve the stress that she feels about leaving long-standing friends, having to develop new friendships, and meeting high academic standards in her new school. After she has been cutting for a few weeks, her parent discovers the injuries and takes her to a psychiatrist mental health provider who prescribes a therapeutic group at the local mental health center and medication to help decrease her anxiety. Which findings indicate that the girl had made appropriate progress toward recovery? Select all that apply.

- ☐ 1. The girl indicated that she had joined three clubs at school and agreed to be an officer in one of them.
- ☐ 2. The girl says she has developed a friendship with a girl in her class and one in her therapy group.
- ☐ 3. The girl wears short-sleeved and/or sleeveless tops when the weather is warm.
- ☐ 4. The girl’s grades are good, and her hours of study are not excessive.
- ☐ 5. The girl begins saying she must study hard so she can get into a good university.

Managing Care, Quality, and Safety of Clients

69. Which child would the nurse identify as being **most** at risk for an episode of major depression?

- ☐ 1. a 16-year-old male who has been struggling in school, earning only Cs and Ds
- ☐ 2. a 13-year-old female who was upset over not being chosen as a cheerleader
- ☐ 3. a 10-year-old male who has never liked school and has few friends
- ☐ 4. a 14-year-old female who recently moved to a new school after her

parents' divorce

70. A nurse on the mental health unit tells the nurse manager, "Kids with conduct disorders might as well be jailed because they all end up as adults with antisocial personality disorder anyway." What is the **best** reply by the nurse manager?

- ☐ 1. "You really sound burned out. Do you have a vacation coming up soon?"
- ☐ 2. "These children are more likely to have problems with depression and anxiety disorder as adults."
- ☐ 3. "You sound really frustrated. Let us talk about the meaning of their behavior."
- ☐ 4. "My experience has not been that negative. Let us see what the other staff members think; maybe I am wrong."

71. Which child would the nurse assess as demonstrating behaviors that need further evaluation?

- ☐ 1. Joey, age 2, who refuses to be toilet trained and talks to himself
- ☐ 2. Adrienne, age 6, who sucks her thumb when tired and has never spent the night with a friend
- ☐ 3. Curt, age 10, who frequently tells his mother that he is going to run away whenever they argue
- ☐ 4. Stephen, age 2, who is indifferent to other children and adults and is mute

72. A nurse has been caring for an adolescent client in a residential facility. The child has been through a series of foster placements since infancy with no success in any placement until the age of 7 when placed with a middle-aged single woman. The client thrived there until the woman was killed in a car accident. The client attempted suicide after her foster mother died in response to the loss, and the child was placed in the residential facility. The nurse has become close to this client and wants to help her address her issues and move on with her life. Which comment to the manager demonstrates that the nurse understands the client's issues and is able to respond appropriately to the client's needs?

- ☐ 1. "It is difficult for her to love and trust again after her losses. In this

facility, she can learn to deal with her loss in a less emotionally charged environment than a foster home.”

☐ 2. “She just needs someone who will love her and give her the things she has missed out on in life. An adoptive family needs to be found for her as soon as possible.”

☐ 3. “I am not sure she is going to be able to get past all the loss and rejection she has experienced. I do not think adoption will ever be a viable option for her.”

☐ 4. “I know her well and am familiar with her issues. I think the best chance for success for her would be if she was adopted into my family.”

73. Which adolescent would the nurse determine needs further evaluation?

☐ 1. a young adolescent girl whose mood changes when upset with her parents, though she has never been in trouble in school or the community

☐ 2. a young adolescent boy who coughs for 5 minutes after trying his first marijuana cigarette and declares he does not want to do it again

☐ 3. a young adolescent boy who restricts his food and fluid intake in order to be able to box in a lower weight class

☐ 4. a young adolescent girl who reads “dark” novels and questions why God allows innocent people to be harmed

74. A new client has just been admitted to an adolescent psychiatric inpatient unit. The charge nurse and an unlicensed assistive personnel (UAP) are discussing the client’s needs. The UAP says, “She is just showing off to try and get our sympathy. There is no need for her to cut herself. Why would adolescents want to do such a thing to themselves?” What response by the charge nurse would **most** help the UAP understand the client and her illness?

☐ 1. “She is not doing the cutting for attention since she always wears clothing that covers up her injuries and further, she is not willing to talk about it.”

☐ 2. “It is hard to see a young person harm herself as she does, but she has serious family issues and does not know better ways to handle them, so we have to help her with that.”

☐ 3. “You do not understand her problems and do not take them seriously, so you should not be allowed to work with her during her hospitalization.”

- ☐ 4. “Perhaps you should transfer to another unit where you are able to have empathy for the clients.”

75. A teenage client is admitted to the psychiatric unit with both bulimia nervosa and anorexia nervosa. Which initial interventions are appropriate for this client? Select all that apply.

- ☐ 1. Assign a staff member to accompany the client when using the bathroom.
- ☐ 2. Have the client keep a self-monitoring journal as a coping strategy.
- ☐ 3. Weigh the client in same amount of clothing and facing away from scale readout at daily scheduled intervals (e.g., 0645 on Tuesdays and Fridays).
- ☐ 4. Inform the client that parenteral nutrition will be necessary if the client does not gain weight.
- ☐ 5. Assign a staff member to sit with client during meals and for 1½ hour after meals.
- ☐ 6. Provide liquid protein supplements when client is unable to eat meals.

76. A young adult female who was admitted to the psychiatric hospital 2 months ago with an eating disorder is being discharged. Which action indicates the client understands discharge instructions?

- ☐ 1. Client returns to the same living situation as she had prior to hospitalization.
- ☐ 2. Client attends a social club at her local church.
- ☐ 3. Client returns to the lab for routine lab tests.
- ☐ 4. Client enrolls in a health club.

Answers, Rationales, and Test-Taking Strategies

The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the

questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in Part 1 of this book.

The Client Experiencing Abuse

1. 2. The safety of the client and her children is the most immediate concern. If there is immediate danger, action must be taken to protect them. The other options can be discussed after the client's safety is assured.

CN: Psychosocial integrity; CL: Analyze

2. 3. The traditional and rigid gender roles described by the client are examples of role stereotyping. Impermeable boundaries, unbalanced power ratio, and dysfunctional feeling tone are also common in abusive families.

CN: Safety and infection control; CL: Analyze

3. 4. The client's safety, including the need to stay alive, is crucial. Therefore, helping the client develop a safety plan is most important to include in the plan of care. Being empathetic, teaching about abuse, and explaining the person's rights are also important after safety is ensured.

CN: Psychosocial integrity; CL: Synthesize

4. 2,3,4,5. The victim of abuse is usually compliant with the spouse and feels guilt, shame, and some responsibility for the battering. Self-blame, substance abuse, and suicidal thoughts and attempts are possible dysfunctional coping methods used by abuse victims. The victim of abuse is not likely to demonstrate assertiveness.

CN: Psychosocial integrity; CL: Analyze

5. 2. The nurse needs more information about the client's decision before deciding what intervention is most appropriate. Judgmental responses could make it difficult for the client to return for treatment should she want to do so. Telling the client that this is a bad decision that she will regret is inappropriate because the nurse is making an assumption. Warning the client that abuse commonly stops when one partner is involved in treatment may be true for some clients. However, until the nurse determines the basis for the

client's decision, this type of response is an assumption and therefore inappropriate. Reminding the client about her duty to protect the children would be appropriate if the client had talked about episodes of current abuse by her partner and the fear that her children might be hurt by him, but the scenario offers no evidence that the husband has threatened the children.

CN: Psychosocial integrity; CL: Synthesize

6. 3. The mother's feelings are the priority here. Addressing the mother's feelings and asking for her view of the situation is most important in building a relationship with the family. Ignoring the mother's feelings will hinder the relationship. Defending the school nurse and the school puts the client's mother on the defensive and stifles communication.

CN: Psychosocial integrity; CL: Synthesize

7. 4. Parental use of nonviolent discipline, the child's talk about what the family is doing, and the easing of the parent's negativity toward the school nurse are all signs of progress. Avoidance and wearing clothes inappropriate for the weather implies that the child has something to hide, likely signs of physical abuse.

CN: Psychosocial integrity; CL: Analyze

8. 4. Ultimately, a victim of a crime needs to move from being a victim to being a survivor. A reasonable sense of safety and security is key to this transition. Getting through the shock and confusion, carrying out home and work routines, and resolving grief over any losses represent steps along the way to becoming a survivor.

CN: Psychosocial integrity; CL: Synthesize

9. 2. The experience of rape is a crisis. Crisis intervention services, especially with a rape crisis nurse, are essential to help the client begin dealing with the aftermath of a rape. Legal assistance may be recommended if the client decides to report the rape and only after crisis intervention services have been provided. A rape support group can be helpful later in the recovery process. Medications for sleep disturbance, especially benzodiazepines, should be avoided if possible. Benzodiazepines are potentially addictive and can be used in suicide attempts, especially when

consumed with alcohol.

CN: Psychosocial integrity; CL: Synthesize

10. 3. Guilt and self-blame are common feelings that need to be addressed directly and frequently. The client needs to be reminded periodically that she did not deserve and did not cause the rape. Continually encouraging the client to report the rape pressures the client and is not helpful. In most cases, resuming sexual relations is a difficult process that is not likely to occur quickly. It is not necessarily true that the rapist will be caught, tried, and jailed. Most rapists are not caught or convicted.

CN: Psychosocial integrity; CL: Apply

11. 4. Use of alcohol reflects unhealthy coping mechanisms. The client's report of needing alcohol to calm down needs to be addressed. Survival is the most important goal during a rape. The client's acknowledging this indicates that she is aware that she made the right choice. Although suicidal thoughts are common, the statement that suicide is an easy escape but the client would be unable to do it indicates low risk. Fantasies of revenge, such as giving the death penalty to all rapists, are natural reactions and are a problem only if the client intends to carry them out directly.

CN: Psychosocial integrity; CL: Evaluate

12. 3. Coercion is the most common strategy used because the child commonly trusts the abuser. Tying the child down usually is not necessary. Typically, the abusive person can control the child by his or her size and weight alone. Bribery usually is not necessary because the child wants love and affection from the abusive person, not money. Young children are not capable of giving consent for sex before they develop an adult concept of what sex is.

CN: Psychosocial integrity; CL: Apply

13. 2. Truancy and running away are common symptoms for young children and adolescents. The stress of the abuse interferes with school success, leading to the avoidance of school. Running away is an effort to escape the abuse and/or lack of support at home. Rather than an inability to play or a lack of play, play is likely to be aggressive with sexual overtones.

Children tend to act out anger rather than control it. Head banging is a behavior typically seen with very young children who are abused.

CN: Psychosocial integrity; CL: Analyze

14. 3. Dealing with the physical pain associated with mutilation is viewed as easier than dealing with the intense anger and emotional pain. The client fears an aggressive outburst when anger and emotional pain increase. Self-mutilation seems easier and safer. Additionally, self-mutilation may occur if the client feels unreal or numb or is dissociating. Here, the mutilation proves to the client that he or she is alive and capable of feeling. The client may want to be less sexually attractive, but this aspect usually is not related to self-mutilation. Binging and purging is commonly done in addition to, not instead of, self-mutilation. Although a few clients report an occasional high with self-mutilation, usually the experience is just relief from anger and rage.

CN: Psychosocial integrity; CL: Analyze

15. 1. The dolls and toys in a play therapy room are useful props to help the child remember situations and reexperience the feelings, acting out the experience with the toys rather than putting the feelings into words. Role-playing without props commonly is more difficult for a child. Although drawing itself can be therapeutic, having the abuser see the pictures is usually threatening for the child. Reporting abuse to authorities is mandatory but does not help the child express feelings.

CN: Psychosocial integrity; CL: Synthesize

16. 2,3,4,5. Using a foam bat while symbolically confronting the abuser, keeping a journal of memories and feelings, and writing letters about the abuse but not sending them are appropriate strategies because they allow anger to be expressed safely. Directly confronting the abuser is likely to result in further harm because the abusers commonly deny the abuse, rationalize about it, or blame the victim.

CN: Psychosocial integrity; CL: Synthesize

17. 4. The safety of other children is a primary concern. It is critical to know whether other children are at risk for being sexually abused by the same perpetrator. Asking about other forms of abuse, how long the abuse

went on, and if the victim did not remember the abuse are important questions after the safety of other children is determined.

CN: Psychosocial integrity; CL: Synthesize

18. 4. From documented cases of child abuse, a profile has emerged of a high-risk parent as a person who is isolated, impulsive, impatient, and single with low self-esteem, a history of substance abuse, a lack of knowledge about a child's normal growth and development, and multiple life stressors. Just because a parent comes from a large family, there is no increase in the incidence of the parent abusing their own children unless they possess the other risk factors.

CN: Psychosocial integrity; CL: Apply

19. 4. Parents of an abused child have difficulty controlling their aggressive behaviors. They may blame the child or others for the injury, may not ask questions about treatment, and may not know developmental information.

CN: Psychosocial integrity; CL: Analyze

20. 1. It is not normal for a preschooler to be totally passive during a painful procedure. Typically, a preschooler reacts to a painful procedure by crying or pulling away because of the fear of pain. However, an abused child may become "immune" to pain and may find that crying can bring on more pain. The child needs to learn that appropriate emotional expression is acceptable. Telling the child that it really did not hurt is inappropriate because it is untrue. Telling the child that nurses are mean does not build a trusting relationship. Praising the child will reinforce the child's response not to cry, even though it is acceptable to do so.

CN: Psychosocial integrity; CL: Synthesize

21. 3. A 3-year-old child has limited verbal skills and should not be asked to describe an event, explain a picture, or respond verbally or nonverbally to questions. More appropriately, the child can act out an event using dolls. The child is likely to be too fearful to name the perpetrator or will not be able to do so.

CN: Psychosocial integrity; CL: Synthesize

22. 3. An almost universal finding in descriptions of abused children is underdevelopment for age. This may be reflected in small physical size or in poor psychosocial development. The child should be evaluated further until a plausible diagnosis can be established. A child who appears happy when personnel work with him is exhibiting normal behavior. Children who are abused often are suspicious of others, especially adults. A child who plays alongside others is exhibiting normal behavior, that of parallel play. A child who sucks his thumb contentedly is also exhibiting normal behavior.

CN: Psychosocial integrity; CL: Analyze

23. 3. Parents who are abusive often suffer from low self-esteem, commonly because of the way they were parented, including not being able to develop trust in caretakers and not being encouraged or offered emotional support by parents. Therefore, the nurse works to bolster the parents' self-esteem. This can be achieved by praising the parents for appropriate parenting. Employment and socioeconomic status are not indicators of abusive parents. Abusive parents usually are attached to their children and do not want to give them up to foster care. Parents who are abusive usually love their children and feel close to them emotionally.

CN: Psychosocial integrity; CL: Analyze

24. 1,4,2,3. The nurse should talk to the boy directly about how he is dealing with the stresses in his life, but he may not be forthcoming if the nurse approaches the self-injury first. Once the nurse has established rapport and learned about the client's view of his situation, it will be more likely that the client will be honest about his self-injury and any depression or suicidal thoughts or plans he may have. Since the mother called the nurse with her concerns about her son, a further interview with the mother would be the next step to take. Because there is conflict in the home, it would be necessary to also interview the father for his perspective of the situation. If he is not aware of his son's self-injury, he needs to be informed of it.

CN: Safety and infection control; CL: Synthesize

25. 2,3,4,5. Education of all students in the school about cyberbullying is appropriate and possible as programs exist to educate students in many communities. That education and his therapy should enable the student to

eventually return to using the Internet safely and to feel more confidence interacting with classmates. Disciplining of the student who posted the picture by school authorities is appropriate and can be helpful in reducing further incidents of cyberbullying. It is unrealistic to think that all those who forwarded the message could be identified, much less taken off a social network.

CN: Psychosocial integrity; CL: Evaluate

The Adolescent with Eating Disorders

26. 1,2,4,5. In hospital settings, clients are not allowed to know their weight at the time they are being weighed to decrease obsessing about weight gain. They must also eat and rest in staff view and cannot use the bathroom for a period to prevent discarding food or vomiting ingested food (purging). The rest prevents the client from exercising off the calories they just consumed. Barring clients from ever talking about food or attending groups until they have gained weight diminishes the therapeutic value of the inpatient hospital stay.

CN: Psychosocial integrity; CL: Create

27. 3. In responding to the client, the nurse must be nonjudgmental and matter of fact. Telling her that weight gain is in her favor ignores the client's extreme fear of gaining weight. Putting off the weigh-in for 2 hours allows the client to manipulate the nurse and interferes with the need to weigh the client at the same time each day. Threatening to call the care provider is not likely to build rapport or a working relationship with the client.

CN: Psychosocial integrity; CL: Synthesize

28. 2. A client with anorexia nervosa commonly has an extreme fear of not being able to control weight. The nurse should address this fear. Explaining the dangers of diet pills or discussing HCP  or family concerns focuses on the effect of the client's weight loss on other people rather than the client. Unless the client is motivated to stop, the client will likely not be successful.

CN: Psychosocial integrity; CL: Synthesize

29. 4. An intense fear of becoming obese, emaciation, and a disturbed

body image all are considered to be characteristics of anorexia nervosa. Near-normal weight is not associated with anorexia. The weight of others is not a primary factor. “Concern about dieting” is not strong enough language to describe the control of food intake in the individual with anorexia nervosa.

 CN: Psychosocial integrity; CL: Apply

30. 1,3,4. The normal albumin level is 3.5 to 5 g/dL (35 to 50 g/L), the normal hemoglobin level is 12 to 16 g/dL (120 to 160 g/L), and the normal potassium is 3.5 to 5 mEq/L (3.5 to 5 mmol/L). These levels are all low. The client is likely not eating a sufficient amount of protein; therefore, the albumin and hemoglobin are low. The potassium level would be low if the client was purging. The sodium level is normally 136 to 145 mEq/L (136 to 145 mmol/L), so this is in the normal range; however, it can be high in a client with an eating disorder. The normal hematocrit level is 37% to 47% (0.37 to 0.47) in an adult.

 CN: Reduction of risk potential; CL: Analyze

31. 3. Parents commonly describe their child as a model child who is a high achiever and compliant. These adolescents are typically well liked by teachers and peers. It is not typical for behavior problems to be reported. The description about having given the child everything and being repaid is more likely to describe an adolescent who is exhibiting behavior problems.

 CN: Psychosocial integrity; CL: Analyze

32. 1. The large carbohydrate intake and significant time in the bathroom are characteristics of bulimia. To address the problem, the client must obtain an evaluation of her physical and psychological status. Suggesting going to a weight loss program or overeating support group frames the problem as strictly a weight issue and ignores the psychological etiology of the problem. Seeing the family’s **HCP**  does not address the psychological aspect of the client’s illness, and the client must make the appointment herself.

 CN: Psychosocial integrity; CL: Apply

33. 1,2,3,4. Because of the large number of calories ingested in a binge and the fact that a purge does not eliminate all calories consumed, the client with bulimia is of more normal weight but still must have a goal of

maintaining that weight. Research has shown that selective serotonin reuptake inhibitors are effective in treating bulimia, and the client is usually amenable to taking the medication. The client with an eating disorder (bulimia and anorexia) has negative self-concepts that fuel her disordered eating, and attaining a positive self-concept is an appropriate goal. The nurse should work with the client with bulimia to help her recognize her eating as disordered. That recognition can make the client more amenable to treatment. It is not realistic to establish a goal that the client with bulimia will never have the desire to purge again.

 CN: Psychosocial integrity; CL: Create

34. 3. A successful outcome for a bulimic client is to avoid using the eating disorder as a coping measure when dealing with stress. Being able to attend college, eat at home, and eat out without bingeing and purging are important goals, but they do not address the primary problem of stress management and its connection to eating.

 CN: Psychosocial integrity; CL: Create

35. 3. Encouraging the client to talk about why she is here and her feelings may reveal more information about what led her to come to the group and what led to her diagnosis. It also provides the nurse with valuable information needed to develop an appropriate plan of care. The comment that the client sounds angry presumes what the client is feeling and focuses the talk on her husband. The focus should be on the client, not the husband. Telling the client that she will like coming to group imposes the nurse's view onto the client. The statement also focuses on having fun in the group instead of stressing the therapeutic value. Having the client tell the nurse something about the cause of her bulimia ignores the client's original statement. In addition, it requires the client to have insight into the cause of her disease, which may not be possible at this point. Also, it may be too early in the relationship to discuss this disorder.

 CN: Psychosocial integrity; CL: Synthesize

36. 2. Because the client eats excessively when upset, the best treatment would be a group to help her learn alternative coping skills. Trying to limit purging without controlling bingeing would result in weight gain and likely

increase the client's purging. Daily family therapy sessions are not realistic. Taking lorazepam whenever she feels she needs to binge may temporarily calm the client but does not address the cause of the bingeing and purging and will lead to drug dependence with long-term use.

CN: Psychosocial integrity; CL: Synthesize

37. 4. The goal of a primary prevention program for eating disorders is for the girls to have positive feelings about themselves and their bodies. Monitoring of weight by parents and/or nurses might note eating disorders early, particularly anorexia, but will not address the cause of the disorder. Limiting the girls' access to media would be impossible and does not prevent distress with one's body image.

CN: Psychosocial integrity; CL: Synthesize

Children and Adolescents with Behavioral Problems

38. 2. The client and mother need to address the issue of responsibility for medication administration. Reinforcing the mother's overinvolvement in medication taking or making negative comments about the client and mother is unlikely to engage them in problem solving about the matter.

CN: Psychosocial integrity; CL: Synthesize

39. 1. This child is demonstrating signs of anxiety and withdrawal. Being a library helper enables the client to use an interest (reading) when interacting with others and gaining pride in helping others. Most interaction will be one-to-one and with adults, which is likely to be more comfortable for her in her state of anxiety. Organizing a class party, a group project with her peers, and a kickball team involve multiple peer interactions, which are likely to be difficult for her at this time. Also, there is no mention of the child liking sports, so kickball would not be an appropriate activity.

CN: Psychosocial integrity; CL: Synthesize

40. 1. Peer acceptance and recognition is a very powerful force in the lives of adolescents, leading to positive or negative behavior depending on the child's peers. While the influence of parents remains strong, peer acceptance combined with the adolescent's desire for independence can lead to -

disobeying the parents. The sanctions provided at school and in the community by law enforcement will support those teens that have other support in their lives but are generally not sufficient to prevent substance use in adolescents lacking support at home and with peers.

CN: Psychosocial integrity; CL: Create

41. 2. This statement indicates insight into possible emotional causes for her pain. After insight is achieved, the client can make behavior changes to effectively cope with her anxiety-related disorder. Saying that she understands why her father is away so often demonstrates insight into her father's actions rather than her own. Wanting to discuss her pain and not her family indicates denial of any connection between her pain and her stress, which perpetuates her current situation. While rest may help her back, the client's statement does not address psychological issues related to the back pain.

CN: Psychosocial integrity; CL: Evaluate

42. 4. ADHD is typically managed by psychostimulant medications, such as methylphenidate and pemoline, along with behavior modification. Antianxiety medications, such as buspirone, are not appropriate for treating ADHD. Homeschooling commonly is not a possibility because both parents work outside the home. Antidepressants, such as imipramine, are indicated for major depressive disorders and must be used with extreme caution in children because they carry the risk of suicidal thinking. Family therapy may be a part of the treatment. Anticonvulsant medications, such as carbamazepine, are not appropriate for ADHD. Also, carbamazepine levels are obtained weekly early during therapy to avoid toxicity and ascertain therapeutic levels.

CN: Pharmacological and parenteral therapies; CL: Apply

43. 1. Suggesting that the mother arrange for respite care so that she can have a regular break would help to alleviate some of the stress that she feels when she is with her child constantly. The mother also could use family and friends to provide some care, thereby helping with giving her a break. The child may improve, so suggesting that the mother take a job to provide a feeling of success would be inappropriate. Having coffee daily with friends

may provide some opportunities for socialization. However, friends may not be able to provide the verbal support that the mother needs. Rather, attending a support group of other parents with children with attention deficit hyperactivity disorder might be helpful. Placing the child in foster care is an extreme measure that may damage the therapeutic relationship with the nurse and dramatically and negatively affect the relationship between the mother and child.

CN: Psychosocial integrity; CL: Synthesize

44. 3. Giving away personal items has consistently been shown to be an indicator of suicide plans in a depressed and suicidal individual. Expression of a desire to date, trying out for an extracurricular activity, or the desire to spend more time with friends indicates a return of interest in normal adolescent activities.

CN: Psychosocial integrity; CL: Analyze

45. 4,3,1,2. The client's anxiety seems to fuel her substance abuse, so treatment for her anxiety is paramount, followed by treatment for substance abuse. Those two interventions should increase her readiness to profit from academic aid offered by the school. Referral to a community college program would help her get ready for college, which will likely decrease her anxiety.

CN: Psychosocial integrity; CL: Create

46. 2. The mother's distress and length of time the problem has existed combined with the efforts she has made to address the problem demonstrate that medication treatment should be considered. The absence of any other symptoms makes a renal workup unnecessary at this time. It is unlikely that social skills training alone will change his nocturnal enuresis. Just waiting for the behavior to stop is likely to further tax the mother and son.

CN: Psychosocial integrity; CL: Create

47. 1. Because weight loss is a common side effect of methylphenidate and because the child's symptoms are controlled with the stimulant, the first action should be to increase the child's oral intake before the medication's side effects begin. Weight should be monitored, but since the child has already lost weight, a remedy is needed as well as monitoring. The weight

loss is directly due to the medication's side effects, so the child will continue to lose weight unless an intervention is made whether or not he is enrolled in school or on summer vacation. A high-protein drink could work, but then, the child is taking in all his calories in the evening, which is not best nutritionally. A change of medication should be the last resort since methylphenidate is the most effective medication for ADHD and has been successful with this child.

CN: Pharmacological and parenteral therapies; CL: Analyze

48. 4. Decreased respirations and coma are the two most dangerous effects of heroin overdose, so an increase in respirations after administration of the naloxone demonstrates initial effectiveness of the medication. Changes in cognition and psychomotor activity will take more time to become apparent. The client's blood opioid level may not drop to a nontoxic level for a few days.

CN: Pharmacological and parenteral therapies; CL: Evaluate

49. 2. Adolescents are more likely than children to attempt or commit suicide. Loss, abuse, and family discord remain significant risk factors. There is no evidence to support that children rarely commit suicide. Additionally, evidence fails to support the belief that children who have lost a parent to suicide will attempt it themselves. Significant events, such as a recent firearm purchase, have not been linked to suicide attempts in children. No geographical region in the United States or Canada is free from adolescent suicide.

CN: Psychosocial integrity; CL: Apply

50. 1,2,4,5. A child with ADHD will manifest excessive climbing and running, excessive fidgeting, inability to take turns, and distractibility. This child does not exhibit pouting or moody behaviors.

CN: Psychosocial integrity; CL: Analyze

51. 2. The nurse needs to find out what exactly the mother knows and has read. Reviewing what the mother has found in her reading that is leading her to doubt the diagnosis will help direct the nurse's teaching and clarify any misperceptions or misinformation that the mother may have. The **HCP** 

may indeed have many years of education and experience, and the focus should be on the daughter, but the nurse needs to address the mother's - concerns at this time.

CN: Psychosocial integrity; CL: Synthesize

52. 1,3,2,4. Electronic games and stories are favorites of most children but are particularly enjoyed by children on the autism spectrum. The headphones block out some of the noises that might be upsetting to a child on the autism spectrum. If the child cannot be engaged electronically, a favorite nonelectronic toy would be the next choice. Stuffed animals or other soft toys can soothe a child who is starting to become upset. Medication should be a last resort as it can have a paradoxical effect if it is an antianxiety medication or may cause too much sedation during the flight.

CN: Psychosocial integrity; CL: Synthesize

53. 1,2,5. The client's school problems, the presence of first-degree relatives diagnosed with bipolar disorder and depression, and her inability to sleep at night mirror aspects of both ADHD and bipolar disorder, which are difficult to distinguish from each other in children. **Healthcare providers (HCPs)**  are reluctant to diagnose young children as bipolar at this age. She may have only one disorder or the other or both. Further monitoring and her response to medication will differentiate whether she is suffering from one of the disorders or both. Any comments indicating that the provider does not know what he or she is doing or that the child's perceptions of her illness are not valid will undermine any trust the father and child might be developing in their caregiver and so should be avoided.

CN: Psychosocial integrity; CL: Apply

54. 1. Stating that attention deficit hyperactivity disorder occurs more commonly in families takes the opportunity for teaching while also helping the father realize that he and his wife are not to blame. Parents who are commonly blamed by society for their child's behavior need help with education. Questioning the father on what he thinks he may have done implies that the parents played some role in this disorder, possibly contributing to the father's guilt. Telling the father that many parents feel this way and that the nurse does not think the parents are at fault is premature at

this point. Telling the father that he should focus on what needs to be done, rather than what caused the disorder, minimizes the father's concerns and feelings.

CN: Psychosocial integrity; CL: Synthesize

55. 3. Focusing on the purpose of the group is the best response.

Adolescents are greatly influenced by their peers. Medication alone is not typically the most successful treatment strategy. Questioning whether the client will continue the medication is negative and is not the reason for her to stay in the group. Asking the rest of the group to respond may or may not give the nurse support for the teenager remaining in the group. Groups commonly have rules regarding movement of members in and out of the group, but this does not address the reasons for the client to remain in the group.

CN: Psychosocial integrity; CL: Synthesize

56. 4. Asking whether the client is thinking about killing himself is the most direct and therefore the best way to assess suicidal risk. Knowing whether the client has watched movies on suicide and death, what the client thinks about suicide, and whether other family members have committed suicide will not tell the nurse whether the client is thinking about committing suicide right now.

CN: Psychosocial integrity; CL: Analyze

57. 1. The teacher needs to be informed that this behavior is inappropriate. Therefore, educating the teacher and encouraging her to respond to misbehavior consistently are correct. Telling the teacher that the nurse can't believe the teacher lets the child get away with the behavior is demeaning and condescending. Allowing the child to continue the misbehavior is counterproductive to discipline and could create other problems.

CN: Psychosocial integrity; CL: Synthesize

58. 3. When an adolescent wants to stop treatment with medication, it represents a desire for more control over his/her life as well as a wish to be free of the disorder with which they have been diagnosed. If the caregiver merely acknowledges the client's right to stop treatment or warns of

consequences if the client stops medication, he or she abdicates the adult role of healthcare advisor. Before any action is taken, the nurse should explore the client's reasoning to see if anything in the medication regimen could be changed to make it more palatable for the client. The client also needs to know that if his current objections cannot be overcome, he can return later to restart his medication.

CN: Psychosocial integrity; CL: Synthesize

59. 2. Consistent discipline and alternative methods of anger management are two important tools for parents who have a child with oppositional defiant disorder. Consistent discipline sets limits for the child. Helping the child learn more appropriate ways to manage anger assists the child in living within societal expectations. Avoiding restriction of television and computer time for punishment or using time-out as the primary means of punishment has not been suggested as an appropriate management method. Typically, using many strategies is more effective. Ignoring bad behavior could be dangerous and does not reinforce to the child that limits on behavior exist in society.

CN: Psychosocial integrity; CL: Synthesize

60. 3. Asking the client to report everything that she has had to eat and drink yesterday and today is the least judgmental approach and also provides helpful information. Confronting the client about drinking alcohol or asking her to admit the real reason for feeling sick can put the client on the defensive and block further communication. The nurse should avoid putting the client on the defensive to facilitate communication that may eventually enable the nurse to get the truth and identify interventions.

CN: Psychosocial integrity; CL: Synthesize

61. 3. The single-dose form of methylphenidate should be taken 10 to 14 hours before bedtime to prevent problems with insomnia, which can occur when the daily or last dose of the medication is taken within 6 hours (for multiple dosing) or 10 to 14 hours (for single dosing) before bedtime. It is recommended that a missed dose be taken as soon as possible; the dose is skipped if it is not remembered until the next dose is due. Any other medication, including over-the-counter medications, should be discussed with

the **healthcare provider (HCP)**  before use to eliminate the risk of a possible drug interaction.

 CN: Pharmacological and parenteral therapies; CL: Create

62. 3,2,1,4. First, the child's reasons for removing the patch need to be explored to determine what needs to be done to solve the problem of inadequate medication administration. Since the child is probably heavily influenced by his parents' attitudes about taking medications, their attitudes need to be addressed next to determine if they openly or subtly oppose the medication or its method of administration. Once the knowledge of the child's and parent's feelings about medication are known, education can be offered to be sure the child understands how the medication can help him cope better in school and home. If the child continues to take off his patch or demonstrates an allergic response to the patch, or if it is determined that his parents are not supportive of the patch, discussion of a trial of another medication to treat the child's symptoms should occur.

 CN: Pharmacological and parenteral therapies; CL: Create

63. 1,2,3,4. The crucial elements of a behavioral contract include compliance with the medication regimen if medication is prescribed, appropriate anger management, consequences for unacceptable behaviors, and rules for interactions with others. Personal possessions may be limited by unit rules but are not part of an individualized behavioral contract.

 CN: Psychosocial integrity; CL: Create

64. 1. While all the occurrences could upset the client in the early stage of treatment, the one involving the most risk to safety is the suicide completion of a peer. Adolescents are susceptible to "copycat" suicides. The fact that she knows the method of suicide of the acquaintance and is at a critical period in treatment, when her antidepressant may have given her increased energy while still experiencing low self-esteem, can put her at significant risk for suicide.

 CN: Safety and infection control; CL: Analyze

The Child and Adolescent with Adjustment Disorders

65. 3. A client who has endured serious chronic illness (both psychiatric and medical) would be well aware of his shortened life span, particularly if he is unable to get a lung transplant. It would not be unusual for him to want to plan ahead so his wishes would be honored in the event of his death. In the absence of other physical signs, an exacerbation of CF or delirium is not demonstrated. Likewise, his successful bipolar treatment in the absence of any other signs rules depression out as a reason for his behavior. Though it may be difficult to think about a young person in terms of dying, the client's consideration of the future is a rational decision.

CN: Psychosocial integrity; CL: Analyze

66. 1,2,4,5. Young children cannot be sad all the time after a loss, but that does not mean they grieve less. Their moods change more quickly, and they often work out their issues through play rather than talking. Because young children do not have a full understanding of death's finality, they may talk to a deceased loved one as if they are present. They also may not understand the circumstances of the death and so may think the loved one left voluntarily and be angry at the deceased for leaving them. Play involving a dangerous object such as a rope, coupled with a stated desire to join the deceased parent, would be cause for alarm as the child could harm himself either purposely or accidentally.

CN: Psychosocial integrity; CL: Apply

67. 1. Five-year-old children view death as reversible, so talking about seeing her mother again is a normal statement for a child of this age. A child of this age would not usually state that she was glad Jesus took her mom but instead might be afraid that God would also take her or her dad. The idea of replacing her mother with a new one, as hinted in the statement that they got another dog after the dog died, has not been supported by studies of grieving children. Stating that mommy went to heaven and that the child will see her someday when the child dies is reflective of more advanced abstract thinking than a 5-year-old would demonstrate.

CN: Health promotion and maintenance; CL: Analyze

68. 2,3,4. The development of friendships and good grades with moderate amounts of study are positive signs since friends and grades in the new

school were sources of stress and anxiety for the girl. The ability to wear clothes appropriate to the weather rather than hiding her arms is a sign she is no longer injuring her arms. Joining three clubs and being an officer in one of them is unlikely and would probably be an additional source of stress for the girl as would be pushing herself to extraordinary academic achievement to secure a place in college when she has just entered junior high.

CN: Psychosocial integrity; CL: Evaluate

Managing Care-Clients with Abuse and Mental Health Problems

69. 4. Children who experience serious losses, especially multiple losses, such as old friends or a parent, are more at risk for depression. Girls also are at greater risk than boys during the adolescent years. While doing poorly in school is a risk factor for depression, it is not as great as having two sudden losses. Being upset over not being selected over being a cheerleader indicates represents a loss, but not multiple or serious losses. Not doing well in school is a risk, but developing new friends shows a positive perspective.

CN: Health promotion and maintenance; CL: Analyze

70. 3. The nurse manager needs to focus on the frustration that the nurse is expressing. Additionally, the nurse manager needs to correct any misinformation or misinterpretation that the staff nurse has. Saying that the nurse sounds burned out and asking about a vacation do not focus on the nurse's frustration or address the inaccuracy of the nurse's statement. There is no evidence to suggest that children with conduct disorder have more than the average adult's risk of depression or anxiety. Therefore, this response is inaccurate and inappropriate. Anecdotal information from personal experience does not supply the nurse with accurate, reliable information.

CN: Management of care; CL: Synthesize

71. 4. Indifference to other people and mutism may be indicators of autism and would require further investigation. A 2-year-old who talks to himself and refuses to cooperate with toilet training is displaying behaviors typical for this age. Occasional thumb sucking and not having spent the night with a friend would be normal at age 6. Threatening to run away when angry is

considered within the range of normal behaviors for a 10-year-old child.

CN: Health promotion and maintenance; CL: Analyze

72. 1. The severe emotional trauma the girl has experienced will likely make it difficult for her to be successful in an adoptive placement at the present time, whether that placement is with someone she knows (the nurse) or another adoptive family. Additionally, adoption by the nurse is inappropriate because it blurs the lines between her professional and personal life and is likely to confuse the client. It is clear that the client has many issues and that love alone is not likely to solve all her problems. Treatment at the residential facility will allow her to work through emotional issues in a more therapeutic environment. Though not currently ready for adoption, she may be ready for adoption in the future after sufficient treatment.

CN: Management of care; CL: Evaluate

73. 3. Restricting intake to lose weight is a first step toward an eating disorder for males as well as females, so this behavior should be investigated further, especially since males of this age are usually unconcerned about their weight. Quick mood changes are common in young adolescents, particularly girls. Such mood changes should not be considered problematic if the adolescent is not experiencing trouble in major areas of his/her life. Experimenting with alcohol or other substances is fairly common in the teen years, but one or two uses do not generally lead to addiction. The negative effect of the coughing may be a deterrent to further use. Religious questioning and exploration of “dark” subjects is common among teens and is part of the development of mature thinking. In the absence of other signs of depression, it does not warrant further evaluation.

CN: Management of care; CL: Evaluate

74. 2. The UAP  is concerned about the behavior of the client and confused about why it is occurring, so the nurse needs to explain a bit about the issues involved as well as demonstrate empathy for the aide. It is appropriate to explain that the client is not cutting for attention, but the nurse’s response does not address the reason for the teen’s behavior and is therefore inadequate. It could also appear that the nurse is denigrating the UAP, which will not encourage the aide to listen to what she has to say. The

comments that the UAP cannot work with the client or that she should transfer are punitive and do nothing to help the UAP understand self-mutilation.

 CN: Management of care; CL: Analyze

75. 1,2,3,5,6. Interventions for the client with both bulimia nervosa and anorexia nervosa involve assigning a staff member to accompany the client to the bathroom; promoting a self-monitoring journal as a nonfood coping strategy; providing daily weight measurement in the same clothing at the same times of the week, while facing the client away from the scale readout; assigning a staff member to sit with the client during meals and stay with the client for 1½ hour after meals; and providing liquid protein supplements when the client is unable to eat meals. Telling the client that parenteral nutrition will be necessary may be perceived as a threat and is not an appropriate initial intervention.

 CN Management of care; CL Apply

76. 3. The client with an eating disorder is instructed to receive regular lab tests to monitor nutritional compliance. Frequently, the living situation from before hospitalization was dysfunctional, and returning to the situation can result in recurrent health problems. Attending a social club is not a priority for the client, and enrolling in a health club could result in the client exercising excessively.

 CN: Management of care; CL: Evaluate

PART 3 Postreview Tests

COMPREHENSIVE TEST 1

This test has 75 questions. Time yourself as you take the test so you can determine the approximate amount of time it takes to complete this many questions. This test reflects the minimum number of questions you might receive on the actual licensing exam.

1. A client with human immunodeficiency virus (HIV) and acquired immunodeficiency syndrome confides that he is homosexual and his employer does not know his HIV status. Which response by the nurse is best?

- ☐ 1. “Would you like me to help you tell them?”
- ☐ 2. “The information you confide in me is confidential.”
- ☐ 3. “I must share this information with your family.”
- ☐ 4. “I must share this information with your employer.”

2. An elderly client is being admitted to same-day surgery for cataract extraction. The client has several diamond rings. The nurse should explain to the client that:

- ☐ 1. the rings will be taped before the surgery.
- ☐ 2. the rings will be placed in an envelope, the client will sign the envelope, and the envelope will be placed in a safe.
- ☐ 3. the rings will be locked in the narcotic box.
- ☐ 4. the nursing supervisor will hold onto the rings during the surgery.

3. Under which circumstance may a nurse communicate medical information without the client's consent?

- ☐ 1. when certifying the client's absence from work
- ☐ 2. when requested by the client's family
- ☐ 3. when treating the client with a sexually transmitted infection
- ☐ 4. when prescribed by another healthcare provider (HCP)

4. A 22-year-old client is brought to the emergency department with his fiancée after being involved in a serious motor vehicle accident. His Glasgow Coma Scale score is 7, and he demonstrates evidence of decorticate posturing. Which action is appropriate for obtaining permission to place a catheter for intracranial pressure (ICP) monitoring?

- ☐ 1. The nurse will obtain a signed consent from the client's fiancée because he is of legal age and they are engaged to be married.
- ☐ 2. The healthcare provider (HCP) will get a consultation from another healthcare provider and proceed with placement of the ICP catheter until the family arrives to sign the consent.
- ☐ 3. Two nurses will receive a verbal consent by telephone from the client's next of kin before inserting the catheter.
- ☐ 4. The healthcare provider will document the emergency nature of the client's condition and that an ICP catheter for monitoring was placed without consent.

5. The nurse notices that a cart being used to transport a client has a nonfunctioning clasp on the safety belt. The nurse should:

- ☐ 1. call the safety/security department to report the problem.
- ☐ 2. use a draw sheet to secure the client during transport.
- ☐ 3. contact the clinical engineering department to repair the clasp.
- ☐ 4. request that the transporter bring a different cart with a functional clasp.

6. When coaching clients to improve their health, which strategy is the **most** effective for the nurse to use to help clients take an active role in their health care?

- ☐ 1. Ask clients to complete a questionnaire.

- ☐ 2. Provide clients with written instructions.
- ☐ 3. Ask clients for their views of their health and health care.
- ☐ 4. Ask clients if they have any questions about their health.

7. The nurse is planning care for a client who chews the fingers constantly. Before applying mitten restraints, the nurse could try which interventions? Select all that apply.

- ☐ 1. Ask the client to rub lotion over the hands every day after bathing.
- ☐ 2. Encourage physical activity, such as ambulation.
- ☐ 3. Provide frequent contacts for communication and socialization.
- ☐ 4. Provide family education.
- ☐ 5. Encourage involvement of family and friends.

8. A client with major depression states, “Life is not worth living anymore. Nothing matters.” Which response by the nurse is **best**?

- ☐ 1. “Are you thinking about killing yourself?”
- ☐ 2. “Things will get better, you know.”
- ☐ 3. “Why do you think that way?”
- ☐ 4. “You should not feel that way.”

9. A client with bipolar 1 disorder has been prescribed olanzapine 5 mg two times a day and lamotrigine 25 mg two times a day. Which adverse effects should the nurse report to the healthcare provider (HCP) immediately? Select all that apply.

- ☐ 1. rash
- ☐ 2. nausea
- ☐ 3. sedation
- ☐ 4. hyperthermia
- ☐ 5. muscle rigidity

10. The nurse is planning care for an older adult with a pressure ulcer (see figure). What should the nurse do? Select all that apply.

- ☐ 1. Elevate the head of the bed to 50 degrees.
- ☐ 2. Obtain daily cultures.
- ☐ 3. Cover with protective dressing.
- ☐ 4. Reposition the client every 2 hours.
- ☐ 5. Request an alternating pressure mattress.

11. A client takes hydrochlorothiazide (HCTZ) for treatment of hypertension. The nurse should instruct the client to report which effects? Select all that apply.

- ☐ 1. muscle twitching
- ☐ 2. abdominal cramping
- ☐ 3. diarrhea
- ☐ 4. confusion
- ☐ 5. lethargy
- ☐ 6. muscle weakness

12. A client has been taking imipramine for depression for 2 days. His sister asks the nurse, “Why is he still so depressed?” Which response by the nurse is **most** appropriate?

- ☐ 1. “Your brother is experiencing a very serious depression.”
- ☐ 2. “I will be sure to convey your concern to his healthcare provider”
- ☐ 3. “It takes 2 to 4 weeks for the drug to reach its full effect.”
- ☐ 4. “Perhaps we need to change his medication.”

13. Which finding requires immediate intervention when planning care for an adolescent with cystic fibrosis (CF)?

- ☐ 1. delayed puberty
- ☐ 2. chest pain with dyspnea
- ☐ 3. poor weight gain
- ☐ 4. large, foul-smelling, bulky stools

14. Assessment of a client starting on lithium reveals dry mouth, nausea, thirst, and mild hand tremor. Based on an analysis of these findings, what should the nurse do **next**?

- ☐ 1. Withhold the lithium, and obtain a lithium level to determine therapeutic effectiveness.
- ☐ 2. Continue the lithium, and immediately notify the healthcare provider (HCP) about the assessment findings.
- ☐ 3. Continue the lithium, and reassure the client that these temporary side effects will subside.
- ☐ 4. Withhold the lithium, and monitor the client for signs and symptoms of increasing toxicity.

15. A client asks the nurse how long it will be necessary to take the medicine for hypothyroidism. The nurse’s response is based on the knowledge that:

- ☐ 1. lifelong daily medicine is necessary.
- ☐ 2. the medication is expensive, and the dose can be reduced in a few months.
- ☐ 3. the medication can be gradually withdrawn in 1 to 2 years.
- ☐ 4. the medication can be discontinued after the client’s thyroid-

stimulating hormone (TSH) level is normal.

16. The nurse should advise which client who is taking lithium to consult with the healthcare provider (HCP) regarding a potential adjustment in lithium dosage?

- ☐ 1. a client who continues work as a computer programmer
- ☐ 2. a client who attends college classes
- ☐ 3. a client who can now care for her children
- ☐ 4. a client who is beginning training for a tennis team

17. A client admitted with a gastric ulcer has been vomiting bright red blood. The hemoglobin level is 5.11 g/dL (51.1 g/L), and blood pressure is 100/50 mm Hg. The client and family state that their religious beliefs do not support the use of blood products and refuse blood transfusions as a treatment for the bleeding. The nurse should collaborate with the healthcare provider (HCP) and family to **next**:

- ☐ 1. discontinue all measures.
- ☐ 2. notify the hospital attorney.
- ☐ 3. attempt to stabilize the client through the use of fluid replacement.
- ☐ 4. give enough blood to keep the client from dying.

18. Nonsteroidal anti-inflammatory drugs (NSAIDs) are commonly used in the treatment of musculoskeletal conditions. It is important for the nurse to remind the client to:

- ☐ 1. take NSAIDs at least three times per day.
- ☐ 2. exercise the joints at least 1 hour after taking the medication.
- ☐ 3. take antacids 1 hour after taking NSAIDs.
- ☐ 4. take NSAIDs with food.

19. When using a Z-track injection technique, the nurse holds the gauze pledget against an IM injection site while removing the needle from the muscle. This technique helps to:

- ☐ 1. seal off the track left by the needle in the tissue.
- ☐ 2. speed the spread of the medication in the tissue.
- ☐ 3. avoid the discomfort of the needle pulling on the skin.
- ☐ 4. prevent organisms from entering the body through the skin puncture.

20. When a client with alcohol dependency begins to talk about not having a problem with alcohol, what is the **best** approach for the nurse to use?

- ☐ 1. Question the client about how much alcohol the client consumes each day.
- ☐ 2. Confront the client about being intoxicated 2 days ago.
- ☐ 3. Point out how alcohol has gotten the client into trouble.
- ☐ 4. Ask the client about his or her reasons for not staying sober.

21. The nurse is caring for a toddler in contact isolation for respiratory syncytial virus (RSV). In what order from first to last should the nurse remove personal protective equipment (PPE)? All options must be used.

1. gloves

2. goggles

3. gown

4. mask

22. The nurse is preparing a teaching plan for a 45-year-old client recently diagnosed with type 2 diabetes mellitus. What is the **first** step in this process?

- ☐ 1. Establish goals.
- ☐ 2. Choose video materials and brochures.
- ☐ 3. Assess the client's learning needs.

- ☐ 4. Set priorities of learning needs.

23. A client with newly diagnosed type 1 diabetes mellitus has a finger stick blood sugar (FSBS) of 483 dL/mL (483 mmol/L). The nurse should **first**:

- ☐ 1. start an intravenous infusion.
- ☐ 2. repeat the finger stick in 30 minutes.
- ☐ 3. notify the healthcare provider (HCP) of the results.
- ☐ 4. obtain a serum glucose level as prescribed.

24. A female client who has diagnosis of borderline personality disorder is manipulative and very disruptive on the hospital unit. She is not dangerous to herself or others but is clearly not making any therapeutic progress. She consistently refuses any medications. The nurse realizes that legally, this client has which option?

- ☐ 1. Refuse treatment.
- ☐ 2. Receive forced treatment if the nursing team concurs.
- ☐ 3. Be medicated if her family signs permission for treatment.
- ☐ 4. Be guided to accept treatment recommendations by threatening loss of privileges.

25. A client admitted in an acute psychotic state hears terrible voices in the head and thinks a neighbor is upset with the client. What is the nurse's **best** response?

- ☐ 1. "What has your neighbor been doing that bothers you?"
- ☐ 2. "How long have you been hearing these terrible voices?"
- ☐ 3. "We will not let your neighbor visit, so you will be safe."
- ☐ 4. "What exactly are these terrible voices saying to you?"

26. A client who has a prescription to receive nothing by mouth (NPO) is constantly asking for a drink of water. Which nursing intervention is the **most** appropriate?

- ☐ 1. Reexplain why it is not possible to have a drink of water.
- ☐ 2. Offer ice chips every hour to decrease thirst.
- ☐ 3. Offer the client frequent oral hygiene care.
- ☐ 4. Divert the client's attention by turning on the television.

27. An older adult who is to be on bed rest has become incontinent of urine. To prevent pressure ulcers, the nurse should do which tasks? Select all that apply.

- ☐ 1. Use a sanitary napkin to absorb urine.
- ☐ 2. Institute a turning schedule.
- ☐ 3. Inspect the groin for wetness.
- ☐ 4. Have client wear incontinence briefs.
- ☐ 5. Anchor a Foley catheter.

28. A mother tells the nurse that her 10-year-old daughter has an increase in hair growth and breast enlargement. The nurse explains to the mother and daughter that after the symptoms of puberty are noticed, menstruation typically occurs within which time frame?

- ☐ 1. 6 months
- ☐ 2. 12 months
- ☐ 3. 30 months
- ☐ 4. 36 months

29. A nurse is teaching a new mother how to prevent burns in the home. Which statement by the mother indicates more teaching is required?

- ☐ 1. "I will set my hot water heater to 49°C (120°F)."
- ☐ 2. "I will not hold my infant while drinking coffee."
- ☐ 3. "I will heat my infant's formula in the microwave."
- ☐ 4. "I will keep loose appliance cords tied up on the counter."

30. After teaching a primigravid client at 10 weeks' gestation about the recommendations for exercise during pregnancy, which client statement indicates successful teaching?

- ☐ 1. "While pregnant, I should avoid contact sports."
- ☐ 2. "Even though I am pregnant, I can learn to ski next month."
- ☐ 3. "While we are on vacation next month, I can continue to scuba dive."
- ☐ 4. "Sitting in a hot tub after exercise will help me to relax."

31. The healthcare provider (HCP) has prescribed a chemotherapy drug to be administered to a client every day for the next week. The client is on an

adult medical-surgical floor, but the nurse assigned to the client has not been trained to handle chemotherapy agents. What is the nurse's **most** appropriate response?

- ☐ 1. Send the client to the oncology floor for administration of the medication.
- ☐ 2. Ask a nurse from the oncology floor to come to the client and administer the medication.
- ☐ 3. Ask another nurse to help mix the chemotherapy agent.
- ☐ 4. Ask the pharmacy to mix the chemotherapy agent and administer it.

32. Which is an appropriate outcome for a client with rheumatoid arthritis?

- ☐ 1. The client will manage joint pain and fatigue to perform activities of daily living.
- ☐ 2. The client will maintain full range of motion in joints.
- ☐ 3. The client will prevent the development of further pain and joint deformity.
- ☐ 4. The client will take anti-inflammatory medications as indicated by the presence of disease symptoms.

33. A healthcare provider (HCP) has been exposed to hepatitis B through a needlestick. Which drug should the nurse anticipate administering as postexposure prophylaxis?

- ☐ 1. hepatitis B immune globulin
- ☐ 2. interferon
- ☐ 3. hepatitis B surface antigen
- ☐ 4. amphotericin B

34. When instilling ear drops on a 2-year-old child, the nurse should pull the pinna in which directions?

- ☐ 1. down and back
- ☐ 2. down and slightly forward
- ☐ 3. up and back
- ☐ 4. up and forward

35. A client is in the compensatory stage of shock. Which finding indicates the client is entering the progressive stage of shock?

- ☐ 1. urinary output of 20 mL/h
- ☐ 2. blood pressure of 110/70 mm Hg
- ☐ 3. heart rate of 110 bpm
- ☐ 4. temperature of 99°F

36. A client has been prescribed hydrochlorothiazide to treat heart failure. The nurse should tell the client to report:

- ☐ 1. urinary retention.
- ☐ 2. muscle weakness.
- ☐ 3. confusion.
- ☐ 4. diaphoresis.

37. The son of a client with Alzheimer's disease excitedly tells the nurse, "Mom was singing one of her favorite old songs. I think she is getting her memory back!" What response by the nurse is **most** appropriate?

- ☐ 1. "She still has long-term memory, but her short-term memory will not return."
- ☐ 2. "I am so happy to hear that. Maybe she is getting better."
- ☐ 3. "Do not get your hopes up. This is only a temporary improvement."
- ☐ 4. "I am glad she can sing even if she cannot talk to you."

38. A client has the leg immobilized in a long leg cast. Which finding indicates the beginning of circulatory impairment?

- ☐ 1. inability to move toes
- ☐ 2. cyanosis of toes
- ☐ 3. sensation of cast tightness
- ☐ 4. tingling of toes

39. A multigravid client at 34 weeks' gestation who is leaking amniotic fluid has just been hospitalized with a diagnosis of preterm premature rupture of membranes and preterm labor. The client's contractions are 20 minutes apart, lasting 20 to 30 seconds. Her cervix is dilated to 2 cm. The nurse reviews prescriptions (see chart). Which prescription should the nurse initiate **first**?

Prescription

Continuous external fetal and contraction monitoring
IV of D5LR @ 125 mL/h
I&O catheterization for urinalysis and culture and sensitivity
Betamethasone 12 mg IM daily × 2 days

- ☐ 1. Initiate fetal and contraction monitoring.
- ☐ 2. Start the intravenous infusion.
- ☐ 3. Obtain the urine specimen.
- ☐ 4. Administer betamethasone.

40. The nurse caring for a client with diabetes realizes that the client has a higher risk of developing cataracts and should also assess the client for indications of:

- ☐ 1. background retinopathy.
- ☐ 2. proliferative retinopathy.
- ☐ 3. neuropathy.
- ☐ 4. diabetic retinopathy.

41. The nurse is developing an education plan for clients with hypertension. The nurse should emphasize which long-term goal?

- ☐ 1. Develop a plan to limit stress.
- ☐ 2. Participate in a weight reduction program.
- ☐ 3. Commit to lifelong therapy.
- ☐ 4. Monitor blood pressure regularly.

42. When developing a plan of care to manage a client's pain from cancer, what should the nurse plan to do?

- ☐ 1. Individualize the pain medication regimen for the client.
- ☐ 2. Select medications that are least likely to lead to addiction.

- ☐ 3. Administer pain medication as soon as the client requests it.
- ☐ 4. Change pain medications periodically to avoid drug tolerance.

43. After explaining to a multigravid client at 36 weeks' gestation who is diagnosed with severe hydramnios about the possible complications of this condition, which client statement indicates the need for further instruction?

- ☐ 1. "Because I have hydramnios, I may gain weight."
- ☐ 2. "Hydramnios has been associated with gastrointestinal disorders in the fetus."
- ☐ 3. "I should continue to eat high-fiber foods and avoid constipation."
- ☐ 4. "I can continue to work at my job at the automobile factory until labor starts."

44. The nurse is instructing a client on how to care for skin that has become dry after radiation therapy. Which statement by the client indicates that the client understands the teaching?

- ☐ 1. "I should take antihistamines to decrease the itching I am experiencing."
- ☐ 2. "It is safe to apply a nonperfumed lotion to my skin."
- ☐ 3. "A heating pad, set on the lowest setting, will help decrease my discomfort."
- ☐ 4. "I can apply an over-the-counter cortisone ointment to relieve the dryness."

45. The antidote for heparin is:

- ☐ 1. vitamin K.
- ☐ 2. warfarin.
- ☐ 3. thrombin.
- ☐ 4. protamine sulfate.

46. Which measure should be implemented promptly after a client's nasogastric (NG) tube has been removed?

- ☐ 1. Provide the client with oral hygiene.
- ☐ 2. Offer the client liquids to drink.
- ☐ 3. Encourage the client to cough and deep breathe.
- ☐ 4. Auscultate the client's bowel sounds.

47. The nurse is assessing an older adult who is living with his son's family. The client has scald burns on the hands and both forearms (10% first- and second-degree burns). The nurse should **first**:

- ☐ 1. cleanse the wounds with warm water.
- ☐ 2. apply antibiotic cream.
- ☐ 3. call for transport to a hospital.
- ☐ 4. cover the burns with sterile dressing.

48. An infant is to receive the diphtheria, tetanus, and acellular pertussis (DTaP) and inactivated polio vaccine (IPV) immunizations. The child is recovering from a cold and is afebrile. The child's sibling has cancer and is receiving chemotherapy. Which action is **most** appropriate?

- ☐ 1. Give the DTaP and withhold the IPV.
- ☐ 2. Administer the DTaP and IPV immunizations.
- ☐ 3. Postpone both immunizations until the sibling is in remission.
- ☐ 4. Withhold both immunizations until the infant is well.

49. When creating a program to decrease the primary cause of disability and death in children, the nurse should:

- ☐ 1. encourage legislators to draft legislation to promote prenatal care.
- ☐ 2. require all children to be immunized.
- ☐ 3. teach accident prevention and safety practices to children and their parents.
- ☐ 4. hire a nurse practitioner for each of the schools in the community.

50. A tour bus has overturned on an exit ramp. Many passengers are injured, but there are no fatalities. While the emergency department nurse prepares for treating the injured, the nurse also anticipates that:

- ☐ 1. the accident victims will be experiencing grief and mourning.
- ☐ 2. many of the passengers may be experiencing feelings of victimization.
- ☐ 3. there is a need for someone to coordinate calls from relatives about the passengers.
- ☐ 4. some of the passengers will need psychiatric hospitalization.

51. The nurse teaches the parents of an infant who has had surgery to correct imperforate anus how to position the infant to prevent tension on the

perineum. The nurse determines more teaching is needed when the parents put the infant in which position?

- ☐ 1. abdomen, with legs pulled up under the body
- ☐ 2. back, with legs suspended at a 90-degree angle
- ☐ 3. left side, with hips elevated
- ☐ 4. right side, with hips elevated

52. When developing the plan of care for a 14-year-old boy who is bored due to being immobilized in a cast, which activity is **most** appropriate?

- ☐ 1. playing a card game with a boy the same age
- ☐ 2. putting together a puzzle with his mother
- ☐ 3. playing video games with a 9-year-old
- ☐ 4. watching a movie with his younger brother

53. After surgery to create a urinary diversion, the client is at risk for a urinary tract infection. The nurse should:

- ☐ 1. clamp the urinary appliance at night.
- ☐ 2. empty the urinary appliance before it is one-third full.
- ☐ 3. limit the client's walking with the appliance.
- ☐ 4. change the urinary appliance daily.

54. When suctioning a client's tracheostomy tube, what should the nurse do?

- ☐ 1. Oxygenate the client before suctioning.
- ☐ 2. Insert the suction catheter about 2 inches (5 cm) into the cannula.
- ☐ 3. Use a bolus of sterile water to stimulate cough.
- ☐ 4. Use clean gloves during the procedure.

55. A 14-month-old child has a severe diaper rash. Which recommendation should the nurse provide to the parents?

- ☐ 1. Continue to use the baby wipes.
- ☐ 2. Change the diaper every 4 to 6 hours.
- ☐ 3. Wash the buttocks using mild soap.
- ☐ 4. Apply powder to the diaper area.

56. An adolescent thinks she has infectious mononucleosis. For which

symptoms should the nurse assess the client? Select all that apply.

- ☐ 1. sore throat
- ☐ 2. malaise
- ☐ 3. weight loss
- ☐ 4. rash
- ☐ 5. swollen lymph glands

57. While assessing the fundus of a multiparous client on the first postpartum day, the nurse performs handwashing and puts on clean gloves. What should the nurse do **next**?

- ☐ 1. Place the nondominant hand above the symphysis pubis and the dominant hand at the umbilicus.
- ☐ 2. Ask the client to assume a side-lying position with the knees flexed.
- ☐ 3. Perform massage vigorously at the level of the umbilicus if the fundus feels boggy.
- ☐ 4. Place the client on a bedpan in case the uterine palpation stimulates the client to void.

58. What should be the nurse's **priority** assessment after an epidural anesthetic has been given to a nulligravid client in active labor?

- ☐ 1. level of consciousness
- ☐ 2. blood pressure
- ☐ 3. cognitive function
- ☐ 4. contraction pattern

59. The nurse monitors the serum electrolyte levels of a client who is taking digoxin. Which electrolyte imbalance is a common cause of digoxin toxicity?

- ☐ 1. hyponatremia
- ☐ 2. hypomagnesemia
- ☐ 3. hypocalcemia
- ☐ 4. hypokalemia

60. After abdominal surgery, a client has a prescription for meperidine IM 100 mg every 3 to 4 hours and acetaminophen with codeine 30 mg. The client has been taking meperidine every 4 hours for the past 48 hours but tells the

nurse that the meperidine is no longer lasting 4 hours and that the client needs to have it every 3 hours. Which nursing measure is **most** appropriate?

- ☐ 1. Realizing that the client is developing tolerance to the meperidine, the nurse administers the meperidine every 3 hours.
- ☐ 2. The nurse urges the client to take the acetaminophen with codeine to prevent addiction to the meperidine.
- ☐ 3. The nurse requests a prescription from the healthcare provider (HCP) to change the dose to an equianalgesic dose of morphine.
- ☐ 4. The nurse encourages the client to do relaxation exercises to provide distraction from the pain.

61. The nurse assesses a 7-month-old infant's growth and development. Which behavior should the nurse consider unusual?

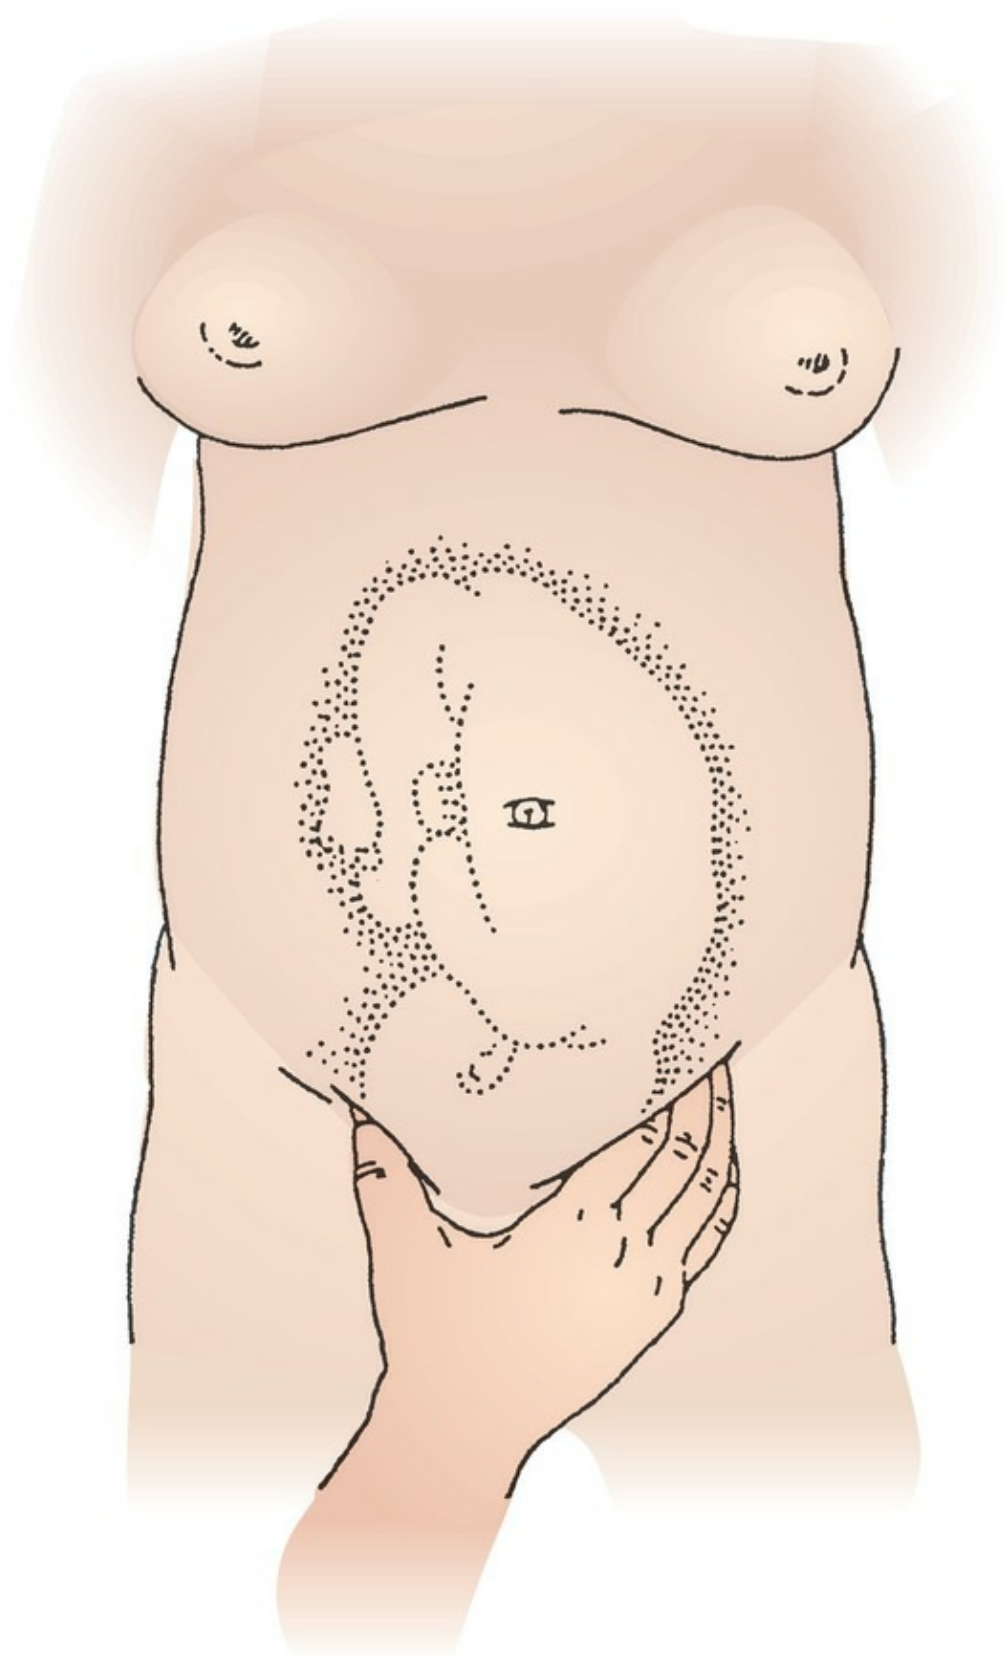

- ☐ 1. drinking from a cup and spilling little of the liquid
- ☐ 2. raising the chest and upper abdomen off the bed with the hands
- ☐ 3. imitating sounds that the nurse makes
- ☐ 4. crying loudly in protest when the mother leaves the room

62. A 13-year-old client is dying of cancer. When providing care for this client, the nurse should incorporate the developmental tasks for this age. According to Erikson's developmental model, the child normally is expected to be working on which psychosocial issue?

- ☐ 1. lifetime vocation
- ☐ 2. social conscience
- ☐ 3. personal values
- ☐ 4. sense of competence

63. The nurse is performing Leopold's maneuvers on a woman who is in her 8th month of pregnancy. The nurse is palpating the uterus as shown below. Which maneuver is the nurse performing?

- ☐ 1. First maneuver
- ☐ 2. Second maneuver
- ☐ 3. Third maneuver
- ☐ 4. Fourth maneuver

64. The nurse is instructing an unlicensed assistive personnel (UAP) on the prevention of postoperative pulmonary complications. Which statement indicates that the UAP has understood the nurse's instructions?

- ☐ 1. "I will turn the client every 2 hours."
- ☐ 2. "I will keep the client's head elevated."
- ☐ 3. "I should suction the client every 2 hours."
- ☐ 4. "I will have the client take 5 to 10 deep breaths every hour."

65. During an appointment with the nurse, a client says, "I could hate God for that flood." The nurse responds, "Oh, do not feel that way. We are making progress in these sessions." The nurse's statement demonstrates a failure to do what?

- ☐ 1. Look for meaning in what the client says.
- ☐ 2. Explain to the client why he may think as he does.
- ☐ 3. Add to the strength of the client's support system.
- ☐ 4. Give the client credit for solving his own problems.

66. The nurse observes that the client with multiple sclerosis looks untidy and sad. The client suddenly says, "I cannot even find the strength to comb my hair," and bursts into tears. Which response by the nurse is **best**?

- ☐ 1. "It must be frustrating not to be able to care for yourself."
- ☐ 2. "How many days have you been unable to comb your hair?"
- ☐ 3. "Why has your husband not been helping you?"
- ☐ 4. "Tell me more about how you are feeling."

67. The nurse is planning care for an obese female client. The client experiences dribbling urine when she coughs, sneezes, and changes positions. The nurse should instruct the client to promote urinary health by encouraging which actions? Select all that apply.

- ☐ 1. Increase consumption of fluids such as coffee and tea.
- ☐ 2. Use a Foley catheter.
- ☐ 3. Participate in a weight loss program.
- ☐ 4. Perform muscle-strengthening exercises (Kegel exercises).
- ☐ 5. Use adult diapers as needed.

68. A term primigravida was involved in a car accident 3 hours ago. She is having labor contractions every 4 minutes, and her cervical exam is dilated 3 cm, 100% effaced, and station -1. She is crying uncontrollably and states her pain is constant and severe, rating it at 10/10. The **priority** action by the nurse is to:

- ☐ **1.** reassure the woman and assist with nonpharmacologic pain interventions.
- ☐ **2.** assess intensity of contractions and determine if she would like an epidural.
- ☐ **3.** notify the provider of the pain and request an assessment for potential abruption.
- ☐ **4.** perform a vaginal exam and coach the woman with breathing exercise for pain control.

69. A nurse interviews the parent of a middle school student who is exhibiting behavioral problems, including substance abuse, following a sibling's suicide. The parent says, "I am a single parent who has to work hard to support my family, and now I have lost my only son, and my daughter is acting out and making me crazy! I just cannot take all this stress!" Which issue is the **priority**?

- ☐ **1.** parent's ability to emotionally support the adolescent in this crisis
- ☐ **2.** potential suicidal thoughts/plans of both family members
- ☐ **3.** the adolescent's anger
- ☐ **4.** the parent's frustration

70. Following surgery, the nurse is to apply sequential compression device to the client's legs. Prior to applying the device, the nurse should **first**:

- ☐ **1.** confirm the client's identity using two client identifiers.
- ☐ **2.** position the client in the bed.
- ☐ **3.** explain the sequential compression therapy to the client.
- ☐ **4.** determine the size of sleeve that is needed.

71. The nurse is caring for a previously healthy, independent 28-year-old client who is alert and oriented and is being admitted to the hospital for unexplained vomiting and abdominal pain. The client has intravenous fluids infusing through a saline lock and has been ambulating in the hallway with a

steady gait. Using the Morse Fall Risk Scale (see chart), what is this client's total score and risk level?

Morse Fall Risk/Scale

Item	Scale	Scoring
1. History of falling, immediate or within 3 months	No 0 Yes 25	
2. Secondary diagnosis	No 0 Yes 15	
3. Ambulatory aid Bed rest/nurse assist Crutches/cane/walker Furniture	0 15 30	
4. IV/heparin lock	No 0 Yes 20	
5. Gait/transferring Normal/bed rest/ immobile Weak Impaired	0 10 20	
6. Mental status Oriented to own ability Forgets limitations	0 15	

_____ Score _____ Risk.

72. Which statements made by a pregnant woman in the first trimester are consistent with this stage of pregnancy? Select all that apply.

- ☐ 1. "My husband told his friends we will have to give up the convertible for a minivan."

- ☐ 2. "Oh my, how did this happen? I do not need this now."
- ☐ 3. "I cannot wait to see my baby. Do you think it will have my blond hair and blue eyes?"
- ☐ 4. "I used a princess theme for decorating the room."
- ☐ 5. "I wonder how it will feel to buy maternity clothes and be fat."
- ☐ 6. "We went to the mall yesterday to buy a crib and dressing table."

73. A client is diagnosed with syndrome of inappropriate antidiuretic hormone (SIADH). The nurse should assess the client for which alteration in fluid and electrolyte balance?

- ☐ 1. increased osmolality of the plasma
- ☐ 2. decreased serum sodium level
- ☐ 3. increased urine output
- ☐ 4. decreased blood pressure

74. A client is admitted to the emergency department with crushing chest injuries sustained in a car accident. Which sign indicates a possible pneumothorax?

- ☐ 1. Cheyne-Stokes respirations
- ☐ 2. increased fremitus
- ☐ 3. diminished or absent breath sounds on the affected side
- ☐ 4. decreased sensation on the affected side

75. A primigravid client at 35 weeks' gestation is scheduled for a biophysical profile. After instructing the client about the test, which client statement about what the test measures indicates effective teaching?

- ☐ 1. amniotic fluid volume
- ☐ 2. placement of the placenta
- ☐ 3. amniotic fluid color
- ☐ 4. fetal gestational age

Answers, Rationales, and Test-Taking Strategies

The answers and rationales for each question follow below, along with keys (🔑) to the client need (CN) and cognitive level (CL) for each

question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in Part 1 of this book.

1. 2. The nurse is responsible for maintaining confidentiality of this disclosure by the client. The nurse cannot discuss the client's health problems with the family or employer. It is the client's reprehensibility to inform others if he or she chooses to do so.

CN: Psychosocial integrity; CL: Synthesize

2. 2. Under the policy for valuables, the nurse documents the description on an envelope with the client, the client and nurse sign the envelope, and the valuables envelope is locked in the safe. The other options increase the risk of loss or damage to the client's valuables.

CN: Management of care; CL: Synthesize

3. 3. Sexually transmitted infections are communicable diseases that must be reported. The nurse is responsible for reporting these diseases to the appropriate public health agency and to otherwise maintain the client's confidentiality. The client's family cannot request release of medical information without the client's **consent**. An **HCP's**  prescription is not a substitute for a client's consent to release medical information in the absence of a communicable disease.

CN: Management of care; CL: Synthesize

4. 4. In a life-threatening emergency where time is of the essence in saving life or limb, **consent**  is not required. This client has a Glasgow Coma Scale score of 7, which indicates a comatose state. The client cannot be aroused, withdraws in a purposeless manner from painful stimuli, exhibits decorticate posturing, and may or may not have brain stem reflexes intact. The placement of the ICP monitor is crucial to determine cerebral blood flow and prevent herniation. The client's fiancée cannot sign the consent because,

until she is his wife or has designated power of attorney, she is not considered his next of kin. The **HCP**  should insert the catheter in this emergency. He does not need to get a consultation from another HCP. When consent is needed for a situation that is not a true emergency, two nurses can receive a verbal consent by telephone from the client's next of kin.

 CN: Management of care; CL: Apply

5. 4. The nurse ensures client safety during transport and therefore requests another cart for transport. The other options do not ensure client safety. Method of transportation and person transporting the client are documented by the nurse responsible for the transfer. The clasp needs to be repaired. Contacting the security department is not appropriate.

 CN: Safety and infection control; CL: Synthesize

6. 3. One of the best strategies to help empower clients to manage their health is to ask them their view of situations and to respond to what they say. This technique acknowledges that clients' opinions have value and relevance to the interview. It also promotes an active role for clients in the process. Use of a questionnaire or written instructions is a means of obtaining information but promotes a passive client role. Asking whether clients have questions encourages participation, but alone, it does not acknowledge their views.

 CN: Management of care; CL: Synthesize

7. 2, 3, 4, 5. Socialization and communication, in addition to increased activity, are all means to aid in prevention of self-injury. Education of family members may foster development of strategies to prevent self-injury; hence, mitten restraints could be avoided. Applying lotion after bathing may not be appropriate when the skin is broken and not intact.

 CN: Management of care; CL: Synthesize

8. 1. When the client verbalizes that life is not worth living anymore, the nurse needs to ask the client directly about suicide by saying, "Are you thinking about killing yourself?" Asking directly does not provoke suicide but conveys concern, understanding, and the worth of the client. Commonly, the client experiences a sense of relief that someone finally hears him. It also helps the nurse plan responsible care by identifying the client who is at risk

for suicide. The nurse should then evaluate the seriousness of the suicidal ideation by inquiring about the intent and plan. Stating “Things will get better” offers hope too soon without first evaluating the intent of the suicidal ideation. Asking “Why do you think that way?” implies a lack of understanding and knowledge on the part of the nurse. Major depression usually is endogenous and biochemically based. Therefore, the client may not know why he does not want to live. Saying “You should not feel that way” admonishes the client, decreases self-worth, and conveys a lack of understanding.

CN: Psychosocial integrity; CL: Synthesize

9. 1, 4, 5. Lamotrigine, an antiepileptic, is used as a mood stabilizer for clients with bipolar disorder and has been found to be effective for the depressive phase of bipolar disorder. Common adverse effects are dizziness, headache, sedation, tremors, nausea, vomiting, and ataxia. The development of a rash needs to be reported and evaluated by the healthcare provider because it could indicate the start of a severe systemic rash known as Stevens-Johnson syndrome, a toxic epidermal necrolysis, which would necessitate the discontinuation of lamotrigine. Hyperthermia in conjunction with muscle rigidity suggests the development of neuroleptic malignant syndrome, a life-threatening complication associated with olanzapine.

CN: Pharmacological and parenteral therapies; CL: Analyze

10. 3, 4, 5. The client has a stage II pressure ulcer. The nurse should take measures to relieve the pressure, treat the local infection, and protect the wound. The nurse should keep the ulcer covered with a protective dressing. The client should turn every 2 hours and use an alternating pressure mattress to relieve pressure on the buttocks. The head of the bed should be elevated no more than 30 degrees. All wounds have bacteria, and obtaining frequent cultures (unless prescribed otherwise) is not necessary.

CN: Safety and infection control; CL: Synthesize

11. 2, 5, 6. HCTZ is a thiazide diuretic used in the management of mild to moderate hypertension and in the treatment of edema associated with heart failure, renal dysfunction, cirrhosis, corticosteroid therapy, and estrogen therapy. It increases the excretion of sodium and water by inhibiting sodium

reabsorption in the distal tubule of the kidneys. It promotes the excretion of chloride, potassium, magnesium, and bicarbonate. Side effects include drowsiness, lethargy, and muscle weakness but not muscle twitching. Although there may be abdominal cramping, there is no diarrhea. The client does not become confused as a result of taking this drug.

CN: Health promotion and maintenance; CL: Analyze

12. 3. The nurse needs to inform the sister that it takes 2 to 4 weeks before a full clinical effect occurs with the drug. The nurse should let her know that her brother will gradually get better and symptoms of depression will improve. Telling the sister that her brother is experiencing a very serious depression does not give the sister important information about the medication. Additionally, this statement may cause alarm and anxiety. Conveying the sister's concern to the **healthcare provider (HCP)**  does not provide her with the necessary information about the client's medication. Telling the sister that the client's medication may need to be changed is inappropriate because a full clinical effect occurs after 2 to 4 weeks.

CN: Pharmacological and parenteral therapies; CL: Synthesize

13. 2. Chest pain and dyspnea are signs of a pneumothorax and should be treated immediately. Delayed puberty is common in adolescents with CF and is caused by poor nutrition. Poor weight gain is common in children with CF because so little is absorbed in the small intestine. Large, foul-smelling stools indicate noncompliance with taking enzymes and should be addressed, but respiratory complications are the greatest concern.

CN: Physiological adaptation; CL: Analyze

14. 3. The client is exhibiting temporary side effects associated with beginning lithium therapy. Therefore, the nurse should continue the lithium and explain to the client that the temporary side effects of lithium will subside. Common side effects of lithium are nausea, dry mouth, diarrhea, thirst, mild hand tremor, weight gain, bloating, insomnia, and light-headedness. Immediately notifying the **HCP**  about these common side effects is not necessary.

CN: Pharmacological and parenteral therapies; CL: Synthesize

15. 1. Thyroid replacement is a lifelong maintenance therapy. The medication is usually given as one dose in the morning. It cannot be tapered or discontinued because the client needs thyroid supplementation to maintain health. The medication cannot be discontinued after the TSH level is normal; the dose will be maintained at the level that normalizes the TSH concentration.

CN: Pharmacological and parenteral therapies; CL: Apply

16. 4. A client who is beginning training for a tennis team would most likely require an adjustment in lithium dosage because excessive sweating can increase the serum lithium level, possibly leading to toxicity. Adjustments in lithium dosage would also be necessary when other medications have been added, when an illness with high fever occurs, and when a new diet begins.

CN: Pharmacological and parenteral therapies; CL: Analyze

17. 3. The most appropriate response is to continue all treatments and attempt to stabilize the client using fluid replacement without administering blood or blood products. It is imperative that the healthcare team respects the client's religious beliefs and wishes, even if they are not those of the healthcare team. Discontinuing all measures is not an option. The healthcare team should continue to provide the best care possible and does not need to notify the attorney.

CN: Management of care; CL: Synthesize

18. 4. NSAIDs irritate the gastric mucosa and should be taken with food. NSAIDs are usually taken once or twice daily. Joint exercise is not related to the drug administration. Antacids may interfere with the absorption of NSAIDs.

CN: Pharmacological and parenteral therapies; CL: Synthesize

19. 1. When administering an injection using the Z-track method, holding the gauze pledget against the site while removing the needle from the muscle helps to seal off the track left by the needle in the tissue. The Z-track technique does not speed the spread of the medication or lessen the discomfort of an injection. Wiping the skin with alcohol prior to

administering the injection prevents the likelihood of microorganisms from entering the body.

CN: Pharmacological and parenteral therapies; CL: Apply

20. 3. When a client talks about not having a problem with alcohol, the nurse needs to point out how alcohol has gotten the client into trouble. Concrete facts are helpful in decreasing the client's denial that alcohol is a problem. The other approaches allow the client to use defense mechanisms, such as rationalization, projection, and minimization, to explain his or her actions. Therefore, these approaches are not helpful.

CN: Psychosocial integrity; CL: Synthesize

21. 1, 3, 2, 4. There are two acceptable ways of removing PPE. The nurse should remove the dirtiest items first. Typically, these items are the gloves followed by the gown. In the alternative method, the gloves and gown may be removed at the same time. It is then recommended that the nurse perform hand hygiene and remove the goggles, which may fit over the mask. Finally, the mask is removed from behind. The nurse should then again perform hand hygiene when all PPE has been removed.

CN: Safety and infection control; CL: Apply

22. 3. Before development and implementation of the teaching plan, it is vital to determine what the client currently knows regarding diabetes and what the client needs to know.

CN: Management of care; CL: Create

23. 4. The nurse should first obtain a serum glucose level for a more accurate information about the client's blood sugar level. The nurse should not wait for 30 minutes to obtain another fingerstick blood sugar when more accurate information will be obtained with a blood glucose level. The nurse should have more information about the glucose level before contacting the HCP . It is not necessary to start an intravenous infusion at this point.

CN: Management of care; CL: Synthesize

24. 1. A client who has not been deemed a danger to self or others or who has not been declared incompetent retains the right to refuse treatment. Legal

protocols need to be followed to initiate treatment against an adult client's wishes, even if the family wishes treatment to occur. Punitive threats of retaliation or loss of privileges are ethically unacceptable in administering treatment.

 CN: Management of care; CL: Analyze

25. 4. The nurse needs to collect additional information about the client's report about hearing voices. Assessing the content of hallucinations is essential to determine whether they are command hallucinations that the client might act on. Asking about what the neighbor has been doing or telling the client that the neighbor will not visit indirectly reinforces the delusion about the neighbor. Although determining the onset and duration of the voices is important, the nurse needs to assess the content of the hallucinations first.

 CN: Psychosocial integrity; CL: Synthesize

26. 3. The most appropriate intervention is to offer the client frequent mouth care to moisten the dry oral mucosa. Reexplaining why the client cannot drink may be helpful but will not relieve the thirst. Ice chips cannot be given to a client who is on NPO status. Diverting the client's attention does not help manage the thirst.

 CN: Basic care and comfort; CL: Synthesize

27. 2, 3, 4. This client is at risk for pressure ulcers because of age, being on bed rest, and being incontinent. The nurse assesses all pressure points and the groin area, assures that the client changes positions every 2 hours, and has the client wear incontinence pads containing absorbent material (specially designed to absorb many times its weight in water) or disposable incontinence briefs. Sanitary napkins are not designed to contain/absorb urine. Anchoring a Foley catheter increases the risk for infection.

 CN: Physiological adaptation; CL: Synthesize

28. 3. After the symptoms of puberty, such as increased hair growth and enlargement of the breasts, are noticed, menstruation typically begins within 30 months.

 CN: Health promotion and maintenance; CL: Apply

29. 3. Infant formula should never be heated in the microwave; the formula may heat at different temperatures and can burn the infant's mouth. Plastic bottle liners may also burst with the heat. Setting your hot water heater a couple of degrees cooler will help keep hot water in the house cooler (recommended since 1974 by the Consumer Product Safety Commission). Small children are at risk for scald injury from hot tap water due to their decreased reaction time, their curiosity, and the thermal sensitivity of their skin. Avoiding holding infants while drinking coffee can prevent possible spills onto children. Keeping cords tied up on the counter prevents children from pulling on dangling cords and spilling hot liquids over themselves.

CN: Safety and infection control; CL: Evaluate

30. 1. The client understands the instructions when she says she should avoid contact sports because they may result in injury to the client and the fetus. Learning to ski while pregnant is not recommended because injury may occur. Scuba diving should be avoided because depth pressures could cause fetal damage. Hot tubs should be avoided during the first trimester because sitting in them can result in fetal hyperthermia and fetal hypoxia. Mild exercises, such as walking, can help strengthen the muscles and prevent some discomforts such as backache.

CN: Health promotion and maintenance; CL: Evaluate

31. 1. The nurse should call the oncology unit to institute a transfer. The nurse handling chemotherapy agents should be specially trained. It is an unwise use of nursing resources to send a nurse from one unit to administer medications to a client on another unit. It is better to centralize and send the client who needs chemotherapy to one unit. Even if the pharmacy mixes the agent, the drug must be administered by a specially trained nurse.

CN: Management of care; CL: Synthesize

32. 1. An appropriate outcome for the client with rheumatoid arthritis is that the client will adopt self-care behaviors to manage joint pain, stiffness, and fatigue and be able to perform activities of daily living. Range-of-motion (ROM) exercises can help maintain mobility, but it may not be realistic to expect the client to maintain full ROM. Depending on the disease progression, there may be further development of pain and joint deformity,

even with appropriate therapy. It is important for the client to understand the importance of taking the prescribed drug therapy even if symptoms have abated.

 CN: Reduction of risk potential; CL: Synthesize

33. 1. Hepatitis B immune globulin is given as prophylactic therapy to individuals who have been exposed to hepatitis B. Interferon has been approved to treat hepatitis B. Hepatitis B surface antigen is a diagnostic test used to detect current infection. Amphotericin B is an antifungal.

 CN: Pharmacological and parenteral therapies; CL: Apply

34. 1. When instilling ear drops on a child younger than age 3 years, the nurse should pull the pinna down and back. This helps open the ear canal to ensure drops reach the tympanic membrane. For an older child, the nurse should pull the pinna up and back.

 CN: Reduction of risk potential; CL: Apply

35. 1. In the compensatory stage of shock, the client exhibits moderate tachycardia, but as the shock continues to the progressive stage, the client will have a decreased urinary output, hypotension, and mental confusion as a result of failure to perfuse and ineffective compensatory mechanisms. The body temperature initially may remain normal. These findings are indications that the body's compensatory mechanisms are failing.

 CN: Reduction of risk potential; CL: Analyze

36. 2. Hydrochlorothiazide is a thiazide diuretic. Muscle weakness can be an indication of hypokalemia. Polyuria is associated with this diuretic, not urinary retention. Confusion and diaphoresis are not side effects of hydrochlorothiazide.

 CN: Pharmacological and parenteral therapies; CL: Analyze

37. 1. The ability to remember an old song is related to long-term memory, which persists after short-term memory is lost. Therefore, the nurse should respond by providing the son with this information. Stating that the nurse is happy to hear about the change and that the client is getting better is inappropriate and inaccurate. This statement ignores the issue of long-term

versus short-term memory. Telling the client not to get his hopes up because the improvement is only temporary is inappropriate. The information provided does not indicate that the client has expressive aphasia, which would be suggested by the statement that the client cannot talk to the son.

CN: Psychosocial integrity; CL: Analyze

38. 4. Tingling and numbness of the toes would be the earliest indication of circulatory impairment. Inability to move the toes and cyanosis are later indicators. Cast tightness should be investigated because cast tightness can lead to circulatory impairment; it is not, however, an indicator of impairment.

CN: Reduction of risk potential; CL: Analyze

39. 1. The nurse should initiate fetal and contraction monitoring for this client upon arrival to the unit. This gives the nurse data regarding changes in fetal and maternal contraction status before completing the other prescriptions. Next, the betamethasone would be given to begin the maturation process for the fetal lungs. The nurse should then start an intravenous infusion to provide a line for immediate intravenous access, if needed, and provide hydration for the client. The nurse should obtain the urine specimen prior to administering any antibiotic therapy, if prescribed.

CN: Management of care; CL: Synthesize

40. 4. Diabetic retinopathy involves background and proliferative retinopathy. Both forms are associated with vascular changes in the basement membrane of the arterioles and capillaries of the choroid and retina. Neuropathy is usually associated with the lower extremities.

CN: Reduction of risk potential; CL: Analyze

41. 3. The most appropriate long-term goal for the client with hypertension is to commit to lifelong therapy. A significant problem in the long-term management of hypertension is compliance with the treatment plan. It is essential that the client understand the reasons for modifying lifestyle, taking prescribed medications, and obtaining regular health care. Limiting stress, losing weight, and monitoring blood pressure are important aspects of care for the client with hypertension; however, the treatment plan must be individualized to include aspects of care that are appropriate for each client.

 CN: Health promotion and maintenance; CL: Synthesize

42. 1. The nurse should work with the client to individualize the plan of care for managing pain. Cancer pain is best managed with a combination of medications, and each client needs to be worked with individually to find the treatment regimen that works best. Cancer pain is commonly undertreated because of fear of addiction. The client who is in pain needs the appropriate level of analgesic and needs to be reassured that addiction is unlikely. Cancer pain is best treated with regularly scheduled doses of medication. Administering the medication only when the client asks for it will not lead to adequate pain control. As drug tolerance develops, the dosage of the medication can be increased.

 CN: Basic care and comfort; CL: Synthesize

43. 4. The client needs further instructions when she says, “I can continue to work at my job at the automobile factory until labor starts.” The goal is to avoid preterm labor. Because the client is experiencing severe hydramnios, she will most likely be maintained on bed rest to increase uteroplacental circulation and reduce pressure on the cervix. Hydramnios has been associated with increased weight gain caused by increased amniotic fluid volume. Hydramnios has been associated with gastrointestinal disorders in the fetus, such as tracheoesophageal fistula with stenosis or intestinal obstruction. The client should continue to eat high-fiber foods and should avoid straining, which could lead to ruptured membranes. Stool softeners may also be prescribed. The client should report any symptoms of fluid rupture or labor.

 CN: Reduction of risk potential; CL: Evaluate

44. 2. Irradiated skin can become dry and irritated, resulting in itching and discomfort. The client should be instructed to clean the skin gently and apply nonperfumed, nonirritating lotions to help relieve dryness. Taking an antihistamine does not relieve the skin dryness that is causing the itching. Heat should not be applied to the area because it can cause further irritation. Medicated ointments should not be applied to the skin without the prescription of the radiation therapist.

 CN: Reduction of risk potential; CL: Evaluate

45. 4. The antidote for heparin is 1% protamine sulfate. Vitamin K is the antidote for warfarin, an oral anticoagulant. Thrombin is a topical - anticoagulant.

CN: Pharmacological and parenteral therapies; CL: Apply

46. 1. The nurse's first action after the removal of an NG tube is to provide the client with oral hygiene. Then it is appropriate to give the client liquids to drink if the client is no longer on nothing-by-mouth status. There is no association between removal of an NG tube and having the client cough and deep breathe. Auscultating the client's bowel sounds should be done before removal of the NG tube.

CN: Basic care and comfort; CL: Synthesize

47. 3. The nurse has the client transported to a hospital. The client's age and the extent of the burns require care by a healthcare team. Additionally, the nurse considers that the client may be a victim of elder abuse and investigates further as needed. The nurse should refrain from cleansing the wound, applying cream, or covering the area.

CN: Physiological adaptation; CL: Synthesize

48. 2. At this time, the infant can be given the vaccines. The fact that the child's sibling is immunosuppressed because of chemotherapy is not a reason to withhold the vaccines. The fact that the child has a cold is not grounds for delaying the immunizations. However, if the child had a high fever, the immunizations would be delayed.

CN: Health promotion and maintenance; CL: Synthesize

49. 3. The primary cause of disability and death in children is injury from accidents. Teaching safety measures to children and their parents is the best way to decrease injury and accidents. Legislation for prenatal care is not a primary prevention for accidents. Communicable diseases are not the primary cause of disability and death in children; therefore requiring immunizations is not an appropriate strategy for this health problem. Having nurse practitioners in schools is not a primary prevention measure for accidents.

CN: Management of care; CL: Synthesize

50. 2. Major accidents can induce feelings similar to those of victims of other kinds of disasters and crime. Therefore, the nurse should also be prepared to assist the passengers with their feelings of victimization. Passengers may mourn the loss of a vacation, but with no fatalities, major grief reactions are not expected. Other personnel can take calls from relatives while the nurse helps the passengers. Psychiatric hospitalization is a premature assumption.

CN: Psychosocial integrity; CL: Analyze

51. 1. When placed on the abdomen, a neonate pulls the legs up under the body, which puts tension on the perineum. Therefore, after surgery, the neonate should be positioned either supine with the legs suspended at a 90-degree angle or on either side with the hips elevated.

CN: Reduction of risk potential; CL: Evaluate

52. 1. Teenagers usually enjoy activities with peers in preference to socializing with their parents or siblings. Peer relationships help the adolescent develop self-identity.

CN: Health promotion and maintenance; CL: Synthesize

53. 2. The urinary appliance should be emptied before the pouch is one-third full to prevent urinary reflux. The appliance should be attached to a leg bag at night to allow for adequate drainage. The urinary appliance is not changed daily. If no leakage occurs and the client's skin remains free from irritation, the appliance can be left in place for 1 week or more. The client can ambulate as tolerated.

CN: Basic care and comfort; CL: Synthesize

54. 1. Preoxygenating the client before suctioning helps prevent the development of hypoxia during the procedure. The suction catheter is inserted about 5 to 6 inches (12.7 to 15. cm) into the cannula. A bolus of 3 to 5 mL of sterile normal saline solution may be inserted into the cannula before suctioning to stimulate coughing and loosen secretions. The nurse uses sterile technique when suctioning a client.

CN: Reduction of risk potential; CL: Apply

55. 3. Because the toddler has a severe diaper rash, it may be best to change all that the parents are doing. The buttocks need to be washed thoroughly with mild soap and dried well. In fact, it is helpful to leave the diaper off and expose the buttocks to the air. Baby wipes commonly contain additives and perfumes that may be irritating to the baby's sensitive skin. The diaper needs to be changed more often than every 4 to 6 hours. Otherwise, the moist diaper environment will continue to irritate the skin, causing the rash to worsen. Powder has limited absorbing ability and will most likely irritate the area more. In addition, some powders contain perfumes or are scented and can irritate the skin.

CN: Basic care and comfort; CL: Synthesize

56. 1, 2, 5. The common presenting symptoms of infectious mononucleosis vary greatly but commonly include fever, malaise, sore throat, and lymphadenopathy. Skin rash, cold symptoms, abdominal pain, and weight loss are rarely presenting symptoms.

CN: Reduction of risk potential; CL: Analyze

57. 1. The nurse should place the nondominant hand above the symphysis pubis and the dominant hand at the umbilicus to palpate the fundus. This prevents uterine inversion and trauma, which can be very painful to the client. The nurse should ask the client to assume a supine, not side-lying, position with the knees flexed. The fundus can be palpated in this position, and the perineal pads can be evaluated for lochia amounts. The fundus should be massaged gently if the fundus feels boggy. Vigorous massaging may fatigue the uterus and cause it to become firm and then boggy again. The nurse should ask the client to void before fundal evaluation. A full bladder can cause discomfort to the client, the uterus to be deviated to one side, and postpartum hemorrhage.

CN: Health promotion and maintenance; CL: Apply

58. 2. Administration of an epidural anesthetic can result in a hypotensive effect on maternal blood pressure. Therefore, the priority assessment is the mother's blood pressure. Ephedrine or wedging the client to a position to keep pressure off the vena cava, such as on the left side, can be used to elevate maternal blood pressure should it drop too low. Epidural anesthesia

has no effect on the level of consciousness or the client's cognitive function. Although the client's contraction pattern may decrease in frequency after administration of the anesthesia, the priority assessment is the client's blood pressure. After blood pressure is maintained, contractions can be assessed.

CN: Pharmacological and parenteral therapies; CL: Analyze

59. 4. Hypokalemia is one of the most common causes of digoxin toxicity. It is essential that the nurse carefully monitor the potassium levels of clients taking digoxin to avoid toxicity. Low serum potassium levels can cause cardiac dysrhythmias. Sodium, magnesium and calcium levels are not significantly affected by the use of digoxin.

CN: Pharmacological and parenteral therapies; CL: Apply

60. 3. Current pain guidelines recommend the removal of meperidine from formularies and the substitution of morphine commonly administered by patient-controlled analgesia. Meperidine can be prescribed for severe pain, but its use is limited by the high incidence of neurotoxicity (seizures) associated with the accumulation of its metabolite, normeperidine. It is contraindicated in clients with acute pain lasting more than 2 days and in those for whom large daily doses (more than 600 mg) are needed. It would be inappropriate to urge the client to take the acetaminophen and codeine to prevent addiction. Addiction is a psychological condition in which a client is driven to take drugs for reasons that are not therapeutic. The client is in pain, and her need for the morphine is therapeutic. Although the client may obtain some relief from relaxation exercises, this alone is not sufficient to provide pain relief.

CN: Pharmacological and parenteral therapies; CL: Synthesize

61. 1. Infants at age 7 months are not capable of drinking from a cup without spilling. At age 6 months, infants can partially lift their weight on the hands, enjoy imitating sounds, and are developing separation anxiety.

CN: Health promotion and maintenance; CL: Analyze

62. 3. According to Erikson, a child of 13 years is normally seeking to meet the need to develop personal identity. Personal values are a component of this identity. Developing a conscience is a component of achieving

initiative during the preschool years. Developing a sense of competence is a component of achieving industry in the school-age years. Developing a lifetime vocation is a component of achieving generativity in adulthood.

CN: Psychosocial integrity; CL: Analyze

63. 3. The third maneuver is used to identify the presenting part. This maneuver is used to identify the part of the fetus that lies over the inlet to the pelvis. While facing the client, the nurse places the tips of the first three fingers on the side of the woman's abdomen above the symphysis pubis and palpates deeply around the presenting part to identify its contour and size. The first maneuver involves using the tips of the fingers of both hands to palpate the uterine fundus. The second maneuver identifies the back of the fetus, and the fourth maneuver identifies the cephalic prominence.

CN: Reduction of risk potential; CL: Apply

64. 4. Having the client deep breathe hourly is the most appropriate action for the **UAP**  to take to help prevent pulmonary complications. The client should be turned at least every 2 hours or as needed for this particular client. Keeping the client's head elevated will not prevent pulmonary complications. Suctioning the client is not a UAP's responsibility, nor does it prevent pulmonary complications.

CN: Management of care; CL: Evaluate

65. 1. The nurse's response fails to identify the meaning in what the client has said. The nurse needs to explore the client's statement about hating God for that flood because the meaning of the client's statement is unclear. Also, clichés such as "Do not feel that way" are not helpful because they ignore the client's feelings and his interpretation of the situation in which he finds himself. Explaining to the client why he may think as he does (offering a rationale) is inappropriate. The nurse's response fails to identify the meaning in what the client has said and is not supportive. There is no evidence that the client is solving his problems.

CN: Psychosocial integrity; CL: Analyze

66. 4. By asking the client to tell more about how she is feeling, the nurse is not making any assumptions about what is troubling the client. The nurse

should acknowledge the client's feelings and encourage her to discuss them. Saying that this situation must be frustrating involves assumptions by the nurse about why the client is crying and is not a therapeutic response. Asking how long the client has been unable to comb her hair takes the focus off her feelings and inhibits therapeutic communication. Inquiring why the client's husband has not helped insinuates that the husband is not helping enough, which is inappropriate, takes the focus off the client's feelings, and inhibits therapeutic communication.

CN: Psychosocial integrity; CL: Synthesize

67. 3. The goal is to promote health in this client who has stress incontinence. Participating in a weight loss program or support group may decrease the intra-abdominal pressure contributing to the incontinence. Participating in swimming, bicycling, or low-impact exercise is beneficial to weight loss. Kegel exercises are helpful in developing muscle control. Wearing adult diapers will absorb leaked urine and prevent excoriation. Clients with urinary stress incontinence are encouraged to avoid drinks with caffeine and alcohol. Perineal care is essential to prevent skin breakdown, but the client does not require a Foley or straight catheter at this time.

CN: Physiological adaptation; CL: Synthesize

68. 3. The woman is at risk for placental abruption due to her recent car accident. Symptoms of a placental abruption include unrelenting pain and a rigid board-like abdomen. She may or may not have vaginal bleeding. In contrast, labor contractions are intermittent. The priority action by the nurse should be to ensure that this client is further evaluated by her **HCP** . Subsequent actions could include assisting with pain control measures, assessing contractions, and checking cervical dilation.

CN: Management of care; CL: Analyze

69. 2. The parent's expressions of stress and grief and the adolescent's behavior and drug use could be preludes to suicide, especially since another member of the family succeeded in suicide. Suicide attempts are more likely in families in which there has been a previous suicide attempt or suicide death, especially for young people. Though the family's emotional states are important, one is not more important than the other. Obviously, the parent's

ability to emotionally support the adolescent in this crisis has been compromised, but the safety of both supersedes this concern.

CN: Safety and infection control; CL: Analyze

70. 1. The nurse must use at least two ways to identify clients. This is done to make sure that each client gets the correct medication/s and/or treatment/s. Although all of the remaining actions need to be done, none of the others would be the first action.

CN: Physiological adaptation; CL: Apply

71. 20, Low Risk. This client's only risk factor is IV access, making this client low risk for a fall. The nurse must remember to reevaluate a client's risk for fall after any change in condition, upon transfer to another unit within the hospital, or after a fall. In most acute care facilities, a fall risk is completed at least every 24 hours, if not every shift.

CN: Safety and infection control; CL: Evaluate

72. 1, 2, 5. The first trimester is when the couple works through the psychological task of accepting the pregnancy. These statements describe the client and her partner coping with the pregnancy, how it feels, and how it will impact their lives. The feelings include pleasure, excitement, and ambivalence. Wondering what the baby will look like and planning for the baby's room occur later in the pregnancy.

CN: Health promotion and maintenance; CL: Analyze

73. 2. SIADH is characterized by excess antidiuretic hormone (ADH, vasopressin) secretion, despite low plasma osmolality. Excess ADH causes water to be retained. As blood volume expands, plasma becomes diluted resulting in dilutional hyponatremia. Aldosterone is suppressed, resulting in increased renal sodium excretion. Water moves from the hypotonic plasma and the interstitial spaces into the cells.

CN: Physiological adaptation; CL: Analyze

74. 3. Accumulation of air in the pleural cavity after a crushing chest injury may be assessed by unilateral diminished or absent breath sounds. Cheyne-Stokes respirations with periods of apnea commonly precede death.

They indicate heart failure or brain death. Fremitus is increased with lung consolidation and decreased with pleural effusion or pneumothorax. Pain occurs at the injury site and increases with inspiration.

CN: Physiological adaptation; CL: Analyze

75. 1. The biophysical profile typically measures five parameters to assess the fetus: fetal breathing, movement, and tone; amniotic fluid volume; and fetal heart reactivity. The test uses a scale of 0 to 2 for each parameter with a maximum score of 10.

CN: Physiological adaptation; CL: Evaluate

COMPREHENSIVE

TEST

2

This test has 110 questions. Time yourself as you take the test so you can determine the approximate amount of time it takes to complete this many questions. This test is close to the average number of questions you might receive on the actual licensing exam.

1. The unit secretary who transcribes the healthcare provider's (HCP's) prescriptions asks the nurse to interpret an illegible prescription. The nurse should clarify the prescription with the:

- ☐ **1.** client.
- ☐ **2.** pharmacist.
- ☐ **3.** HCP.
- ☐ **4.** client's family.

2. A client with cholecystitis is taking propantheline bromide. The expected outcome of this drug is:

- ☐ **1.** increased bile production.
- ☐ **2.** decreased biliary spasm.
- ☐ **3.** absence of infection.
- ☐ **4.** relief from nausea.

3. The nurse refers the parents of a child with cystic fibrosis to an organization that helps families with children who have this disease. Such organizations are especially beneficial for parents by helping them:

- ☐ **1.** find tutors to educate their children at home.
- ☐ **2.** obtain genetic counseling.
- ☐ **3.** meet with other parents of children with cystic fibrosis for mutual support.
- ☐ **4.** obtain financial assistance to purchase medications for their children.

4. A client tells the nurse that “the hospital food is horrible.” What should the nurse tell the client?

- ☐ 1. “The staff is doing the best it can to cook in such large quantities.”
- ☐ 2. “I will report this to the healthcare provider (HCP).”
- ☐ 3. “Would you like to speak with the dietitian about the food and meal selection?”
- ☐ 4. “I do not like the hospital cafeteria food either.”

5. An elderly client had a thrombotic cerebrovascular accident and now has flaccid hemiplegia of the right side. When planning care for this client, the nurse understands that rehabilitation begins:

- ☐ 1. as soon as anticoagulant therapy is started.
- ☐ 2. when the client is admitted to the hospital.
- ☐ 3. when the client can first work cooperatively with healthcare personnel.
- ☐ 4. as directed by the physical therapist.

6. A client has been involuntarily committed to a hospital because he has been assessed as being dangerous to self or others. The client has lost which right?

- ☐ 1. the right to refuse medications and treatments
- ☐ 2. the right to send and receive uncensored mail
- ☐ 3. freedom from seclusion and restraints
- ☐ 4. the right to leave the hospital against medical advice

7. Which statement by a client taking valproic acid for bipolar disorder indicates that further teaching about this medication is necessary?

- ☐ 1. “I need to take the pills at the same time each day.”
- ☐ 2. “I can chew the pills if necessary.”
- ☐ 3. “I can take the pills with food.”
- ☐ 4. “I need to call my healthcare provider (HCP) if I start bruising easily.”

8. The nurse is making rounds and observes a client who is unconscious (see figure). The unlicensed assistive personnel (UAP) has just turned the client from lying on her back. Before raising the side rail, the nurse should:

- ☐ 1. elevate the head of the bed to 30 degrees.
- ☐ 2. ask the nursing assistant to add a pillow under the right arm.
- ☐ 3. inspect the skin at pressure points from the back-lying position.
- ☐ 4. help the nursing assistant move the client closer to the head of the bed.

9. A client is having elective surgery under general anesthesia. Who is responsible for obtaining the informed consent?

- ☐ 1. the nurse
- ☐ 2. the surgeon
- ☐ 3. the anesthesiologist
- ☐ 4. the social worker

10. The family of an elderly client with terminal cancer inquires about hospice services. The nurse explains that hospice care:

- ☐ 1. focuses only on the needs of the client.
- ☐ 2. can only be provided in the inpatient setting.
- ☐ 3. is staffed exclusively by professional healthcare workers.
- ☐ 4. focuses on supportive care for the client and family.

11. When caring for a child who has been receiving long-term steroid therapy, the nurse should assess the child for:

- ☐ 1. usual behavior and temperament.
- ☐ 2. loss of weight from baseline.
- ☐ 3. development of truncal obesity.
- ☐ 4. demonstration of a growth spurt.

12. The nurse manager has assigned a nurse as the circulating nurse for a surgical abortion. The nurse has a religious objection and wishes to refuse to participate in an abortion. The nurse manager of the operating room should:

- ☐ 1. require the nurse to do this assignment.
- ☐ 2. change the assignment and record the behavior on the nurse's evaluation.
- ☐ 3. change the assignment without comment.
- ☐ 4. change the assignment to circulate but have the nurse prepare the equipment.

13. A client is taking phenytoin as an antiepileptic medication. The nurse should instruct the client to obtain:

- ☐ 1. increased iron.
- ☐ 2. increased calcium.
- ☐ 3. frequent dental examinations.
- ☐ 4. frequent eye examinations.

14. A hospitalized 5-year-old is pulseless, and after verifying the child is not breathing, the nurse begins chest compressions. The nurse should apply pressure:

- ☐ 1. on the lower sternum with the heel of one hand.
- ☐ 2. midway on the sternum with the tips of two fingers.
- ☐ 3. over the apex of the heart with the heel of one hand.
- ☐ 4. on the upper sternum with the heels of both hands.

15. The nurse instructs a client with coronary artery disease in the proper use of nitroglycerin. The client has had two previous episodes of coronary artery disease. At the onset of chest pain, what should the client do?

- ☐ 1. Call 911 when three nitroglycerin tablets taken every 5 minutes are not effective.
- ☐ 2. Call 911 when five nitroglycerin tablets taken every 5 minutes are not effective.
- ☐ 3. Take one tablet and then immediately call 911.
- ☐ 4. Go to the emergency department if two nitroglycerin tablets taken 5 minutes apart are not effective.

16. The nurse is coaching an older adult who has been diagnosed with high serum lipids and leads a sedentary lifestyle. The goal is to increase the amount of exercise this client currently performs. After assessing the client's interests and setting an acceptable goal with the client, which exercise will offer the client the **most** health benefits while being practical to implement?

- ☐ 1. jogging three to five times per week for 30 to 60 minutes
- ☐ 2. playing golf three times per week for 60 minutes
- ☐ 3. walking three to five times per week for 30 to 60 minutes
- ☐ 4. swimming once a week for 30 minutes

17. During the health history, a client bluntly states, "I think I am better off dead." What is the **best** response by the nurse?

- ☐ 1. "Has a family member ever committed suicide?"
- ☐ 2. "When did these feelings begin?"
- ☐ 3. "Do you have someone at home to help you?"
- ☐ 4. "Are you thinking about suicide?"

18. A client is taking methotrexate for severe rheumatoid arthritis. The nurse instructs the client that it will be necessary to monitor:

- ☐ 1. serum glucose.
- ☐ 2. serum electrolytes.
- ☐ 3. complete blood count (CBC) with differential and platelet count.
- ☐ 4. sedimentation rate.

19. An elderly client is constipated and tells the nurse that this has not happened before. What should the nurse tell the client?

- ☐ 1. "Constipation is an expected problem at your age. Wait to see if this continues."

- ☐ 2. “You need to eat more fiber. I will tell the dietician.”
- ☐ 3. “You need to drink more water. I will start a record so you can keep track”
- ☐ 4. “This may be a sign of a more serious problem; I will report this to your healthcare provider (HCP).”

20. A nurse is interviewing a client who will begin rehabilitation for alcohol dependency. Which approach by the nurse is **most** helpful to the client before starting the program?

- ☐ 1. “You need to be very serious about this program.”
- ☐ 2. “You need to want to be alcohol-free before we can help you.”
- ☐ 3. “This program requires you to do a lot of hard work.”
- ☐ 4. “We will help you be successful so that you can stay alcohol-free.”

21. A client who has been newly diagnosed with type 1 diabetes asks the nurse, “Why do I have to take two shots of insulin? One shot is not enough?” The nurse should tell the client:

- ☐ 1. “A single shot of long-acting insulin would be preferable.”
- ☐ 2. “You might be able to change to oral medications soon.”
- ☐ 3. “Two shots will give you better control and decrease complications.”
- ☐ 4. “I will ask the healthcare provider (HCP) to change your insulin schedule.”

22. The nurse reviews the peak and trough serum levels from a client who is receiving gentamicin sulfate in order to:

- ☐ 1. adjust the dosage to the therapeutic range.
- ☐ 2. avoid allergic reactions.
- ☐ 3. prevent side effects.
- ☐ 4. reach therapeutic levels more quickly.

23. The nurse who is caring for a client with type 1 diabetes mellitus should use which report to determine how well the insulin, diet, and exercise are balanced?

- ☐ 1. fasting serum glucose level
- ☐ 2. 1-week dietary recall
- ☐ 3. home log of blood glucose levels

- ☐ 4. glycosylated hemoglobin level

24. The nurses have instituted a falls prevention program. Which strategy will have the **highest** likelihood of preventing falls?

- ☐ 1. putting a falls risk sign on the clients' doors
- ☐ 2. having the client wear a color-coded armband
- ☐ 3. making rounds of the unit and clients' rooms
- ☐ 4. keeping all beds in low position

25. A client is receiving a unit of packed red blood cells. Before the transfusion started, the client's blood pressure was 90/50 mm Hg, pulse rate 100 bpm, respirations 20 breaths/min, and temperature 98°F (36.7°C). Fifteen minutes after the transfusion starts, the client's blood pressure is 92/54 mm Hg, pulse 100 bpm, respirations 18 breaths/min, and temperature is 101.4°F (38.6°C). The nurse should **first**:

- ☐ 1. stop the transfusion.
- ☐ 2. raise the head of the bed.
- ☐ 3. obtain a prescription for antibiotics.
- ☐ 4. offer the client a cool washcloth.

26. A client is receiving opioid epidural analgesia. The nurse should notify the healthcare provider (HCP) if the client has which findings? Select all that apply.

- ☐ 1. blood pressure of 80/40 mm Hg and baseline blood pressure of 110/60 mm Hg
- ☐ 2. respiratory rate of 14 breaths/min and baseline respiratory rate of 18 breaths/min
- ☐ 3. report of crushing headache
- ☐ 4. 1.5 mL of blood aspirated from the catheter before the bolus injection
- ☐ 5. pain rating of 3 on a scale of 1 to 10

27. Which dietary strategy **best** meets the nutritional needs of a client with acquired immunodeficiency syndrome (AIDS)?

- ☐ 1. Tell the client to eat large meals frequently.
- ☐ 2. Encourage mega doses of nutritional supplements.
- ☐ 3. Instruct the client to cook foods thoroughly and adhere to safe food-

handling practices.

- ☐ 4. Tell the client to prepare food in advance and leave it out to eat small amounts throughout the day.

28. The nurse is examining a 6-week-old dark-skinned infant. There are large spots of deep blue pigmentation across the infant's buttocks. The nurse should identify this sign as characteristic of:

- ☐ 1. vascular disease.
- ☐ 2. telangiectatic nevi.
- ☐ 3. infant milia.
- ☐ 4. Mongolian spots.

29. A nulliparous client has been given a prescription for oral contraceptives. The nurse should instruct the client to report which sign to the healthcare provider (HCP) immediately?

- ☐ 1. blurred vision
- ☐ 2. nausea
- ☐ 3. weight gain
- ☐ 4. mild headache

30. An 80-year-old client is admitted with nausea and vomiting. The client has a history of heart failure and is being treated with digoxin. The client has been nauseated for a week and began vomiting 2 days ago. Laboratory values indicate hypokalemia. Because of these clinical findings, the nurse should assess the client carefully for:

- ☐ 1. chronic renal failure.
- ☐ 2. exacerbation of heart failure.
- ☐ 3. digoxin toxicity.
- ☐ 4. metabolic acidosis.

31. The nurse instructs the client with osteoporosis that food products high in calcium include:

- ☐ 1. rice.
- ☐ 2. broccoli.
- ☐ 3. apples.
- ☐ 4. meat.

32. A woman is using progestin injections for contraception. The nurse instructs the client to return for an appointment in:

- ☐ 1. 1 month.
- ☐ 2. 3 months.
- ☐ 3. 4 months.
- ☐ 4. 6 months.

33. While the nurse is caring for a multigravid client at 39 weeks' gestation in active labor whose cervix is dilated to 7 cm and completely effaced at +1 station, the client says, "I need to push!" What should the nurse do **next**?

- ☐ 1. Turn the client to her left side.
- ☐ 2. Tell her to push when she has the urge.
- ☐ 3. Have her pant quickly during the contraction.
- ☐ 4. Tell her to focus on an object in the room to relax.

34. When teaching a client with chronic renal failure who is taking antibiotics about signs and symptoms of potential nephrotoxicity to report, the nurse should encourage the client to promptly report which changes in the color of the urine? Select all that apply.

- ☐ 1. straw colored
- ☐ 2. cloudy
- ☐ 3. smoky
- ☐ 4. pink

35. The nurse is coaching a client with heart failure about reducing fluid retention. Which strategy will be **most** effective in reducing a client's fluid retention?

- ☐ 1. low-sodium diet
- ☐ 2. walking for 20 minutes 3 times a week
- ☐ 3. restricting fluid intake
- ☐ 4. elevating the feet

36. During a physical examination, the nurse observes a copper bracelet on a client's wrist. The client states that she is wearing it to treat her arthritis. The nurse should:

- ☐ 1. recognize that the client is wearing a protective object she believes wards off illness.
- ☐ 2. inform the client that this is a not a helpful practice and ask her to remove the bracelet.
- ☐ 3. tell the client that wearing the bracelet is a form of quackery and not to use the bracelet as a treatment.
- ☐ 4. continue to wear the copper bracelet because this is a medically supported treatment for arthritis.

37. The heart rate of a newly born term neonate is regular at 142 bpm. What should the nurse do **next**?

- ☐ 1. Notify the neonate's healthcare provider (HCP).
- ☐ 2. Check for the presence of cyanosis.
- ☐ 3. Assess the heart rate again in 3 hours.
- ☐ 4. Document this as a normal neonatal finding.

38. The nurse is teaching a client with diabetes insipidus about using desmopressin nasal spray. The therapeutic effects of desmopressin nasal spray are obtained when the client no longer has:

- ☐ 1. polydipsia.
- ☐ 2. nasal congestion.
- ☐ 3. headache.
- ☐ 4. blurred vision.

39. A client is recovering from an infected abdominal wound. Which foods should the nurse encourage the client to eat to support wound healing and recovery from the infection?

- ☐ 1. chicken and orange slices
- ☐ 2. cheeseburger and French fries
- ☐ 3. cheese omelet and bacon
- ☐ 4. gelatin salad and tea

40. The nurse teaches the client with iron deficiency anemia that food sources with high iron content include:

- ☐ 1. cheese.
- ☐ 2. squash.

- ☐ 3. apples
- ☐ 4. beef.

41. A toddler admitted in respiratory distress keeps pulling at the oxygen mask, trying to remove it. Which interventions are indicated? Select all that apply.

- ☐ 1. Restrain the child.
- ☐ 2. Have the parent read to the child.
- ☐ 3. Administer a sedative.
- ☐ 4. Encourage the parent to hold the child.
- ☐ 5. Tell the child the mask will help him breathe better.
- ☐ 6. Ask the parent to leave the child's bedside.

42. The nurse is developing a plan of care for a client who has joint stiffness due to rheumatoid arthritis. Which measure will be the **most** effective in relieving stiffness?

- ☐ 1. a warm shower before performing activities of daily living
- ☐ 2. aspirin after activity to decrease inflammation
- ☐ 3. a 10-lb (4.5-kg) weight loss to limit stress on joints
- ☐ 4. cold compresses to joints for 30 minutes to relieve stiffness

43. A client is taking large doses of aspirin daily to treat rheumatoid arthritis. The nurse should instruct the client to tell the healthcare provider (HCP) when having:

- ☐ 1. abdominal cramps.
- ☐ 2. tinnitus.
- ☐ 3. rash.
- ☐ 4. low blood pressure.

44. A client is transferred from the coronary care unit to the step-down unit. Which information should be included in the transfer report? Select all that apply.

- ☐ 1. The client needs oxygen at 2 L/min.
- ☐ 2. The client has a "do-not-resuscitate" prescription.
- ☐ 3. The client uses the bedpan.

- ☐ 4. The client has four grandchildren.
- ☐ 5. The client has been in normal sinus rhythm for 6 hours.

45. A multigravid client at 26 weeks' gestation with a history of pregnancy-induced hypertension (PIH) asks the nurse about traveling from North America to a village in India by airplane to visit her father, who wishes to see her before she gives birth. Which response by the nurse is **most** appropriate?

- ☐ 1. "Air travel at this point in your pregnancy can lead to preterm labor."
- ☐ 2. "You can travel by airplane as long as you take frequent walks during the trip."
- ☐ 3. "You need to avoid traveling because of your history of PIH."
- ☐ 4. "You would be placing yourself and your fetus at risk for communicable diseases common in India."

46. A pregnant woman does not have funds to purchase adequate, nutritious food. She works part time at a low-wage job and has two other children. The nurse can refer the client to which type of assistance?

- ☐ 1. home-delivered meals
- ☐ 2. neighbors who can provide food
- ☐ 3. the pregnant woman's employer
- ☐ 4. food bank

47. The client has various sensory impairments associated with type 1 diabetes. The nurse determines that the client needs further instruction when the client says:

- ☐ 1. "I will carefully test the temperature of my bathwater."
- ☐ 2. "I will avoid kitchen activities."
- ☐ 3. "I will avoid hot water bottles or heating pads."
- ☐ 4. "I will inspect my skin daily for pressure points and injury."

48. The nurse is providing discharge instructions to the client with peripheral vascular disease. The nurse should include which information in the discussion with this client? Select all that apply.

- ☐ 1. Avoid prolonged standing and sitting.
- ☐ 2. Limit walking so as not to activate the "muscle pump."

- ☐ 3. Keep extremities elevated on pillows.
- ☐ 4. Keep the legs in a dependent position.
- ☐ 5. Use a heating pad to promote vasodilation.

49. A father tells the nurse that his adolescent son spends lots of time in his room, his grades are falling, and he has given away a few of his favorite video games. What is the **most** appropriate action for the nurse?

- ☐ 1. Give the father the telephone number for the local crisis hotline.
- ☐ 2. Have the father take the adolescent to the nearest mental health outpatient facility now.
- ☐ 3. Make a same-day appointment for the adolescent with his usual healthcare provider (HCP).
- ☐ 4. Obtain more history information from the distraught father before making a decision.

50. A 7-year-old child is admitted to the hospital with acute rheumatic fever with chorea-like movements. Which eating utensil should the nurse remove from the meal tray?

- ☐ 1. fork
- ☐ 2. spoon
- ☐ 3. plastic cup
- ☐ 4. drinking straw

51. A client's catheter is removed 4 days after a transurethral resection of the prostate (TURP). He is experiencing urinary dribbling. What should the nurse do?

- ☐ 1. Teach the client Kegel exercises.
- ☐ 2. Obtain a urine culture and sensitivity analysis to screen for a urinary infection.
- ☐ 3. Encourage voiding every hour to prevent dribbling.
- ☐ 4. Inform him that the dribbling will stop after a few days.

52. The parent of a 2-month-old infant with colic states, "I do not know what to do anymore. She is up in the middle of the night crying all the time." What should the nurse tell the parent to do?

- ☐ 1. Walk the floor with the baby at night.

- ☐ 2. Take the infant for a short drive in the car.
- ☐ 3. Allow the infant to cry it out in her crib.
- ☐ 4. Offer cereal to fill the baby's stomach.

53. After the application of an arm cast, the client has pain on passive stretching of the fingers, finger swelling and tightness, and loss of function. Based on these data, the nurse anticipates that the client may be developing:

- ☐ 1. delayed bone union.
- ☐ 2. compartment syndrome.
- ☐ 3. fat embolism.
- ☐ 4. osteomyelitis.

54. Which is a **priority** for exercising for a client who has just had a myocardial infarction?

- ☐ 1. low-back training program
- ☐ 2. risk modification education
- ☐ 3. strength training program
- ☐ 4. jogging exercise program

55. While assessing a 4-day-old neonate born at 28 weeks' gestation, the nurse cannot elicit the neonate's Moro reflex, which was present 1 hour after birth. The nurse notifies the healthcare provider (HCP) because this may indicate which complication?

- ☐ 1. postnatal asphyxia
- ☐ 2. skull fracture
- ☐ 3. intracranial hemorrhage
- ☐ 4. facial nerve paralysis

56. The nurse is teaching the client about the appropriate use of lorazepam to manage anxiety. Which statement indicates that the client understands the nurse's teaching?

- ☐ 1. "I can take my medicine whenever I feel anxious."
- ☐ 2. "It is okay to double my dose if I need to."
- ☐ 3. "My medicine is not for the everyday stress of life."
- ☐ 4. "It is safe to have a glass of wine while taking this medicine."

57. The healthcare provider (HCP) prescribes a maternal blood test for alpha fetoprotein for a nulligravid client at 16 weeks' gestation. When developing the teaching plan, the nurse bases the explanations on the understanding that this test is used to detect which condition?

- ☐ 1. neural tube defects
- ☐ 2. Rh incompatibilities
- ☐ 3. inborn errors of metabolism
- ☐ 4. lecithin-sphingomyelin ratio

58. An unlicensed assistive personnel (UAP) recorded a client's 0600 blood glucose level as 126 mg/dL (7 mmol/L) instead of 216 mg/dL (12 mmol/L). The UAP did not recognize the error until 0900 but reported it to the nurse right away. What should the nurse do **first**?

- ☐ 1. Complete an incident report.
- ☐ 2. Wait and observe the client for symptoms of hyperglycemia.
- ☐ 3. Reprimand the UAP for the error.
- ☐ 4. Call the healthcare provider (HCP) and complete an incident report.

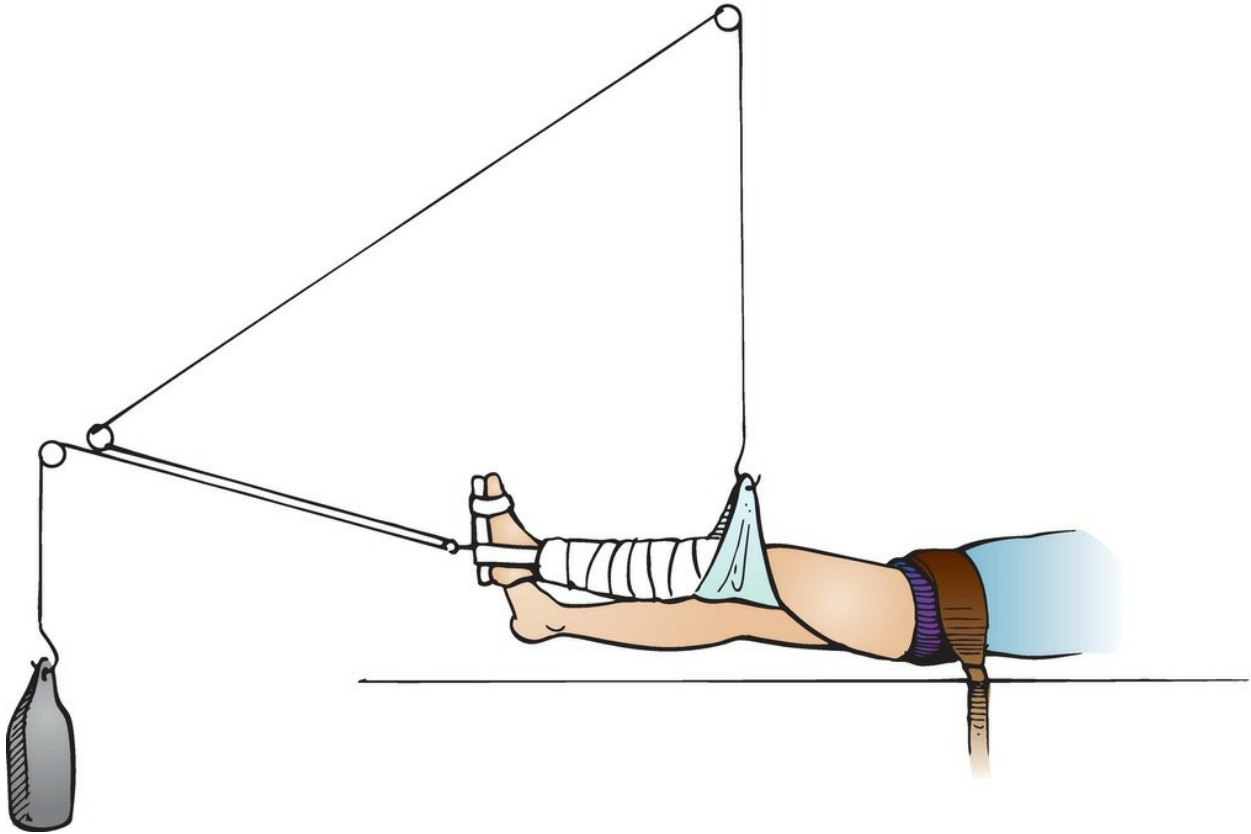

59. A client recovering from an abdominal hysterectomy has pain in her right calf. The nurse should:

- ☐ 1. palpate the calf to note pain.
- ☐ 2. measure the circumference of both calves and note the difference.
- ☐ 3. have the client flex and extend her leg and note the presence of pain.
- ☐ 4. raise the right leg and lower it to detect changes in skin color.

60. A client recently diagnosed with lung cancer tells the nurse that she has been having difficulty sleeping and is often preoccupied with thoughts about how her life has changed. She says, "I wish my life could just go on the way it was." Which issue should the nurse discuss with the client **first**?

- ☐ 1. preparing a will
- ☐ 2. managing insomnia
- ☐ 3. understanding grief
- ☐ 4. relieving anxiety

61. A 12-year-old has a fractured femur and is immobilized in traction as shown in the figure. What should the nurse do?

- ☐ 1. Add additional weight until the foot is only 2 inches (5 cm) from the bed.
- ☐ 2. Only offer foods that are easy to eat.
- ☐ 3. Place a pillow under the fractured leg to provide support.
- ☐ 4. Provide opportunities for age-appropriate activities.

62. The nurse is participating in a blood pressure screening event. After three separate readings taken at least 2 minutes apart, the nurse determines that a client has a blood pressure of 160/90 mm Hg. The nurse should advise the client to:

- ☐ 1. have blood pressure evaluated again within 1 month.
- ☐ 2. begin an exercise program.
- ☐ 3. examine lifestyle to decrease stress.
- ☐ 4. schedule a complete physical immediately.

63. A client's wife arrives on the nursing unit 6 hours after her husband's car accident, explaining that she has been out of town. She is distraught because she was not with her husband when he was admitted. The nurse

should **first**:

- ☐ 1. allow her to verbalize her feelings and concerns.
- ☐ 2. describe her husband's medical treatment since admission.
- ☐ 3. explain the nature of the injury and reassure her that her husband's condition is stable.
- ☐ 4. reassure her that the important fact is that she is here now.

64. A client is scheduled to have a graded exercise test. The nurse explains to the client that the test will determine how:

- ☐ 1. to set the incline gradient on a treadmill.
- ☐ 2. well the body reacts to controlled exercise stress.
- ☐ 3. far he or she can walk.
- ☐ 4. long he or she can walk.

65. The mother of an infant with hemophilia tells the nurse that she is planning to do home schooling when the child reaches school age. She does not want her child in school because the teacher will not watch the child as well as she would. The mother's comments represent what common parental reaction to a child's chronic illness?

- ☐ 1. overprotection
- ☐ 2. devotion
- ☐ 3. mistrust
- ☐ 4. insecurity

66. A client with acute psychosis has been taking haloperidol for 3 days. When evaluating the client's response to the medication, which comment reflects the **greatest** improvement?

- ☐ 1. "I know these voices are not real, but I am still scared of them."
- ☐ 2. "I am feeling so restless, and I cannot sit still."
- ☐ 3. "Boy, do I need a shower. I think it has been days since I have had one."
- ☐ 4. "I am ready to talk about my discharge medications."

67. The nurse is administering an IV potassium chloride supplement to a client who has heart failure. When developing a plan of care for this client, the nurse should consider that:

- ☐ 1. hyperkalemia will intensify the action of the client's digoxin preparation.
- ☐ 2. the client's potassium levels will be unaffected by a potassium-sparing diuretic.
- ☐ 3. the administration of the IV potassium chloride should not exceed 10 mEq/h or a concentration of 40 mEq/L.
- ☐ 4. metabolic alkalosis will increase the client's serum potassium levels.

68. When assessing a client who is incontinent for risk for developing a pressure ulcer, the nurse should note which factor that can **most** alter tissue tolerance and lead to the development of a pressure ulcer?

- ☐ 1. the client's gender
- ☐ 2. exposure to moisture
- ☐ 3. presence of hypertension
- ☐ 4. smoking

69. A nurse is teaching a parenting class about how to prevent thrush (oral candidiasis). Which statement by a parent indicates more teaching is required?

- ☐ 1. "I will sterilize pacifiers."
- ☐ 2. "I should rinse my child's mouth after using a corticosteroid."
- ☐ 3. "If my child uses a spacer with asthma medications, I need to rinse it after each use."
- ☐ 4. "I should rinse my child's glass after each use."

70. A 10-year-old with a history of recent respiratory infection has swelling around the eyes in the morning and dark urine. What question should the nurse ask **first**?

- ☐ 1. "Has the child had a rash and fever?"
- ☐ 2. "Has the child had a sore throat?"
- ☐ 3. "Does the child have any allergies?"
- ☐ 4. "Does the child drink lots of liquids?"

71. Which nursing intervention is the **highest priority** during the first 24 hours postoperatively for the client who had a total laryngectomy due to cancer of the larynx?

- ☐ 1. Provide adequate nourishment.
- ☐ 2. Prevent skin breakdown around the stoma.
- ☐ 3. Maintain proper bowel elimination.
- ☐ 4. Maintain a patent airway.

72. It has been 5 months since a client lost his wife and child in a car-train accident. The nurse should determine that the client needs continuing counseling if he makes which statement?

- ☐ 1. "I am sleeping, eating, and working pretty well, but I still get so sad at times."
- ☐ 2. "I miss them so much, but I can tell I am getting better day by day."
- ☐ 3. "I wish I did not have to sleep. I hate the nightmares about what the car looked like."
- ☐ 4. "I never thought I would get over this, but I am working with my legislator for train crossing safety."

73. A client is hearing voices that are telling her to kill herself. She is demanding a knife to use on her wrists. Which is **most** appropriate intervention at this time?

- ☐ 1. Put the client in restraints after giving an IM dose of PRN medication.
- ☐ 2. Ask the client to talk about her anger and what is causing it.
- ☐ 3. Give oral PRN doses of haloperidol and lorazepam as prescribed.
- ☐ 4. Search the client's room for potential weapons after locking the unit kitchen.

74. Which measure is contraindicated when the nurse assists a child who has leukemia with oral hygiene?

- ☐ 1. applying petroleum jelly to the lips
- ☐ 2. cleaning the teeth with a toothbrush
- ☐ 3. swabbing the mouth with moistened cotton swabs
- ☐ 4. rinsing the mouth with a nonirritating mouthwash

75. The nurse realizes that a medication error has been made and a client has received the wrong medication. What should the nurse do **first**?

- ☐ 1. Assess the client's condition.
- ☐ 2. Notify the healthcare provider (HCP) of the error.

- ☐ 3. Complete an incident report.
- ☐ 4. Report the error to the unit manager.

76. The nurse is assessing a client who is 2 years of age and in the emergency department for burns on both feet, both lower legs, and the buttocks. The only area not burned from the waist down is the inside of the back of the knee. The parents inform the nurse that the child stepped into the bathtub and then sat down in the water when the water was too hot. What should the nurse do in order of priority from first to last? All options must be used.

1. Provide fluid resuscitation and pain medications.

2. Assess burn depth in the different areas.

3. Document parent-child interactions.

4. Report incident to the authorities.

77. When planning a health promotion class with a group of women, the nurse should include which information about reducing the risk of developing osteoarthritis?

- ☐ 1. Follow a high-protein diet.
- ☐ 2. Exercise for 20 minutes at least twice a week.
- ☐ 3. Prevent obesity.
- ☐ 4. Take a multivitamin supplement daily.

78. A neonate circumcised with a Plastibell 1 hour ago is brought to his mother for feeding. What should the nurse instruct the mother to do?

- ☐ 1. Read a pamphlet about circumcision care.
- ☐ 2. Remove the petroleum jelly gauze in 24 hours.
- ☐ 3. Tell the nurse when the neonate voids.
- ☐ 4. Place petroleum jelly over the site every 2 hours.

79. The nurse is assessing a client who has benign prostatic hypertrophy (BPH). The nurse should ask the client if he has:

- ☐ 1. impotence.
- ☐ 2. flank pain.
- ☐ 3. difficulty starting the urinary stream.
- ☐ 4. hematuria.

80. Which intervention should the nurse anticipate using when caring for a term neonate diagnosed with transient tachypnea at 2 hours after birth?

- ☐ 1. Monitor the neonate's color and cry every 4 hours.
- ☐ 2. Feed the neonate with a bottle every 3 hours.
- ☐ 3. Obtain extracorporeal membrane oxygenation equipment.
- ☐ 4. Provide warm, humidified oxygen in a warm environment.

81. The skin tone of a client of Vietnamese descent with dark skin who has early signs of iron deficiency anemia appears:

- ☐ 1. reddish-brown.
- ☐ 2. yellowish-brown.
- ☐ 3. black-brown.
- ☐ 4. whitish-brown.

82. Which laboratory finding is present in nephrotic syndrome?

- ☐ 1. decreased total serum protein
- ☐ 2. hypercalcemia
- ☐ 3. hyperglycemia
- ☐ 4. decreased hematocrit

83. While caring for several preterm infants in the special care nursery, which action is **most** important for preventing nosocomial infections in these

neonates?

- ☐ 1. using sterile supplies for all treatments
- ☐ 2. performing thorough handwashing before giving infant care
- ☐ 3. donning cover gowns for nurses and visitors to the unit
- ☐ 4. wearing a mask, and changing it frequently when giving care

84. Which type of restraints is **best** for the nurse to use for a child in the immediate postoperative period after cleft palate repair?

- ☐ 1. safety jacket
- ☐ 2. elbow restraints
- ☐ 3. wrist restraints
- ☐ 4. body restraints

85. A nulliparous client tells the nurse that during her last pelvic examination, the healthcare provider (HCP) said that her uterus was in a severe retroverted position. The nurse determines that the client may experience:

- ☐ 1. frequent vaginal infections.
- ☐ 2. pain from endometriosis.
- ☐ 3. severe menstrual cramping.
- ☐ 4. difficulty conceiving a child.

86. A client in severe respiratory distress is admitted to the hospital. When assessing the client, the nurse should:

- ☐ 1. conduct a complete health history.
- ☐ 2. complete a comprehensive physical examination.
- ☐ 3. delay assessment until client's respiratory distress is resolved.
- ☐ 4. focus assessment on the respiratory system and distress.

87. A client has had a total hip replacement. Which sign **most** likely indicates that the hip has dislocated?

- ☐ 1. abduction of the affected leg
- ☐ 2. loosening of the prosthesis
- ☐ 3. external rotation of the affected leg
- ☐ 4. shortening of the affected leg

88. A client with schizophrenia is withdrawn, is suspicious of others, and projects blame. The client's behavior reflects problems in which stage of development as identified by Erikson?

- ☐ 1. trust versus mistrust
- ☐ 2. autonomy versus shame and doubt
- ☐ 3. initiative versus guilt
- ☐ 4. intimacy versus isolation

89. The nurse is assessing a client who has just experienced a crisis. The nurse should **first** assess the client for which behavior?

- ☐ 1. capability of effective problem solving
- ☐ 2. increased level of anxiety
- ☐ 3. shortened attention span
- ☐ 4. seeks help from others

90. A client with a new ileal conduit asks the nurse when to wear the appliance. What should the nurse tell the client?

- ☐ 1. "You need to wear your appliance all the time."
- ☐ 2. "You need to wear your appliance after you irrigate."
- ☐ 3. "It is only necessary to wear your appliance at night."
- ☐ 4. "The appliance must be worn after your meals."

91. A child has been exposed to varicella. Which precaution should the nurse institute for infection control?

- ☐ 1. airborne precautions
- ☐ 2. droplet precautions
- ☐ 3. contact precautions
- ☐ 4. indirect contact precautions

92. Which nursing goal is appropriate for a client with multiple myeloma?

- ☐ 1. Achieve effective management of bone pain.
- ☐ 2. Recover from the disease with minimal disabilities.
- ☐ 3. Decrease episodes of nausea and vomiting.
- ☐ 4. Avoid hyperkalemia.

93. After an episode of severe pain, a client says to the nurse, "The pain

really frightened me. I thought I was going to die.” Which statement is the **most** appropriate response from the nurse?

- ☐ 1. “I understand that pain can be a frightening experience.”
- ☐ 2. “Why were you frightened? You have had pain before.”
- ☐ 3. “There is no need to be frightened of pain.”
- ☐ 4. “Pain cannot cause you to die. Try to relax.”

94. A child returns to the pediatric unit after a bowel resection. Which action has the **highest priority**?

- ☐ 1. Administer IV fluids.
- ☐ 2. Keep the child on nothing-by-mouth status.
- ☐ 3. Monitor vital signs frequently.
- ☐ 4. Assess the child’s pain level.

95. When obtaining a health history, the nurse understands that which client statement indicates the need for further follow-up?

- ☐ 1. “I have some shortness of breath when I exercise.”
- ☐ 2. “No matter how much I drink, I am still thirsty all the time.”
- ☐ 3. “I wake up early in the morning and cannot return to sleep.”
- ☐ 4. “In the past couple of weeks, I have been having a lot of trouble urinating.”

96. A young adult has been diagnosed with hypertrophic cardiomyopathy. The nurse should further assess the client for:

- ☐ 1. angina.
- ☐ 2. fatigue and shortness of breath.
- ☐ 3. abdominal pain.
- ☐ 4. hypertension.

97. The nurse should advise the mother of a toddler suspected of having pinworms to do the cellophane tape test at which time?

- ☐ 1. before bathing
- ☐ 2. after a bowel movement
- ☐ 3. while the child is asleep
- ☐ 4. after a meal

98. Which finding provides the **most** evidence that a fetus might have a gastrointestinal tract anomaly?

- ☐ **1.** meconium in the amniotic fluid
- ☐ **2.** low implantation of the placenta
- ☐ **3.** increased amount of amniotic fluid
- ☐ **4.** pre-eclampsia in the last trimester

99. Using the Morse Fall Risk Scale (see exhibit), the nurse should initiate **highest** fall risk precautions for which client?

Morse Fall Risk/Scale

Item	Scale	Scoring
1. History of falling, immediate or within 3 months	No 0 Yes 25	
2. Secondary diagnosis	No 0 Yes 15	
3. Ambulatory aid Bed rest/nurse assist Crutches/cane/walker Furniture	0 15 30	
4. IV/heparin lock	No 0 Yes 20	
5. Gait/transferring Normal/bed rest/ immobile Weak Impaired	0 10 20	
6. Mental status Oriented to own ability Forgets limitations	0 15	

- ☐ 1. an 84-year-old client with diabetes admitted with new-onset confusion who reportedly fell at home last week, is currently on bed rest, and has normal saline infusing per saline lock
- ☐ 2. a 48-year-old alert and oriented client with quadriplegia admitted for

wound care of a stage IV pressure ulcer, receiving IV antibiotics per a peripherally inserted central catheter

☐ **3.** a 62-year-old client with a history of Parkinson's disease, admitted for pneumonia and receiving IV antibiotics, who has fallen at home but is able to ambulate with a cane and who during his hospitalization has gotten out of bed without calling for assistance

☐ **4.** a 27-year-old client with acute pancreatitis receiving morphine sulfate IV every 2 hours as needed for pain, no significant medical history, smokes two packs of cigarettes per day, may be up independently, and has steady gait

100. A 17-year-old gang member, who is living on the streets, is hospitalized after an overdose. When medically stable, the teen is admitted to the adolescent psychiatric unit of the same hospital. In what order of priority from first to last should the nurse explore the issues? All options must be used.

1. the reason the teen is not living with parents

2. the desire to leave or remain in the gang

3. the current level of suicidal risk

4. the desire to return home or go elsewhere after discharge

101. How does the nurse on the obstetrics unit assure client safety? Select

all that apply.

- ☐ 1. reconciliation of medication prescriptions
- ☐ 2. communication among staff
- ☐ 3. placing culturally similar clients together
- ☐ 4. use of two unique identifiers
- ☐ 5. staff training

102. A nurse is planning care with a family of a 4-year-old in preschool who is often disruptive in class, is difficult to engage, and rarely speaks. The child flaps his arms and screeches when he is upset. What would be the **most** appropriate responses for the nurse to make to the parents? Select all that apply.

- ☐ 1. “Has your child received all his childhood immunizations? You know there is evidence that childhood immunizations play a role in the development of autism.”
- ☐ 2. “Has your child been evaluated by a pediatrician? He seems to have some behaviors that are abnormal for a child of his age.”
- ☐ 3. “How does your child behave at home? If you do not see acting out behavior at home, part of his problem may be dealing with new situations such as school.”
- ☐ 4. “How do you respond if he disobeys or acts out at home? If your techniques help stop or prevent negative behavior, perhaps the teachers can try similar measures at school.”
- ☐ 5. “Have you considered private school? This environment does not seem right for your child.”

103. A client is anxious following a robbery. The client is worried about identity theft and states, “I could lose everything. I cannot stand the fears I have. I reported everything, but I still cannot eat or sleep.” Which intervention should the nurse implement **first**?

- ☐ 1. Request a prescription for an antianxiety medication.
- ☐ 2. Provide a list of free legal resources.
- ☐ 3. Refer the client to a support group.
- ☐ 4. Listen empathetically while the client discusses the fears.

104. When a client wants to read the medical record, the nurse should:

- ☐ 1. call the healthcare provider (HCP) to obtain permission.
- ☐ 2. give the client the medical record and answer the client's questions.
- ☐ 3. tell the client to read the medical record when the HCP makes rounds.
- ☐ 4. answer any questions the client has without giving the client the medical record.

105. A nurse is relieving the triage nurse in the labor and birth unit who is going to lunch. The report indicates that there are three clients having their vital signs assessed and a fourth client is on her way to the unit from the emergency department. In which order of priority from first to last should the nurse manage these clients? All options must be used.

1. the client with clear vesicles and brown vaginal discharge at 16 weeks' gestation

2. the client with right lower quadrant pain at 10 weeks' gestation

3. the client who is at term and has had no fetal movement for 2 days

4. the client from the emergency department at term and screaming loudly because of labor contractions

106. The nurse is beginning the shift and is planning care for six clients on the postpartum unit. Three of the clients have immediate needs, and three of the clients are listed as "stable." For the **best** utilization of time and client

safety, the nurse should make rounds on which client **first**?

- ☐ 1. the three clients who are reported to be stable
- ☐ 2. the mother with a 4-hour-old infant with initial blood glucose of 33 mg/dL (1.8 mmol/L) and now at 45 mg/dL (2.5 mmol/L) breast-feeding her infant
- ☐ 3. a mother who had a spontaneous vaginal birth (SVB) and received carboprost 1 hour ago for increased bleeding
- ☐ 4. a mother with a 3-day-old who had a bilirubin level of 13 mg/dL (220 μ mol/L) 30 minutes ago and is now in a biliblanket at the mother's bedside

107. The nurse on the postpartum unit is caring for four couplets. There will be a new admission in 30 minutes. The new client is a G4 P4, Spanish-speaking only client with an infant who is in the special care nursery (SCN) for respiratory distress. The nurse should place the new client in a room with which client?

- ☐ 1. a G4 P4 who is 2 days postpartum with infant, Spanish speaking only
- ☐ 2. a G1 P1 who is 1 day postpartum with an infant in the SCN
- ☐ 3. a G6 P6 who gave birth 4 hours ago by cesarean section for fetal distress, infant at bedside
- ☐ 4. a G1 P1 who is a non-English-speaking client with infant in SCN for fetal distress

108. The nurse is developing a community health education program about sexually transmitted infections. Which information about women who acquire gonorrhea should be included?

- ☐ 1. Women are more reluctant than men to seek medical treatment.
- ☐ 2. Gonorrhea is not easily transmitted to women who are menopausal.
- ☐ 3. Women with gonorrhea are usually asymptomatic.
- ☐ 4. Gonorrhea is usually a mild disease for women.

109. Which client is at **greatest** risk for falling?

- ☐ 1. a 22-year-old man with three fractured ribs and a fractured left arm
- ☐ 2. a 70-year-old woman with episodes of syncope
- ☐ 3. a 50-year-old man with angina
- ☐ 4. a 30-year-old woman with a fractured ankle

110. A child with meningococcal meningitis is being admitted to the pediatric unit. In preparation for the child's arrival, the nurse should **first**:

- ☐ 1. institute droplet precautions.
- ☐ 2. obtain the child's vital signs.
- ☐ 3. ask the parent about medication allergies.
- ☐ 4. inquire about the health of siblings at home.

Answers, Rationales, and Test-Taking Strategies

*The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in Part 1 of this book.*

1. 3. Illegible writing is one of the most common reasons for medication errors. The **HCP**  should be called to clarify the prescription. The previous medication record should not be used as a substitute for the exact prescription written by the HCP. The pharmacist or the client's family cannot interpret a prescription written by an HCP.

 CN: Management of care; CL: Synthesize

2. 2. Propantheline bromide is an anticholinergic used to decrease biliary spasm. Decreasing biliary spasm helps to reduce pain in cholecystitis. Propantheline does not increase bile production or have an antiemetic effect, and it is not effective in treating infection.

 CN: Pharmacological and parenteral therapies; CL: Apply

3. 3. An important function of support organizations for any health problem is to put parents of children with the condition in touch with each other. Other parents can commonly offer support and help. In some instances,

organizations can offer assistance, such as providing equipment required for home care of their child with cystic fibrosis. These organizations do not obtain tutors for children, nor do they provide medications, financial assistance, or genetic counseling for parents.

 CN: Management of care; CL: Apply

4. 3. Strategies for meeting client satisfaction include involving hospital department personnel to improve service. Saying, “The staff is doing the best it can,” or, “I will report this to the **healthcare provider (HCP)**,” does not offer a practical resolution to the client’s problem. Expressing a personal dislike for the food negates the client’s problem and does not offer a solution.

 CN: Management of care; CL: Synthesize

5. 2. Rehabilitation for a client who has sustained a cerebrovascular accident begins at the time the client is admitted to the hospital. The first goal of rehabilitation should be to help prevent deformities. This goal is achieved through such techniques as positioning the client properly in bed, changing the client’s position frequently, and supporting all parts of the body in proper alignment. Passive range-of-motion exercises may also be started, unless contraindicated.

 CN: Management of care; CL: Synthesize

6. 4. An involuntarily admitted client loses the right to leave the hospital until the condition is stable enough that the client no longer poses a danger to self or others. While hospitalized, the client retains all civil rights such as receiving mail, making phone calls, refusing treatment, and also receiving the least restrictive treatment. Should the involuntarily admitted client refuse treatment once admitted, he will be evaluated for the need to receive treatment against wishes in order to decrease the risk for self-harm or harm to others.

 CN: Management of care; CL: Analyze

7. 2. Chewing the pill or capsule form of valproic acid can cause mouth and throat irritation and is contraindicated. Taking the pills at the same time each day is important to maintain therapeutic effectiveness of the drug. Taking the pills with food is appropriate if the client is experiencing

gastrointestinal upset. Valproic acid may cause clotting problems; therefore, bruising should be reported.

CN: Pharmacological and parenteral therapies; CL: Evaluate

8. 3. The client is positioned correctly in the sidelying position. The pillows support the client's joints and do not cause unnecessary pressure on the joints or skin. It is not necessary to add another pillow under the arm or to elevate the head of the bed. The nurse should assess the client's skin for signs of breakdown, particularly at the elbows, back, hips, and heels where there were pressure points from the position in which the client was previously lying.

CN: Reduction of risk potential; CL: Evaluate

9. 2. It is the role of the surgeon or the person performing the procedure to obtain the **informed consent** 📖. This consists of informing the client about the procedure, the risks of treatment, the side effects, other types of treatments available, and the effects without the procedure. Nurses, anesthesiologists, and social workers do not obtain informed consent.

CN: Management of care; CL: Apply

10. 4. Hospice care focuses on supportive care for the client and family. Care for the family may continue throughout the bereavement period. Hospice care involves care of the client at home as well as in an inpatient setting. Although professional care is provided in hospice, family members, volunteers, and unlicensed assistive personnel (UAP) also participate in the care of the client.

CN: Basic care and comfort; CL: Apply

11. 3. One of the side effects of steroid therapy is fat deposition on the trunk and face, producing classic Cushingoid signs. Therefore, the nurse should expect to find truncal obesity. Steroids also can cause altered moods or mood swings. Typically, long-term steroid use results in weight gain. Steroids may inhibit the action of growth hormone. Therefore, a growth spurt is not likely.

CN: Pharmacological and parenteral therapies; CL: Analyze

12. 3. The nurse should not be required to participate in an abortion if it contradicts the nurse's religious beliefs. The behavior should not be reflected negatively on the nurse's evaluation. Preparing equipment and supplies for the case may be viewed as the same as circulating for the case. The nurse has a right not to participate in an abortion unless it is an absolute emergency and no one else is available to care for the client.

CN: Management of care; CL: Synthesize

13. 3. Phenytoin causes hyperplasia of the gums, and the client needs frequent dental examinations and meticulous oral hygiene. Phenytoin therapy may contribute to a folic acid deficiency, but it is not related to iron or calcium metabolism. A need for frequent eye examinations is not related to the side effects of phenytoin.

CN: Pharmacological and parenteral therapies; CL: Synthesize

14. 1. The chest is compressed with the heel of one hand positioned on the lower sternum, two fingerbreadths above the sternal notch (at the nipple line). Fingertips are used to compress the sternum in infants, and the heels of both hands are used in adult cardiopulmonary resuscitation.

CN: Safety and infection control; CL: Apply

15. 1. Nitroglycerin tablets should be taken 5 minutes apart for three doses; if this is ineffective, 911 should be called to obtain an ambulance to take the client to the emergency department. The client should not drive or have a family member drive the client to the hospital.

CN: Pharmacological and parenteral therapies; CL: Synthesize

16. 3. The client will obtain the most health benefits from aerobic exercises such as walking, biking, jogging, or swimming. Because the client has been sedentary, the nurse instructs the client to start the exercise program with walking slowly 10 minutes four times a day and increasing to 30 to 60 minutes three to five times per week. Jogging is not a realistic exercise at this time. Playing golf is not considered an aerobic activity; therefore, it is not beneficial in lowering serum lipids. To illicit cardiovascular changes, the client would need to swim more than once a week.

CN: Health promotion and maintenance; CL: Synthesize

17. 4. The client who voices death wishes must be asked directly about thoughts of suicide and specific suicide plans. The other questions are important history questions but are not crucial to address the follow-up needed when the client verbalizes a death wish.

 CN: Psychosocial integrity; CL: Synthesize

18. 3. This client should be monitored for blood dyscrasias, evidenced by decreased platelet count and white blood cell count with changes in the CBC differential. Elevated serum electrolytes, serum glucose, and sedimentation rates are not side effects of this drug.

 CN: Pharmacological and parenteral therapies; CL: Apply

19. 4. The new onset of constipation may be a sign of a tumor or other health problems. Constipation is not an expected change of aging. Increased fiber and fluid intake is helpful with constipation, but in this case, the client needs to be seen by a **HCP**  to rule out a health problem.

 CN: Reduction of risk potential; CL: Synthesize

20. 4. Saying, “We will help you be successful so that you can stay alcohol-free,” conveys interest in the client as a worthwhile individual who needs help and treatment. This statement also helps to build trust and enhances self-esteem. The other statements confront the client and may result in the client’s feeling belittled, judged, and rejected.

 CN: Psychosocial integrity; CL: Synthesize

21. 3. Research has shown that at least two injections daily provide improved blood glucose control and decreased incidence of target end-organ damage. Type 1 diabetes requires insulin replacement and cannot be managed with oral medications alone. It would be inappropriate to ask the **HCP**  to change the insulin schedule.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

22. 1. Peak and trough serum levels are used to adjust the dosage within a therapeutic range. Monitoring drug levels does not prevent allergic reactions. Preventing toxicity helps decrease the risk of some side effects, but will not but not totally prevented them. Peaks and trough levels are monitored only

after a drug has been given long enough to achieve therapeutic levels.

CN: Pharmacological and parenteral therapies; CL: Apply

23. 4. A glycosylated hemoglobin level gives the nurse data about the average blood glucose concentration over 2 to 3 months, providing a picture of the client's overall glucose control. A fasting serum glucose level gives a picture of the client's recent glucose level, not the overall effectiveness of the therapeutic regimen. A 1-week diet recall is not always accurate. Although a home log would provide some information about overall control and compliance, the log may not have all of the glucose levels recorded.

CN: Reduction of risk potential; CL: Evaluate

24. 3. When making rounds, nurses can note a variety of risks in the clients' rooms, in the hallways, and other areas where clients might be at risk. Using signs and color-coded armbands and keeping the bed in a low position are also useful, but making rounds offers the opportunity for nurses to intervene immediately and teach the client, family, and staff when risks are noted.

CN: Safety and infection control; CL: Synthesize

25. 1. The nurse's first action should be to clamp off the transfusion because the client is having a transfusion reaction. It is most important that the client not receive any more blood. Other measures may be appropriate after the blood has been stopped. The nurse should raise the head of the bed if the client becomes short of breath. There is no need for antibiotic therapy for a blood transfusion related to a temperature spike. The nurse can provide a cool washcloth for a headache or fever; however, this is not a priority.

CN: Pharmacological and parenteral therapies; CL: Synthesize

26. 1, 3, 4. A drop in blood pressure to 80/40 mm Hg is significant and should be reported to the **HCP** . Hypotension and vasodilation may occur as a result of sympathetic nerve blockage along with the pain nerve blockage. A report of a crushing headache suggests that the epidural catheter may be dislodged in the subarachnoid space rather than the epidural space. The HCP also should be notified any time if more than 1 mL of fluid or blood is aspirated from the catheter before a bolus injection. A respiratory rate of 14

breaths/min, although somewhat decreased from baseline, is within acceptable parameters. However, if the rate drops to 10 breaths/min or less, the HCP should be notified. A pain rating of 3 out of 10 suggests that pain is being relieved with the epidural analgesia.

CN: Pharmacological and parenteral therapies; CL: Synthesize

27. 3. A client with AIDS is immunocompromised, and food safety is an important concern. Food-borne illnesses and infections can be devastating to the client with AIDS. Large, frequent meals are not necessary. Megadoses of vitamins can result in toxicities that may aggravate the client's clinical condition. Leaving food out encourages growth of microorganisms.

CN: Safety and infection control; CL: Synthesize

28. 4. This finding describes Mongolian spots, which are common in newborns of African, Asian, or Latin descent. Telangiectatic nevi, or “stork bites,” are pink lesions commonly found on the back of the neck. Milia are small white papules over the nose and cheek that indicate blocked sebaceous glands.

CN: Health promotion and maintenance; CL: Analyze

29. 1. Blurred vision is a serious adverse effect of oral contraceptives, possibly because of severe hypertension as a result of the medication. If the client experiences blurred vision, she needs to contact her **HCP** immediately. Nausea, weight gain, and mild headache are common and possibly bothersome side effects and should be noted. However, they do not need to be reported immediately unless they are severe, prolonged, or accompanied by other symptoms.

CN: Pharmacological and parenteral therapies; CL: Analyze

30. 3. Nausea and vomiting, along with hypokalemia, are likely indicators of digoxin toxicity. Hypokalemia is a common cause of digoxin toxicity; therefore, serum potassium levels should be carefully monitored if the client is taking digoxin. The earliest clinical signs of digoxin toxicity are anorexia, nausea, and vomiting. Bradycardia, other dysrhythmias, and visual disturbances are also common signs. Chronic renal failure usually causes hyperkalemia. With persistent vomiting, the client is more likely to develop

metabolic alkalosis than metabolic acidosis.

CN: Pharmacological and parenteral therapies; CL: Analyze

31. 2. Food sources high in calcium include steamed broccoli, dairy products, and fortified cereals. Rice, apples, and meat are not calcium-rich sources. Menopausal women need 1,500 mg of calcium daily.

CN: Reduction of risk potential; CL: Apply

32. 2. At the time a client receives a Depo-Provera injection, a follow-up appointment should be made for 3 months later. The nurse should emphasize the need to adhere to the medication schedule to prevent an unplanned pregnancy. One of the most common reasons for failure of this contraceptive is lack of adherence to the appointment schedule for injections every 3 months.

CN: Pharmacological and parenteral therapies; CL: Apply

33. 3. Panting will alleviate the client's urge to push. The client risks edema or tearing of the cervix if pushing begins before complete cervical dilation (10 cm) is achieved. Although turning the client to her left side improves uteroplacental blood flow, it will have no effect on diminishing the client's urge to push. Although focusing on an object in the room may help the client to relax, it will have no effect on diminishing the client's urge to push due to the pressure of a fetus at +1 station.

CN: Health promotion and maintenance; CL: Synthesize

34. 2, 3, 4. The client who is taking potentially nephrotoxic antibiotics should notify the **healthcare provider (HCP)** 📖 if the urine is cloudy, smoky, or pink; early signs of nephrotoxicity are manifested by changes in urine color. Straw-colored urine is normal.

CN: Pharmacological and parenteral therapies; CL: Analyze

35. 1. In clients with fluid retention, sodium restriction may be necessary to promote fluid loss. Increasing exercise will not reduce fluid retention. Exercise will promote circulation, but will not manage the fluid retention. Restricting fluid intake will not reduce retained fluids; increased fluids will increase urine output and promote improved fluid balance. Elevating the

client's feet helps promote venous return and fluid reabsorption but in itself will not reduce the volume of excess fluid.

CN: Reduction of risk potential; CL: Synthesize

36. 1. The client might wear objects as a protection against specific medical disorders. Typically, these practices bring no harm to the client and should not be discouraged. The client should continue to be encouraged to follow the medical guidance of her **healthcare provider (HCP)** . If the practice is not harming the client, it is inappropriate to label it quackery and demand that the client discontinue it. There is no medical evidence to support the wearing of a copper bracelet.

CN: Health promotion and maintenance; CL: Synthesize

37. 4. Normally, a neonate's heart rate should be between 120 and 160 bpm shortly after birth. The nurse should document this as a normal neonatal finding. The **HCP**  does not need to be notified. Assessing for cyanosis is a routine assessment at birth, but with the neonate's heart rate at 142 bpm, cyanosis should be minimal and typically located in the hands and feet. Heart rate assessments are performed routinely according to facility protocol. For example, the heart rate is assessed soon after birth, every 15 minutes for 1 hour, every 30 minutes for 1 hour, and then every 4 hours.

CN: Health promotion and maintenance; CL: Synthesize

38. 1. The therapeutic effects of desmopressin nasal spray are relief from polydipsia and control of polyuria and nocturia in the client with diabetes insipidus. Side effects include nasal congestion and headache. Blurred vision is not related to desmopressin.

CN: Pharmacological and parenteral therapies; CL: Evaluate

39. 1. Protein and vitamin C are particularly important in promoting wound healing and recovery from infection. A diet high in carbohydrates is also essential. Because the client with an infection commonly does not feel like eating, it is important that what the client eats should be nutritious. Chicken and orange slices would help meet the client's protein and vitamin needs. A meal of a cheeseburger and fries or a cheese omelet and bacon are high in fat and low do not contain as much vitamin C as the chicken and

orange slices. Gelatin salad and tea contain minimal nutrients.

CN: Basic care and comfort; CL: Apply

40. 4. Beef, liver, iron-fortified cereals, and spinach are iron-rich foods. Cheese, squash, and apples do not have significant sources of iron.

CN: Reduction of risk potential; CL: Apply

41. 2, 4. Children in respiratory distress need to be kept as quiet as possible to decrease respiratory and heart rates. Toddlers need a parent with them for security. The best way to quiet toddlers is to read or to hold them. Restraints increase heart and respiratory rates. A sedative will mask the signs of further respiratory distress. Although you could tell toddlers that a mask will help with breathing, they cannot understand the rationale and thus fully comprehend its importance. Asking the parents to leave the bedside will most likely result in greater upset, further contributing to respiratory distress.

CN: Basic care and comfort; CL: Synthesize

42. 1. Warm showers, baths, or hand soaks can help relieve joint stiffness and allow the client to more comfortably perform activities of daily living. Aspirin or other anti-inflammatory drugs should be taken before activity to help decrease inflammation and reduce joint pain and inflammation. Although weight loss may decrease stress on joints, pain and stiffness will continue to be a problem. Cold compresses are most effective for relieving joint pain, whereas moist heat is useful for decreasing pain and stiffness. When cold compresses are applied, their use should be limited to 10 to 15 minutes at a time to decrease the risk of tissue damage.

CN: Basic care and comfort; CL: Synthesize

43. 2. Tinnitus or ringing in the ears is a sign of aspirin toxicity and should be reported. Clients should be instructed to take aspirin as prescribed and to avoid overdosage. Gastrointestinal symptoms associated with aspirin include nausea, heartburn, and epigastric discomfort caused by gastric irritation. Abdominal cramps, rash, and hypotension are not related to aspirin therapy.

CN: Pharmacological and parenteral therapies; CL: Analyze

44. 1, 2, 3, 5. The nurse should report that the client is using oxygen, has a

“do-not-resuscitate” prescription, can use the bedpan, and is in normal sinus rhythm. Information about having four grandchildren is not needed to help with the client’s continuity of care.

 CN: Management of care; CL: Apply

45. 3. Traveling is not advised because of the client’s history of PIH. The client may be in jeopardy if complications occur and medical care is not available. In some cases, insurance companies will not cover costs of medical care in foreign countries. Air travel is not associated with preterm labor, although some airlines advise clients who are at 28 weeks’ gestation or beyond not to travel by air. Any travel that causes fatigue should be avoided. Additionally, any pregnant client should get frequent exercise while traveling to avoid venous stasis from prolonged sitting. The client is not at greater risk for communicable diseases. The priority is the client’s history of PIH, which, if it occurs, could lead to complications.

 CN: Reduction of risk potential; CL: Synthesize

46. 4. The best option is a food bank; the nurse can guide the client to choose optimally nutritious foods. Home-delivered meals are expensive. Neighbors are unlikely to sustain in providing sufficient food. The employer is not responsible for providing food.

 CN: Management of care; CL: Apply

47. 2. Safety concerns are essential for a client with sensory impairment. Water temperature should be tested carefully, hot water bottles should be avoided, and the skin should be inspected regularly. Independence and self-care are also important; the client should not be instructed to avoid kitchen activities out of fear of injury.

 CN: Safety and infection control; CL: Evaluate

48. 1, 3. Elevating the extremities counteracts the forces of gravity and promotes venous return and reduces venous stasis. Walking is encouraged to activate the muscle pump and promote collateral circulation. Prolonged sitting and standing lead to venous stasis and should be avoided. Although heat promotes vasodilation, use of a heating pad is to be avoided to reduce the risk of thermal injury secondary to diminished sensation.

 CN: Reduction of risk potential; CL: Create

49. 3. These behaviors suggest that the adolescent is thinking of suicide. Because of these behaviors, it is imperative for the adolescent to see his healthcare professional as soon as possible to determine whether he has suicidal thoughts. After the nurse makes the appointment, then it would be appropriate to obtain more information. Giving the father the telephone number for the local crisis hotline is appropriate after the appointment is made, to ensure that the father has additional support should the adolescent's behavior escalates and an emergency arises. Taking the adolescent to the nearest mental health outpatient facility now is not warranted unless the adolescent's behavior escalates.

 CN: Psychosocial integrity; CL: Synthesize

50. 1. For a child with chorea-like movements, safety is of prime importance. Feeding the child may be difficult. Forks should be avoided because of the danger of injury to the mouth and face with the tines. Spoons, straws, and plastic cups pose little risk.

 CN: Safety and infection control; CL: Synthesize

51. 1. After TURP, sphincter tone is poor, resulting in dribbling or incontinence. Kegel exercises can increase sphincter tone and decrease dribbling. Voiding every hour will not prevent dribbling or improve sphincter tone. It may take up to 12 months for urinary continence to be regained. Dribbling is not a sign of a urinary track infection.

 CN: Reduction of risk potential; CL: Synthesize

52. 2. Numerous things have been tried by parents with babies crying with colic. However, research has identified that the motion of a car is soothing to a baby with colic, commonly quieting the infant. The more the infant cries, the more air is swallowed, adding to the colic pain. Cereal should not be offered until the infant is age 4 to 6 months because of the increased risk of food allergies. Additionally, cereal has not been found to help with colic.

 CN: Health promotion and maintenance; CL: Synthesize

53. 2. Compartment syndrome, caused by compression of blood vessels

and nerves, can lead to irreversible muscle and nerve damage if not detected early. Common signs of compartment syndrome in the arm include pain unrelieved by analgesics, pain on passive extension of fingers, loss of function, numbness and tingling, pallor, coolness of the extremity, and decreased or absent peripheral pulse. Delayed bone union does not cause symptoms of neurovascular impairment. Fat embolism is characterized primarily by confusion and respiratory symptoms. Osteomyelitis is a bone infection and is manifested by signs and symptoms of inflammation and infection.

CN: Reduction of risk potential; CL: Analyze

54. 2. Cardiac rehabilitation includes client and family education and individualized activity counseling. Generally, the educational programs focus on presenting all of the risk factors associated with coronary artery disease. Low-back training is associated with a back injury recovery program. A strength training or jogging exercise program is not appropriate immediately after a cardiac event.

CN: Basic care and comfort; CL: Synthesize

55. 3. When the nurse cannot elicit the Moro reflex of a 4-day-old preterm infant and the Moro reflex was present at birth, intracranial hemorrhage or cerebral edema should be suspected. Other symptoms include lethargy, bulging fontanel, and seizure activity. Confirmation can be made by ultrasound. Postnatal asphyxia is suggested by respiratory distress, grunting, nasal flaring, and cyanosis. A skull fracture can be confirmed by radiography. However, it is unlikely to occur in a preterm neonate. Rather, it is more common in the large-for-gestational-age neonate. Facial nerve paralysis is indicated when there is no movement on one side of the face. This condition is more common in the large-for-gestational-age neonate.

CN: Reduction of risk potential; CL: Analyze

56. 3. The statement, “My medicine is not for the everyday stress of life,” indicates an accurate understanding of the nurse’s teaching about the use of lorazepam. Antianxiety agents like the benzodiazepines are used to treat anxiety that is unmanageable by other means and beyond the client’s ability to cope. For the drug to be effective, it must be taken as prescribed.

Lorazepam can cause physical and psychological dependence. Tolerance can occur, and doubling the dose of lorazepam may increase the risk of tolerance. Lorazepam is a central nervous system depressant. When it is taken in combination with alcohol, the depressant effect increases, posing a danger to the client.

CN: Pharmacological and parenteral therapies; CL: Evaluate

57. 1. A blood test for alpha fetoprotein is recommended at 15 to 20 weeks' gestation to screen for certain chromosomal abnormalities and neural tube defects such as spina bifida. Chorionic villi sampling is used to detect chromosomal anomalies. Amniotic fluid amino acid determination is used to detect inborn errors of metabolism such as phenylketonuria. An amniocentesis is used to determine the lecithin-sphingomyelin ratio for fetal lung maturity, indicated by a ratio of 2:1, or chromosomal abnormalities. Rh incompatibilities are predicted with blood type testing measured with antigen tests.

CN: Reduction of risk potential; CL: Apply

58. 4. The error should be reported to the **HCP**  promptly; the HCP may write additional prescriptions. The nurse should complete an incident report because a potentially dangerous event happened during the client's care. The nurse should observe the client for symptoms of hyperglycemia but first must call the HCP and complete an incident report. The **UAP**  does not need to be reassigned for this error. The nurse does not need to reprimand the UAP for the error because the UAP already knows an error was made and has reported it to the nurse.

CN: Management of care; CL: Synthesize

59. 2. After abdominal pelvic surgery, the client is especially prone to thrombophlebitis. Measuring calf circumference can help detect edema in the affected leg. The calf should not be rubbed or palpated because a clot could be loosened and travel to the lungs as a pulmonary embolism. Homan's sign, which is calf pain on dorsiflexion of the foot when the leg is raised, is sometimes associated with thrombophlebitis. Having the client flex and extend the leg does not provide useful assessment data; the leg will not change color when raised and lowered.

 CN: Reduction of risk potential; CL: Analyze

60. 3. The client is grieving and is telling the nurse that she grieves for the changes occurring in her life since her cancer diagnosis. The nurse can discuss the grief process with the client and offer support at this time. While the client does have insomnia and is anxious, the priority is to help the client manage her grieving. It is premature to discuss preparing a will.

 CN: Psychosocial integrity; CL: Analyze

61. 4. The traction is set up correctly. Additional weights are not needed. A well-balanced diet with fiber should be offered; there is no indication that the client needs to have only easy-to-eat foods. A pillow under the leg would negate the effects of the traction. Because the adolescent is positioned this way for an extended period, the nurse can help by finding activities that interest the client.

 CN: Basic care and comfort; CL: Synthesize

62. 1. The client with a systolic blood pressure of 160 to 179 mm Hg should be evaluated by a healthcare professional within 1 month of the screening. The client with a diastolic blood pressure of 90 to 99 mm Hg should be rechecked within 2 months. Exercise and stress reduction may be desirable activities, but it is first necessary to evaluate the cause of elevated blood pressure. In the absence of other symptoms, it is not necessary to have the client evaluated immediately.

 CN: Health promotion and maintenance; CL: Synthesize

63. 1. Verbalizing feelings and concerns helps decrease anxiety and allows the family member to move on to understanding the current situation. Describing events or explaining equipment is appropriate when the person is not distraught and is ready to learn. Reassuring the family member does not allow verbalization of feelings and discounts the person's feelings.

 CN: Psychosocial integrity; CL: Synthesize

64. 2. Graded exercise testing is a diagnostic and prognostic tool used to determine the physiologic responses to controlled exercise stress. Information gained from a graded exercise test can achieve diagnostic, functional, and

therapeutic objectives for the client. Graded exercise tests involve the use of a treadmill, stationary bicycle, or arm ergometry. The information obtained from this test is not used to set the incline on the treadmill, and measuring the distance walked and the duration of the walk is not the purpose of a graded exercise test.

CN: Reduction of risk potential; CL: Apply

65. 1. Overprotection is a typical parental reaction to chronic illness in a child. Characteristics include sacrifice of self and family for the child, failure to recognize the child's capabilities and sense of responsibility, placement of overly stringent restrictions on play and peer friendship, and a lack of confidence in other peoples' capabilities.

CN: Psychosocial integrity; CL: Analyze

66. 1. Knowing that the voices are not real is a reflection that the haloperidol is effective in decreasing psychosis. Restlessness may be a side effect of haloperidol, not an indication of improvement. Awareness of need for activities of daily living is an indicator of improvement. However, recognizing that the voices are not real demonstrates a greater awareness of the client's disorder than the need for hygiene does. Wanting to prepare for discharge before stabilization reflects denial of illness.

CN: Pharmacological and parenteral therapies; CL: Evaluate

67. 3. When administering IV potassium chloride, the administration should not exceed 10 or a concentration of 40 via a peripheral line. These limits are extremely important to prevent the development of hyperkalemia and the possibility of cardiac dysrhythmias. In some situations, with dangerously low serum potassium levels, the client may need cardiac monitoring and more than 10 mEq (mmol/L) of potassium per hour. Potassium-sparing diuretics may lead to hyperkalemia because they affect the kidney's ability to excrete excess potassium. Metabolic alkalosis can cause potassium to shift into the cells, thus decreasing the client's serum potassium levels. Hypokalemia can lead to digoxin toxicity.

CN: Pharmacological and parenteral therapies; CL: Synthesize

68. 2. Exposure to moisture can lead to maceration and the development of

pressure ulcers. It is important for the client's skin to be kept clean and dry with prompt attention to cleanliness after incidents of incontinence. The client's gender and the presence of hypertension are not factors leading to pressure ulcers. Smoking affects the oxygen status of the client but does not directly lead to the development of pressure ulcers.

CN: Reduction of risk potential; CL: Apply

69. 4. A new glass should be used each time the child wants a drink. Thrush is a fungal infection. Children who regularly use a corticosteroid inhaler, use oral corticosteroids, or have received antibiotics disturbing normal flora are at risk. It can also occur chronically in children who have an immune disorder. To prevent reinfection, parents should sterilize bottle nipples and pacifiers. Children with asthma should rinse their mouth well with water after using a corticosteroid, and if a spacer (reduces the amount of medicine in the mouth and throat) is used, it also needs to be rinsed.

CN: Health promotion and maintenance; CL: Evaluate

70. 2. In conjunction with the child's history of recent respiratory infection and report of dark urine, swelling around the eyes should lead the nurse to suspect acute glomerulonephritis. Therefore, the nurse should ask about a recent sore throat because a child with glomerulonephritis typically would have had a sore throat in the past 10 days. Drinking lots of liquids is unrelated to the periorbital edema.

CN: Physiological adaptation; CL: Analyze

71. 4. During the first 24 hours after a total laryngectomy, maintaining a patent airway is a priority goal. After a total laryngectomy, the client will have a tracheostomy with increased secretions and will require suctioning and tracheostomy care. Providing adequate nutrition, preventing skin breakdown, and maintaining proper bowel elimination will be appropriate as the client recovers, but maintaining a patent airway is the initial priority goal.

CN: Reduction of risk potential; CL: Synthesize

72. 3. Not sleeping to avoid nightmares reflects inadequate grief resolution. The client is not letting go or resolving the vivid memories of the trauma as expected. Statements that the client gets sad at times but can

function in daily activities or that the client still misses his family but acknowledges improvement indicate that the client is recovering and continued counseling is not necessary. Working for train crossing safety indicates motivation to help others escape what he has experienced. This action also denotes a goal for the future, indicating recovery.

 CN: Psychosocial integrity; CL: Evaluate

73. 3. Haloperidol and lorazepam together decrease hallucinations and agitation, thus decreasing the risk of self-harm. Putting the client in restraints is premature because danger is not imminent. Asking the client to talk about her anger is inappropriate because the client is beyond rational conversation. A room search is appropriate only after the crisis with the client is handled.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

74. 2. The oral mucous membranes are easily damaged and are commonly ulcerated in the client with leukemia. It is better to provide oral hygiene without using a toothbrush, which can easily damage sensitive oral mucosa. Applying petroleum jelly to the lips, swabbing the mouth with moistened cotton swabs, and rinsing the mouth with a nonirritating mouthwash are appropriate oral care measures for a child with leukemia.

 CN: Basic care and comfort; CL: Synthesize

75. 1. The nurse's first response to the error is to assess the client for any untoward reactions as a result of the error. Notifying the **HCP** and unit manager of the error as well as completing an incident report are all appropriate later actions, but the first action is to assess the client.

 CN: Management of care; CL: Synthesize

76. 2, 1, 3, 4. When a child steps into hot water, he or she does not sit down in it. This child was held in the scalding water and when he was held in the water, he abducted his knees (hence the areas not burned behind the knees). The nurse first assesses the extent of the burn and then assures fluid resuscitation and pain relief as needed. The nurse also documents what the parents report as well as the parent-child interaction. The burns appear to be from child abuse and must be reported to the authorities, which the nurse can do when the child is stable.

 CN: Management of care; CL: Synthesize

77. 3. Obesity is a risk factor for osteoarthritis because it places increased stress on the joints. A high-protein diet, regular exercise, and vitamin supplements do not reduce a client's risk of developing osteoarthritis.

 CN: Health promotion and maintenance; CL: Create

78. 3. The nurse should instruct the mother to report the first voiding after the circumcision because edema could cause a urinary obstruction. Although reading a pamphlet about circumcision care may be helpful, it may not be appropriate for all mothers. Some mothers could have difficulty reading or understanding the information. Petroleum jelly gauze is used with Gomco clamp circumcisions, not Plastibell. Petroleum jelly should not be used with Plastibell circumcision methods because the bell prevents further bleeding.

 CN: Health promotion and maintenance; CL: Synthesize

79. 3. The symptoms of BPH are related to obstruction as a result of an enlarged prostate. Difficulty in starting the urinary stream is a common symptom, along with dribbling, hesitancy, and urinary retention. Impotence does not result from BPH. Flank pain is most commonly related to pyelonephritis. Hematuria occurs in urinary tract infections, renal calculi, and bladder cancer, to name some of the most common causes.

 CN: Physiological adaptation; CL: Analyze

80. 4. Symptoms of transient tachypnea include respirations as high as 150 breaths/min, retractions, flaring, and cyanosis. Treatment is supportive and includes provision of warm, humidified oxygen in a warm environment. The nurse should continuously monitor the neonate's respirations, color, and behaviors to allow for early detection and prompt intervention should problems arise. Feedings are given by gavage rather than bottle to decrease respiratory stress. Obtaining extracorporeal membrane oxygenation equipment is not necessary but may be used for the neonate diagnosed with meconium aspiration syndrome.

 CN: Physiological adaptation; CL: Synthesize

81. 2. One of the early signs of iron deficiency anemia in a client of

Vietnamese descent with dark skin is yellowish-brown skin tones. The nurse can assess for petechiae or jaundice, which may be observed in the conjunctiva or buccal mucosa.

CN: Physiological adaptation; CL: Analyze

82. 1. A decreased total serum protein occurs as extensive amounts of protein are excreted from the body through the urine. Clients may develop hypocalcemia. Hyperglycemia is not a finding related to nephrotic syndrome. A decreased hematocrit is not a finding related to nephrotic syndrome.

CN: Physiological adaptation; CL: Analyze

83. 2. The number one cause of nosocomial infections in hospital units is not washing the hands. Nosocomial infections can be significantly reduced by thorough handwashing before caring for each infant. Sterile supplies are not necessary for all treatments. Cover gowns and masks, although helpful in reducing the risk of exposure to blood and body fluids, do not decrease the risk of nosocomial infection.

CN: Safety and infection control; CL: Synthesize

84. 2. Recommended restraints for a child who has had palate surgery are elbow restraints. They minimize the limitation placed on the child but still prevent the child from injuring the repair with fingers and hands. A safety jacket or wrist or body restraints restrict the child unnecessarily.

CN: Safety and infection control; CL: Synthesize

85. 4. Severe retroversion or anteversion may lead to infertility or difficulty conceiving a child because these positions can block the deposition or migration of sperm. The normal position of the uterus is tipped slightly forward. Frequent vaginal infections commonly are associated with diabetes or human immunodeficiency virus infection, not abnormal uterine positions. Pain from endometriosis (abnormal myometrial growth outside the uterus) is not associated with abnormal uterine positions. Severe menstrual cramping or dysmenorrhea (primary) is caused by increased prostaglandin production, not abnormal uterine positions. Secondary dysmenorrhea is associated with pelvic inflammatory disease or endometriosis.

CN: Health promotion and maintenance; CL: Analyze

86. 4. During an episode of acute respiratory distress, it is important that the nurse focus the assessment on the client's respiratory system and distress to quickly address the client's problem. Conducting a complete health history and a comprehensive physical examination can be deferred until the client's condition is stabilized. It is not appropriate to delay all assessments until the respiratory distress is resolved because the nurse must have data to guide treatment.

CN: Physiological adaptation; CL: Analyze

87. 4. The most likely indication of a dislocated hip is a shortening of the affected leg. Other indications of dislocation include increasing pain, loss of function to the extremity, and deformity. Abduction of the leg after total hip replacement is a desirable position to prevent dislocation. Loosening of the prosthesis does not necessarily indicate that the hip has dislocated. External rotation of the hip can occur without the hip's being dislocated. However, a neutral position of rotation is the desired position.

CN: Physiological adaptation; CL: Analyze

88. 1. The client who is withdrawn, is suspicious, and projects blame is exhibiting problems in trust versus mistrust. Shame and doubt would be reflected as low self-esteem and suspiciousness. Guilt would be reflected in self-blame for all problems. Isolation would be reflected in a lack of long-term relationships.

CN: Psychosocial integrity; CL: Analyze

89. 2. During the first phase of a crisis, the client exhibits elevated levels of anxiety. If the client is able to use problem-solving capabilities, there is no crisis. A shortened attention span is a characteristic of the fourth phase of the crisis. Reaching out to others for help is indicative of the third phase of a crisis.

CN: Psychosocial integrity; CL: Apply

90. 1. An ileal conduit is a urinary diversion that requires the client to wear an appliance, or pouch, at all times because urine drains continuously. Ileal conduits are not irrigated. The urinary drainage is affected by fluid intake, not meals.

 CN: Physiological adaptation; CL: Apply

91. 1. Children with varicella or suspected varicella should be treated under airborne precautions in addition to standard precautions. Varicella is transmitted by airborne nuclei. Droplet precautions are indicated for conditions such as pertussis, meningococcal pneumonia, and rubella. Contact precautions are indicated for conditions such as draining major abscesses, acute viral conjunctivitis, and *Clostridium difficile* gastroenteritis. Indirect contact is not a method of controlling infection. Rather, it is a mode of transmission involving contamination via some intermediate object, such as an instrument, needle, or dressing, or by hands that are not washed or gloves that are not changed between clients.

 CN: Safety and infection control; CL: Synthesize

92. 1. In multiple myeloma, neoplastic plasma cells invade the bone marrow and begin to destroy the bone. As a result of this skeletal destruction, pain can be significant. There is no cure for multiple myeloma. Nausea and vomiting are not characteristics of the disease, although the client may experience anorexia. The client should be monitored for signs of hypercalcemia resulting from bone destruction, not for hyperkalemia.

 CN: Physiological adaptation; CL: Synthesize

93. 1. The nurse's most appropriate response is to acknowledge and validate the client's concerns. Questioning the client's fears is not a therapeutic response and can make the client feel defensive. False reassurance that the client should not be afraid disregards the client's fears and does not promote further communication between the client and nurse. Dismissing the client's feelings and telling the client to relax do not encourage sharing of feelings.

 CN: Psychosocial integrity; CL: Synthesize

94. 3. In a child with abdominal surgery, it is important to check vital signs frequently to assess for internal bleeding. Administering IV fluids, assessing pain, and keeping the child on nothing-by-mouth status are all important, but monitoring vital signs frequently is the priority.

 CN: Reduction of risk potential; CL: Synthesize

95. 2. Polydipsia, or increased thirst, is a classic clinical manifestation of diabetes. The excessive loss of fluids is the result of the osmotic diuresis that occurs with glycosuria. It is unlikely that shortness of breath, early awakening, or trouble urinating are related to diabetes mellitus.

CN: Physiological adaptation; CL: Analyze

96. 2. Cardiomyopathy is a broad term that includes three major forms: dilated, hypertrophic, and restrictive cardiomyopathies. The underlying etiology of hypertrophic cardiomyopathy is unknown; it is typically observed in young men but is not limited to them. Common symptoms are fatigue, low tolerance to activity related to the low ejection fraction, and shortness of breath. Angina may be observed if coronary artery disease is present. Abdominal pain and hypertension are not common.

CN: Physiological adaptation; CL: Analyze

97. 3. Pinworms come out of the rectum during the nighttime and early morning hours. Therefore, the best time to apply the tape to get results is while the child is asleep.

CN: Physiological adaptation; CL: Apply

98. 3. Maternal hydramnios occurs when the fetus has a congenital obstruction of the gastrointestinal tract, such as in the presence of a tracheoesophageal fistula. The fetus normally swallows amniotic fluid and absorbs the fluid from the gastrointestinal tract. Excretion then occurs through the kidneys and placenta. Most fluid absorption occurs in the colon. Absorption cannot occur when the fetus has a gastrointestinal obstruction. Meconium in the amniotic fluid, low implantation of the placenta, and pre-eclampsia could occur but are more specifically associated with fetal hypoxia.

CN: Health promotion and maintenance; CL: Analyze

99. 3. Using the Morse Fall Scale, risk factors for this client include history of falling, secondary diagnosis, ambulatory aid, IV/heparin lock, weak gait/transfer, and forgetting limitations (100 points). Client no. 1 is also high risk with a secondary diagnosis, history of falling, IV access, and confusion but is on bed rest (75 points). Client no. 2 risks include IV access

and secondary diagnosis (35 points). Client no. 4 is at risk due to his IV access only (20 points).

CN: Safety and infection control; CL: Analyze

100. 3, 2, 4, 1. Safety is the first priority, followed by the client's feelings about leaving the gang. If the client chooses to remain in the gang, the other issues are moot. If the client wishes to leave the gang, the issue of living arrangements becomes significant. If the wish is to return home, it would be important to discover the reasons why the teen left the home and to explore if relationships can be repaired. If the client desires to live elsewhere, it would need to be a place safe from the gang. Foster or adoptive care is unlikely because the client is near 18 years of age.

CN: Safety and infection control; CL: Create

101. 1, 2, 4, 5. Client care safety is enhanced by the process of reconciling all medication prescriptions at least one time each 24 hours of hospitalization. This can rule out duplication of prescriptions, missing medication prescriptions, or alerting the staff to medications that should have been terminated. Communication among all staff members enhances client safety and prevents errors in written or in verbal format. Culturally similar clients are appreciative of being with someone who can speak their language or share thoughts and ideas, but this does not increase the safety of the clients. The use of two identifiers should be consistently used to prevent wrong client and procedure errors. Staff training is an extremely valuable tool to educate and increase communication among staff members concerning existing or potential safety situations.

CN: Safety and infection control; CL: Create

102. 2, 3, 4. The child's behavior appears to fit the criteria for autism, but suggesting the child's immunizations are causative is inaccurate according to recent research and dangerous regarding possibly convincing the mother to forego future immunizations. A better approach would be to suggest a full evaluation by a primary care provider, especially since symptoms could result from other illnesses or conditions. Inquiring about the child's behavior at home and the mother's discipline techniques would give the nurse a better idea of the home environment and could help determine whether this is a

problem confined to the school setting or one that also occurs at home. Asking for the mother's input regarding discipline demonstrates a desire to involve her in problem solving. Suggesting a different school without a full evaluation does not address the problem.

 CN: Psychosocial integrity; CL: Apply

103. 4. Receiving empathy and talking about fears and feelings validate that the client is having typical reactions to a crime. A support group may help, but its effects will not be immediate. Legal resources may prove helpful, but the nurse does not yet have a clear picture if more legal resources are needed. Short-term medications for anxiety may be appropriate if other strategies are not quickly effective.

 CN: Psychosocial integrity; CL: Analyze

104. 2. The client should be allowed to see the **medical record**. As a client advocate, the nurse should answer questions for the client. The nurse helps the client become a primary partner in the health team. The **HCP** should not need to give permission for the client to see the medical record. As a client advocate, the nurse should not make excuses to put the client off in regard to seeing the medical record.

 CN: Management of care; CL: Apply

105. 4, 2, 1, 3. First, the nurse should assess the client from the emergency department who is screaming because she may be anywhere along the labor continuum and her status will be unknown until she has a vaginal exam to determine cervical effacement and dilation. The nurse should next assess the client with right lower quadrant pain as she may be experiencing an ectopic pregnancy or appendicitis and may need further evaluation by the **healthcare provider (HCP)**. The client with clear vesicles and brown vaginal discharge is experiencing a molar pregnancy and will need to have a D&C to evacuate the vesicles; this condition will not jeopardize the life of the mother if no intervention occurs within an hour. The client who is at term without fetal movement is a priority from an emotional standpoint if there is no heart beat when she is evaluated, but the physical status of the fetus with no fetal movement for 2 days will not change if not seen within the next ½ hour, and the nurse can see this client last. The emotional care for this client will be

extensive if there is a diagnosis of fetal demise, and the nurse should plan the time to be available to support this client as needed.

CN: Management of care; CL: Synthesize

106. 3. The client most in need of validating safety is the mother who has received carboprost 1 hour ago for increased bleeding. Her bleeding level needs to be documented as having been evaluated at the beginning of the shift and to determine if it has decreased to within normal limits (i.e., saturating <1 pad/h). The three stable clients will need to have an initial assessment by the oncoming nurse but can wait until the nurse can first assess the mother who is receiving carboprost. The mother with the 4-hour-old infant is able to breast-feed to maintain the blood glucose level, and the mother with the 3-day-old infant in the biliblanket is stable at this point.

CN: Management of care; CL: Synthesize

107. 1. The ability to communicate with a person of the same language would be an advantage, an opportunity for socialization and support for the new mother who speaks Spanish. If a Spanish-speaking mother were placed with the client who also had a baby in SCN, she would have no communication opportunity, and the same would apply for rooming with the mother who has had a cesarean section. The client who is non-English speaking does not identify the language spoken, and the nurse cannot assume that it is Spanish.

CN: Management of care; CL: Synthesize

108. 3. Many women who acquire gonorrhea are asymptomatic or experience mild symptoms that are easily ignored. They are not necessarily more reluctant than men to seek medical treatment, but they are more likely not to realize they have been affected. Gonorrhea is easily transmitted to all women and can result in serious consequences, such as pelvic inflammatory disease and infertility.

CN: Management of care; CL: Create

109. 2. The 70-year-old woman with syncopal episodes is at greatest risk for falling. The nurse should assess the client's gait and balance and the syncopal episodes. The 22-year-old man with upper body fractures and the

50-year-old man with angina are not at risk for falling. The 30-year-old woman could be at risk for falling, but she is at less risk than the 70-year-old client with syncope.

CN: Management of care; CL: Analyze

110. 1. The child with meningococcal meningitis requires droplet precautions for at least the first 24 hours after effective therapy is initiated to reduce the risk of transmission to others on the unit. After the child has been placed on droplet precautions, other actions, such as taking the child's vital signs, asking about medication allergies, and inquiring about the health of siblings at home, can be performed.

CN: Management of care; CL: Synthesize

COMPREHENSIVE

TEST

3

This test has 265 questions. Time yourself as you take the test so you can determine the approximate amount of time it takes to complete this many questions. This test reflects the maximum number of questions you might receive on the actual licensing exam.

1. A client asks why she feels so much variability in fetal activity each day. The nurse explains that fetal movement is affected by which factors? Select all that apply.

- ☐ **1.** fetal sleep
- ☐ **2.** barometric pressure
- ☐ **3.** blood glucose
- ☐ **4.** time of day
- ☐ **5.** cigarette smoking

2. The parent of a 2-week-old infant brings the child to the clinic for a checkup. The parent expresses concern about the baby's breathing because the infant breathes quickly for a while and then breathes slowly. The nurse interprets this finding as an indication of what factor?

- ☐ **1.** a normal pattern in infants of this age
- ☐ **2.** the need for an apnea monitor
- ☐ **3.** a need for close monitoring for the parent
- ☐ **4.** the need for a chest radiograph

3. A nurse performs care on the client's Hickman catheter according to hospital policy. The client develops an infection and is considering litigation. The nurse's practice is:

- ☐ **1.** malpractice.
- ☐ **2.** *respondeat superior*.

- ☐ 3. negligent.
- ☐ 4. tort.

4. When conducting the preoperative preparations, the nurse determines that the client with a primary language of Spanish has difficulty understanding English, and the nurse does not speak Spanish. The surgeon needs to obtain the client's informed consent. The **best** course for obtaining the client's informed consent is to:

- ☐ 1. have the client call a family member to act as interpreter.
- ☐ 2. have the client sign the Spanish surgical consent form.
- ☐ 3. call the Spanish interpreter to translate the surgeon's explanation of the procedure, risks, and alternatives to obtain the client's consent and to answer the client's questions.
- ☐ 4. notify the surgical charge nurse of the situation.

5. The nurse is discharging a client who has been hospitalized for preterm labor. The client needs further instruction when she says:

- ☐ 1. "If I think I have a bladder infection, I need to see my obstetrician."
- ☐ 2. "If I have contractions, I should contact my healthcare provider (HCP)."
- ☐ 3. "Drinking water may help prevent early labor for me."
- ☐ 4. "If I travel on long trips, I need to get out of the car every 4 hours."

6. A client who has glaucoma has been prescribed timolol eyedrops. The nurse should give which instructions about the administration of the eyedrops?

- ☐ 1. Instill the eyedrops whenever the eyes feel irritated.
- ☐ 2. The medication may cause some transient eye discomfort.
- ☐ 3. Keep the medication refrigerated between doses.
- ☐ 4. The need to use the eyedrops will be reevaluated after 1 month.

7. A client newly diagnosed with deep vein thrombosis (DVT) of the left lower left extremity is on bed rest. The nurse should instruct the unlicensed assistive personnel (UAP) providing routine morning care for the client to:

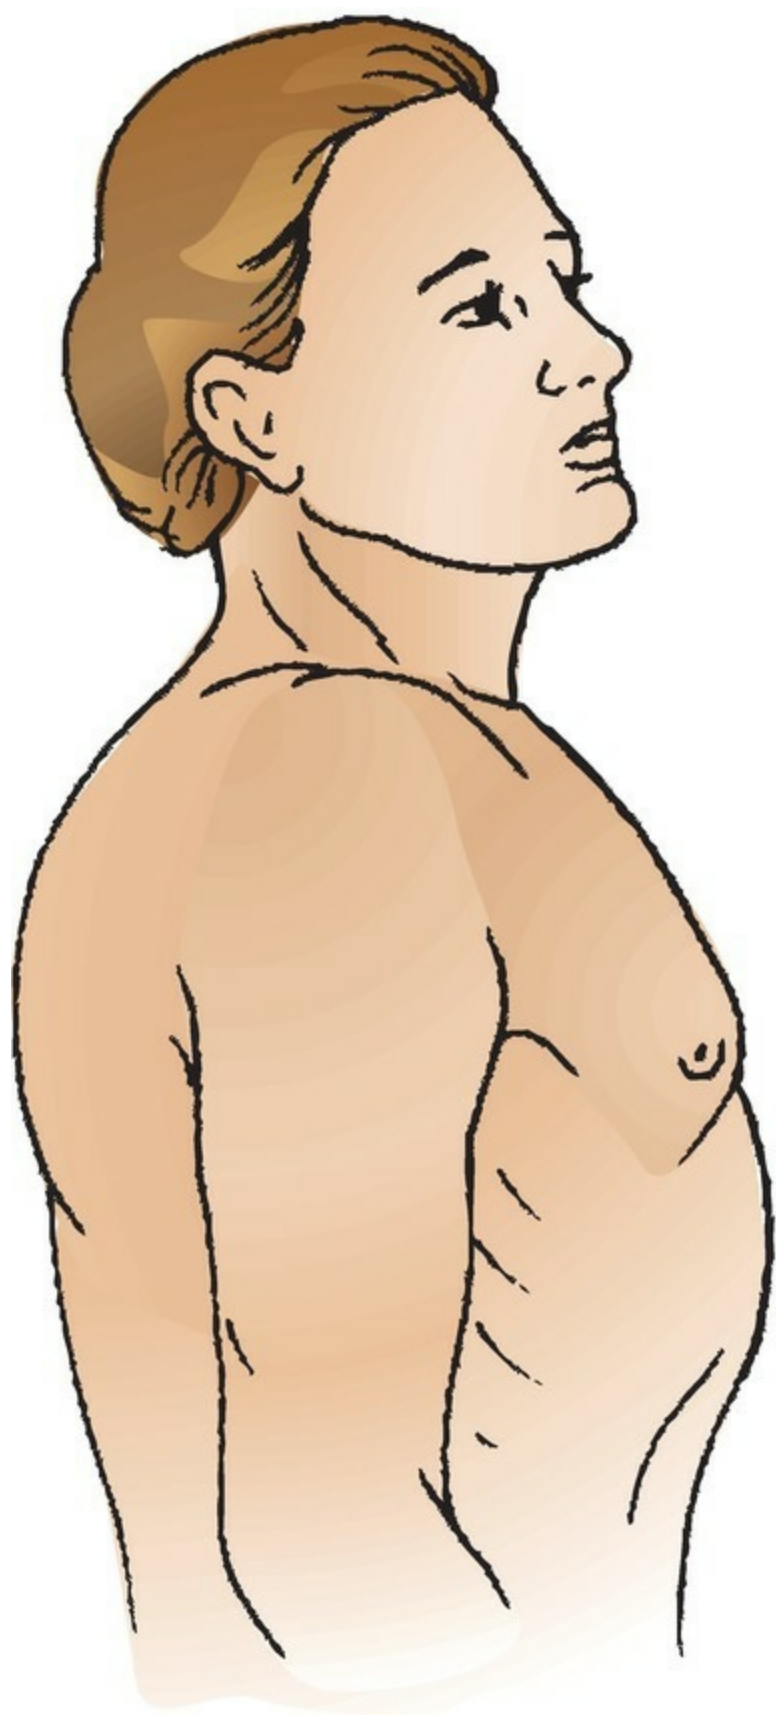

- ☐ 1. check that the legs are in a low, dependent position.
- ☐ 2. ensure that the lower extremity is elevated.

- ☐ 3. massage the leg and foot with lotion.
- ☐ 4. place one or two pillows under the client's left knee.

8. The nurse observes a darkish blue pigment on the buttocks and back of an infant of African descent. Which action is **most** appropriate?

- ☐ 1. Ask the obstetrician to assess the child.
- ☐ 2. Assess the child for other areas of cyanosis.
- ☐ 3. Document this observation in the child's medical record.
- ☐ 4. Advise the mother that the bruising will fade in a few days.

9. The nurse is assessing a client with chronic obstructive pulmonary disease. The client weighs 200 lb (90.7 kg) and is 6 feet (183 cm) tall. Using the diagram shown here, the nurse should record in the health history that the client's chest is:

- ☐ 1. barrel shaped.
- ☐ 2. indicative of lifting weights.
- ☐ 3. normal for the client's age, height, and weight.
- ☐ 4. showing the effects of long-term use of bronchodilators.

10. A diabetic primigravid client at 38 weeks' gestation asks the nurse why she had a fetal acoustic stimulation during her last nonstress test. Which should the nurse include as the rationale for this test?

- ☐ 1. to listen to the fetal heart rate
- ☐ 2. to startle and awaken the fetus
- ☐ 3. to stimulate mild contractions
- ☐ 4. to confirm amniotic fluid amount

11. When creating an educational program about safety, what information should the nurse include about sexual predators? Select all that apply.

- ☐ 1. Child molesters pick children or teens over whom they have some authority, making it easier for them to manipulate the child with special favors or attention.
- ☐ 2. Child molesters resort to molestation because they have bad childhoods, so understanding that can help them decrease their molesting.
- ☐ 3. Child molesters gain the child's trust before making sexual advances so the child feels obligated to comply with sex.
- ☐ 4. Child molesters often choose children whose parents must work long hours, making the extra attention initially welcomed by the child.
- ☐ 5. Child molesters maintain the secrecy of their actions by making threats if offering attention and favors fail or if the child is close to revealing the secret.

12. A client with severe depression states, "My heart has stopped, and my blood is black ash." The nurse interprets this statement to be evidence of which problem?

- ☐ 1. hallucination
- ☐ 2. illusion
- ☐ 3. delusion
- ☐ 4. paranoia

13. The mother of an older infant reports stopping the prescribed iron supplements after 2 weeks of treatment. Which response by the nurse is **most** appropriate?

- ☐ 1. "Bring the child in so that we can retest him."
- ☐ 2. "You need to continue the iron for several more weeks."
- ☐ 3. "Let us start a diet that is high in iron."
- ☐ 4. "No more medication is needed at this time."

14. The parents of a child with cystic fibrosis express concern about how the disease was transmitted to their child. The nurse should explain that:

- ☐ 1. a disease carrier also has the disease.
- ☐ 2. two parents who are carriers may produce a child who has the disease.
- ☐ 3. a disease carrier and an affected person will never have children with the disease.
- ☐ 4. a disease carrier and an affected person will have a child with the disease.

15. A Jewish client requests an orthodox diet while hospitalized. The nurse should refer this request to the:

- ☐ 1. dietitian.
- ☐ 2. healthcare provider (HCP).
- ☐ 3. unit case manager.
- ☐ 4. rabbi in pastoral care.

16. Which interventions should the nurse use to assist the client with grandiose delusions? Select all that apply.

- ☐ 1. Accept the client while not arguing with the delusion.
- ☐ 2. Focus on the feelings or meaning of the delusion.
- ☐ 3. Focus on events and topics based in reality.
- ☐ 4. Confront the client's beliefs.
- ☐ 5. Interact with the client only when the client is based in reality.

17. A mother reports she cannot afford the antibiotic azithromycin, which was prescribed by the healthcare provider (HCP) for her toddler's otitis media. What is the nurse's **best** response?

- ☐ 1. Instruct the mother on the importance of the medication.
- ☐ 2. Ask the mother if she has considered using any medical assistance programs in her community.
- ☐ 3. Confer with the HCP about whether a less expensive drug could be prescribed.
- ☐ 4. Consult with the social worker.

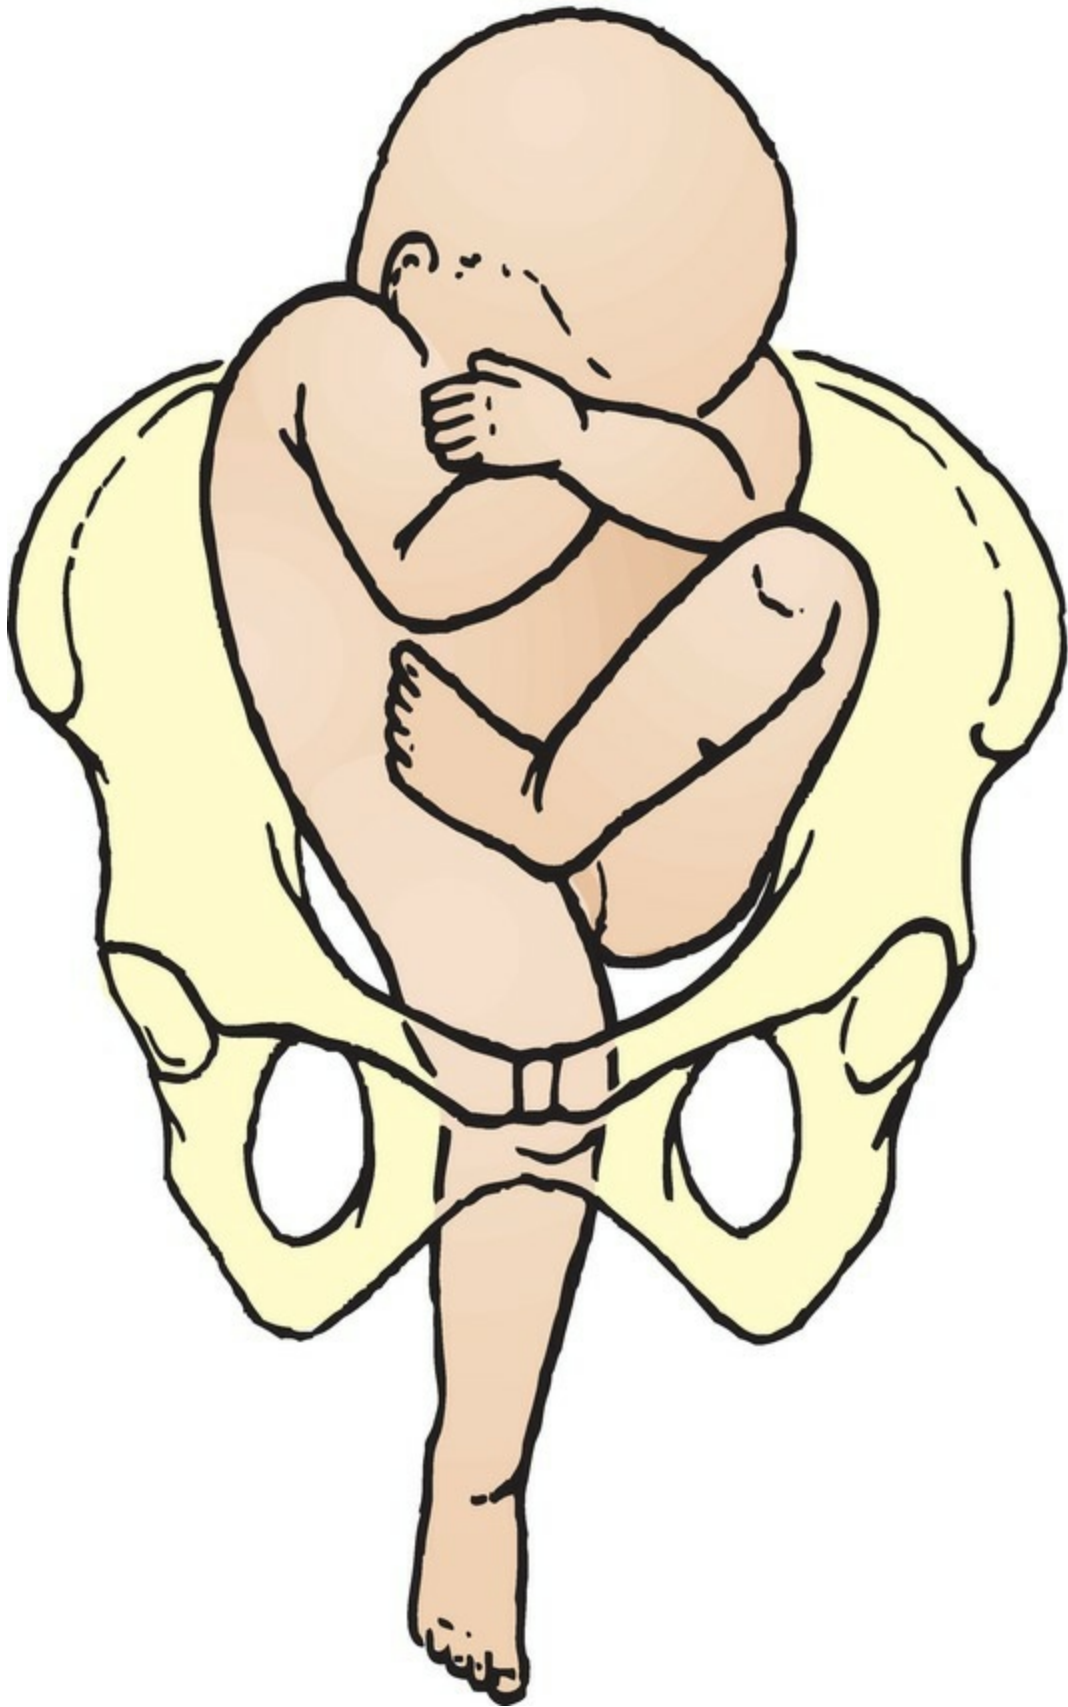

18. Which response is **most** helpful for a client who is euphoric, intrusive, and interrupts other clients engaged in conversations to the point where they get up and leave or walk away?

- ☐ 1. "When you interrupt others, they leave the area."
- ☐ 2. "You are being rude and uncaring."
- ☐ 3. "You should remember to use your manners."
- ☐ 4. "You know better than to interrupt someone."

19. The nurse is transferring a multigravid client who is at 25 weeks' gestation with preeclampsia from the obstetrical intensive care unit to the antenatal unit. To safely manage this preeclamptic client, what should be included in the transfer report about this client? Select all that apply.

- ☐ 1. record of blood pressure trends
- ☐ 2. record of urine protein
- ☐ 3. edema observed by healthcare provider (HCP)
- ☐ 4. client use of dietary sodium
- ☐ 5. fetal position
- ☐ 6. fetal heart rate pattern

20. The nurse is assessing fetal presentation in a multiparous client. The figure below indicates which presentation?

- ☐ 1. frank breech
- ☐ 2. complete breech
- ☐ 3. footling breech
- ☐ 4. vertex

21. A client believes she is experiencing premenstrual syndrome (PMS). The nurse should **next** ask the client about what symptom?

- ☐ 1. menstrual cycle irregularity with increased menstrual flow
- ☐ 2. mood swings immediately after menses
- ☐ 3. tension and fatigue before menses and through the second day of the menstrual cycle
- ☐ 4. midcycle spotting and abdominal pain at the time of ovulation

22. Which should the nurse closely assess in a client who is reversing from general anesthesia and receiving clindamycin?

- ☐ 1. tachycardia
- ☐ 2. respiratory depression
- ☐ 3. hypotension
- ☐ 4. renal failure

23. A client with delirium becomes very anxious and says, "I cannot stop what is happening to me. Make it stop, please!" What is the nurse's **most** appropriate response?

- ☐ 1. "I will get you some medicine to help you relax. The more you worry, the worse it will get."
- ☐ 2. "As soon as we know what is causing this, we can try to stop it. I will get you some medicine to help you relax."
- ☐ 3. "I wish I could do something to make it stop, but unfortunately I cannot."
- ☐ 4. "I will sit with you until you calm down a little."

24. A 16-year-old client is in the emergency department for treatment of minor injuries from a car accident. A crisis nurse is with the client because the client became hysterical and was saying, "It is my fault. My Mom is going to kill me. I do not even have a way home." What should be the nurse's **initial** intervention?

- ☐ 1. Hold her hands and say, “Slow down. Take a deep breath.”
- ☐ 2. Say, “Calm down. The police can take you home.”
- ☐ 3. Put a hand on her shoulder and say, “It was not your fault.”
- ☐ 4. Say, “Your mother is not going to kill you. Stop worrying.”

25. A hospitalized adolescent with type 1 diabetes mellitus is weak and nauseated with poor skin turgor. The nurse notes a fruity odor to the client’s breath. The client uses insulin lispro. The last meal was lunch, 2 hours ago. Place the nursing actions in the order in which the nurse should perform them. All options must be used.

1. Obtain a fingerstick test for blood glucose.

2. Start an IV infusion with normal saline solution.

3. Administer insulin lispro.

4. Notify the healthcare provider (HCP).

26. A nurse is planning care for a hospitalized child who is 10 years of age and is delegating care to a pediatric care assistant. When a nurse delegates a task to an unlicensed assistive personnel (UAP), which factor is **most** important?

- ☐ 1. The nurse has observed the UAP perform the task.
- ☐ 2. The child and UAP have established a positive relationship.
- ☐ 3. The task is appropriate for that individual’s preparation.

- ☐ 4. The UAP has previously performed the task.

27. The nurse is assessing a client with superficial thrombophlebitis in the greater saphenous vein of the left leg. The client has “aching” in the leg. Which finding indicates the nurse should contact the healthcare provider (HCP) to request a prescription to improve the client’s comfort?

- ☐ 1. brown discoloration of the skin with edema in the lower left leg
- ☐ 2. dark, protruding veins of both legs that are uncomfortable when standing
- ☐ 3. absence of pain or swelling when the client dorsiflexes the left foot
- ☐ 4. red, warm, palpable linear cord along the vein that is painful on palpation

28. A client who has been recently diagnosed with acquired immunodeficiency syndrome (AIDS) inquires about hospice services. The nurse explains that hospice care is appropriate:

- ☐ 1. for clients with an inevitable death within weeks to months.
- ☐ 2. for all clients with AIDS at any stage.
- ☐ 3. only when the client has written advance directives.
- ☐ 4. when the client is ready to discuss the prognosis.

29. While assessing a neonate at age 24 hours, the nurse observes several irregularly shaped, red, flat patches on the back of the neonate’s neck. The nurse interprets this as which finding?

- ☐ 1. stork bite
- ☐ 2. port-wine stain
- ☐ 3. newborn rash
- ☐ 4. café au lait spot

30. A mother who is Mexican brings her 2-month-old son to the emergency department with a high fever and possible sepsis. A lumbar puncture is prescribed, but the mother will not sign the consent until the father arrives to give permission. What should the nurse do?

- ☐ 1. Report this to the social worker.
- ☐ 2. Call the regional protective services for children.
- ☐ 3. Wait until the father arrives.

- ☐ 4. Inform the healthcare provider (HCP) that the mother has refused to have the procedure.

31. What action is **most** appropriate when dealing with a client who is expressing anger verbally, is pacing, and is irritable?

- ☐ 1. Convey empathy and encouraging ventilation.
- ☐ 2. Use calm, firm directions to get the client to a quiet room.
- ☐ 3. Put the client in restraints.
- ☐ 4. Discuss alternative strategies for when the client is angry in the future.

32. A client with Alzheimer's disease is started on a low dose of lorazepam because of agitation and a sleep disturbance. The nurse should assess the client for which complication?

- ☐ 1. nighttime agitation
- ☐ 2. extrapyramidal side effects
- ☐ 3. vomiting
- ☐ 4. anticholinergic side effects

33. The nurse is conducting a counseling session with a client experiencing posttraumatic stress disorder (PTSD) using a 2-way video telehealth system from the hospital to the client's home, which is 2 hours away from the nearest mental health facility. What are expected outcomes of using telehealth as a venue to provide health care to this client? Select all that apply. The client will:

- ☐ 1. save travel time from the house to the healthcare facility.
- ☐ 2. avoid reliving a traumatic event that might be precipitated by visiting a healthcare facility.
- ☐ 3. experience a shorter recovery time than being treated on-site at a healthcare facility.
- ☐ 4. receive health care for this mental health problem.
- ☐ 5. obtain group support from others with a similar health problem.

34. A client who is postmenopausal with an intact uterus asks the nurse why her hormone medicine has two drugs, estrogen and progesterone. Which statement by the nurse provides the client with accurate information?

- ☐ 1. "The progesterone will help prevent cervical cancer."

- ☐ 2. "The progesterone will help prevent breast cancer."
- ☐ 3. "The progesterone will help prevent liver disease."
- ☐ 4. "The progesterone will help prevent endometrial cancer."

35. A child who is of preschool age is diagnosed as having severe autism. The **most** effective therapy involves which intervention?

- ☐ 1. antipsychotic medications
- ☐ 2. group psychotherapy
- ☐ 3. 1:1 play therapy
- ☐ 4. social skills group

36. The nurse on the antenatal unit is planning care for four clients. The nurse should assess which client **first**?

- ☐ 1. a 29-year-old client carrying twins, being treated for preterm labor at 29 weeks' gestation and receiving magnesium sulfate at 2 g/h, who has had no contractions for the past 2 hours; both twins appear stable, according to the nurse's shift report
- ☐ 2. a 19-year-old 18 weeks intrauterine pregnancy (IUP) who is now 12 hours postmotor vehicle accident with bright red vaginal bleeding
- ☐ 3. a client at 38 weeks' gestation hospitalized frequently during this pregnancy for placenta previa and who 2 days ago was admitted with severe bright red vaginal bleeding that has tapered off now
- ☐ 4. a 9-week IUP hospitalized for hyperemesis gravidarum who has not vomited for the last 12 hours

37. The nurse should turn the client on bed rest every 2 hours to prevent the development of pressure ulcers. In addition, the nurse should:

- ☐ 1. have the client walk at least twice a day.
- ☐ 2. insert an indwelling urinary catheter.
- ☐ 3. monitor serum albumin.
- ☐ 4. monitor the white blood cell count.

38. A client, hospitalized with heart failure, is receiving digoxin and furosemide intravenously and now has continuous ringing in the ears. What is the appropriate action for the nurse to take at this time?

- ☐ 1. Obtain a digoxin level to check for toxicity.

- ☐ 2. Note the observation in the medical record, and plan to reassess in 2 hours.
- ☐ 3. Ask the client about taking aspirin in addition to other medications.
- ☐ 4. Discontinue the furosemide, and notify the healthcare provider (HCP).

39. A woman who speaks Spanish only and is very upset brings her child to the clinic with bleeding from the mouth. Which is the appropriate **first** action by the nurse who does not speak Spanish?

- ☐ 1. Call for the Spanish interpreter.
- ☐ 2. Grab the child, and take the child to the treatment room.
- ☐ 3. Immediately apply ice to the child's mouth.
- ☐ 4. Give the ice to the mother, and demonstrate what to do.

40. The nurse should give which discharge instructions about thermal injury to a client with peripheral vascular disease? Select all that apply.

- ☐ 1. "Warm the fingers or toes by using an electric heating pad."
- ☐ 2. "Avoid sunburn during the summer."
- ☐ 3. "Wear extra socks in the winter."
- ☐ 4. "Choose loose, soft, cotton socks."
- ☐ 5. "Use an electric blanket when you are sleeping."

41. A client receives an IV dose of gentamicin sulfate. How long after the completion of the dose should the peak serum concentration level be measured?

- ☐ 1. 10 minutes
- ☐ 2. 20 minutes
- ☐ 3. 30 minutes
- ☐ 4. 40 minutes

42. An 86-year-old has few health problems, performs self-care, plays cards, and talks about "the good old days." The client wants to make "final" arrangements, such as completing an advance directive and planning and paying for a funeral and burial. The nurse determines that the client:

- ☐ 1. is depressed and should be watched for further signs of depression.
- ☐ 2. is responding in an age-appropriate manner.
- ☐ 3. is potentially suicidal and should be placed on suicide precautions and

seen by a psychiatrist.

- ☐ 4. has a premonition about dying soon.

43. A client with hydrocephalus reports having had a headache in the morning on arising for the last 3 days, but it disappears later in the day. The nurse should:

- ☐ 1. notify the healthcare provider (HCP).
- ☐ 2. tell the client that this is normal because intracranial pressure (ICP) fluctuates throughout the day.
- ☐ 3. instruct the client to increase fluid intake prior to going to bed to prevent headache in the morning.
- ☐ 4. advise the client to request pain medication from the HCP.

44. A primigravid client visits the clinic for a routine examination at 35 weeks' gestation. The client's blood pressure is near the baseline of 120/74 mm Hg with no proteinuria or evidence of facial edema. The client asks the nurse, "What should I take if I get an occasional headache after looking at my computer at work all day?" The nurse instructs the client that she can occasionally take which over-the-counter medication?

- ☐ 1. acetaminophen
- ☐ 2. aspirin
- ☐ 3. ibuprofen
- ☐ 4. naproxen

45. A client is experiencing a flashback from the use of lysergic acid diethylamide (LSD). What should the nurse do?

- ☐ 1. Confront the client's misperceptions.
- ☐ 2. Reassure the client while presenting reality.
- ☐ 3. Seclude the client until the flashback ends.
- ☐ 4. Challenge the client's unrealistic statements.

46. A 19-year-old client has undergone an examination and had evidence collected after being raped. Her father is overheard yelling at his daughter, "You are going to tell me who did this to you. What is his name?" Which is the nurse's **best** response?

- ☐ 1. "Please come with me, sir. I need some important information."

- ☐ 2. “Stop yelling. You are being inappropriate.”
- ☐ 3. “Please be quiet. You are not helping your daughter this way.”
- ☐ 4. “If you do not stop yelling, I will have to call Security.”

47. Which ethnic group is more likely to develop severe hypertension?

- ☐ 1. Asian
- ☐ 2. African
- ☐ 3. European
- ☐ 4. Native American/First Nations

48. A nurse is establishing priorities for home visits to a group of clients. Which client can be seen later on in the week?

- ☐ 1. a client recently diagnosed with terminal cancer with metastasis to the brain
- ☐ 2. a female client recently diagnosed with human immunodeficiency virus (HIV)
- ☐ 3. a client who is to demonstrate the ability to perform an insulin injection
- ☐ 4. a client with acquired immune deficiency syndrome (AIDS) with CD4 <200 cells/mm²

49. During a neonate’s assessment shortly after birth, the nurse observes a large pad of fat at the back of the neck, widely set eyes, simian hand creases, and epicanthal folds. Which action is **most** appropriate?

- ☐ 1. Notify the healthcare provider (HCP) immediately.
- ☐ 2. Ask the mother to consent to genetic studies.
- ☐ 3. Explain these deviations to the newborn’s mother.
- ☐ 4. Document these findings as minor deviations.

50. To help prevent hip flexion deformities associated with rheumatoid arthritis, the nurse should help the client assume which position in bed several times a day?

- ☐ 1. prone
- ☐ 2. very low Fowler’s
- ☐ 3. modified Trendelenburg
- ☐ 4. side lying

51. A client with severe arthritis has been receiving maintenance therapy of prednisone 10 mg/day for the past 6 weeks. The nurse should instruct the client to immediately report symptoms of:

- ☐ 1. respiratory infection.
- ☐ 2. joint pain.
- ☐ 3. constipation.
- ☐ 4. joint swelling.

52. A nurse hears a client state, "I have had it with this marriage. It would be so much easier to just hire someone to kill my husband!" What action should the nurse take?

- ☐ 1. Since the client is still admitted to the hospital, the nurse must hold the statement in confidence.
- ☐ 2. The nurse must start the process to warn the client's husband.
- ☐ 3. An assessment of the client's response to treatment must be performed.
- ☐ 4. The comment must be held in confidence because the client did not report the statement directly to the nurse.

53. When teaching unlicensed assistive personnel (UAP) about the importance of handwashing in preventing disease, the nurse should instruct the UAP that:

- ☐ 1. "It is not necessary to wash your hands as long as you use gloves."
- ☐ 2. "Handwashing is the best method for preventing cross-contamination."
- ☐ 3. "Waterless commercial products are not effective for killing organisms."
- ☐ 4. "The hands do not serve as a source of infection."

54. A 7-year-old child is admitted to the hospital with acute rheumatic fever. During the acute phase of the illness, which diversional activity would the nurse **most** discourage?

- ☐ 1. reading a book with the father
- ☐ 2. playing with a doll with the nurse
- ☐ 3. watching the television with a sibling
- ☐ 4. playing checkers with a roommate

55. Before discharge from the hospital after a myocardial infarction, a

client is taught to exercise by gradually increasing the distance walked. Which vital sign should the nurse teach the client to monitor to determine whether to increase or decrease the exercise level?

- ☐ 1. pulse rate
- ☐ 2. blood pressure
- ☐ 3. body temperature
- ☐ 4. respiratory rate

56. A woman is taking oral contraceptives. The nurse teaches the client to report which complication?

- ☐ 1. breakthrough bleeding
- ☐ 2. severe calf pain
- ☐ 3. mild headache
- ☐ 4. weight gain of 3 lb (1.4 kg)

57. Which nursing action is essential for the hospitalized client with a new tracheostomy?

- ☐ 1. Decrease secretions.
- ☐ 2. Provide client teaching regarding tracheostomy care.
- ☐ 3. Relieve anxiety related to the tracheostomy.
- ☐ 4. Maintain a patent airway.

58. The nurse walks into the room of a client who has a “do-not-resuscitate” prescription and finds the client without a pulse, respirations, or blood pressure. What should the nurse do **first**?

- ☐ 1. Stay in the room, and call the nursing team for assistance.
- ☐ 2. Push the emergency alarm to call a code.
- ☐ 3. Page the client’s healthcare provider (HCP).
- ☐ 4. Pull the curtain and leave the room.

59. When developing a nutritional plan for a child who needs to increase protein intake, the nurse should suggest which foods? Select all that apply.

- ☐ 1. whole wheat bread
- ☐ 2. cooked dry beans
- ☐ 3. peanut butter

☐ 4. yogurt

☐ 5. apple

60. Immediately after receiving an injection of bupivacaine, the client becomes restless and nervous and reports a feeling of impending doom. The nurse should:

☐ 1. ask the client to explain these feelings.

☐ 2. reassure the client that it is normal to feel restless before a procedure.

☐ 3. assess the client's vital signs.

☐ 4. administer epinephrine.

61. The nurse is conducting walking rounds and observes the client (see figure). What should the nurse do?

- ☐ 1. Loosen the bed restraints so the client can sit up.
- ☐ 2. Raise the side rails to full upright position.
- ☐ 3. Assess the client to determine why she wants to sit up.
- ☐ 4. Elevate the head of the bed.

62. A menopausal woman is taking hormone replacement therapy. The

nurse teaches the client that a warning sign for endometrial cancer that needs to be reported is:

- ☐ 1. hot flashes.
- ☐ 2. irregular vaginal bleeding.
- ☐ 3. urinary urgency.
- ☐ 4. dyspareunia.

63. A client tells the nurse that she has had sexual contact with someone whom she suspects has genital herpes. The nurse should instruct the client to:

- ☐ 1. anticipate lesions within 25 to 30 days.
- ☐ 2. continue sexual activity unless lesions are present.
- ☐ 3. report any difficulty urinating.
- ☐ 4. drink extra fluids to prevent lesions from forming.

64. When explaining the risk for having a child with cystic fibrosis to a husband and wife, the nurse should tell them:

- ☐ 1. the risk is greatest when both clients have the recessive gene.
- ☐ 2. the gene is carried on the X chromosome and there is little risk.
- ☐ 3. the disease will only occur if the child is a male.
- ☐ 4. the disease does not have a genetic basis.

65. The nurse is assessing a client with peripheral arterial disease who had a femoral-popliteal bypass. Which finding indicates improved arterial blood supply to the lower extremity?

- ☐ 1. decrease in muscle pain when walking
- ☐ 2. dependent rubor
- ☐ 3. absence of pulse using a Doppler ultrasound
- ☐ 4. reduction in pitting edema

66. The nurse is caring for a client who had an open cholecystectomy 24 hours ago. The client's vital signs have been stable for the last 24 hours, but the client now has a temperature of 38.4°C (101.1°F), a heart rate of 116 bpm, and a respiratory rate of 26 breaths/min. The client has an IV infusion running at a keep-open rate. The nurse contacts healthcare provider (HCP) and receives several prescriptions (see chart).

Which prescription should the nurse implement **first**?

Prescriptions

- | |
|---|
| 1. Continue to check vital signs every 2 hours. |
| 2. Draw stat blood cultures × 2. |
| 3. CT of abdomen. |
| 4. Start broad-spectrum IV antibiotic 4 hours after blood cultures are drawn. |
| 5. Draw CBC, CRP, ESR, and UA with culture and sensitivity if indicated. |
| 6. Ensure patent IV access for fluid bolus |

- ☐ 1. Obtain blood cultures.
- ☐ 2. Increase the rate of the intravenous infusion.
- ☐ 3. Obtain CT of the abdomen.
- ☐ 4. Chart vital signs.

67. A client was talking with her husband by telephone, and then she began swearing at him. The nurse interrupts the call and offers to talk with the client. She says, “I cannot talk about that bastard right now. I just need to destroy something.” What should the nurse do **next**?

- ☐ 1. Tell her to write her feelings in her journal.
- ☐ 2. Urge her to talk with the nurse now.
- ☐ 3. Ask her to calm down or she will be restrained.
- ☐ 4. Offer her a phone book to “destroy” while staying with her.

68. A man of Chinese descent is admitted to the hospital with multiple injuries after a motor vehicle accident. His pain is not under control. The client states, “If I could be with my people, I could receive acupuncture for this pain.” The nurse should understand that acupuncture in the Asian culture

is based on the theory that it:

- ☐ 1. purges evil spirits.
- ☐ 2. promotes tranquility.
- ☐ 3. restores the balance of energy.
- ☐ 4. blocks nerve pathways to the brain.

69. The nurse is caring for a multigravid client in active labor when the nurse detects variable fetal heart rate decelerations on the electronic monitor. The nurse interprets this as the compression of which structure?

- ☐ 1. head
- ☐ 2. chest
- ☐ 3. umbilical cord
- ☐ 4. placenta

70. A neonate is experiencing respiratory distress and is using a neonatal oxygen mask. An unlicensed assistive personnel (UAP) has positioned the oxygen mask as shown. The nurse is assessing the neonate and determines that the mask:

- ☐ 1. is appropriate for the neonate.
- ☐ 2. is too large because it covers the neonate's eyes.
- ☐ 3. is too small because it is obstructing the nose.
- ☐ 4. should be covered with a soft cloth before being placed against the skin.

71. Which findings should lead the nurse to suspect that a client who had a cesarean birth 8 hours earlier is developing disseminated intravascular

coagulation (DIC) and report to the healthcare provider (HCP)? Select all that apply.

- ☐ 1. petechiae on the arm where the blood pressure was taken
- ☐ 2. heart rate of 126 bpm
- ☐ 3. abdominal incision dressing with bright red drainage
- ☐ 4. platelet count of 80,000/mm³ ($80 \times 10^9/L$)
- ☐ 5. urine output of 350 mL in the past 8 hours
- ☐ 6. temperature of 98.4°F (36.9°C)

72. Two days after placement of a pleural chest tube, the tube is accidentally pulled out of the chest wall. The nurse should **first**:

- ☐ 1. immerse the tube in sterile water.
- ☐ 2. apply an occlusive dressing such as petroleum jelly gauze.
- ☐ 3. instruct the client to cough to expand the lung.
- ☐ 4. auscultate the lung to determine whether it collapsed.

73. Three victims with gunshot wounds are brought to the emergency department. The nurse should take which action to preserve forensic evidence?

- ☐ 1. Cut around blood stains to remove clothing.
- ☐ 2. Place each item of clothing in a separate paper bag.
- ☐ 3. Place all wet clothing in a plastic bag.
- ☐ 4. Refrain from documenting client statements.

74. An 18-year-old female client who is sexually active with her boyfriend has a purulent vaginal discharge that is sometimes frothy. The nurse interprets this as suggesting a:

- ☐ 1. sexually transmitted infection.
- ☐ 2. normal variation in vaginal discharge.
- ☐ 3. need for vaginal douching.
- ☐ 4. side effect of a birth control method.

75. A client is admitted to the hospital with a diagnosis of a pulmonary embolism. Which problem should the nurse address **first**?

- ☐ 1. productive cough

- ☐ 2. activity intolerance
- ☐ 3. difficulty breathing
- ☐ 4. impaired gas exchange

76. A client is receiving morphine sulfate by a patient-controlled analgesia (PCA) system after a left lower lobectomy 4 hours ago. The client reports moderately severe pain in the left thorax that worsens when coughing. The nurse's **first** course of action is to:

- ☐ 1. reassure the client that the PCA system is working and will relieve pain.
- ☐ 2. encourage the client to rest; no further assessment is needed.
- ☐ 3. assess the pain systematically with the hospital-approved pain scale.
- ☐ 4. encourage the client to take deep breathes and expectorate the mucous that is stimulating the cough.

77. Which is characteristic of cardiogenic shock?

- ☐ 1. hypovolemia
- ☐ 2. increased cardiac output
- ☐ 3. decreased myocardial contractility
- ☐ 4. infarction

78. A loading dose of digoxin is given to a client newly diagnosed with atrial fibrillation. The nurse instructs the client about the medication and the importance of monitoring his heart rate. An expected outcome of this instruction is:

- ☐ 1. a return demonstration of palpating the radial pulse.
- ☐ 2. a return demonstration of how to take the medication.
- ☐ 3. verbalization of why the client has atrial fibrillation.
- ☐ 4. verbalization of the need for the medication.

79. The nurse is reviewing the laboratory results of a client with hypothyroidism. An expected finding is:

- ☐ 1. decreased thyroxine (T_4) and increased thyroid-stimulating hormone (TSH) levels.
- ☐ 2. decreased TSH and increased T_4 levels.

- ☐ 3. decreased creatine phosphokinase levels.
- ☐ 4. absence of antithyroid antibodies.

80. The nurse administers a tap water enema to a client. While the solution is being infused, the client has abdominal cramping. What should the nurse do **first**?

- ☐ 1. Clamp the tubing, and carefully withdraw the tube.
- ☐ 2. Temporarily stop the infusion, and have the client take deep breaths.
- ☐ 3. Raise the height of the enema container.
- ☐ 4. Rub the client's abdomen gently until the cramps subside.

81. The mother of a 7-month-old child born 6 weeks early asks the nurse what play activities and toys is appropriate for her child. What should the nurse suggest?

- ☐ 1. picture books
- ☐ 2. peekaboo
- ☐ 3. rattle
- ☐ 4. colored blocks

82. Which is the **most** accurate method of determining the extent of a client's fluid loss?

- ☐ 1. measuring intake and output
- ☐ 2. assessing vital signs
- ☐ 3. weighing the client
- ☐ 4. assessing skin turgor

83. The nurse uses Montgomery straps **primarily** so the client is free from:

- ☐ 1. falls.
- ☐ 2. bruises.
- ☐ 3. skin breakdown.
- ☐ 4. wandering.

84. The nurse is counseling a client regarding treatment of the client's newly diagnosed depression. The nurse emphasizes that full benefit from antidepressant therapy usually takes how long?

- ☐ 1. 1 week
- ☐ 2. 2 to 4 weeks
- ☐ 3. 5 to 7 weeks
- ☐ 4. 8 weeks

85. A multigravid client is scheduled for a percutaneous umbilical blood sampling procedure. The nurse instructs the client that this procedure is useful for diagnosing which condition?

- ☐ 1. twin pregnancies
- ☐ 2. fetal lung maturation
- ☐ 3. Rh disease
- ☐ 4. alpha fetoprotein level

86. A 70-year-old, previously well client asks the nurse, “I notice I have tremors. Is this just normal for my age?” What should the nurse tell the client?

- ☐ 1. “I would not be worried because this is common with aging.”
- ☐ 2. “You should report this to the healthcare provider (HCP) because it may indicate a problem.”
- ☐ 3. “You should drink orange juice when this occurs.”
- ☐ 4. “You should have your blood pressure checked when this occurs.”

87. A client is prescribed atropine 0.4 mg intramuscularly. The atropine vial is labeled 0.5 mg/mL. How many milliliters should the nurse plan to administer? Record your answer using one decimal place.

_____ mL.

88. A school-age child diagnosed with attention deficit hyperactivity disorder is prescribed methylphenidate. What finding should alert the school nurse to the possibility that the child is experiencing a common side effect of the drug?

- ☐ 1. loss of appetite
- ☐ 2. vomiting
- ☐ 3. photosensitivity
- ☐ 4. weight gain

89. A client has a dull headache, is dizzy, and has an increased pulse rate. The results of arterial blood gas analysis are as follows: pH, 7.26; partial pressure of carbon dioxide, 50 mm Hg (6.7 kPa); and bicarbonate, 24 mEq/L (24 mmol/L). These findings indicate which acid-base imbalance?

- ☐ 1. respiratory alkalosis
- ☐ 2. respiratory acidosis
- ☐ 3. metabolic acidosis
- ☐ 4. metabolic alkalosis

90. Which meal would be appropriate for the child with osteomyelitis to choose?

- ☐ 1. beef and bean burrito with cheese, carrot and celery sticks, and a glass of milk
- ☐ 2. fries, beef hot dog, and an apple
- ☐ 3. potato soup, jelly sandwich, and a peach
- ☐ 4. tomato soup made with water, grilled cheese sandwich, and a banana

91. The nurse is planning a continuous quality improvement (CQI) process to decrease the infection rate on the nursing unit. The nurse should consider which factors when planning the process? Select all that apply.

- ☐ 1. CQI processes are required by accrediting agencies.
- ☐ 2. The approach to CQI can be retrospective or concurrent.
- ☐ 3. Institutional review board (IRB) approval is required.
- ☐ 4. CQI is conducted by people who are not part of the process.
- ☐ 5. The CQI process has a fixed end point.

92. The nurse is conducting a health assessment of an older adult. The client tells the nurse about cramping leg pain that occurs when walking for 15 minutes; the pain is relieved with rest. The lower extremities are slightly cool to touch, and pedal pulses are palpable +1. The nurse should instruct the client to:

- ☐ 1. increase the length of time for walking.
- ☐ 2. include more potassium in the diet.
- ☐ 3. perform leg circles and ankle pumps.
- ☐ 4. seek consultation from the healthcare provider (HCP).

93. A client has a newly placed tracheostomy tube. The nurse should assess the client for which possible complication?

- ☐ 1. decreased cardiac output
- ☐ 2. damage to the laryngeal nerve
- ☐ 3. pneumothorax
- ☐ 4. acute respiratory distress syndrome

94. Which comment from a client indicates a need for further instruction after being taught about taking ciprofloxacin?

- ☐ 1. "I must drink 500 to 1,500 mL of water a day."
- ☐ 2. "I should not take an antacid before taking the ciprofloxacin."
- ☐ 3. "I should let the healthcare provider (HCP) know if I start vomiting from the ciprofloxacin."
- ☐ 4. "I may get light-headed from the ciprofloxacin."

95. A multiparous client tells the nurse that she is using medroxyprogesterone for contraception. The nurse should instruct the client to increase her intake of which nutrient?

- ☐ 1. folic acid
- ☐ 2. vitamin C
- ☐ 3. magnesium
- ☐ 4. calcium

96. When reviewing the plan of care for a client with Alzheimer's disease, which intervention would the nurse question?

- ☐ 1. reminiscence group
- ☐ 2. walking
- ☐ 3. pet therapy
- ☐ 4. stress management

97. Before an incisional cholecystectomy is performed, the nurse instructs the client in the correct use of an incentive spirometer. Why is incentive spirometry essential after surgery in the upper abdominal area?

- ☐ 1. The client will be maintained on bed rest for several days.
- ☐ 2. Ambulation is restricted by the presence of drainage tubes.

- ☐ 3. The operative incision is near the diaphragm.
- ☐ 4. The presence of a nasogastric tube inhibits deep breathing.

98. The nurse should instruct the parents of a school-age child with hemophilia to implement which interventions when the child develops bleeding into a joint? Select all that apply.

- ☐ 1. Have the child rest.
- ☐ 2. Apply heat to the joint area.
- ☐ 3. Begin factor VIII therapy.
- ☐ 4. Start physical therapy.
- ☐ 5. Apply a topical antifibrinolytic.

99. When cleaning the skin around an incision and drain site, what should the nurse do?

- ☐ 1. Clean the incision and drain site separately.
- ☐ 2. Clean from the incision to the drain site.
- ☐ 3. Clean from the drain site to the incision.
- ☐ 4. Clean the incision and drain site simultaneously.

100. The nurse is teaching a client about using topical gentamicin sulfate. Which comment by the client indicates the need for additional teaching?

- ☐ 1. "I will avoid being out in the sun for long periods."
- ☐ 2. "I should stop applying when the redness is gone."
- ☐ 3. "I will call the healthcare provider (HCP) if the condition worsens."
- ☐ 4. "I should apply it to large open areas."

101. Which goal is **most** important when developing a long-term care plan for a child with hemophilia?

- ☐ 1. Increase the parent's and child's knowledge about hemophilia.
- ☐ 2. Prevent injury during each stage of development.
- ☐ 3. Improve the child's self-esteem during bleeding episodes.
- ☐ 4. Manage acute pain when there is bleeding into joints.

102. When preparing a 3-year-old child to have blood specimens drawn for laboratory testing, the nurse should:

- ☐ 1. explain the procedure in advance.

- ☐ 2. explain why the blood needs to be drawn.
- ☐ 3. use distraction techniques during the procedure.
- ☐ 4. provide verbal explanations about what will occur.

103. The client has been prescribed lisinopril to treat hypertension. The nurse should assess the client for which electrolyte imbalance?

- ☐ 1. hyponatremia
- ☐ 2. hypocalcemia
- ☐ 3. hyperkalemia
- ☐ 4. hypermagnesemia

104. A usually reliable interpreter called by the nurse to help communicate with a mother of a child who does not speak English and has brought her child in for a routine visit has yet to arrive in the clinic. The nurse has paged the interpreter several times. What should the nurse do **next**?

- ☐ 1. Continue with the examination.
- ☐ 2. Reschedule the infant's appointment for later in the week.
- ☐ 3. Ask the mother to stay longer in the hope that the interpreter arrives.
- ☐ 4. Page the interpreter one more time.

105. A client with angina shows the nurse the nitroglycerin that the client carries in a plastic bag in a pocket. The nurse instructs the client that nitroglycerin should be kept in:

- ☐ 1. the refrigerator.
- ☐ 2. a cool, moist place.
- ☐ 3. a dark container to shield from light.
- ☐ 4. a plastic pill container where it is readily available.

106. A client with a chronic mental illness who does not always take her medications is separated from her husband and receives public assistance funds. She lives with her mother and older sister and manages her own medication. The client's mother is in poor health and also receives public assistance benefits. The client's sister works outside the home, and the client's father is dead. Which issue should the nurse address **first**?

- ☐ 1. family support
- ☐ 2. marital communication

- ☐ 3. financial concerns
- ☐ 4. medication compliance

107. A client is receiving total parenteral nutrition (TPN). The nurse notices that the bag of TPN solution has been infusing for 24 hours but has 300 mL of solution left. The nurse should:

- ☐ 1. continue the infusion until the remaining 300 mL is infused.
- ☐ 2. change the filter on the tubing and continue with the infusion.
- ☐ 3. notify the healthcare provider (HCP) and obtain prescriptions to alter the flow rate of the solution.
- ☐ 4. discontinue the current solution, change the tubing, and hang a new bag of TPN solution.

108. The nurse should suspect that the client taking disulfiram has ingested alcohol when the client exhibits which symptom?

- ☐ 1. sore throat and muscle aches
- ☐ 2. nausea and flushing of the face and neck
- ☐ 3. fever and muscle soreness
- ☐ 4. bradycardia and vertigo

109. A client with a history of cardiac problems is having severe chest pain. What should be the nurse's **first** response?

- ☐ 1. Notify the healthcare provider (HCP).
- ☐ 2. Administer an analgesic to control the pain.
- ☐ 3. Assess the client's pain.
- ☐ 4. Start oxygen at 2 L/min via nasal cannula.

110. Which characteristic should the nurse include in the teaching plan for a multiparous client after giving birth to a neonate diagnosed with trisomy 13?

- ☐ 1. webbed neck
- ☐ 2. small testes
- ☐ 3. congenital heart defects
- ☐ 4. polydactyly

111. A nulligravid client calls the clinic and tells the nurse that she forgot

to take her oral contraceptive this morning. The nurse should tell the client to:

- ☐ 1. take the medication immediately.
- ☐ 2. restart the medication in the morning.
- ☐ 3. use another form of contraception for 2 weeks.
- ☐ 4. take two pills tonight before bedtime.

112. A client is being treated for acute low back pain. The nurse should report which of these clinical manifestations to the healthcare provider (HCP) **immediately**?

- ☐ 1. diffuse, aching sensation in the L4 to L5 area
- ☐ 2. new onset of footdrop
- ☐ 3. pain in the lower back when the leg is lifted
- ☐ 4. pain in the lower back that radiates to the hip

113. A client with type 1 diabetes mellitus asks the nurse about taking ginseng at home. The nurse should tell the client:

- ☐ 1. "No, there are no therapeutic benefits of ginseng."
- ☐ 2. "Taking ginseng will increase the risk of hypoglycemia."
- ☐ 3. "You can take the ginseng to help improve your memory."
- ☐ 4. "You can take ginseng if you take it with a carbohydrate."

114. A client has had a central venous pressure line inserted. The nurse should **immediately** report which sign to the healthcare provider (HCP)?

- ☐ 1. sharp pain on the affected side
- ☐ 2. urinary output of 50 mL/h
- ☐ 3. heart rate of 88 bpm
- ☐ 4. discomfort at the insertion site

115. The nurse teaches the client with cirrhosis that the expected outcome of taking lactulose is:

- ☐ 1. one regular bowel movement a day.
- ☐ 2. two to three soft stools per day.
- ☐ 3. four to five loose stools per day.
- ☐ 4. five to six loose stools per day.

116. The nurse is evaluating the laboratory results of a client who was

recently admitted to the hospital. Which result indicates the presence of inflammation?

- ☐ 1. decreased sedimentation rate
- ☐ 2. thrombocytopenia
- ☐ 3. leukocytosis
- ☐ 4. erythrocytosis

117. The client sustained an open fracture of the femur from an automobile accident. The nurse should assess the client for which type of shock?

- ☐ 1. cardiogenic
- ☐ 2. hypovolemic
- ☐ 3. neurogenic
- ☐ 4. anaphylactic

118. The nurse is assessing a teenage girl (see figure). The nurse should describe the girl shown in the figure as having:

- ☐ 1. normal posture.
- ☐ 2. kyphosis.
- ☐ 3. scoliosis.
- ☐ 4. lordosis.

119. A client reports having pain in the casted left arm that is unrelieved by pain medication. The nurse assesses the arm and notes that the fingers are swollen and difficult to separate. What should the nurse do **first**?

- ☐ 1. Administer morphine 2 mg intravenously.
- ☐ 2. Apply an ice bag to the fingers to relieve pain.
- ☐ 3. Elevate the arm on two pillows and reassess in 30 minutes.
- ☐ 4. Call the healthcare provider (HCP) to report swelling and pain.

120. A primiparous client develops uterine atony and postpartum hemorrhage 1 hour after a vaginal birth. The healthcare provider (HCP) has prescribed IM prostaglandin F_{2a}. After administration of the medication, the nurse should observe the client for which complication?

- ☐ 1. tachycardia
- ☐ 2. hypotension
- ☐ 3. constipation
- ☐ 4. abdominal distention

121. A client receives morphine for postoperative pain. The nurse should:

- ☐ 1. take apical heart rate after each dose of morphine.
- ☐ 2. assess urinary output every 8 hours.
- ☐ 3. assess mental status every shift.
- ☐ 4. check for pedal edema every 4 hours.

122. While caring for a mother and her 1-day-old neonate born vaginally at 30 weeks' gestation, the nurse explains about the neonate's need for gavage feeding at this time instead of the mother's plan for bottle-feeding. What should the nurse include as the rationale for this feeding plan?

- ☐ 1. The neonate has difficulty coordinating sucking, swallowing, and breathing.
- ☐ 2. A high-calorie formula, presently needed at this time, is more easily

delivered via gavage.

- ☐ 3. Gavage feedings can minimize the neonate's increased risk of developing hypoglycemia.
- ☐ 4. This type of feeding, easily given in the isolette, decreases the neonate's risk of cold stress.

123. The nurse is giving preoperative instructions to a client who will have a reversal of a colostomy. The nurse should prepare the client to expect which nursing actions during the immediate postoperative period? Select all that apply.

- ☐ 1. nasogastric (NG) tube attached to low intermittent suction
- ☐ 2. administration of IV fluids
- ☐ 3. daily measurement of abdominal girth
- ☐ 4. calculation of intake and output every 8 hours
- ☐ 5. assessment of vital signs every 6 hours

124. The nurse is teaching a client with rheumatoid arthritis about how to manage the fatigue associated with this disease. Which statement indicates the client understands how to manage the fatigue?

- ☐ 1. "I sleep for 8 to 10 hours every night so that I will have the energy to care for my children during the day."
- ☐ 2. "I schedule afternoon rest periods for myself in addition to sleeping 10 hours every night."
- ☐ 3. "I spend one weekend day a week resting in bed while my husband cares for the children."
- ☐ 4. "I get up early in the morning and get all my household chores completed before my children wake up."

125. The nurse is caring for a child with hemophilia who is actively bleeding from the leg. The nurse should apply:

- ☐ 1. direct pressure, checking every few minutes to see if the bleeding has stopped.
- ☐ 2. ice to the injured leg area several times a day.
- ☐ 3. direct pressure to the injured area continuously for 10 minutes.
- ☐ 4. ice bag with elevation of the leg twice a day.

126. When assessing for signs of a blood transfusion reaction in a client with dark skin, the nurse should assess the client for:

- ☐ 1. hypertension.
- ☐ 2. diaphoresis.
- ☐ 3. polyuria.
- ☐ 4. warm skin.

127. Which is **least** likely a danger associated with pancytopenia?

- ☐ 1. anemia
- ☐ 2. bleeding
- ☐ 3. infection
- ☐ 4. hypothyroidism

128. A client suspected of being a victim of abuse returns to the emergency department and, sobbing, tells the nurse, “I guess you really know that my husband beats me and that is why I have bruises all over my body. I do not know what to do. I am afraid he will kill me one of these times.” Which response **best** demonstrates that the nurse recognizes the client’s needs at this time?

- ☐ 1. “The fear that your husband will kill you is unfounded.”
- ☐ 2. “We can begin by discussing various options open to you.”
- ☐ 3. “You can legally leave your husband because he has no right to hurt you.”
- ☐ 4. “We can begin by listing ways to avoid making your husband angry with you.”

129. The infusion rate of total parenteral nutrition (TPN) is tapered before being discontinued. This is done to prevent which complication?

- ☐ 1. essential fatty acid deficiency
- ☐ 2. dehydration
- ☐ 3. rebound hypoglycemia
- ☐ 4. malnutrition

130. A client has just returned from surgery for a gastrectomy. The nurse should position the client in which position?

- ☐ 1. prone
- ☐ 2. supine
- ☐ 3. low Fowler's
- ☐ 4. right or left Sims'

131. A child with heart disease starts on oral digoxin. When preparing to administer the medication, what should the nurse do **first**?

- ☐ 1. Check the last serum electrolyte results for the child.
- ☐ 2. Verify the dosage with a licensed practical/vocational nurse (LPN/VN) who is working that day.
- ☐ 3. Ask the mother if she is willing to administer the medication.
- ☐ 4. Teach the mother how to measure the child's heart rate.

132. A client with diabetes has been diagnosed with hypertension, and the healthcare provider (HCP) has prescribed atenolol, a beta-blocker. When performing discharge teaching, it is important for the nurse to emphasize that the addition of atenolol can cause:

- ☐ 1. a decrease in the hypoglycemic effects of insulin.
- ☐ 2. an increase in the hypoglycemic effects of insulin.
- ☐ 3. an increase in the incidence of ketoacidosis.
- ☐ 4. a decrease in the incidence of ketoacidosis.

133. The nurse is caring for a client who has deep partial-thickness and full-thickness burns. During the emergent (resuscitative) phase of burn management, the nurse should assess the client for a fluid shift from the:

- ☐ 1. intracellular to extracellular compartment.
- ☐ 2. extracellular to intravascular compartment.
- ☐ 3. interstitial to the intracellular compartment.
- ☐ 4. intravascular to the interstitial compartment.

134. The nurse is caring for an elderly client who has experienced a sensorineural hearing loss. The nurse anticipates that the client will exhibit which symptom?

- ☐ 1. difficulty hearing high-pitched sounds
- ☐ 2. problems with speaking clearly
- ☐ 3. inability to assign meaning to sound

- ☐ 4. vertigo when changing positions

135. The nurse is evaluating the effectiveness of fluid resuscitation during the emergency period of burn management. Which finding indicates that adequate fluid replacement has been achieved in the client?

- ☐ 1. an increase in body weight
- ☐ 2. fluid intake less than urinary output
- ☐ 3. urine output greater than 35 mL/h
- ☐ 4. blood pressure of 90/60 mm Hg

136. The parent of a child who is taking an antibiotic for bilateral otitis media tells the nurse that they have stopped the medicine since the child is better and are saving the rest of the medication to use the next time the child gets sick. What should the nurse tell the parent?

- ☐ 1. "It is important to give the medicine as prescribed."
- ☐ 2. "How do you know your child's ears are cured?"
- ☐ 3. "Your child needs all of the medicine so that the infection clears."
- ☐ 4. "Stopping the medicine is not what is best for your child!"

137. A client who comes to the emergency department with multiple bruises on her face and arms, a black eye, and a broken nose says that these injuries occurred when she fell down the stairs. The nurse suspects that the client may have been physically assaulted. What should the nurse do next?

- ☐ 1. Ask the client directly about the possibility of physical abuse.
- ☐ 2. Tell the client that it is difficult to believe that such injuries resulted from a fall.
- ☐ 3. Ask the client what she did to make someone beat her so badly.
- ☐ 4. Discuss with the client what she can do to de-escalate the situation next time.

138. What is the primary goal for the care of a client who is in shock?

- ☐ 1. Achieve adequate tissue perfusion.
- ☐ 2. Preserve renal function.
- ☐ 3. Prevent hypostatic pneumonia.
- ☐ 4. Maintain adequate vascular tone.

139. A client with emphysema has been admitted to the hospital. The nurse should assess the client further for:

- ☐ 1. frequent coughing.
- ☐ 2. bronchospasms.
- ☐ 3. underweight appearance.
- ☐ 4. copious sputum.

140. The parent of a young child diagnosed with low-dose lead exposure asks about long-term effects. Which conditions should the nurse mention as possible long-term effects to this parent? Select all that apply.

- ☐ 1. seizures
- ☐ 2. depression
- ☐ 3. hyperactivity
- ☐ 4. aggression
- ☐ 5. impulsiveness

141. Which information is appropriate to include in an incident report?

- ☐ 1. an interpretation of the likely cause of the incident
- ☐ 2. what the nurse saw and did
- ☐ 3. the client's statement about the incident that occurred
- ☐ 4. the extenuating circumstances involved in the situation

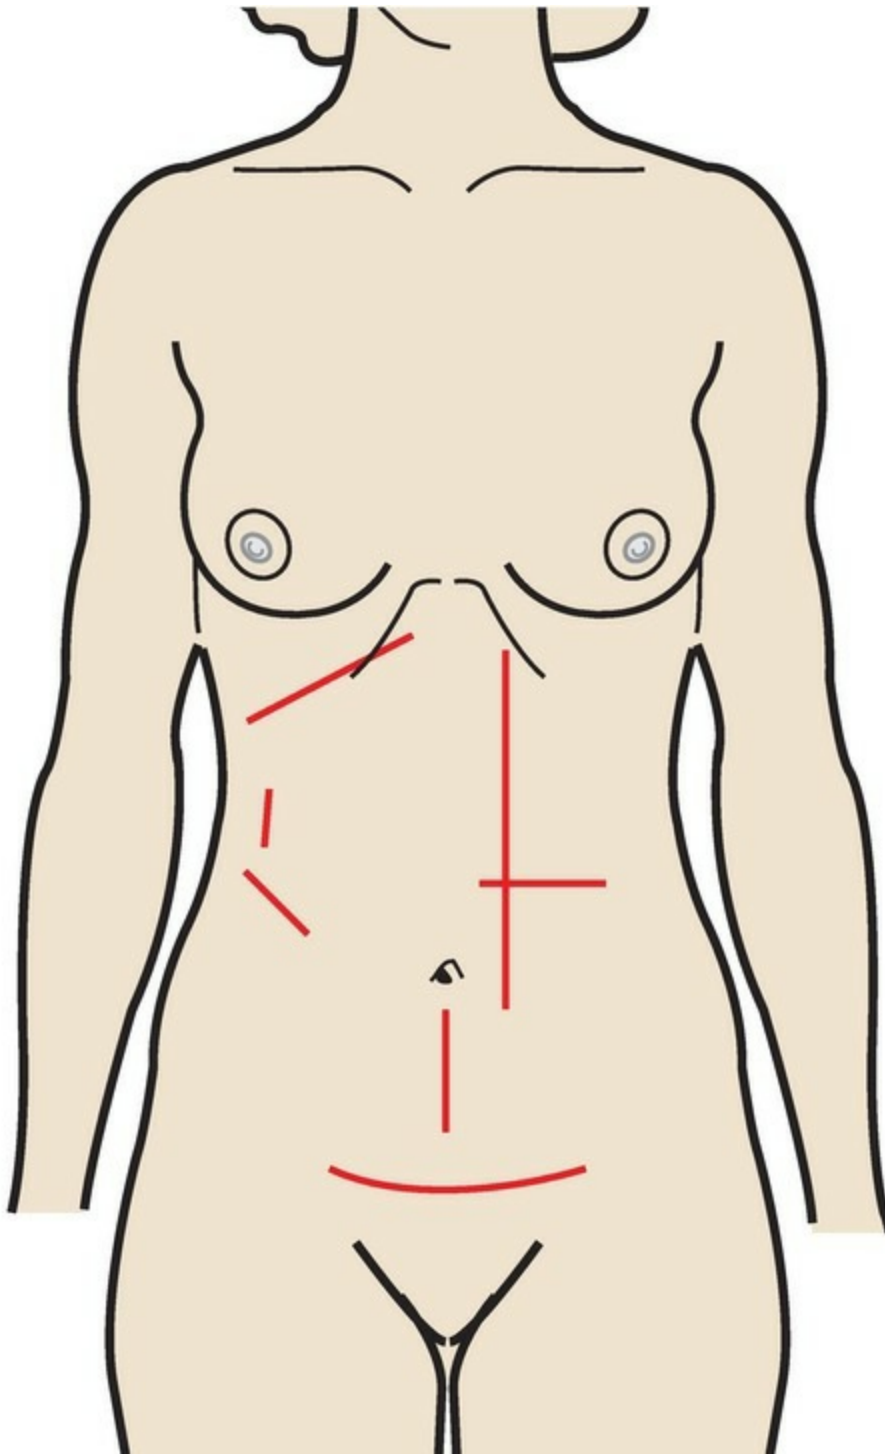

142. The nurse is preparing a teaching plan for a client who is being discharged after being admitted for chest pain. The client has had one previous myocardial infarction 2 years ago and has been taking simvastatin 40 mg for the last 2 years. After reviewing the lab results for the client's cholesterol levels (see chart), the nurse should:

Lab Report

Test	Result	Units	Reference Range
Cholesterol total	195 (5.05)	mg/dL (mmol/L)	<200 (<5.18)
Triglycerides	106 (1.20)	mg/dL (mmol/L)	<150 (<1.69)
HDL-cholesterol	69 (1.79)	mg/dL (mmol/L)	>39 (<1.03)

- ☐ 1. ask if the client is taking the simvastatin regularly.
- ☐ 2. tell the client that the cholesterol levels are within normal limits.
- ☐ 3. instruct the client to lower the saturated fat in the diet.
- ☐ 4. review the chart for lab reports of hemoglobin and hematocrit.

143. The client is to have a gastrectomy. The surgeon will use a transverse incision. Prior to surgery, the nurse is checking to be sure the correct site has been marked. Identify the site the client should have marked.

144. A 58-year-old homeless person is brought to the emergency department by the police after being found unconscious on the street. Following examination and evaluation of laboratory test results, a diagnosis of diabetic ketoacidosis is confirmed. Which information is **most** crucial to document on the client's medical record? Select all that apply.

- ☐ 1. size of pupils and reaction of pupils to light
- ☐ 2. response to verbal and painful stimuli
- ☐ 3. skin condition and presence of any rashes, lesions, or ulcers
- ☐ 4. blood pressure
- ☐ 5. length of time the client has had diabetes
- ☐ 6. hourly urine output

145. The nurse is reconciling the medications with a client who is being discharged. Which information indicates there is a “discrepancy”?

- ☐ 1. There is agreement between the client’s home medication list and current medication prescriptions.
- ☐ 2. There is justification for a difference in the medication prescriptions.
- ☐ 3. There is lack of congruence between a client’s home medication list and current medication prescriptions.
- ☐ 4. Sample medications have been included in the medication list.

146. The healthcare provider (HCP) has determined that a primigravid client in active labor requires a cesarean birth because of cephalopelvic disproportion. After the birth of a healthy neonate, which assessment should the nurse make **first**?

- ☐ 1. nasopharyngeal secretions
- ☐ 2. high-pitched cry
- ☐ 3. skull fracture
- ☐ 4. decreased muscle tone

147. An older adult’s daughter is asking about the follow-up evaluation for her father after his pneumonectomy for primary lung cancer. The nurse should tell the daughter:

- ☐ 1. “The usual follow-up is chest x-ray and liver function tests every 3 months.”
- ☐ 2. “The follow-up for your father will be a chest x-ray and a computed tomography scan of the abdomen every year.”
- ☐ 3. “No follow-up is needed at this time.”
- ☐ 4. “The follow-up for your father will be a chest x-ray every 6 months.”

148. A parent of a toddler brings the child to the emergency department

because the child has accidentally been scalded by hot water spilling from the stove. In order to differentiate the burn from potential abuse, the nurse should **first** assess the child:

- ☐ 1. on the back of the body.
- ☐ 2. on the front of the body.
- ☐ 3. for circular patterns.
- ☐ 4. on the buttocks.

149. A 17-year-old client visits the clinic at 36 weeks' gestation. The client's blood pressure is 130/90 mm Hg. On previous visits, her blood pressure ranged from 100 to 110 mm Hg systolic and 70 to 80 mm Hg diastolic. Further assessment reveals slight edema of her hands and 1+ proteinuria. The nurse anticipates that the healthcare provider (HCP) will **most** likely prescribe which treatment?

- ☐ 1. IV magnesium sulfate
- ☐ 2. labetalol
- ☐ 3. bed rest with bathroom privileges
- ☐ 4. hourly blood pressure checks

150. A female client who is 32 years of age has been diagnosed with stage 1 hypertension. The client's height is 5 feet 5 inches (165 cm), and her weight is recorded as 125 pounds (56.6 kg); she reports that she frequently eats at "fast-food" restaurants and enjoys a glass of wine to relax on weekends. In developing a teaching plan for this client, the nurse should address which topic?

- ☐ 1. potential use of nitroprusside
- ☐ 2. adverse effects of alcohol
- ☐ 3. decreasing dietary caloric intake
- ☐ 4. low-sodium food choices

151. The nurse observes that an area in the mouth of a child with leukemia is bleeding. Which item should the nurse use to promote homeostasis over the lesion?

- ☐ 1. karaya gum
- ☐ 2. a cotton ball imbedded with petroleum jelly

- ☐ 3. a nonsticking gauze sponge
- ☐ 4. a dry tea bag

152. A client with a fractured leg has been instructed to ambulate without weight bearing on the affected leg. The nurse evaluates that the client is ambulating correctly if the client uses which crutch-walking gait?

- ☐ 1. two-point gait
- ☐ 2. four-point gait
- ☐ 3. three-point gait
- ☐ 4. swing-to gait

153. Which is appropriate for the nurse to include in a plan for the prevention of pressure ulcers?

- ☐ 1. daily skin cleaning with soap and hot water
- ☐ 2. gentle massage of bony prominences every shift
- ☐ 3. encouraging the client to sit up as much as possible
- ☐ 4. systematic skin assessment at least once per shift

154. A client at 36 weeks' gestation tells the nurse, "I have been having a lot of backaches lately." After giving instructions about how to decrease the backaches, the nurse determines that the client needs further instruction when she makes which statement?

- ☐ 1. "I should walk with my pelvis tilted backward."
- ☐ 2. "I may need to put a board under my mattress."
- ☐ 3. "I should squat and not bend to pick up objects."
- ☐ 4. "I should wear flat or low-heeled shoes."

155. Which is an initial clinical manifestation of gonorrhea in men?

- ☐ 1. impotence
- ☐ 2. scrotal pain
- ☐ 3. penile lesion
- ☐ 4. urethral discharge

156. A client's blood pressure is elevated at 160/90 mm Hg. The healthcare provider (HCP) prescribed "clonidine 1 mg by mouth now." The nurse sent the prescription to pharmacy at 0710, but the medication still has

not arrived at 0800. The nurse should do all **except**:

- ☐ 1. check all appropriate places on the unit to which the drug could have been delivered.
- ☐ 2. check the client's blood pressure.
- ☐ 3. call the pharmacy.
- ☐ 4. go to the pharmacy to obtain the drug.

157. The client with major depression states, "I am too tired to get out of bed to go to group therapy. I just want to rest." The nurse should tell the client:

- ☐ 1. "Perhaps you will feel better later on."
- ☐ 2. "I will let you rest for as long as you need."
- ☐ 3. "Attending group therapy is an important part of your treatment plan."
- ☐ 4. "You have been in bed long enough and need to get up."

158. After teaching the mother of a 7-month-old diagnosed with bronchiolitis, the nurse determines that the teaching has been effective when the mother states she will immediately report which sign or symptom?

- ☐ 1. seven wet diapers a day
- ☐ 2. temperature of 100°F (37.8°C) for 2 days
- ☐ 3. clear nasal discharge for longer than 2 days
- ☐ 4. longer periods of sleep than usual

159. A 4-year-old who weighs 40 lbs (18 kg) is brought to the emergency department with sudden onset of a temperature of 103°F (39.4°C), sore throat, and refusal to drink. The child will not lie down and prefers to lean forward while sitting up. What should the nurse do **next**?

- ☐ 1. Give 600 mg of acetaminophen rectally, as prescribed.
- ☐ 2. Inspect the child's throat for redness and swelling.
- ☐ 3. Have an appropriate-sized tracheostomy tube readily available.
- ☐ 4. Obtain a specimen for a throat culture.

160. Which client would benefit from the application of warm moist heat?

- ☐ 1. a client with appendicitis
- ☐ 2. a client with a recently sprained joint

- ☐ 3. a client with a suspected malignancy
- ☐ 4. a client with low back pain

161. A client is newly diagnosed with pernicious anemia. The nurse emphasizes to the client the need to increase vitamin B₁₂ intake by:

- ☐ 1. increasing dietary intake of vitamin B₁₂.
- ☐ 2. taking an oral vitamin B₁₂ replacement.
- ☐ 3. taking vitamin B₁₂ injections or nasal spray replacement.
- ☐ 4. chelation therapy.

162. The nurse has received a prescription to add 20 mEq of potassium chloride to a 1,000-mL bottle of IV fluid. The nurse has a 30-mL, multiple-dose vial of potassium chloride. The label reads 2 mEq/mL. How many milliliters should the nurse add to the IV fluid? Record your answer using a whole number.

_____ mL.

163. A client with major depression and suicidal ideation is suddenly calmer and more energetic. Which conclusion should the nurse reach?

- ☐ 1. The client is improving.
- ☐ 2. The client's medication dosage is too high.
- ☐ 3. The client is overstimulated.
- ☐ 4. The client is suicidal.

164. A multigravid client at 38 weeks' gestation is scheduled to undergo a contraction stress test. What should the nurse include in the explanation as the purpose of this test?

- ☐ 1. evaluation of fetal lung maturity
- ☐ 2. determination of the fetal biophysical profile
- ☐ 3. assessment of fetal ability to tolerate labor
- ☐ 4. determination of fetal response during movements

165. The nurse is caring for a client who has been diagnosed with atypical pneumonia. The nurse should assess this client carefully for:

- ☐ 1. high fever.

- ☐ 2. tachypnea.
- ☐ 3. dry cough.
- ☐ 4. severe chills.

166. The nurse is teaching a client with emphysema how to do pursed-lip breathing. What is the expected outcome of using pursed-lip breathing?

- ☐ 1. increased oxygenation
- ☐ 2. prolonged exhalation
- ☐ 3. increase exercise tolerance
- ☐ 4. relief from shortness of breath

167. What is the advantage of using automated medication dispensing equipment?

- ☐ 1. It facilitates the change-of-shift count of narcotics.
- ☐ 2. It keeps a record of narcotic usage.
- ☐ 3. It allows nurses unmonitored access to narcotics.
- ☐ 4. It cancels the charges for narcotics.

168. Immediately following an automobile accident, a 21-year-old client has severe pain in the right chest from hitting the steering wheel and a compound fracture of the right tibia and fibula and multiple lacerations and contusions. The priority for care is **first** to:

- ☐ 1. reduce the client's anxiety.
- ☐ 2. maintain adequate oxygenation.
- ☐ 3. decrease chest pain.
- ☐ 4. maintain adequate circulating volume.

169. While assessing a primiparous client 8 hours after childbirth, the nurse inspects the episiotomy site, finding it edematous and slightly reddened. Which interpretation by the nurse is **most** appropriate?

- ☐ 1. The client needs application of an ice pack.
- ☐ 2. The episiotomy site is infected.
- ☐ 3. A hematoma will likely develop.
- ☐ 4. The client has had a repair of a vaginal laceration.

170. When administering an IM injection, the nurse should use the Z-track

technique when the medication:

- ☐ 1. takes a long time to absorb.
- ☐ 2. takes effect very quickly.
- ☐ 3. is irritating to tissues.
- ☐ 4. is viscous in consistency.

171. A client with bipolar disorder is monopolizing the use of the telephone by making several calls each day, interfering with the ability of other clients to use the telephone. The nurse should:

- ☐ 1. provide a separate phone for the client.
- ☐ 2. limit the amount of calls the client can make each day.
- ☐ 3. remind the client that others need to use the telephone.
- ☐ 4. take away the client's telephone privileges.

172. When preparing a 20-month-old for removal of a foreign body in the nasal passage by the healthcare provider (HCP), the nurse should use which method of restraint?

- ☐ 1. jacket restraint
- ☐ 2. elbow restraint
- ☐ 3. use of father to hold
- ☐ 4. papoose board

173. The nurse auscultates the lungs of a client who has been diagnosed with a tumor in the lung and notes wheezing over one lung. The nurse should assess the client further for:

- ☐ 1. the presence of exudate in the airways.
- ☐ 2. the client's history of smoking.
- ☐ 3. an indication of pleural effusion.
- ☐ 4. obstruction of the airway.

174. The nurse is teaching a client who is taking insulin about the signs of diabetic ketoacidosis, which include:

- ☐ 1. Kussmaul's respirations.
- ☐ 2. excessive hunger.
- ☐ 3. dry, flaky skin.

- ☐ 4. high blood pressure.

175. A nurse receives a lithium level report of 1.0 mEq/L (1.0 mmol/L) for a client who has been taking lithium for 2 months. How does the nurse interpret this information?

- ☐ 1. an error in reporting
- ☐ 2. too low to be therapeutic
- ☐ 3. too high, indicating toxicity
- ☐ 4. within the therapeutic range

176. A child with 20% second- and third-degree burns is admitted to the burn center. The child weighs 44 lbs (20 kg). The nurse has started an IV infusion of lactated Ringer solution and inserted an indwelling catheter. Which of the findings indicate that the child is going into shock? Select all that apply.

- ☐ 1. Urinary output is 25 mL/h.
- ☐ 2. Specific gravity is within normal limits.
- ☐ 3. Pain is 7 on a pain scale of 1 to 10.
- ☐ 4. Heart rate is elevated.
- ☐ 5. Blood pressure is dropping.

177. A client has been receiving radiation therapy for 3 weeks to treat cancer and has fatigue. The nurse should consider which factor when planning to help the client cope with the fatigue?

- ☐ 1. Fatigue is a temporary problem that requires no active intervention.
- ☐ 2. The cause of the fatigue should be determined.
- ☐ 3. Fatigue indicates that the client's cancer is not under control.
- ☐ 4. A balance of activity and rest will help manage the fatigue.

178. When educating unlicensed nursing personnel (UAP) about how to prevent the development of pressure ulcers, the nurse should emphasize that **most** tissue injuries related to shearing can be prevented by:

- ☐ 1. close adherence to a turning schedule.
- ☐ 2. keeping the skin clean and dry.
- ☐ 3. proper positioning and moving of the client.
- ☐ 4. use of skin lubricants.

179. When using crutches, the nurse should instruct the client to bear weight primarily on the:

- ☐ 1. axillae.
- ☐ 2. elbows.
- ☐ 3. upper arms.
- ☐ 4. hands.

180. A child with aggressive and impulsive behaviors is admitted to the child psychiatric unit with a diagnosis of a conduct disorder. Which intervention is appropriate?

- ☐ 1. Allow autonomy.
- ☐ 2. Elicit descriptions of feelings.
- ☐ 3. Set limits.
- ☐ 4. Teach assertiveness.

181. What should the nurse do **first** when admitting a toddler with croup?

- ☐ 1. Monitor vital signs.
- ☐ 2. Assess respiratory status.
- ☐ 3. Ensure adequate fluid intake.
- ☐ 4. Place a tracheostomy set at the bedside.

182. Before the nurse administers IV replacement of 5% dextrose in water with potassium chloride, what nursing intervention must be completed **first**?

- ☐ 1. adding potassium chloride to the bag at the bedside
- ☐ 2. evaluating laboratory results for electrolytes
- ☐ 3. priming tubing using sterile technique
- ☐ 4. checking the rate for IV push administration

183. A 45-year-old client diagnosed with colon cancer states, “I do not want any treatment. I have not seen any family members in 25 years. I am a loner. Besides, I will decide when and how I want to die.” In which order of priority from first to last should the nurse perform the actions? All options must be used.

- 1. Ask the client what methods for suicide are available.

2. Tell the client that the primary care provider will ask for a psychiatric consult.

3. Ask the client about thoughts of suicide.

4. Express concern for the client's feelings and safety.

184. Which sign is an early indication that a client has developed hypocalcemia?

- ☐ 1. tingling in the fingers
- ☐ 2. depressed reflexes
- ☐ 3. ventricular dysrhythmias
- ☐ 4. memory changes

185. The nurse is auscultating the lung sounds of a client with long-standing emphysema. The nurse is **most** likely to detect:

- ☐ 1. fine crackles.
- ☐ 2. diminished breath sounds.
- ☐ 3. stridor.
- ☐ 4. pleural friction rub.

186. A client with a paranoid personality disorder sees some clients laughing during a group activity and asks the nurse, "Why are they laughing at me? I bet they are making fun of me." Which response by the nurse is **most** appropriate?

- ☐ 1. "You should not let yourself get so upset."

- ☐ 2. "Do not worry about them. They do not mean any harm."
- ☐ 3. "Look. They seem to be having fun."
- ☐ 4. "They are laughing at a joke John told. They are not laughing at you."

187. Mebendazole is prescribed for an 8-year-old child with pinworms. The child has an 18-month-old brother and a 4-year-old sister. The nurse should be sure that the parents are also treating which family members with this drug?

- ☐ 1. both of the siblings
- ☐ 2. the parents and brother
- ☐ 3. everyone who lives in the household
- ☐ 4. the parents and sister

188. When planning a presentation on the topic of osteoporosis to a group of middle-aged women, the nurse should include which information in the presentation?

- ☐ 1. An early symptom of osteoporosis is the dowager's hump.
- ☐ 2. Women of African and Latin descent are at greater risk.
- ☐ 3. Loss of height is an early symptom of the disease.
- ☐ 4. Conventional radiographs are usually used to confirm the disease.

189. Which rationale **best** explains why the nurse should evaluate gastric residual before administering the client's next enteral feeding?

- ☐ 1. to determine how well nutrients are being absorbed
- ☐ 2. to determine if the client is receiving enough feeding
- ☐ 3. to prevent overdistention of the stomach
- ☐ 4. to prevent mixing undigested formula with partially digested formula

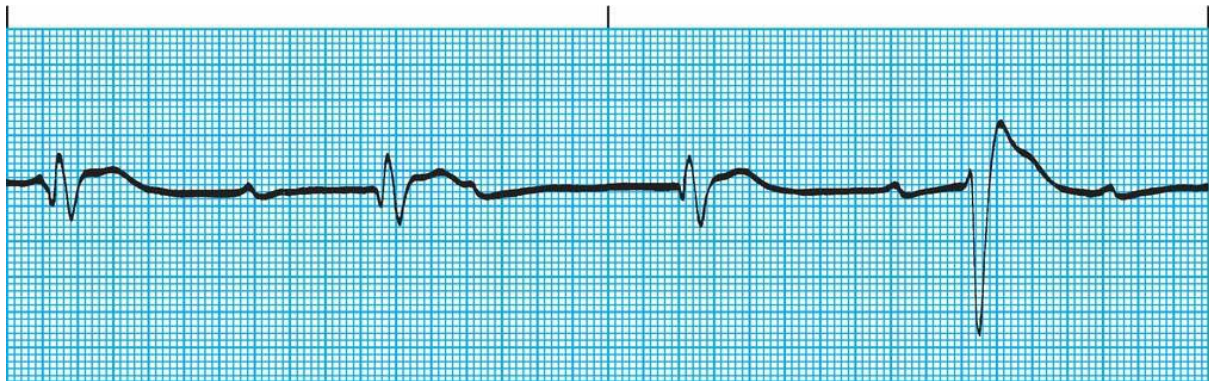

190. The results of which serologic test should the nurse have on the medical record before a client is started on tissue plasminogen activator or alteplase recombinant?

- ☐ 1. partial thromboplastin time
- ☐ 2. potassium level
- ☐ 3. Lee-White clotting time
- ☐ 4. fibrin split product

191. When planning the care for a client diagnosed with hepatitis A, the nurse should include which interventions? Select all that apply.

- ☐ 1. Implement an exercise program.
- ☐ 2. Provide relief from nausea and vomiting.
- ☐ 3. Administer pain medication.
- ☐ 4. Encourage multiple small meals daily.
- ☐ 5. Plan frequent rest periods.

192. The nurse is assessing a client who has had a myocardial infarction. The nurse notes the cardiac rhythm shown. The nurse identifies that this rhythm is:

- ☐ 1. atrial fibrillation.
- ☐ 2. ventricular tachycardia.
- ☐ 3. premature ventricular contractions.
- ☐ 4. third-degree heart block.

193. The client with borderline personality disorder spends much time around the nurse's station, making numerous minor requests. The nurse interprets these behaviors as indicating which factor?

- ☐ 1. fears of abandonment and attention seeking
- ☐ 2. enjoyment of bothering the staff
- ☐ 3. boredom suggesting the need for something to do
- ☐ 4. lack of desire for involvement in milieu activities

194. A client has soft wrist restraints to prevent the client from pulling out the nasogastric tube. Which nursing intervention should be implemented while the restraints are on the client?

- ☐ 1. Instruct the client not to move while the restraints are in place.
- ☐ 2. Remove the restraints every 4 hours to provide skin care.
- ☐ 3. Secure the restraints to side rails of the bed.
- ☐ 4. Check on the client every 30 minutes while the restraints are on.

195. A client with alcohol dependence states, “I feel so bad because of what I have done to my wife and kids. I am just no good.” Which response by the nurse is **most** appropriate?

- ☐ 1. “Why do you think you are no good?”
- ☐ 2. “They will need to forgive your shortcomings.”
- ☐ 3. “Alcohol dependence is a disease that can be treated.”
- ☐ 4. “Alcoholism is painful for everyone involved.”

196. Which statement by a parent indicates the **best** understanding of why raisins should be limited as a snack food in toddlers?

- ☐ 1. “Raisins are low in nutritional value.”
- ☐ 2. “Raisins can increase tooth decay.”
- ☐ 3. “Raisins are easy to choke on.”
- ☐ 4. “Raisins are hard to digest entirely.”

197. A client has been diagnosed with atrial fibrillation. The healthcare provider (HCP) prescribed warfarin to be taken on a daily basis. The nurse instructs the client to avoid using which over-the-counter medication while taking warfarin?

- ☐ 1. aspirin
- ☐ 2. diphenhydramine
- ☐ 3. digoxin
- ☐ 4. pseudoephedrine

198. The nurse should inform a client taking carbamazepine that it can affect other medications in which way?

- ☐ 1. It decreases the effects of oral anticoagulants.
- ☐ 2. It decreases the serum concentration of verapamil.
- ☐ 3. It increases the serum concentration of other anticonvulsants.
- ☐ 4. It increases the effects of oral contraceptives.

199. A client has been diagnosed with hepatitis A. Which goal is **most** appropriate for the client?

- ☐ 1. Achieve control of abdominal pains.
- ☐ 2. Increase activity levels gradually.
- ☐ 3. Be able to breathe without difficulty.
- ☐ 4. Experience relief from edema.

200. Which activity by the mother offers the **most** support to the child during the first few days after surgery to repair a cleft lip?

- ☐ 1. holding and cuddling the child
- ☐ 2. helping the child play with some toys
- ☐ 3. reading some of the child's favorite stories
- ☐ 4. staying at the bedside and holding the child's hand

201. Which strategy is the **most** effective for a nurse to use to reduce the number of children involved in automobile accidents who were not wearing seat belts?

- ☐ 1. Contact the local government representative to discuss new legislation about child seat belts.
- ☐ 2. Attend a school board meeting to advocate for classes teaching children seat belt safety.
- ☐ 3. Call the town mayor's office with this information so that the mayor can discuss it with the media.
- ☐ 4. Start a letter-writing campaign to the school superintendent about seat belt importance.

202. The nurse is developing a discharge plan for a client who has had a myocardial infarction. Planning for discharge for this client should begin:

- ☐ 1. on discharge from the hospital.
- ☐ 2. on discharge from the cardiac care unit.
- ☐ 3. on admission to the hospital.
- ☐ 4. four weeks after the onset of illness.

203. A child is admitted to the emergency department with dyspnea related to bronchospasms. The nurse should place the client in which position?

- ☐ 1. high Fowler's
- ☐ 2. side lying
- ☐ 3. prone
- ☐ 4. supine

204. A client's chest tube is to be removed by the healthcare provider (HCP). Which item should the nurse have ready to be placed directly over the wound when the chest tube is removed?

- ☐ 1. butterfly dressing
- ☐ 2. Montgomery strap
- ☐ 3. fine mesh gauze dressing
- ☐ 4. petrolatum gauze dressing

205. The nurse is preparing to administer IM morphine sulfate to a client who is in pain. On checking the healthcare provider's (HCP's) prescription, the nurse notes that the prescription states "morphine sulfate 60 mg IM every 4 hours as needed for pain." The usual dose of morphine is 10 to 15 mg. What is the **most** appropriate action for the nurse to take?

- ☐ 1. Administer the medication as prescribed.
- ☐ 2. Administer 15 mg of the drug.
- ☐ 3. Contact the HCP to verify the prescription.
- ☐ 4. Ask another nurse to review the prescription.

206. Following surgery for removal of a brain tumor, a client is coughing and short of breath and has a "bad" feeling. The nurse obtains the following vital signs: blood pressure of 80/60 mm Hg, pulse rate of 120 bpm, and respiratory rate of 30 shallow breaths/minute. What should the nurse do **first**?

- ☐ 1. Call the neurosurgeon.
- ☐ 2. Place the client in the Trendelenburg position.
- ☐ 3. Consult the neurologic clinical nurse specialist (CNS).
- ☐ 4. Activate the rapid response team (RRT).

207. The nurse is preparing a client for paracentesis. What should the nurse do?

- ☐ 1. Have the client void before the procedure.
- ☐ 2. Scrub the client's abdomen with an antiseptic skin cleanser.

- ☐ 3. Position the client supine.
- ☐ 4. Put the client on nothing-by-mouth (NPO) status 4 hours before the procedure.

208. Which behavior in a 20-month-old would lead the nurse to suspect that the child is being abused?

- ☐ 1. absence of crying during the examination
- ☐ 2. clinging to the parent during the examination
- ☐ 3. playing with toys on the examination room floor
- ☐ 4. talking easily with the nurse

209. What information should the nurse plan to include when teaching the client and family about a substance abuse problem?

- ☐ 1. the role of the family in perpetuating the problem
- ☐ 2. the family's responsibility for the client
- ☐ 3. the physical, physiologic, and psychological effects of substances
- ☐ 4. the reasons that could have led the client to use the substance

210. A client who has had a laparoscopic cholecystectomy receives discharge instructions from the nurse. Which statement indicates that the client has understood the instructions?

- ☐ 1. "I need to maintain a low-fat diet for the next 6 months."
- ☐ 2. "I can remove the dressing from my incision tomorrow and take a shower."
- ☐ 3. "I can anticipate some nausea for several days after surgery."
- ☐ 4. "I can return to work in 4 to 6 weeks."

211. The nurse is obtaining a health history from an adult from Mexico. The nurse should interpret the findings by understanding that in this client's culture, what are highly valued?

- ☐ 1. children
- ☐ 2. materialism
- ☐ 3. firstborn sons
- ☐ 4. the elderly

212. A client has extreme fatigue and is malnourished, and laboratory tests

reveal a hemoglobin level of 8.5 g/dL (85 g/L). The nurse should specifically ask the client about the intake of food **high** in which nutrients?

- ☐ 1. vitamins A, E, and C
- ☐ 2. vitamins B₆ and B₁₂, folate, iron, and copper
- ☐ 3. thiamine, riboflavin, and niacin
- ☐ 4. vitamins A and B

213. The nurse is assessing a neonate born to a mother with type 1 diabetes. Which finding is expected?

- ☐ 1. hypertonia
- ☐ 2. hyperactivity
- ☐ 3. large size
- ☐ 4. scaly skin

214. A client who had transurethral resection of the prostate has dribbling urine after his Foley catheter is removed on the second postoperative day. The nurse notes that the client had 200 mL of urine output in the last 8 hours with a 1,000-mL intake. The nurse should **first**:

- ☐ 1. apply a condom catheter.
- ☐ 2. assess for bladder distention.
- ☐ 3. obtain a urine specimen for culture.
- ☐ 4. teach the client Kegel exercises.

215. A client has atrial fibrillation. The nurse should monitor the client for:

- ☐ 1. cardiac arrest.
- ☐ 2. cerebrovascular accident.
- ☐ 3. heart block.
- ☐ 4. ventricular fibrillation.

216. A child diagnosed with tinea is being treated with griseofulvin. What should the nurse tell the parents to do?

- ☐ 1. Give the medication before a meal.
- ☐ 2. Have the child avoid intense sunlight.
- ☐ 3. Give the medication for 10 days.

- ☐ 4. Encourage increased fluid intake.

217. The nurse is developing a care plan for a client with a diagnosis of a borderline personality disorder. Which interventions would be effective to help the client cope and control emotions? Select all that apply.

- ☐ 1. Assist client with identifying his/her emotions.
- ☐ 2. Decrease impulsivity.
- ☐ 3. Have client keep a journal of emotions and coping techniques.
- ☐ 4. Encourage the client to delay gratification.
- ☐ 5. Use confrontation techniques.

218. A client undergoes cystoscopy with bladder biopsy. After the procedure, which assessment is **most** appropriate for the nurse to make?

- ☐ 1. Assess the patency of the Foley catheter.
- ☐ 2. Assess urine for excessive bleeding.
- ☐ 3. Percuss the bladder for distention.
- ☐ 4. Obtain a urine specimen for culture.

219. The nurse is assessing an infant who is 6 months of age and has a black eye; the infant is brought by his mother to the quick-care clinic. The mother reports that the daycare provider told her the child “fell down the steps with his walker.” What should the nurse do in order of priority from first to last? All options must be used.

1. Report the incident to the social services department.

2. Document findings accurately.

3. Ask the mother for details about the incident and the daycare center.

4. Place an ice bag on the infant’s eye.

220. A client of Mexican descent has bacterial pneumonia and has a temperature of 102°F (39°C). The client tells the nurse that the client has treated the infection by drinking milk, and the nurse interprets the client's remark as:

- ☐ 1. confusion from fever.
- ☐ 2. use of the hot disease concept.
- ☐ 3. use of milk as a laxative.
- ☐ 4. the need for a dietitian to assist her with meal planning.

221. A female client with paranoid schizophrenia has been hearing negative voices and "getting special messages from various sources." Which intervention is **most** appropriate for the client's symptoms?

- ☐ 1. Ask her to make simple decisions.
- ☐ 2. Be matter-of-fact with her.
- ☐ 3. Monitor her reactions to television programs.
- ☐ 4. Reinforce appropriate dress and hygiene.

222. The nurse is talking with a client who was diagnosed with bulimia 3 months ago. The client needs more education about the illness if she makes which comments? Select all that apply.

- ☐ 1. "I know that this illness is chronic and intermittent. I will always have to control it."
- ☐ 2. "If I start severely restricting my eating, I may be building up to a bingeing episode."
- ☐ 3. "When I am not bingeing and purging, I can skip that eating disorder support group."
- ☐ 4. "I have made a real effort to be more social and involved in activities."
- ☐ 5. "My depression is gone, so I do not need my antidepressant any longer."

223. The nurse judges that the parents of a newborn with imperforate anus know what a low defect is when they say that the rectum:

- ☐ 1. is below the abdominal rectus muscle.
- ☐ 2. is above the abdominal rectus muscle.
- ☐ 3. has descended through the puborectalis muscle.
- ☐ 4. has ascended through the puborectalis muscle.

224. An elderly client is receiving meperidine after abdominal surgery. The nurse should observe the client for which **most** significant side effect of meperidine?

- ☐ 1. respiratory depression
- ☐ 2. dysrhythmias
- ☐ 3. constipation
- ☐ 4. seizures

225. The mother of a child with bronchial asthma tells the nurse that the child wants a pet. Which pet is **most** appropriate?

- ☐ 1. cat
- ☐ 2. fish
- ☐ 3. gerbil
- ☐ 4. canary

226. A client with iron deficiency anemia is taking iron supplements. The nurse emphasizes to the client that the drug will have increased absorption if taken with:

- ☐ 1. milk.
- ☐ 2. orange juice.
- ☐ 3. food.
- ☐ 4. beta-carotene.

227. When obtaining the nursing history of a client who has type 1 diabetes mellitus, the nurse should assess the client for which early symptom of renal insufficiency?

- ☐ 1. polyuria
- ☐ 2. dysuria

- ☐ 3. hematuria
- ☐ 4. oliguria

228. When an infant resumes taking oral feedings after surgery to correct intussusception, the parents comment that the child seems to suck on the pacifier more since the surgery. The nurse explains that sucking on a pacifier:

- ☐ 1. provides an outlet for emotional tension.
- ☐ 2. indicates readiness to take solid foods.
- ☐ 3. indicates intestinal motility.
- ☐ 4. is an attempt to get attention from the parents.

229. A client is planning to be treated for infertility with the zygote intrafallopian transfer (ZIFT) method. Which information should the nurse include when teaching the client about this type of treatment method?

- ☐ 1. Fertilization takes place outside of the body.
- ☐ 2. ZIFT is helpful for clients with bilateral blocked fallopian tubes.
- ☐ 3. Ova and sperm are needed for instillation into the fallopian tube.
- ☐ 4. Fertilized ova are instilled into the vagina to enter the uterus.

230. When assessing for oxygenation in a client with dark skin, the nurse should examine the client's:

- ☐ 1. skin.
- ☐ 2. buccal mucosa.
- ☐ 3. nape of the neck.
- ☐ 4. forehead.

231. To prevent shoulder ankyloses following chest surgery, the nurse should teach the client to:

- ☐ 1. turn from side to side.
- ☐ 2. raise and lower the head.
- ☐ 3. raise the arm on the affected side over the head.
- ☐ 4. flex and extend the elbow on the affected side.

232. A client with a tracheostomy tube coughs and dislodges the tracheostomy tube. The nurse's **first** action should be to:

- ☐ 1. call for emergency assistance.

- ☐ 2. attempt reinsertion of tracheostomy tube.
- ☐ 3. position the client in semi-Fowler's position with the neck hyperextended.
- ☐ 4. insert the obturator into the stoma to reestablish the airway.

233. The experienced licensed practical/vocational nurse (LPN/VN) under the supervision of the registered nurse (RN) team leader is providing nursing care for an infant with respiratory syncytial virus (RSV). Which tasks are appropriate for the RN to delegate to the LPN/VN? Select all that apply.

- ☐ 1. Auscultate breath sounds.
- ☐ 2. Administer prescribed aerosolized medications.
- ☐ 3. Initiate nursing care plan.
- ☐ 4. Check oxygen saturation using pulse oximetry.
- ☐ 5. Complete in-depth admission assessment.
- ☐ 6. Evaluate the parent's ability to administer aerosolized medications.

234. A first-time mother is concerned that her 6-month-old infant is not gaining enough weight. What should the nurse tell the mother?

- ☐ 1. "Birth weight doubles by 6 months of age."
- ☐ 2. "Birth weight doubles by 3 months of age."
- ☐ 3. "The baby will eat what he needs."
- ☐ 4. "You need to make sure the baby finishes each bottle."

235. When assessing a client who reports a back injury, it is critical for the nurse to question the client about:

- ☐ 1. family history of back problems.
- ☐ 2. previous hospitalizations.
- ☐ 3. personal history of illness.
- ☐ 4. mechanism of injury.

236. A client is taking metoprolol and hydrochlorothiazide. The medication is effective if it:

- ☐ 1. lowers the blood pressure.
- ☐ 2. increases the heart rate.
- ☐ 3. improves circulation in the extremities.

- ☐ 4. decreases dyspnea.

237. A client in cardiac rehabilitation would like to eat the right foods to ensure adequate endurance on the treadmill. Which nutrient is **most** helpful for promoting endurance during sustained activity?

- ☐ 1. protein
- ☐ 2. carbohydrate
- ☐ 3. fat
- ☐ 4. water

238. The nurse is examining an older adult woman with possible rheumatoid arthritis. The nurse should ask the client if she is having:

- ☐ 1. nausea.
- ☐ 2. dizziness.
- ☐ 3. fatigue.
- ☐ 4. limitation of movement.

239. The nurse instructs the client in mixing and administering regular and NPH insulin. Which statement indicates that the client needs additional instruction?

- ☐ 1. "I draw up the regular insulin first."
- ☐ 2. "I shake the bottle of NPH insulin before drawing it up."
- ☐ 3. "I store the insulin in a cool place."
- ☐ 4. "I insert the needle at a 90-degree angle."

240. The mother of a child with newly diagnosed Duchenne's muscular dystrophy asks how her child developed the disease. The nurse gives a response incorporating which statement about its transmission?

- ☐ 1. "It is an autosomal recessive genetic disorder."
- ☐ 2. "It is a genetic disorder carried by males and transmitted to male children."
- ☐ 3. "It is a disorder primarily transmitted by males in the family."
- ☐ 4. "It is a disorder usually carried by females and transmitted to male children."

241. What is a **priority** nursing goal for an infant with intussusception?

- ☐ 1. Restore fluids.
- ☐ 2. Control diarrhea.
- ☐ 3. Protect the skin.
- ☐ 4. Manage acute pain.

242. A client is trying to lose weight at a moderate pace. If the client eliminates 1,000 cal/day from his normal intake, how many pounds (or kilograms) would the client lose in 1 week?

_____ lb/kg.

243. The healthcare provider (HCP) prescribes IV cefazolin 1 g for a client. In preparing to administer the cefazolin, the nurse notes that the client is allergic to penicillin. Based on this information, what is an appropriate action for the nurse to take?

- ☐ 1. Continue to prepare to administer the cefazolin as prescribed.
- ☐ 2. Notify the HCP of the client's allergy to penicillin.
- ☐ 3. Administer the cefazolin, staying at the client's bedside during the infusion.
- ☐ 4. Call the pharmacist to verify that the cefazolin should be administered as prescribed.

244. A client is prescribed buspirone 5 mg two times a day. Which statements indicate that the client has understood the nurse's teaching about this drug? Select all that apply.

- ☐ 1. "This medicine will make me sleepy."
- ☐ 2. "Buspirone will relax my muscles."
- ☐ 3. "My anxiety will be completely gone by tomorrow."
- ☐ 4. "Buspirone will help me not to worry so much."
- ☐ 5. "I will be able to focus better."

245. When a client has a tearing of tissue with irregular wound edges, the nurse should document this as:

- ☐ 1. contusion.
- ☐ 2. abrasion.
- ☐ 3. laceration.
- ☐ 4. colonization.

246. A client with schizophrenia is responding well to risperidone and is no longer psychotic. After teaching the client about managing the illness, which statement reflects a need for further intervention?

- ☐ 1. "I just do not know if I can afford to keep taking medicines every day."
- ☐ 2. "When my thoughts start racing, I know I need to relax more."
- ☐ 3. "I can name the side effects of risperidone, but I am not having any."
- ☐ 4. "I do not listen to my mom's religious beliefs about not using medicines."

247. While a mother is feeding her full-term neonate 1 hour after birth, she asks the nurse, "What are these white dots in my baby's mouth? I tried to wash them out, but they are still there." After assessing the neonate's mouth, the nurse explains that these spots indicate which condition?

- ☐ 1. Koplik's spots
- ☐ 2. Epstein's pearls
- ☐ 3. precocious teeth
- ☐ 4. thrush curds

248. A nurse is assessing a client with hepatitis A. The client reports that the appetite is poor and the presence of food causes nausea. The nurse should encourage the client to eat:

- ☐ 1. high-fat foods at each meal.
- ☐ 2. foods high in protein.
- ☐ 3. the majority of the calories in the morning during small frequent snacks.
- ☐ 4. a low-calorie diet with numerous snacks.

249. A client had a cast applied to the left femur to stabilize a fracture. To promote early rehabilitation, the nurse should **first**:

- ☐ 1. call physical therapy to provide passive exercise of the affected limb.
- ☐ 2. teach the client how to do isometric exercises of the quadriceps.
- ☐ 3. show the family how to do active range-of-motion exercises of the unaffected limb.
- ☐ 4. obtain weights so the client can exercise the upper extremities.

250. The client arrives in the emergency department following a bicycle

accident in which the client's forehead hit the pavement. The client is diagnosed as having a hyphema. The nurse should place the client in which position?

- ☐ 1. supine
- ☐ 2. semi-Fowler's
- ☐ 3. side lying on the affected side
- ☐ 4. side lying on the unaffected side

251. The nurse has just received change-of-shift report for four clients. Based on this report, the nurse should assess which client **first**?

- ☐ 1. a 38-year-old who is 2 days postmastectomy due to breast cancer, having difficulty coping with the diagnosis
- ☐ 2. a 52-year-old with pneumonia and chronic back pain who is requesting pain medication
- ☐ 3. a 35-year-old admitted after motor vehicle accident whose urine output has totaled 30 mL over the last 2 hours
- ☐ 4. an 84-year-old with resolving left-sided weakness who is slightly confused and has been awake most of the night

252. An obese diabetic client who has bilateral leg aching is to start a cardiac rehabilitation with an exercise program. Using which exercise equipment will be **most** helpful to the client?

- ☐ 1. stationary bicycle
- ☐ 2. treadmill
- ☐ 3. elliptical trainer
- ☐ 4. stair climber

253. The nurse has received a change-of-shift report. The nurse should assess which client **first**?

- ☐ 1. a 72-year-old admitted 2 days ago with a blood alcohol level of 0.08
- ☐ 2. a 36-year-old with chest tube due to spontaneous pneumothorax with current respiratory rate 18 breaths/min and oxygen saturation 95% on oxygen at 2 L per nasal cannula
- ☐ 3. a 28-year-old who is 2 days postappendectomy with discharge prescriptions written and whose husband is waiting to take her home

- ☐ 4. a 62-year-old admitted with a recent gastrointestinal (GI) bleeding whose hemoglobin is 13.8 g/dL (138 g/L)

254. An infant is born with facial abnormalities, growth retardation, and vision abnormalities. These abnormalities are likely caused by maternal:

- ☐ 1. alcohol consumption.
- ☐ 2. vitamin B₆ deficiency.
- ☐ 3. vitamin A deficiency.
- ☐ 4. folic acid deficiency.

255. The adolescent with cystic fibrosis has been placed on ciprofloxacin for a lung infection. Which statement from the client indicates the need for more teaching?

- ☐ 1. "I will not take this drug with any dairy products."
- ☐ 2. "I will need to have drug levels drawn while I am on this medication."
- ☐ 3. "I should immediately report any muscle or joint pain."
- ☐ 4. "If I miss a dose, I should take it as soon as I remember."

256. A client whose condition remains stable after a myocardial infarction gradually increases activity. To determine whether the activity is appropriate for the client, the nurse should assess the client for:

- ☐ 1. edema.
- ☐ 2. cyanosis.
- ☐ 3. dyspnea.
- ☐ 4. weight loss.

257. The parents of a 7-year-old child with glomerulonephritis ask what they can do to ensure that their other children do not develop the disease. The nurse should respond with which statement?

- ☐ 1. "If you suspect your child has a urinary tract infection, see your primary healthcare provider (HCP) right away."
- ☐ 2. "I am afraid there is nothing you can do; glomerulonephritis is a genetic disorder."
- ☐ 3. "Glomerulonephritis is not contagious, so your other children will not get the disease."
- ☐ 4. "If your child has a streptococcal infection, complete the course of

prescribed antibiotics.”

258. A client admitted for alcohol detoxification is taking disulfiram. The nurse should instruct the client to avoid ingestion of which foods and/or liquids? Select all that apply.

- ☐ 1. aged cheeses
- ☐ 2. beer
- ☐ 3. communal wine at church
- ☐ 4. chocolates
- ☐ 5. cough syrup

259. The nurse is evaluating an infant for auditory ability. What is the expected response in an infant with normal hearing?

- ☐ 1. blinking and stopping body movements when sound is introduced
- ☐ 2. evidence of shy and withdrawn behaviors
- ☐ 3. saying “da-da” by age 5 months
- ☐ 4. absence of squealing by age 4 months

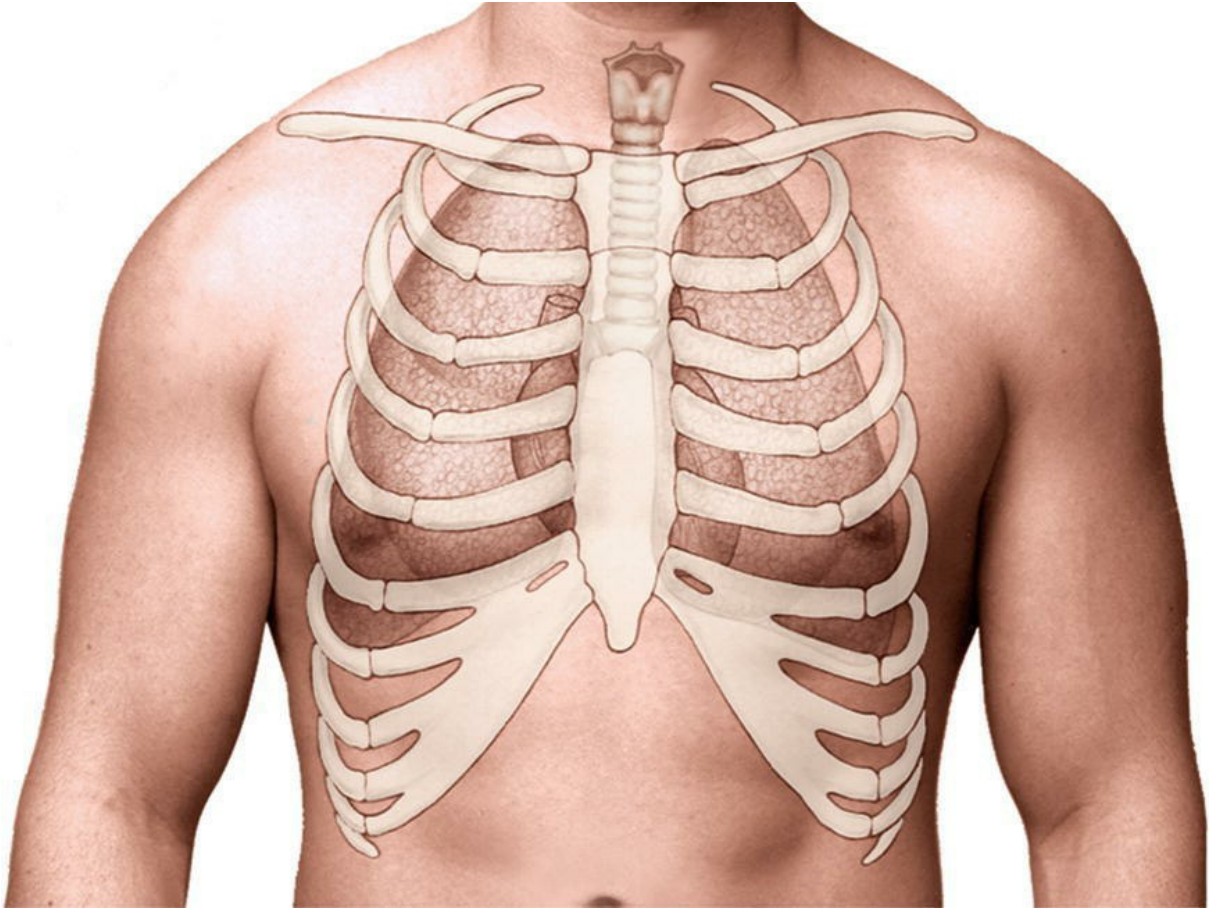

260. When admitting a neonate whose mother received magnesium sulfate, the nurse should assess the baby for which complication? Select all that apply.

- ☐ 1. increased Moro reflex
- ☐ 2. decreased muscle tone
- ☐ 3. increased respirations
- ☐ 4. decreased respirations
- ☐ 5. increased temperature

261. The neonate has a prescribed IV rate of 8 mL/h. Fluid totals are recorded every 2 hours on the even hours. There is a new prescription written at 1030 to decrease the IV rate to 6 mL/h. What is the fluid total to be infused and recorded at 1200?

_____ mL.

262. The nurse is auscultating S₁ and S₂ in a client. Identify the area where the nurse should hear S₁ the loudest.

263. While assessing the psychosocial aspects of a primigravid client at 30 weeks' gestation, what feelings are expected?

- ☐ 1. vulnerability
- ☐ 2. confirmation
- ☐ 3. ambivalence
- ☐ 4. body image disturbance

264. The nurse must be aware that adverse drug reactions in the elderly client may be underestimated because:

- ☐ 1. adverse reactions rarely have an atypical presentation.
- ☐ 2. cognitive impairment is an expected finding in the elderly client.
- ☐ 3. physical or psychological symptoms are attributed to the effects of aging.
- ☐ 4. excess sedation is difficult to assess in the elderly client.

265. A parent tells the nurse that their 8-month-old infant is anxious.

Which suggestion by the nurse is **most** appropriate to help the parent lessen anxiety in the infant?

- ☐ 1. Limit holding the infant to feeding times.
- ☐ 2. Talk quietly to the infant while awake.
- ☐ 3. Play music in his room for most of the day and night.
- ☐ 4. Have a close friend keep the infant for a few days.

Answers, Rationales, and Test-Taking Strategies

*The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the **Content Mastery and Test-Taking Skill Self-Analysis** worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in Part 1 of this book.*

1. 1, 3, 4, 5. The fetus does go through sleep cycles, rendering it less likely to move while it is asleep. Blood glucose does cross the placenta and can affect fetal movement. Cigarette smoking causes carbon monoxide to cross the placenta, which reduces fetal oxygen. Pregnant women are more likely to notice fetal movement while they are sitting or lying down, and time of day often determines this. Most pregnant women notice fetal movement in the evening. Barometric pressure does not affect fetal activity in utero.

CN: Health promotion and maintenance; CL: Analyze

2. 1. The infant is exhibiting periodic breathing, which is normal in infants of this age. The infant typically alternates short periods of rapid, louder respirations with periods of slower, quieter respirations.

CN: Health promotion and maintenance; CL: Analyze

3. 2. *Respondeat superior* is Latin for “The master is responsible for the acts of his servants.” The nurse, as an employee of the hospital, acted

according to the established policy of the hospital. Because the nurse followed hospital policy, it is unlikely that this incident involved malpractice, negligence, or tort law.

CN: Management of care; CL: Evaluate

4. 3. The surgeon is required to give the client explanations and have questions answered. The nurse has no way of assessing the client's understanding without the interpreter. The client should sign the Spanish **consent** form only after receiving an explanation of the procedure, its risks, and alternatives. A family member cannot be relied on to translate the surgeon's instructions. The nurse is commonly asked to witness the explanation and to obtain the client's signature on the informed consent form. Informed consent is the provision of information concerning the procedure and its risks, not obtaining the client's signature on the form. The surgical charge nurse does not need to be notified.

CN: Management of care; CL: Synthesize

5. 4. Traveling is usually discouraged if preterm labor has been a problem, as it restricts normal movement. A client should be able to walk around frequently to prevent blood clots and to empty her bladder at least every 1 to 2 hours. Bladder infections often stimulate preterm labor, and preventing them is of great importance to this client. Contractions that recur indicate the return of preterm labor, and the **HCP**  needs to be notified. Dehydration is known to stimulate preterm labor, and encouraging the client to drink adequate amounts of water helps to prevent this problem.

CN: Reduction of risk potential; CL: Evaluate

6. 2. Timolol can cause some eye discomfort when administered. It is important for the client to continue to take the drug. Glaucoma eyedrops should be administered as prescribed, not whenever the client desires. The client with glaucoma needs to take eye medication on an ongoing basis to control the disorder and prevent vision damage. There is no need to refrigerate the drug.

CN: Pharmacological and parenteral therapies; CL: Synthesize

7. 2. DVT causes edema; therefore, the **UAP**  should elevate the

extremity to promote venous return. Dependent positioning is appropriate for a client with arterial insufficiency. Placing a pillow under the knee would position the foot in a low position, and pressure behind the knee may obstruct venous flow. Massaging the extremity could dislodge the thrombus.

CN: Management of care; CL: Synthesize

8. 3. The bluish pigment on the buttocks and back of an infant of African descent is a common finding and should be documented as Mongolian spots in the child's **medical record**. These spots typically fade by the time the child is 5 or 6 years. Additional assessment by the care provider is not indicated. The marks are not bruises.

CN: Health promotion and maintenance; CL: Synthesize

9. 1. This client has a barrel chest. The anterior-posterior diameter of the chest is larger than the transverse diameter, as is characteristic of the client with chronic obstructive pulmonary disease. Although the client may be muscular from lifting weights, the barrel chest is not associated with the client's age, height, or weight. Use of bronchodilators will not change the shape of the client's chest.

CN: Physiological adaptation; CL: Analyze

10. 2. Fetal acoustic stimulation involves the use of an instrument that emits sound levels of approximately 80 dB at a frequency of 80 Hz. The sharp sound startles and awakens the fetus and is used with nonstress testing as a method to evaluate fetal well-being. A fetoscope or Doppler stethoscope is used to listen to the fetal heart rate. Nipple stimulation or intravenous oxytocin is used to stimulate contractions. Ultrasound testing is used to determine amniotic fluid volume.

CN: Reduction of risk potential; CL: Apply

11. 1, 3, 4, 5. Child molesters prey on lonely children or those who spend a lot of time at home alone due to a working parent. They initially show interest and assist the child and family such as by providing rides, money, and homework help. Once trust is established, molesters push for a more sexual relationship, which they justify by pointing out what they have done to help the child. If the child tries to stop the sexual interaction or appears ready

to tell someone, molesters will use threats to maintain the secret. Though some child molesters have had difficult childhoods in which they may have been molested, having them recognize that is not enough to keep them from offending again.

CN: Safety and infection control; CL: Apply

12. 3. A client with severe depression may experience symptoms of psychosis such as hallucinations and delusions that are typically mood congruent. The statement “My heart has stopped and my blood is black ash” is a mood-congruent somatic delusion. A delusion is a firm, false, fixed belief that is resistant to reason or fact. A hallucination is a false sensory perception unrelated to external stimuli. An illusion is a misinterpretation of a real sensory stimulus. Paranoia refers to suspiciousness of others and their actions.

CN: Psychosocial integrity; CL: Analyze

13. 2. Typically, iron supplements are needed for at least 1 month. By the end of this time, there should be a significant rise in the hemoglobin and hematocrit. Therefore, the mother needs to continue the iron supplements for several more weeks. Testing the child after only 2 weeks of treatment may not be beneficial. A significant rise in hemoglobin and hematocrit usually requires approximately 1 month of therapy. An iron-rich diet should have been started when the diagnosis was made and continued for at least the duration of iron supplement therapy.

CN: Pharmacological and parenteral therapies; CL: Synthesize

14. 2. Cystic fibrosis is the most common inherited disease in children. It is inherited as an autosomal recessive trait, meaning that the child inherits the defective gene from both parents. The chances are one in four for each of this couple’s pregnancies.

CN: Reduction of risk potential; CL: Apply

15. 1. The dietary department should meet with the client to ensure that the foods are available and prepared according to religious beliefs. On admission, the client should be asked whether there are special dietary needs. The dietary department should be notified of these special needs, and a dietary

representative should meet with the client and family when possible. The **HCP** 📖 should be consulted if a requested food is contrary to a prescribed diet restriction. The unit case manager does not need to be contacted regarding a dietary request. The rabbi is not involved in dietary requests.

🔑 CN: Management of care; CL: Apply

16. 1, 2, 3. For the client with grandiose delusions, the nurse should accept the client but not argue with the delusion to build trust and the client's self-esteem. Focusing on the underlying feeling or meaning of the delusion helps to meet the client's needs. Focusing on events and topics based in reality distracts the client from the delusional thinking. Confronting the client's delusions or beliefs can lead to agitation in the client and the need to cling to the grandiose delusion to preserve self-esteem. Interacting with the client only when based in reality ignores the client's needs and therapeutic nursing intervention.

🔑 CN: Psychosocial integrity; CL: Synthesize

17. 3. The nurse must act as an advocate for the client when the client cannot afford treatment. It may be possible to substitute a less expensive antibiotic. Correct procedure includes contacting the **HCP** 📖 to explain the mother's economic situation and request a substitution. For example, amoxicillin is more economical than azithromycin. If it is not possible to use another antibiotic, then the nurse can explore other avenues with the mother and/or social worker.

🔑 CN: Management of care; CL: Synthesize

18. 1. Saying "When you interrupt others, they leave the area" is most helpful because it serves to increase the client's awareness of others' perceptions of the behavior by giving specific feedback about the behavior. The other statements are punitive and authoritative, possibly threatening to the client, and likely to increase defensiveness, decrease self-worth, and increase feelings of guilt.

🔑 CN: Psychosocial integrity; CL: Synthesize

19. 1, 2, 3, 6. The important information to be given with a preeclamptic client should include blood pressure trends while being monitored and the

protein that is and has been present in the urine as these are indicators of increasing eclampsia. Edema of the face, a history of headache, blurred vision, and epigastric pain are important as these also indicate worsening preeclampsia. The fetal position at 25 weeks is of minor importance as the fetus is constantly changing positions at this point in the pregnancy. The use of dietary sodium does not have an impact on preeclampsia. Glycosuria is an important consideration if this client has gestational diabetes but is not significant for the client with preeclampsia.

CN: Safety and infection control; CL: Synthesize

20. 3. Although breech presentations are rare, footling breech occurs when there is an extension of the fetal knees and one or both feet protrude through the pelvis. In frank breech, there is flexion of the fetal thighs and extension of the knees. The feet rest at the sides of the fetal head. In complete breech, there is flexion of the fetal thighs and knees; the fetus appears to be squatting. Vertex position occurs in 95% of births; in such cases, the head is engaged in the pelvis.

CN: Health promotion and maintenance; CL: Apply

21. 3. The timing of symptoms is important to the diagnosis of PMS. The client should keep a 3-month log of symptoms and menses. With PMS, the symptoms begin 3 to 7 days before menses and resolve 1 to 2 days after the menstrual cycle has started. Menstrual cycle irregularity and mood swings after menses are not related to PMS, and other causes should be investigated. Midcycle spotting and pain are related to ovulation.

CN: Health promotion and maintenance; CL: Analyze

22. 2. The client who has received general anesthesia with neuromuscular blocking agents must be carefully monitored when given clindamycin. A serious interaction could be enhanced, neuromuscular blockage, skeletal muscle weakness, or respiratory depression, if this combination is used during or immediately after surgery. Concurrent use should be avoided. The combined effect of the medications places the client at increased risk, and the nurse should assess the client closely for respiratory depression or paralysis. The nurse will be monitoring the client's heart rate, blood pressure, and urinary output but not specifically because of potential drug interactions and

adverse effects of clindamycin.

CN: Pharmacological and parenteral therapies; CL: Analyze

23. 2. The client needs to know that there is a cause for the delirium, that there is hope for treatment, and that medications can help decrease anxiety. Giving medications can help the anxiety, but the client also needs an explanation about the condition. Saying that the more the client worries, the worse the delirium will get is inappropriate and most likely would add to the client's anxiety.

CN: Psychosocial integrity; CL: Synthesize

24. 1. The client is in a crisis and has a high anxiety level. Holding the client's hands and encouraging the client to slow down and take a deep breath conveys caring and helps decrease anxiety. Telling the client to calm down or stop worrying offers no concrete directions for accomplishing this task. It is unknown from the data who was at fault in the accident. Therefore, it is inappropriate for the nurse to state that it was not the client's fault.

CN: Psychosocial integrity; CL: Synthesize

25. 1, 4, 2, 3. The client is experiencing ketoacidosis. The nurse should first obtain the blood glucose level and then notify the **HCP**  who will then prescribe the appropriate dose of insulin. Prior to administering the insulin, the nurse will start the IV infusion.

CN: Physiological adaptation; CL: Synthesize

26. 3. Tasks that the **UAP**  can undertake vary greatly. The nurse must be aware of the scope of the UAP's preparation and the policies of the healthcare agency. The important consideration is that the task is appropriate for that individual and is within the guidelines for practice at the healthcare agency. The UAP can perform complicated tasks within the scope of the preparation. Although the nurse observes the UAP and evaluates the UAP on his or her ability to perform the task, the most important aspect of delegation is to delegate within the UAP's educational preparation. A positive relationship with clients, while desirable, is not essential to delegation. Delegation involves giving clear directions and following up after the task has been delegated.

 CN: Management of care; CL: Analyze

27. 4. Superficial thrombophlebitis is associated with pain, warmth, and erythema. The nurse can request a prescription for warm packs to relieve the pain. Venous insufficiency causes edema and a brown discoloration of the lower leg. Varicose veins are dark, protruding veins, and symptoms of discomfort increase with standing. Pain on dorsiflexion of the foot indicates deep vein thrombosis; the client does not indicate having this pain.

 CN: Physiological adaptation; CL: Synthesize

28. 1. Hospice programs are appropriate programs for clients with any type of terminal illness when death is imminent within weeks up to 6 months. Clients may discuss their prognosis of a terminal illness before it progresses to the terminal stage when a referral to hospice care is indicated. Clients are not required to have advance directives to be admitted to hospice services, but will be asked to complete them upon admission.

 CN: Management of care; CL: Apply

29. 1. Several irregularly shaped red patches, common skin variations in neonates, are termed stork bites. They eventually fade away as the neonate grows older. Port-wine stains are disfiguring darkish red or purplish skin discolorations on the scalp and face that may need laser therapy for removal. Newborn rash is typically generalized over the body, not localized to one body area, and is commonly raised. Café au lait spots are brown and typically found anywhere on the body. More than six spots or spots larger than 1.5 cm are associated with neurofibromatosis, a genetic condition of neural tissue.

 CN: Health promotion and maintenance; CL: Analyze

30. 3. In the traditional Mexican household, the man is the head of the family and makes the major decisions. Efforts should be made to reach the father as soon as possible to acquire his permission. It is not necessary to contact the social worker at this point. The client has not refused the procedure, so it is premature to contact the **HCP** . This is not a situation of suspected child abuse.

 CN: Management of care; CL: Synthesize

31. 1. At this time, the client's anger is not out of control, so empathy and talking are appropriate to diffuse the anger. Using time-out is appropriate when the client's anger is escalating and the client can no longer talk about the anger rationally. Restraints are appropriate only when there is imminent risk of harm to the client or others. Future strategies are discussed after the initial incident is resolved.

CN: Psychosocial integrity; CL: Synthesize

32. 1. In the cognitively impaired client, benzodiazepines, such as lorazepam, can increase confusion and nighttime agitation. Extrapyrimal side effects are more common with antipsychotics. Vomiting and sweating are signs of benzodiazepine withdrawal. Anticholinergic side effects are more likely with antipsychotics and tricyclic antidepressants.

CN: Pharmacological and parenteral therapies; CL: Analyze

33. 1, 2, 4. Telehealth is becoming an increasingly available way for nurses to conduct counseling sessions with clients who are at a distance from a **healthcare provider (HCP)**  or healthcare facility. The client saves travel time and can avoid precipitating symptoms associated with the stress disorder that might occur as a result of a visit to a healthcare facility. The client also can access care that might not otherwise be easily available. Treatment for PTSD is long term, and there is no evidence to suggest that telehealth versus face-to-face counseling shortens recovery time. Counseling sessions using telehealth technology are conducted on an individual basis between one client and an HCP, but group support may be available if required as a part of a treatment plan.

CN: Management of care; CL: Evaluate

34. 4. A woman with a uterus who takes unopposed estrogen has an increased risk of endometrial cancer. The addition of progesterone prevents the formation of endometrial hyperplasia. Progesterone does not prevent breast, liver, or cervical cancer.

CN: Pharmacological and parenteral therapies; CL: Apply

35. 3. The pre-school-age child with severe autism will benefit from one-on-one play therapy. The therapist can develop a rapport with this child with

nonverbal play. Antipsychotic medications are not indicated for the autism client. The child has difficulty with interpersonal relationships; therefore, group psychotherapy and social skills groups would not be effective.

CN: Psychosocial integrity; CL: Analyze

36. 2. The client who is 18 weeks with an intrauterine pregnancy (IUP) is not stable with bright red vaginal bleeding. Even with a nonviable fetus, the mother is in jeopardy with continued bleeding. The client who is 9 weeks IUP and has not vomited for 12 hours appears stable at this point with a nonviable fetus. The G8 also appears stable as her bleeding has tapered off since admission. The 29-week gestation client carrying twins has no information indicating that she is in jeopardy, with no contractions in the past 2 hours, and is becoming more stable.

CN: Health promotion and maintenance; CL: Synthesize

37. 3. The nurse should monitor the client's serum albumin. A decreased serum albumin indicates malnutrition and is considered a risk factor in the development of pressure ulcers. Other risk factors include immobility, incontinence, and decreased sensation. Having the client walk and inserting an indwelling catheter require a **healthcare provider's (HCP's)** prescription. The white blood cell count is monitored if an infection is present.

CN: Physiological adaptation; CL: Synthesize

38. 4. The nurse should recognize the ringing in the ears, or tinnitus, as a sign of ototoxicity probably caused by the furosemide. The appropriate action is for the nurse to stop the furosemide and notify the **HCP** . If the drug is stopped soon enough, permanent hearing loss can be avoided, and the tinnitus should subside. The nurse should note the observation in the **medical record** but should not delay action. Tinnitus is not a symptom of digoxin toxicity. Aspirin can cause tinnitus, but the nurse should first investigate the obvious cause of tinnitus, which in this case is the furosemide.

CN: Pharmacological and parenteral therapies; CL: Synthesize

39. 4. Any injury to the mouth results in copious amounts of blood because the mouth is a highly vascular area. Because the nurse does not know

the mother and does not speak Spanish, the most appropriate action is to give the mother the ice and demonstrate what she is to do. The child will be less fearful if the ice is applied by the mother. Calling for an interpreter is appropriate after caring for the immediate need of the child. Grabbing the child away will probably upset the mother more, further adding to the stress experienced by the child.

 CN: Psychosocial integrity; CL: Synthesize

40. 2, 3, 4. The client should recognize the signs of potential thermal dangers to prevent skin breakdown and wear clean, loose, soft cotton socks so that the feet are comfortable, air can circulate, and moisture is absorbed. In the winter or if the client has cold feet, the client should be encouraged to wear an extra pair of socks and a larger shoe size. Getting a sunburn during the summer puts the client at risk for tissue injury and skin breakdown. Using a heating pad to warm the feet or using an electric blanket places the client at risk for injury and should be avoided.

 CN: Reduction of risk potential; CL: Create

41. 3. The peak serum dose of an antibiotic is drawn 30 minutes after the completion of the IV dose of the antibiotic.

 CN: Pharmacological and parenteral therapies; CL: Apply

42. 2. Given the client's age, making final plans is age appropriate. The absence of any signs of ill health, depression, or suicidal ideation makes the other options inappropriate.

 CN: Psychosocial integrity; CL: Analyze

43. 1. ICP is highest in the early morning, and the client with hydrocephalus may be experiencing signs of increased ICP that need to be treated. The increased ICP is not related to fluid levels, and the nurse should not advise the client to increase fluid intake. While ICP does fluctuate during the day, it is highest in the morning, and the nurse should notify the **HCP** . Pain medication will not treat the potentially increasing ICP and may mask important signs of increasing ICP.

 CN: Physiological adaptation; CL: Synthesize

44. 1. The nurse should instruct the client that symptoms from an occasional headache due to eye strain or continuous work at a computer can be relieved by acetaminophen. Although this drug causes prostaglandin inhibition, this effect is rapidly reversed and cleared with no apparent harmful effects in pregnancy. If the headaches become more frequent or severe, the client should be instructed to contact her **healthcare provider (HCP)**  immediately. Aspirin should be avoided during pregnancy because it inhibits prostaglandin synthesis. It also decreases uterine contractility and may delay the onset of labor or prolong pregnancy and labor. Aspirin decreases platelet aggregation, possibly increasing the risk of bleeding. Ibuprofen and naproxen can lead to premature closure of the fetal ductus arteriosus and decreased amniotic fluid with prolonged use. They may also prolong pregnancy or labor because of their antiprostaglandin effects.

CN: Pharmacological and parenteral therapies; CL: Synthesize

45. 2. When a client is experiencing a flashback, the nurse should stay with the client, offer reassurance, and present reality in a nonthreatening manner to minimize the client's anxiety and agitation. The client needs to be told that he or she is experiencing an effect from lysergic acid diethylamide and that he or she is safe and the flashback will end. Confronting the client's misperceptions or challenging unrealistic statements could increase anxiety and agitation, possibly leading to aggressive behavior. Secluding the client until the flashback ends usually is not necessary or appropriate unless the client threatens or demonstrates aggression toward self or others.

CN: Psychosocial integrity; CL: Apply

46. 1. With this level of anger in a crisis, the father needs simple but firm directions to leave the room, calm down, and then to talk. Doing so relieves the daughter of any pressure from her father. Telling the father to stop yelling or be quiet provides no concrete directions to the father and may embarrass him in front of his daughter. Telling the father that if he does not stop yelling, the nurse will call Security is a threat, possibly leading to an escalation of the situation.

CN: Psychosocial integrity; CL: Synthesize

47. 2. Epidemiologic and experimental research studies indicate that

people of African descent are more likely to develop severe hypertension.

CN: Health promotion and maintenance; CL: Analyze

48. 2. Female clients with HIV are at risk for acquiring the papillomavirus, which predisposes them to cancer. This client needs to have regular Pap smears. Visiting this client could be delayed. Because of the safety risks and the need for pain management, the nurse visits the client with brain metastasis as soon as possible. A client with diabetes who may not inject insulin properly will be at great risk, and the nurse should plan to visit this client early as well. Because the client with CD4 is at great risk for a fulminating infection, the nurse does not postpone the appointment.

CN: Management of care; CL: Synthesize

49. 1. A large pad of fat at the back of the neck, widely set eyes, a simian crease in the hands, and epicanthal folds are typically associated with Down syndrome. The nurse should notify the **HCP**  immediately. The HCP should obtain **consent** for genetic studies and is responsible for explaining these deviations to the parents. However, the nurse may need to provide additional teaching to the mother and to answer any questions that may arise.

CN: Health promotion and maintenance; CL: Synthesize

50. 1. To help prevent flexion deformities, a client with rheumatoid arthritis should lie in a prone position in bed for about ½ hour several times a day. This positioning helps keep the hips and knees in an extended position and prevents joint flexion. Low Fowler's, modified Trendelenburg, and side-lying positions do not prevent hip flexion.

CN: Basic care and comfort; CL: Synthesize

51. 1. Clients receiving chronic steroid therapy can become immunosuppressed and are prone to infections. Signs of infection can also be masked with prednisone. Signs and symptoms of infection should be reported immediately. Joint pain, constipation, and joint swelling are not related to the adverse effects of steroid therapy.

CN: Pharmacological and parenteral therapies; CL: Synthesize

52. 2. Confidentiality must be broken if there are credible threats made

against another person's safety. Confidentiality does not override the safety of other persons.

 CN: Management of care; CL: Apply

53. 2. Handwashing with the correct technique is the best method for preventing cross-contamination. The hands serve as a source of infection. Waterless commercial products containing at least 60% alcohol are as effective at killing organisms as handwashing.

 CN: Management of care; CL: Synthesize

54. 4. School-age children enjoy board games and are commonly intense about following rules. Their play can become emotional. Adequate rest is of utmost importance during the acute stage of rheumatic fever. Therefore, playing a game with another child probably would be too strenuous. Such diversional activities as reading a book, playing with a doll, and watching television would be more satisfactory.

 CN: Health promotion and maintenance; CL: Synthesize

55. 1. The client who is on a progressive exercise program at home after a myocardial infarction should be taught to monitor the pulse rate. The pulse rate can be expected to increase with exercise, but exercise should not be increased if the pulse rate increases more than about 25 bpm from baseline or exceeds 100 to 125 bpm. The client should also be taught to discontinue exercise if chest pain occurs.

 CN: Basic care and comfort; CL: Analyze

56. 2. Women who take oral contraceptives are at increased risk for thromboembolic conditions. Severe calf pain needs to be investigated as a potential sign of deep vein thrombosis. Breakthrough bleeding, mild headache, or weight gain may be common benign side effects that accompany oral contraceptive use. Clients may be monitored for these side effects without a change in treatment.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

57. 4. The priority for a client with a new tracheostomy is to maintain a patent airway. A new tracheostomy commonly causes bleeding and excess

secretions, and the client may require frequent suctioning to maintain a patent airway.

 CN: Reduction of risk potential; CL: Synthesize

58. 1. The nurse should call to the nursing station to ask the nursing team for assistance. It is not necessary to page the **HCP**  because this is not an emergency, but the nurse will need to notify the provider of the client's death, and then also notify the family. A "code" should not be called because the client and family have designated a "do-not-resuscitate" status. Nursing personnel should begin postmortem care so that the family does not walk in unannounced to find their loved one deceased and looking disarrayed.

 CN: Management of care; CL: Synthesize

59. 2, 3, 4. Yogurt, dry beans, and peanut butter all contain protein in amounts that make them good sources of protein for the child. Whole wheat bread and apples are carbohydrates and do not provide a sufficient source of protein.

 CN: Basic care and comfort; CL: Apply

60. 3. The nurse should assess the client's vital signs because there is a likelihood of having a reaction to the bupivacaine. If the client's vital signs are abnormal, immediate intervention may be necessary. Although the nurse may ask the client to continue to describe feelings, this is not likely to be a psychosocial reaction. Simple reassurance is inappropriate in most clinical situations and can be dangerous if physiologic causes of restlessness are overlooked. The nurse should not administer epinephrine until vital signs have been assessed.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

61. 3. The nurse should first determine why the client wants to sit up and then, if needed delegate someone to assist the client. Loosening the restraints will not keep the client safe in bed. Raising the side rails and elevating the head of the bed do not address the client's needs.

 CN: Management of care; CL: Synthesize

62. 2. Endometrial cancer has very few warning signals; irregular bleeding

may be the only sign. Any irregular bleeding in a menopausal woman should be investigated, and an endometrial biopsy may be prescribed. Hot flashes result from the decreased estrogen levels that accompany menopause. Urinary urgency should be monitored and treated as a separate problem. Dyspareunia is the occurrence of pain in the labial, vaginal, or pelvic areas during or after sexual intercourse. It may be caused by inadequate vaginal lubrication in the menopausal woman.

CN: Pharmacological and parenteral therapies; CL: Analyze

63. 3. The client should be encouraged to report painful urination or urinary retention. Lesions may appear 2 to 12 days after exposure. The client is capable of transmitting the infection even when asymptomatic, so a barrier contraceptive should be used. Drinking extra fluids will not stop the lesions from forming.

CN: Management of care; CL: Synthesize

64. 1. Cystic fibrosis is an autosomal recessive genetic disorder. This means that both parents have the gene. There is a one in four chance with each pregnancy from such parents that the child will have cystic fibrosis.

CN: Physiological adaptation; CL: Synthesize

65. 1. With increased blood supply to the leg, there should be less or absent claudication (cramping pain in leg with walking). Pulses should be palpable with improved blood supply. Edema is associated with venous disease. Pallor with elevation and dependent rubor are symptoms of peripheral arterial disease.

CN: Physiological adaptation; CL: Evaluate

66. 1. The nurse should first obtain the blood culture because subsequent treatment will be dependent on the results. The client has an intravenous infusion; the **HCP**  did not write a prescription to increase the infusion rate. Unless indicated otherwise, the nurse can take the client's vital signs after completing scheduling the CT scan and other laboratory work.

CN: Reduction of risk potential; CL: Synthesize

67. 4. At this level of aggression, the client needs an appropriate physical

outlet for the anger. She is beyond writing in a journal. Urging the client to talk to the nurse now or making threats, such as telling her that she will be restrained, is inappropriate and could lead to an escalation of her anger.

CN: Psychosocial integrity; CL: Synthesize

68. 3. Acupuncture, like acumassage and acupressure, is performed in certain Asian cultures to restore the energy balance within the body. Pressure, massage, and fine needles are applied to energy pathways to help restore the body's balance. Acupuncture is not based on a belief in purging evil spirits. Although pain relief through acupuncture can promote tranquility, acupuncture is performed to restore energy balance. In the Western world, many researchers think that the gate-control theory of pain may explain the success of acupuncture, acumassage, and acupressure.

CN: Basic care and comfort; CL: Apply

69. 3. Variable decelerations are associated with compression of the umbilical cord. The nurse should alter the client's position and increase the IV fluid rate. Fetal head compression is associated with early decelerations. Severe compression of the fetal chest, such as during the process of vaginal birth, may result in transient bradycardia. Compression or damage to the placenta, typically from abruptio placentae, results in severe, late decelerations.

CN: Reduction of risk potential; CL: Analyze

70. 1. The mask is appropriate because it covers the nose and mouth and fits snugly against the cheeks and chin. Masks that are too large may cover the eyes. Masks that are too small obstruct the nose. The mask does not need to be covered with a cloth.

CN: Management of care; CL: Evaluate

71. 1, 2, 3, 4. DIC is diagnosed based on clinical symptoms and laboratory findings. Findings such as excessive and unusual bruising or bleeding over areas of tissue trauma, such as IV insertion or incision sites, or application of a blood pressure cuff should be reported to the **HCP** . Tachycardia and diaphoresis also may be noted. Laboratory results reveal low platelet, fibrinogen, proaccelerin, antihemophilic factor, and prothrombin levels.

Bleeding time is normal, and partial thromboplastin time is increased. A urine output of 350 mL in 8 hours indicates adequate renal function. Temperature is not an indication of DIC.

CN: Physiological adaptation; CL: Analyze

72. 2. If the chest tube is accidentally pulled out (a rare occurrence), a petroleum jelly gauze and sterile 4- × 4-inch dressing should be applied over the chest wall insertion site immediately. The dressing should be covered with adhesive tape and be occlusive, and the surgeon should be notified. The lungs can be auscultated, and vital signs can be taken after the dressing is in place and the surgeon has been called. Placing the tube in sterile water will not reestablish a seal to prevent air entering the insertion site of the chest tube.

CN: Reduction of risk potential; CL: Synthesize

73. 2. Preserving forensic evidence is essential for investigative purposes following injuries that may be suspected as having criminal intent. The nurse places each item of clothing in a separate paper bag and labels it; wet clothing is hung to dry. The nurse does not cut or otherwise unnecessarily handle clothing, particularly clothing with evidence such as blood or body fluids. The nurse documents carefully the clients' description of the incident and uses quotes around the clients' exact words where possible; documentation will become a part of the clients' **medical records** and can be subpoenaed for subsequent investigation.

CN: Management of care; CL: Synthesize

74. 1. A frothy, purulent vaginal discharge in a sexually active female client is typically caused by a sexually transmitted infection such as trichomonas. Other diseases, such as chlamydia, may also be present. Both the client and the boyfriend need treatment after the disease is determined. Normal variations in female vaginal discharge should be clear to white, not frothy or purulent. The client should be instructed to wear cotton underwear and avoid pantyhose, wet gym clothes, and tight-fitting garments, such as jeans, so that air can circulate.

CN: Management of care; CL: Analyze

75. 4. Emboli obstruct blood flow, leading to a decreased perfusion of the lung tissue. Because of the decreased perfusion, a ventilation-perfusion mismatch occurs, causing hypoxemia to develop. Arterial blood gas analysis typically will indicate hypoxemia and hypocapnia. A priority objective in the treatment of pulmonary emboli is maintaining adequate oxygenation. A productive cough and activity intolerance do not indicate impaired gas exchange. The client does not demonstrate an ineffective breathing pattern; rather, the problem of impaired gas exchange is caused by the inability of blood to flow through the lung tissue.

CN: Physiological adaptation; CL: Synthesize

76. 3. Systematic pain assessment is necessary for adequate pain management in the postoperative client. Even though the client is receiving morphine sulfate by PCA, assessment is needed if the client is experiencing pain. Encouraging the client to rest or to ignore pain without further assessment is not a sufficient intervention.

CN: Basic care and comfort; CL: Synthesize

77. 3. Cardiogenic shock occurs when myocardial contractility decreases and cardiac output greatly decreases. The circulating blood volume is within normal limits or increased. Infarction is not always the cause of cardiogenic shock.

CN: Physiological adaptation; CL: Analyze

78. 1. The goal of the education program is to instruct the client to take the pulse; therefore, the expected outcome would be the ability to give a return demonstration of how to palpate the heart rate.

CN: Reduction of risk potential; CL: Evaluate

79. 1. The nurse should expect to find decreased levels of thyroxine and triiodothyronine and increased TSH. Other indicators of hypothyroidism are the presence of antithyroid antibodies and elevation of the creatine phosphokinase (CPK-MM) level. Hypothyroidism has a metabolic effect on skeletal muscle. Muscle injury results, causing the CPK-MM to spill out of the damaged cells and into the bloodstream.

CN: Physiological adaptation; CL: Analyze

80. 2. If the client begins to experience abdominal cramping during administration of the enema fluid, the nurse's first action is to temporarily stop the infusion and have the client take a few deep breaths. After the cramping subsides, the nurse can continue with the enema solution. If the cramping does not subside, the nurse should clamp the tubing and remove it. Raising the height of the container will increase the flow of fluid and cause the cramping to increase. Rubbing the abdomen while infusing the enema fluid will not stop the cramping.

CN: Basic care and comfort; CL: Synthesize

81. 3. Although chronologically the infant is 7 months old, because of being born 6 weeks early, the child is only 5½ months old developmentally. Appropriate activities for a 5- to 5½-month-old infant include placing a rattle or ball in the infant's hand. Picture books are an appropriate choice for an infant older than 9 months. Playing peekaboo is appropriate for a 9- to 12-month-old infant. Colored blocks are appropriate for a toddler approximately age 15 to 18 months.

CN: Health promotion and maintenance; CL: Synthesize

82. 3. Accurate daily weight measurement provides the best measure of a client's fluid status: 1 kg (2.2 lb) is equal to 1,000 mL of fluid. To be accurate, weight should be obtained at the same time every day, with the same scale, and with minimal clothing on.

CN: Physiological adaptation; CL: Analyze

83. 3. The nurse uses Montgomery straps primarily to avoid the removal of long-term abdominal dressing tape and ultimate skin breakdown.

CN: Basic care and comfort; CL: Apply

84. 2. Full benefit from an antidepressant medication usually takes about 2 to 4 weeks on an adequate dose.

CN: Pharmacological and parenteral therapies; CL: Apply

85. 3. Percutaneous umbilical blood sampling is a useful procedure for diagnosing Rh disease, obtaining fetal complete blood count, and karyotyping chromosomes to evaluate for genetic disorders. Ultrasound commonly is used

to detect twins. A lecithin-sphingomyelin ratio is the procedure of choice to diagnose fetal lung maturation. A maternal blood test is used to determine the alpha fetoprotein level.

 CN: Reduction of risk potential; CL: Apply

86. 2. Fine tremors are the first symptom reported in 70% of clients with Parkinson's disease. A new onset of tremors needs to be investigated by the HCP . Tremors are not an expected change with aging.

 CN: Reduction of risk potential; CL: Synthesize

87. 0.8 mL

$$\frac{0.4 \text{ mg}}{X} = \frac{0.5 \text{ mg}}{1 \text{ mL}}$$

$$0.4 = 0.5X$$

$$\frac{0.4}{0.5} = X$$

$$0.8 \text{ mL} = X.$$

 CN: Pharmacological and parenteral therapies; CL: Apply

88. 1. Loss of appetite is one of the more common adverse effects associated with methylphenidate. Although nausea is associated with this drug, vomiting is not. Photosensitivity is not associated with this drug. Because of decreased appetite, the client will not gain more weight.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

89. 2. The pH of 7.26 indicates that the body is in a state of acidosis. The elevated partial pressure of carbon dioxide value accompanied by a normal

bicarbonate value indicates that the acid-base imbalance is respiratory acidosis. The additional clinical findings of headache, dizziness, and increased pulse rate, resulting from the elevated partial pressure of carbon dioxide, further support this diagnosis.

CN: Physiological adaptation; CL: Analyze

90. 1. Children with osteomyelitis need a diet that is high in protein and calories. Milk, eggs, cheese, meat, fish, and beans are the best sources of these nutrients.

CN: Physiological adaptation; CL: Synthesize

91. 1, 2. The purpose of CQI is to improve a local process to benefit clients and providers; it is required by the institution, regulatory, or accrediting agencies. The approach to the problem can be retrospective or concurrent; institutional review board (IRB approval) is not required unless the results will be made available to external parties, and specific clients could be identified. CQI is performed by clinicians and managers who are part of the process being studied; the timeframe is continuous or cyclical.

CN: Management of care; CL: Synthesize

92. 4. This client has indications of peripheral artery disease (PAD) and needs additional follow-up. Increasing walking or exercising the legs and feet likely will not be sufficient to improve peripheral circulation. Muscle cramping is a result of inadequate arterial circulation. Increasing potassium will not decrease the cramping.

CN: Physiological adaptation; CL: Synthesize

93. 2. Tracheostomy tubes are associated with several potential complications, including laryngeal nerve damage, bleeding, and infection. Tracheostomy tubes do not cause decreased cardiac output, pneumothorax, or acute respiratory distress syndrome.

CN: Physiological adaptation; CL: Analyze

94. 1. To reduce the risk of crystalluria, the client should drink 2,000 to 3,000 mL of water a day, not 1,000 to 1,500 mL. The client should not take an antacid before taking ciprofloxacin. An antacid decreases the absorption of

the drug. The client should let the **HCP**  know if vomiting occurs from the medication. The client may get light-headed from the ciprofloxacin. If so, the client should not drive a motor vehicle and should contact the HCP.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

95. 4. The nurse should instruct the client to increase her intake of calcium because there is a slight increase in the risk of osteoporosis with this medication. Weight-bearing exercises are also advised. The drug may also impair glucose tolerance in women who are at risk for diabetes.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

96. 4. Stress management is not beneficial to the client with Alzheimer's disease because of cognitive impairment, confusion, and short-term memory loss. Reminiscence group, walking, and pet therapy are beneficial.

 CN: Psychosocial integrity; CL: Synthesize

97. 3. The incisions made for upper abdominal surgeries, such as cholecystectomies, are near the diaphragm and make deep breathing painful. Incentive spirometry, which encourages deep breathing, is essential to prevent atelectasis after surgery. The client is not maintained on bed rest for several days. The client is encouraged to ambulate by the first postoperative day, even with drainage tubes in place. Nasogastric tubes do not inhibit deep breathing and coughing.

 CN: Physiological adaptation; CL: Apply

98. 1, 3. When a child with hemophilia develops bleeding into a joint, the parents should have the child rest and begin factor VIII therapy. If therapy is started immediately, usually other interventions such as ice are not necessary. Heat causes vasodilation and promotes bleeding. Starting factor VIII immediately helps prevent chronic joint disease. Starting physical therapy further traumatizes the joint, possibly increasing the bleeding. Applying a topical agent does not control internal bleeding.

 CN: Reduction of risk potential; CL: Create

99. 1. When cleaning the skin around an incision and drain, the nurse should clean the incision and drain separately to avoid contaminating either

wound. This is applying the principle of working from the least contaminated area to the most contaminated area. In this case, both areas are fresh wounds and should be kept separate.

 CN: Management of care; CL: Apply

100. 4. The aminoglycoside antibiotic gentamicin sulfate should not be applied to large denuded areas because toxicity and systemic absorption are possible. The nurse should instruct the client to avoid excessive sun exposure because gentamicin sulfate can cause photosensitivity. The client should be instructed to apply the cream or ointment for only the length of time prescribed because a superinfection can occur from overuse. The client should contact the **HCP**  if the condition worsens after use.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

101. 2. The priority for ongoing care for this child is to prevent injury while maintaining normal growth and interests. As with all chronic illnesses, there is a potential for self-esteem problems, but no data are presented to support this as a priority for care planning. The parents should have a good understanding of the disease process and realize the importance of obtaining regular health care for their child. The client may have episodes of acute pain, for the child who has bleeding into a joint, but this is a transient situation.

 CN: Reduction of risk potential; CL: Synthesize

102. 3. A 3-year-old child responds best to distraction during a procedure because of the typical level of cognitive development of a 3-year-old and the fear of painful events. Preparation for the procedure should be done immediately beforehand, so that the child will not become too frightened. A 3-year-old is not concerned about the why of the procedure but about whether the procedure will hurt. This child is too young for verbal explanations alone because of the limited verbal abilities at this age and the fear of a painful event.

 CN: Health promotion and maintenance; CL: Synthesize

103. 3. Lisinopril is an angiotensin-converting enzyme (ACE) inhibitor. Hyperkalemia can be a side effect of ACE inhibitors. Because of this side effect, ACE inhibitors should not be administered with potassium-sparing

diuretics.

CN: Pharmacological and parenteral therapies; CL: Analyze

104. 2. The interpreter may have been delayed. Therefore, the nurse's best action would be to reschedule the child's appointment when the interpreter can be scheduled as well. Because the mother does not speak English, there is no point in examining the infant because history information is needed and most likely would be too difficult to obtain. Asking the mother to stay longer is rude to her. Also, doing so would probably be difficult because of the communication gap. If the interpreter is delayed, paging one more time will not help.

CN: Management of care; CL: Synthesize

105. 3. Nitroglycerin in all dosage forms (sublingual, transdermal, or intravenous) should be shielded from light to prevent deterioration. The client should be instructed to keep the nitroglycerin in the dark container that is supplied by the pharmacy, and it should not be removed or placed in another container.

CN: Pharmacological and parenteral therapies; CL: Apply

106. 4. Medication noncompliance is a primary cause of exacerbation in chronic mental illnesses. Of the issues listed, medications should be addressed first. Other issues, such as family, marriage, and finances, can be addressed as client stabilization is maintained.

CN: Psychosocial integrity; CL: Synthesize

107. 4. IV fluids should not be infused for longer than 24 hours because of the risk of bacterial growth in the solution. The appropriate action for the nurse to take is to discontinue the current TPN solution, change the tubing, and hang a new bag of solution. Changing the filter does not decrease the risk of contamination. Notifying the **HCP** 📖 for a change in flow rate is not an acceptable solution.

CN: Pharmacological and parenteral therapies; CL: Synthesize

108. 2. The client who drinks alcohol while taking disulfiram experiences sweating, flushing of the neck and face, tachycardia, hypotension, a

throbbing headache, nausea and vomiting, palpitations, dyspnea, tremor, and weakness.

CN: Pharmacological and parenteral therapies; CL: Analyze

109. 3. The nurse's first response is to further assess the client's pain. After a thorough assessment, additional appropriate actions may be to notify the **HCP** , administer an analgesic, and administer oxygen.

CN: Basic care and comfort; CL: Synthesize

110. 4. Trisomy 13 (Patau's syndrome) is an autosomal disorder. Characteristics include cleft lip and palate, polydactyly, malformed ears, and mental retardation. These neonates typically die during infancy. A webbed neck is associated with Turner's syndrome (45 total chromosomes). Small testes and absence of sperm are associated with Klinefelter's syndrome (47 chromosomes). Congenital heart defects are associated with trisomy 21 (Down syndrome) and trisomy 18 (Edwards' syndrome).

CN: Physiological adaptation; CL: Synthesize

111. 1. The nurse should instruct the client to take the medication immediately or as soon as she remembers that she missed the medication. There is only a slight risk that the client will become pregnant when only one pill has been missed, so there is no need to use another form of contraception. However, if the client wishes to increase the chances of not getting pregnant, a condom can be used by the male partner. The client should not omit the missed pill and then restart the medication in the morning because there is a possibility that ovulation can occur, after which intercourse could result in pregnancy. Taking two pills is not necessary and also will result in putting the client off her schedule.

CN: Pharmacological and parenteral therapies; CL: Synthesize

112. 2. Neurologic symptoms, such as footdrop, or bowel or bladder changes, should be reported to the **HCP**  immediately. When musculoskeletal strain causes back pain, these symptoms may take 4 to 6 weeks to resolve. As an accompanying symptom of acute low back pain, the client may have a diffuse, aching sensation in the L4 to L5 area, pain in the lower back when the leg is lifted, or pain that radiates to the hip.

 CN: Reduction of risk potential; CL: Analyze

113. 2. Taking ginseng when on insulin is not encouraged because ginseng increases the risk of hypoglycemia. Ginseng can be therapeutic in certain situations but is potentially harmful for clients taking insulin. Taking ginseng with a carbohydrate will not offset the effect of the ginseng.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

114. 1. Sudden, sharp pain with breathing or coughing on the affected side, tachypnea, dyspnea, diminished or absent breath sounds on the affected side, tachycardia, anxiety, and restlessness indicate a pneumothorax, which can be a complication of inserting a central venous pressure line. The other findings are within normal limits.

 CN: Physiological adaptation; CL: Analyze

115. 2. The expected effect of lactulose is for the client to have two to three soft stools a day to help reduce the pH and serum ammonia levels, which will prevent hepatic encephalopathy.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

116. 3. Leukocytosis, an increased white blood cell count, indicates the presence of inflammation, infection, or a leukemia process. In inflammation and infection, the client's sedimentation rate is increased. Thrombocytopenia, a platelet deficiency, occurs in the client with leukemia, immunocompromised client, client with aplastic anemia, or client with other conditions. Erythrocytosis, an elevation of the red blood cell count, occurs in polycythemia vera.

 CN: Physiological adaptation; CL: Analyze

117. 2. A fractured femur, especially an open fracture, can cause much soft tissue damage and lead to significant blood loss. Hypovolemic shock can develop. Cardiogenic shock occurs when cardiac output is decreased as a result of ineffective pumping. Neurogenic shock occurs as a result of an impaired autonomic nervous system function. Anaphylactic shock is the result of an allergic reaction.

 CN: Physiological adaptation; CL: Analyze

118. 4. This girl has an exaggeration of the lumbar spine, swayback, or lordosis. Kyphosis is an increased convexity or roundness of the curve of the thoracic spine. Scoliosis is a lateral curvature of the spine.

CN: Health promotion and maintenance; CL: Analyze

119. 4. The most appropriate action is to report the swelling, loss of mobility, and unrelieved pain to the **HCP** . These symptoms are indicators of neurovascular impairment. Administering opioids will not eliminate the cause of the problem, which is unrelieved pressure on nerves and blood supply. If prompt action (cutting the cast) is not taken to relieve the pressure, permanent muscular and neurologic injury may result. Applying the ice bag would have been appropriate earlier to decrease or prevent swelling, but applying it at this time could actually lead to further decreased circulation. The arm should be elevated, but the nurse cannot wait 30 minutes to reassess the client without risking permanent damage.

CN: Reduction of risk potential; CL: Synthesize

120. 1. Prostaglandin F_{2a} promotes uterine contractions, thereby minimizing uterine atony and subsequent hemorrhage. Possible side effects include nausea, tachycardia, hypertension, and diarrhea. Abdominal distention is not associated with the use of prostaglandin F_{2a} .

CN: Pharmacological and parenteral therapies; CL: Analyze

121. 2. Morphine can cause urinary retention. The nurse should assess the client for urinary hesitancy or retention and note the urinary output. It is not necessary to take the apical heart rate after each dose of morphine. Mental status should be assessed after each dose because morphine can cause such effects as sedation, delirium, and disorientation. Assessing for pedal edema is not necessary.

CN: Pharmacological and parenteral therapies; CL: Analyze

122. 1. Before 32 weeks' gestation, most neonates have difficulty coordinating sucking and swallowing reflexes along with breathing. Increased respiratory distress may occur with bottle-feeding. Bottle-feedings can be given after the neonate shows sucking and swallowing behaviors. High-calorie formulas can be given by bottle or by gavage feeding. Although

frequent feeding prevents hypoglycemia, the feeding does not have to be given via a gavage tube. Although these neonates can be stressed by cold, they can be kept warm with blankets while being bottle-fed or fed while in the warm isolette environment.

CN: Health promotion and maintenance; CL: Apply

123. 1, 2, 4. After bowel surgery, an NG tube attached to low intermittent suction is used to remove gastric fluids. The amount of fluid from the NG tube suction is important because it contributes to the client's overall fluid and electrolyte balance. IV fluids are used to maintain hydration, and intake and output is measured to determine hydration status. Postoperative vital signs are assessed more frequently than every 6 hours. Bowel sounds will be auscultated to determine when they return. Measuring abdominal girth is not necessary following colostomy reversal.

CN: Physiological adaptation; CL: Synthesize

124. 2. Regularly scheduled rest periods during the day along with 8 to 10 hours of sleep at night helps relieve the fatigue, pain, and stiffness associated with rheumatoid arthritis. Even with mild rheumatoid arthritis, the client may find it difficult to perform activities of daily living without some rest periods. Spending 1 day a week in bed to relieve fatigue does not adequately manage the disease. The client must recognize the need for rest before feeling exhausted because overexertion can cause exacerbations. In addition, prolonged periods of inactivity can increase joint stiffness and pain. Getting up early to do household chores before the children are awake does not allow for adequate rest.

CN: Basic care and comfort; CL: Evaluate

125. 3. For the child with hemophilia who is actively bleeding, the nurse should apply direct pressure to the injured area for 10 minutes continuously along with elevating the leg. The continuous application of direct pressure aids in stopping the bleeding. Elevating the leg reduces blood flow to the area, thereby minimizing the extent of blood loss. Although ice will cause local vasoconstriction and slow the bleeding, applying continuous direct pressure is essential.

CN: Physiological adaptation; CL: Synthesize

126. 2. The nurse should assess for signs of impending shock such as diaphoresis. The client would have hypotension, dysuria, and cool skin.

CN: Pharmacological and parenteral therapies; CL: Analyze

127. 4. Hypothyroidism is not associated with pancytopenia. Various anemias are associated with pancytopenia owing to the reduction in all cellular elements of the blood. Bleeding and clotting difficulties can be associated with pancytopenia. Infection is a common danger associated with pancytopenia.

CN: Physiological adaptation; CL: Analyze

128. 2. The client's return to the emergency department and her statement about not knowing what to do about being abused by her husband indicate that the client is asking for help. The nurse's best course of action is to explain the various options available to her. This helps the client make decisions based on appropriate knowledge. Research reveals that women are more likely to be killed by partners than by strangers. Although the client can legally leave her husband, this answer provides the client with no safety options. Listing ways to avoid making the husband angry ignores the dynamics of abuse and blames the victim.

CN: Psychosocial integrity; CL: Synthesize

129. 3. When dextrose is abruptly discontinued, rebound hypoglycemia can occur. The nurse should assess the client for symptoms of hypoglycemia. Essential fatty acid deficiency is very unlikely to occur because some of these fatty acids are stored. Preventing dehydration or malnutrition is not the reason for tapering the infusion rate; the client's hydration and nutritional status and ability to maintain adequate intake must be established before TPN is discontinued.

CN: Pharmacological and parenteral therapies; CL: Apply

130. 3. The nurse places a postoperative client who has had abdominal surgery in low Fowler's position. This position relaxes abdominal muscles and promotes maximum respiratory and cardiovascular function.

CN: Reduction of risk potential; CL: Synthesize

131. 1. It is most important to know the child's serum potassium level when administering digoxin. Digoxin increases contractility of the heart and increases renal perfusion, resulting in a diuretic effect with increased loss of potassium and sodium. Hypokalemia increases the risk of digoxin toxicity. Verifying the dosage is specified by facility policy and varies among facilities. Although the child may take the medication better from the mother than from the nurse, asking the mother to give the medication is not necessary. In addition, this would be done after the nurse has checked the electrolyte levels. Teaching the parent how to measure the child's heart rate can be done at any time, not necessarily when preparing to give digoxin.

CN: Pharmacological and parenteral therapies; CL: Synthesize

132. 2. There is a direct interaction between the effects of insulin and those of beta-blockers. The nurse must be aware that there is a potential for increased hypoglycemic effects of insulin when a beta-blocker is added to the client's medication regimen. The client's blood sugar should be monitored. Ketoacidosis occurs in hyperglycemia. Although a decrease in the incidence of ketoacidosis could occur when a beta-blocker is added, the direct result is an increase in the hypoglycemic effect of insulin.

CN: Pharmacological and parenteral therapies; CL: Apply

133. 4. During the emergent phase of burn management, there is a massive shift of fluid from the blood vessels (intravascular compartment) into the tissues (interstitial compartment). The result of this shift is hypovolemic shock and edema formation. The fluid shift is caused by increased capillary permeability that allows water, sodium, and protein to shift to the tissues. As the emergent period ends and capillary permeability returns to normal, the fluid in the interstitial compartment will return to the intravascular compartment.

CN: Physiological adaptation; CL: Analyze

134. 1. The client with sensorineural hearing loss has difficulty hearing high-pitched sounds. Aging and ototoxicity are two causes of sensorineural hearing loss. The client's ability to speak is not affected. The client who cannot assign meaning to sound has central hearing loss. Vertigo is commonly an indication of an inner ear problem.

 CN: Physiological adaptation; CL: Analyze

135. 3. A urine output of 30 to 50 mL/h indicates adequate fluid replacement in the client with burns. An increase in body weight may indicate fluid retention. A urine output greater than fluid intake does not represent a fluid balance. Depending on the client, blood pressure of 90/60 mm Hg could indicate the presence of a hypovolemic state; by itself, it does not indicate adequate fluid replacement.

 CN: Physiological adaptation; CL: Evaluate

136. 3. Commonly, when a child appears better, the parents stop the medication. Unfortunately, the infection remains. Therefore, the nurse needs to explain that all of the medication must be administered to clear up the infection. Explaining why the medicine should be continued is more helpful to parents than saying it needs to be given. Telling the parent that stopping the medication is not what is best for the child implies blame and is - condescending.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

137. 1. Many clients who experience abuse are hesitant to talk about it and need help to do so. The nurse should ask the client directly about abuse when it is suspected, using a sensitive, empathetic, and compassionate approach. In this way, the client can feel comfortable revealing information about the abuse. Telling the client that it is difficult to believe her injuries resulted from a fall is not helpful because it is blameful and puts the client on the defensive. Asking the client what she did to make someone hit her or discussing what she can do the next time blames and alienates the client.

 CN: Psychosocial integrity; CL: Synthesize

138. 1. A primary outcome for the care of the client in shock is to achieve adequate tissue perfusion, thus avoiding multiple organ dysfunction. The lungs are susceptible to injury, especially acute respiratory distress syndrome. Vasoconstriction occurs as a compensatory mechanism until the client enters the irreversible stage of shock.

 CN: Reduction of risk potential; CL: Evaluate

139. 3. The client with emphysema is commonly underweight in appearance. The weight loss may be caused by the increased energy required to support the work of breathing. Frequent coughing, bronchospasms, and copious sputum are clinical manifestations of chronic bronchitis.

 CN: Physiological adaptation; CL: Analyze

140. 3, 4, 5. The neurologic system can be affected and cause long-term consequences in a young child exposed to lead. Common behavioral effects include hyperactivity, impulsivity, and aggression. Seizures may occur in a child with high-dose lead exposure. Depression is not usually associated with lead exposure.

 CN: Physiological adaptation; CL: Apply

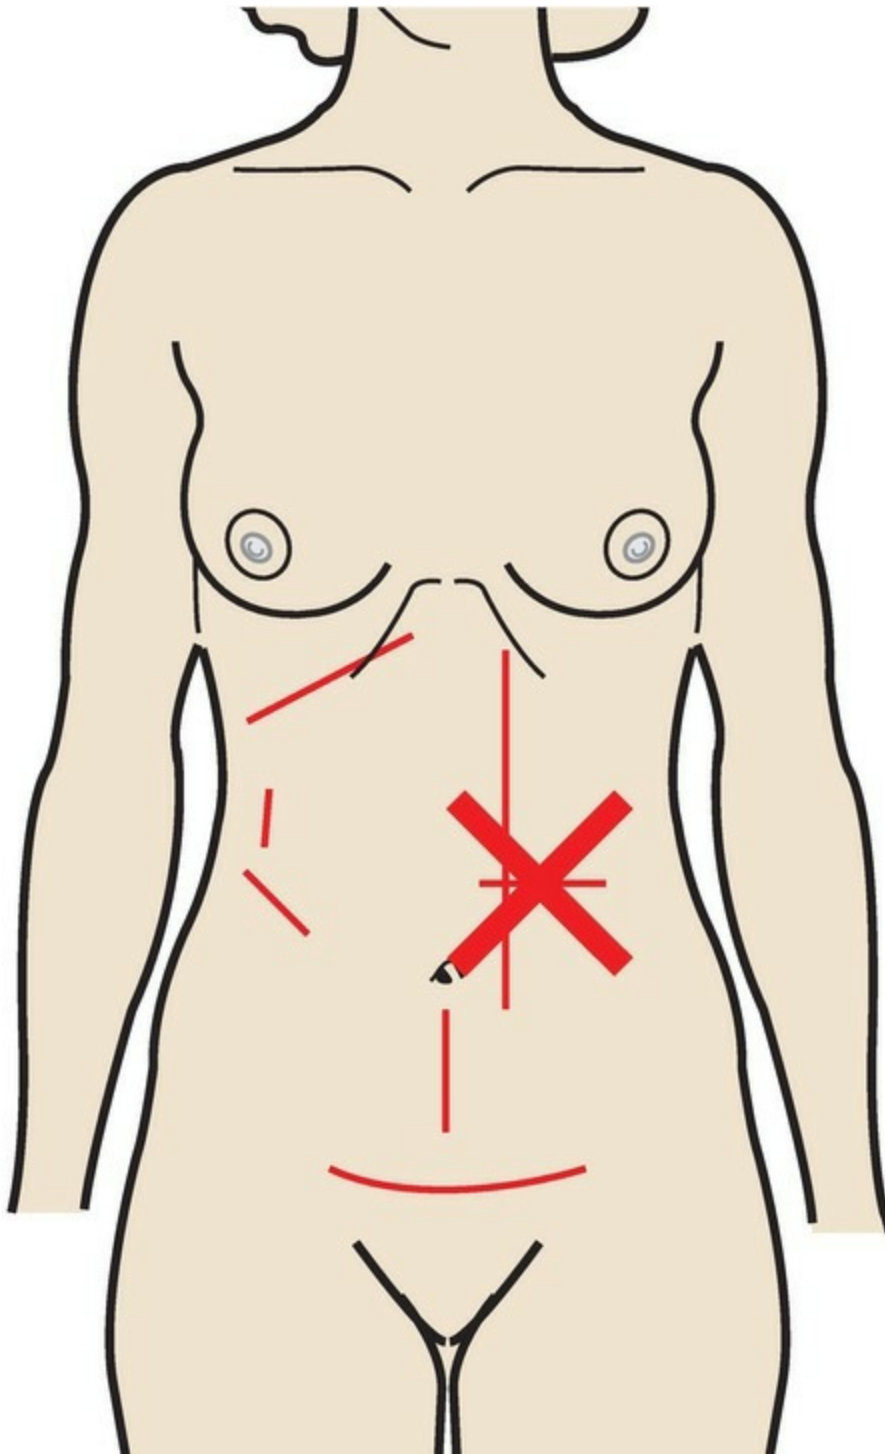

141. 2. The incident report includes only what the nurse saw and did—the objective data. The nurse does not try to interpret the likely cause of the incident, include statements from the client about the incident, or comment on extenuating circumstances.

 CN: Management of care; CL: Apply

142. 2. The serum cholesterol is within normal range for this client indicating the medication is effective. Since the cholesterol levels are within normal limits, it is likely that the client is taking the medication and asking may indicate the nurse has doubts or mistrusts that the client is taking the medication. The client does not need to change the diet at this point. Hemoglobin and hematocrit are not affected by simvastatin; since liver damage is a side effect of simvastatin, the nurse could review the liver function studies.

 CN: Pharmacologic and parenteral therapies; CL: Synthesize

143. 3. The area on the abdomen where the transverse incision will be made should be marked by the surgeon.

 CN: Reduction of risk potential; CL: Evaluate

144. 1, 2, 3, 4, 6. Diabetic ketoacidosis is a potentially life-threatening problem. The state of unconsciousness requires very astute monitoring of the neurologic condition. Frequent assessments of neurologic status (including

the client's ability to respond to stimuli), blood pressure, and urinary output need to be documented. Assessment of skin condition for the presence of lesions, bruises, ulcers, or bumps is documented to assess for possible injuries, such as falls associated with head injury or internal injuries. Although it would be helpful to know how long the client has had diabetes, this information is not essential to document.

CN: Physiological adaptation; CL: Analyze

145. 3. The medications prescribed for, administered to, or dispensed to the client while under the care of a healthcare organization are compared to those on the list, and any discrepancies (e.g., omissions, duplications, potential interactions) are resolved. A complete list of the client's medications is communicated to the next provider of service when a client is referred or transferred to another setting, service, practitioner, or level of care within or outside the organization. The complete, accurate list of medications is also provided to the client on discharge from the organization. The next provider of service checks the Medication Reconciliation List again to make sure it is accurate and in concert with any new medications to be prescribed.

CN: Safety and infection control; CL: Analyze

146. 1. A neonate born by cesarean section has not had the benefit of the chest-squeezing action of a vaginal birth, which helps remove some of the nasopharyngeal secretions. The nurse should place the neonate under the radiant warmer and suction the mouth and nares with a bulb syringe to remove nasopharyngeal secretions. A high-pitched cry is associated with neurologic involvement or neonatal drug withdrawal and is unrelated to cesarean birth. Skull fractures may occur with difficult vaginal births and are not typically seen with cesarean births. Decreased muscle tone is associated with oversedation, neurologic impairment, or use of general anesthesia.

CN: Health promotion and maintenance; CL: Analyze

147. 4. Follow-up generally involves semiannual chest radiographs. Recurrence usually occurs locally in the lungs and may be identified on chest radiographs. Follow-up after cancer treatment is an important component of the treatment plan. Serum markers (liver function tests) have not been shown to detect recurrence of lung cancer. There are no data to support the need for

an abdominal computed tomography scan.

CN: Reduction of risk potential; CL: Synthesize

148. 2. Accidental scaldings are usually splash related and occur on the front of the body. Any burns on the back of the body or in a well-defined circular or glove pattern may indicate physical abuse. Immersion burns on the buttocks are also suspicious injuries.

CN: Health promotion and maintenance; CL: Analyze

149. 3. A client exhibiting mild preeclampsia is initially treated with activity restriction. Bed rest, or lying on the left side, decreases pressure on the vena cava and improves circulatory blood flow. Restriction of visitors and a quiet environment are also necessary. IV magnesium sulfate, a central nervous system depressant, is usually prescribed for the client with severe preeclampsia. Labetalol is used for the client with severe preeclampsia. Frequent monitoring of the client's blood pressure is important. However, hourly blood pressure checks are more routinely prescribed for the client with severe preeclampsia. Additionally, the client needs to rest, and checking her blood pressure hourly could interfere with her ability to rest.

CN: Reduction of risk potential; CL: Synthesize

150. 4. Lifestyle modification to lower blood pressure includes weight reduction in clients who are overweight, reducing the intake of dietary sodium, and an increase in physical activity. Client teaching involves instruction on low-sodium diet and foods because of the propensity for high-sodium foods at fast-food restaurants. The client is of a normal weight, and alcohol intake is in moderation. Nitroprusside is a treatment for hypertensive crisis.

CN: Physiological adaptation; CL: Synthesize

151. 4. A dry tea bag placed on the bleeding area can be effective to control bleeding from lesions on the oral mucosa. The tannic acid in the tea apparently helps control bleeding.

CN: Reduction of risk potential; CL: Synthesize

152. 3. The three-point gait, in which the client advances the crutches and

the affected leg at the same time while weight is supported on the unaffected extremity, is the appropriate gait of choice. This allows for non-weight bearing on the affected extremity. The two-point, four-point, and swing-to gaits require some weight bearing on both legs, which is contraindicated for this client.

 CN: Reduction of risk potential; CL: Evaluate

153. 4. The best treatment for a pressure ulcer is prevention. If a client has been determined to be at risk for developing a pressure ulcer, a systematic skin assessment should be conducted at least once per shift. Other preventive measures include daily gentle cleaning of the skin and avoiding harsh soaps and hot water, which are damaging to the skin. Massage of bony prominences is not done because it can increase damage to the underlying tissue. The client should be encouraged to change position at least every 2 hours to avoid pressure on any one area for a prolonged period.

 CN: Reduction of risk potential; CL: Synthesize

154. 1. The client needs further instructions when she says “I should walk with my pelvis tilted backward.” Walking in this position puts greater strain on the back. The client should walk with her pelvis tilted forward. Pelvic tilt exercises can also help the client with backaches. Putting a board under the mattress makes the mattress firmer and provides more support. Squatting and not bending to pick up objects helps decrease back strain. Squatting involves the use of the large thigh muscles rather than those of the back. Flat or low-heeled shoes provide better balance and greater support and can help decrease backaches.

 CN: Reduction of risk potential; CL: Evaluate

155. 4. Urethritis is usually the initial clinical manifestation of gonorrhea in men. The symptoms include a profuse, purulent discharge and dysuria. Complications are uncommon, but they include prostatitis and sterility. Impotence, scrotal pain, and penile lesions are not associated with gonorrhea.

 CN: Safety and infection control; CL: Analyze

156. 4. Although the nurse needs to obtain and administer the medication as soon as possible, it is inappropriate for the nurse to go to the pharmacy and

request the drug without first calling the pharmacy and checking to see whether the medication was delivered. The drug may have been delivered to several appropriate spots on the unit, such as the client's drug bin, the transport system, or the delivery box. The nurse should assess the client's blood pressure to determine the immediacy of the condition for which the medication was prescribed.

CN: Safety and infection control; CL: Synthesize

157. 3. The client with major depression suffers from lack of energy and withdrawal. The nurse should emphasize the importance of group involvement for the client to gain support from others and to see that others have similar problems and concerns. Attendance at group sessions and activities decreases social isolation and destructive rumination. The other statements are not therapeutic and interfere with increasing the client's involvement with others.

CN: Psychosocial integrity; CL: Synthesize

158. 4. An infant's sleeping longer than usual can indicate that the child is expending too much energy to breathe and is tiring, suggesting that the child's condition is getting worse. This should be reported to the **healthcare provider (HCP)** . Fewer than seven wet diapers a day indicates that the child is not drinking enough. A temperature of 100°F (37.8°C) for longer than 2 days should be reported. Clear nasal drainage is expected. However, yellow nasal drainage lasting longer than 24 hours should be reported.

CN: Reduction of risk potential; CL: Evaluate

159. 3. The child is exhibiting signs and symptoms of possible epiglottitis. As a result, the child is at high risk for laryngospasm and airway occlusion. Therefore, the nurse should have a tracheostomy tube and setup readily available should the child experience an airway occlusion. Although acetaminophen is an antipyretic, the dosage of 600 mg to be administered rectally is too high. A typical 4-year-old weighs approximately 40 lb (18 kg). The recommended dose is 125 mg. When any type of respiratory illness, and especially epiglottitis, is suspected, putting any object, including a tongue depressor for inspection or a cotton-tipped applicator to obtain a throat culture, in the back of the mouth or throat or having the child open the mouth

is inappropriate because doing so may predispose the child to laryngospasm or occlusion of the airway by a swollen epiglottis.

CN: Reduction of risk potential; CL: Synthesize

160. 4. Direct application of warm moist heat would benefit a client with low back pain because the heat relaxes muscle spasms. Heat should not be applied to a client who has appendicitis because it can lead to rupture of the appendix and peritonitis. Ice is applied to recently sprained joints to help decrease edema. Applying heat to the area of a suspected malignancy can increase blood flow to the tumor and promote nourishment of the cancer cells.

CN: Basic care and comfort; CL: Analyze

161. 3. The client with pernicious anemia will require lifelong supplementation of vitamin B₁₂, available through injection or nasal spray administration. It must be given in these forms to ensure absorption. Oral vitamin B₁₂ would not be absorbed because the client lacks the intrinsic factor in the stomach necessary for absorption. Chelation therapy is used to extract metals at toxic levels such as in lead poisoning.

CN: Pharmacological and parenteral therapies; CL: Apply

162. 10 mL. To administer 20 mEq of potassium chloride, the nurse needs to administer 10 mL. The following formula is used to calculate the correct dosage:

$$20 \text{ mEq} / X \text{ mL} = 2 \text{ mEq} / 1 \text{ mL}$$

$$X = 10 \text{ mL}$$

CN: Pharmacological and parenteral therapies; CL: Apply

163. 4. When a client with major depression and suicidal ideation displays a sudden elevation in mood, seems calmer, has more energy, and is more peaceful, the nurse should judge these behaviors as an indication that a suicide attempt is imminent. These symptoms may indicate relief from

ambivalent thoughts about suicide and that the client has an immediate plan for killing himself.

 CN: Psychosocial integrity; CL: Analyze

164. 3. The purpose of a contraction stress test is to determine fetal response during labor. If late decelerations are noted with the contractions, the test is considered positive or abnormal. Fetal lung maturity is evaluated through amniocentesis to obtain the lecithin-sphingomyelin ratio. The nonstress test is part of the biophysical profile. Determining fetal response during movements is evaluated as part of the nonstress test.

 CN: Reduction of risk potential; CL: Apply

165. 3. Atypical pneumonia is characterized by a gradual onset of symptoms, such as dry cough, headache, sore throat, fatigue, nausea, and vomiting. Typical pneumonia is characterized by tachypnea, fever, chills, and productive cough with purulent sputum.

 CN: Physiological adaptation; CL: Analyze

166. 2. The primary reason for instructing the client with emphysema about how to pursed-lip breathe is to prolong exhalation. Prolonging exhalation helps to prevent bronchiolar collapse and the trapping of air. It does not directly prevent respiratory infection. Because pursed-lip breathing affects the expiratory phase of the respiratory cycle, it does not affect oxygenation. It may decrease shortness of breath, but this is not the primary reason for the technique.

 CN: Reduction of risk potential; CL: Apply

167. 2. The primary purpose of the automated dispensing machine for nurses is to keep an up-to-date record of the narcotic usage and count. The automated dispensing machine has eliminated the need for change-of-shift counts for narcotics. It does not include unmonitored access by nurses to narcotics, which would not be considered an advantage. The pharmacy has direct information about the narcotics being used on the client at what intervals and by whom, and it automatically records the charges of narcotics used. Not recording the charges would not be an advantage.

 CN: Management of care; CL: Apply

168. 2. Blunt chest trauma can lead to respiratory failure. Maintenance of adequate oxygenation is the priority for the client. Decreasing the client's anxiety is related to maintaining effective respirations and oxygenation. Although pain is distressing to the client and can increase anxiety and decrease respiratory effectiveness, pain control is secondary to maintaining oxygenation, as is maintaining adequate circulatory volume.

CN: Physiological adaptation; CL: Synthesize

169. 1. An episiotomy that is edematous and slightly reddened 8 hours after childbirth is normal. Therefore, the nurse should offer the client an ice pack to provide some relief from the perineal pain for the first 24 hours. An infection is present if greenish, purulent drainage is observed from the site. The edema and discoloration of the episiotomy at this time after childbirth are normal and do not indicate that a hematoma is likely to develop. A laceration when repaired should appear intact with edges well approximated, clean, and dry.

CN: Health promotion and maintenance; CL: Analyze

170. 3. The Z-track technique is used with medications that are irritating to tissues. It allows the medication to be trapped in the muscle and prevents it from leaking back through the tissues.

CN: Basic care and comfort; CL: Apply

171. 2. The nurse should limit the amount of telephone calls the client can make. Setting limits for a client with bipolar disorder, mania, helps to control the hyperactive client who has excessive goal-directed activity, especially when it interferes with the rights of other clients. Giving the client access to a separate phone rewards the behavior. Reminding the client that others need to use the telephone will probably be futile because the client with mania is experiencing cognitive impairment and needs to be active. Taking away the client's telephone privileges is not the best action because the client has a right to use the telephone. The nurse is responsible for helping the client manage behavior by setting constructive limits.

CN: Psychosocial integrity; CL: Synthesize

172. 4. Because a toddler is strong and moves frequently, the child needs

to be restrained during the removal procedure by a total body restraint. To protect the child, the papoose board is best because the arms, legs, chest, and head can be fully restrained. A jacket restraint would immobilize only the child's upper body. Elbow restraints would immobilize only the child's arms. The father should be available to provide comfort before and after the procedure but not to hold the child down during the procedure.

 CN: Safety and infection control; CL: Synthesize

173. 4. Wheezing over one lung in the presence of a lung tumor is most likely caused by obstruction of the airway by a tumor. Exudate would be more likely to cause crackles. The client's history of smoking would not cause unilateral wheezing. Pleural effusion would produce diminished or absent breath sounds.

 CN: Physiological adaptation; CL: Apply

174. 1. The client with diabetic ketoacidosis exhibits Kussmaul's respiration as well as flushed skin, dry mouth, urinary frequency, hyperglycemia, and ketonuria. Excessive hunger and high blood pressure are not associated with diabetic ketoacidosis.

 CN: Reduction of risk potential; CL: Apply

175. 4. For the client who has been receiving lithium therapy for the past 2 months, a maintenance serum lithium level of 0.6 to 1.2 mEq/L (0.6 to 1.2 mmol/L) is considered therapeutic. A lithium level >1.2 mEq/L (1.2 mmol/L) suggests toxicity.

 CN: Pharmacological and parenteral therapies; CL: Analyze

176. 4, 5. The child is observed for shock that can occur following a severe burn. Shock is noted by the increasing heart rate and dropping blood pressure. This child has an adequate urine output (more than 1 mL/kg body weight), and the specific gravity is within normal range. Pain is expected and is not an indicator of shock.

 CN: Physiological adaptation; CL: Analyze

177. 4. The plan of care to treat fatigue associated with radiation therapy should include encouraging the client to remain active and to plan scheduled

rest periods as necessary before activity. Engaging in activities, such as walking, has been shown to decrease the cycle of fatigue, anxiety, and depression that can occur during treatment. Fatigue is a very common side effect of radiation therapy that typically begins during the 3rd or 4th week of treatment and persists until after treatment ends. The presence of fatigue does not mean that the cancer is not responding to treatment or that the client has developed another health problem.

CN: Reduction of risk potential; CL: Synthesize

178. 3. Shearing forces occur because of improper movement and positioning, which causes the underlying tissues and capillary blood supply to be pulled and disrupted. This leads to tissue trauma and the potential beginning of skin breakdown. To prevent shearing, clients should be moved with the use of lift sheets and other devices, thus preventing dragging of the skin across the mattress and linens. Clients should also be positioned and supported to prevent pulling or tension of the skin across bony prominences. Turning clients, if not done properly, can cause shearing injuries. Keeping the skin clean, dry, and moisturized is an important aspect of care, but care must be used to decrease the amount of pulling forces exerted on the tissues.

CN: Reduction of risk potential; CL: Apply

179. 4. The proper use of crutches requires supporting the body weight primarily on the hands. Improper use of crutches can cause nerve damage from excess pressure on the axillary nerve.

CN: Reduction of risk potential; CL: Apply

180. 3. The nurse promotes consistent limit setting for the client with the aggressive and impulsive behaviors of a conduct disorder. It is not appropriate for the nurse to allow autonomy or elicit a description of feelings; assertiveness classes are also inappropriate.

CN: Psychosocial integrity; CL: Apply

181. 2. For the child with croup, assessing the child's respiratory status is the priority. It is especially important to assess airway patency because laryngeal spasms can occur suddenly. After the nurse has assessed the toddler's respiratory status, having a tracheostomy set at the bedside would

be the next priority. Monitoring vital signs is important, as is ensuring adequate fluid intake to keep secretions loose, but assessing respiratory status is key.

CN: Physiological adaptation; CL: Synthesize

182. 2. IV solutions are prescribed based upon the fluid and electrolyte status of the client, so laboratory results should be monitored first. Safety recommendations are for standard premixed solutions. If solutions are not premixed, additives are completed by the pharmacy, not at the bedside. Potassium chloride is never given by IV push because this could be fatal. Administration guidelines require no more than 10 mEq (10 mmol/L) of potassium chloride be infused per hour on a general medical-surgical unit. An infusion device or pump is required for safe administration.

CN: Pharmacological and parenteral therapies; CL: Synthesize

183. 3, 1, 4, 2. Even with such a blatant suicide clue, it is still important to confirm that he is truly suicidal. Then, it is crucial to know what methods of suicide are available to him. Before asking for a psychiatric consult, the client needs to understand that the nurse cares, is empathetic, and will take actions to protect him from harm.

CN: Safety and infection control; CL: Analyze

184. 1. Neuromuscular irritability is usually the first indication that a client has developed a low serum calcium level. Numbness and tingling around the mouth as well as in the extremities is an early sign of neuromuscular irritability. Depressed reflexes, decreased memory, and ventricular dysrhythmias are indications of hypercalcemia.

CN: Physiological adaptation; CL: Analyze

185. 2. In emphysema, the anteroposterior diameter of the chest wall is increased. As a result, the client's breath sounds may be diminished. Fine crackles are present when there is fluid in the lungs. Stridor occurs as a result of a partially obstructed larynx or trachea; stridor can be heard without auscultation. A pleural friction rub is present when pleural surfaces are inflamed and rub together.

CN: Physiological adaptation; CL: Analyze

186. 4. The client with paranoid personality disorder interprets the actions of others as personal threats, feels vulnerable, and is overly sensitive to others' motives. Saying "They are laughing at a joke John told. They are not laughing at you" is a simple explanation of others' behavior, which helps to decrease the client's suspiciousness and promote trust. The other statements do not help the client to realistically interpret situations and the behavior of others and are not helpful in reducing the client's suspicions or mistrust.

CN: Psychosocial integrity; CL: Synthesize

187. 4. Mebendazole is prescribed for household members older than 2 years. Although the child's 18-month-old brother would not receive the drug, the 4-year-old sister and parents would.

CN: Pharmacological and parenteral therapies; CL: Synthesize

188. 3. Loss of height and back pain are early indications of the disease that are caused by collapse of the vertebrae. Later signs include the dowager's hump and loss of the waistline. The dowager's hump is a later sign of osteoporosis that occurs when the vertebrae can no longer support the upper body in an upright position. Fair-skinned, small-boned, White, and Asian women are at greater risk for osteoporosis. Conventional radiographs are little help because more than 30% of the bone mass must be lost before the disease is detected. High-density bone scans can detect the disease earlier.

CN: Reduction of risk potential; CL: Synthesize

189. 3. The primary reason for evaluating gastric residual is to determine whether gastric emptying has been delayed and the stomach is becoming overdistended from the feeding. With delayed gastric emptying, the possibility of aspiration of the feeding into the lungs is increased. It is not possible to determine how well the client's body is absorbing nutrients or whether the client is receiving enough feeding by checking the gastric residual. It is not necessary to keep partially digested formula separate from undigested formula.

CN: Reduction of risk potential; CL: Apply

190. 1. The baseline values of the client's partial thromboplastin time, bleeding time, and prothrombin time should be obtained. Potassium levels do

not indicate a client's coagulation time. The Lee-White clotting time or baseline fibrin split product does not need to be established before starting tissue plasminogen activator or alteplase.

CN: Reduction of risk potential; CL: Apply

191. 2, 4, 5. Clients with hepatitis A commonly experience fatigue and altered nutrition due to anorexia and nausea. Because of the severe fatigue associated with hepatitis, clients are encouraged to rest and restrict activity during the active phase of the disease. It is important that frequent rest periods be planned throughout the day. Clients may experience nausea and vomiting; thus, providing relief is important. Small, frequent meals help clients manage the anorexia associated with hepatitis. An exercise program is not appropriate due to the need for rest. Clients with hepatitis do not experience pain. All medications administered to clients with hepatitis need to be evaluated for their potential for hepatotoxicity.

CN: Physiological adaptation; CL: Synthesize

192. 4. Third-degree heart block occurs when atrial stimuli are blocked at the atrioventricular junction. Impulses from the atria and ventricles are conducted independently of each other. The atrial rate is 60 to 100 bpm; the ventricular rate is usually 10 to 60 bpm.

CN: Reduction of risk potential; CL: Analyze

193. 1. Clients with borderline personality disorder have fears of abandonment and seek attention. Clients are dependent and fear being alone; this stems from disapproval, feelings of being abandoned, and not having needs met earlier in their life. The nurse intervenes by reducing attention-seeking behaviors and abandonment fears to help with intense feelings and emotions.

CN: Psychosocial integrity; CL: Analyze

194. 4. The application of restraints places the client in a vulnerable, confined position. The nurse should check on the client every 30 minutes while restrained to make sure that the client is safe. The client should be able to move while the restraints are in place. The restraints should be removed every 2 hours to provide skin care and exercise the extremities. Restraints

should not be secured to the side rails; they should be secured to the movable bed frame so that when the bed is adjusted, the restraints will not be pulled too tightly.

 CN: Safety and infection control; CL: Synthesize

195. 3. The most appropriate response is “Alcohol dependence is a disease that can be treated” because it conveys hope. It also emphasizes that the client has a treatable illness, which is helpful in reducing denial and guilt and encouraging the client to seek and comply with treatment. Clients often cannot answer “why” questions. The other statements are judgmental and guilt producing, possibly leading to denial and furthering the need for alcohol.

 CN: Psychosocial integrity; CL: Synthesize

196. 2. Raisins are high in nutritional value but are sticky and have a high sugar content. The raisin can stick to the teeth and act like high-sugar foods in promoting tooth decay. Although anything can be aspirated, round, hard, smooth foods are more easily aspirated than raisins, which are soft and chewy. Raisins need to be chewed thoroughly for maximum nutritional value.

 CN: Health promotion and maintenance; CL: Evaluate

197. 1. Aspirin is an antiplatelet medication. The use of aspirin is contraindicated while taking warfarin because it will potentiate the drug’s effects. Diphenhydramine and pseudoephedrine do not affect blood coagulation. Digoxin is not an over-the-counter medication; it requires a prescription.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

198. 1. The nurse should inform the client that carbamazepine can decrease the effects of oral anticoagulants. Carbamazepine can increase the serum concentration of verapamil and can decrease the serum concentration of other anticonvulsants and the effects of oral contraceptives.

 CN: Pharmacological and parenteral therapies; CL: Apply

199. 2. Viral hepatitis causes fatigue. It is important for the client to rest to allow the liver to recover. Activity levels are resumed gradually as the client

begins to recover. Abdominal pain is not a common manifestation of hepatitis. The client typically does not have difficulty breathing or experience edema.

CN: Physiological adaptation; CL: Synthesize

200. 1. The mother should be encouraged to hold and cuddle her child to provide needed emotional support. Such activities as helping the child play with toys, reading stories, and staying with the child would not be contraindicated but do not offer as much emotional support as holding and cuddling.

CN: Psychosocial integrity; CL: Synthesize

201. 2. The best strategy to affect child seat belt safety is to attend the school board meeting and advocate for educational programming. The programming could be simple and done quickly. This action also targets the best audience.

CN: Health promotion and maintenance; CL: Synthesize

202. 3. A basic principle of rehabilitation, including cardiac rehabilitation, is that rehabilitation begins on hospital admission. Early rehabilitation is essential to promote maximum functional ability as the client recovers from an illness. Delaying rehabilitation activities is associated with poorer client outcomes.

CN: Basic care and comfort; CL: Apply

203. 1. The goal of the intervention is to decrease the child's work of breathing by decreasing pressure on the diaphragm and increase chest expansion by increasing the pull of gravity on the diaphragm. Placing the client in high Fowler's position accomplishes this. Side-lying positions make it more difficult to expand the side of the lung closest to the bed. The prone or supine position does not decrease the work of breathing unless the head of the bed is raised.

CN: Physiological adaptation; CL: Synthesize

204. 4. Immediately after chest tube removal, a petrolatum gauze is placed over the wound and covered with a dry sterile dressing. This serves as an

airtight seal to prevent air leakage or air movement in either direction. Bandages or straps are not applied directly over wounds. Mesh gauze allows air movement.

 CN: Management of care; CL: Apply

205. 3. The most appropriate action is to contact the **HCP**  to verify that the prescription is correct. Although 60 mg of morphine is a significant dose, the amount of morphine administered to a client can vary widely, especially if a client has been taking morphine for an extended period and has developed a tolerance to the medication. The safest approach is for the nurse to verify prescriptions that do not appear to fall within the norm. Administering the medication without verification is unsafe. The nurse cannot decide to reduce the amount of a prescribed medication without a prescription. Asking another nurse to review the prescription is not inappropriate; however, checking with the HCP to verify the prescription should be done.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

206. 4. RRTs , or medical emergency teams, provide a team approach to evaluate and treat immediately clients with alterations in vital signs or neurological deterioration. Calling the neurosurgeon or consulting the CNS may not result in a rapid response. The Trendelenburg position is usually used in treating shock, but because the client has had brain surgery, the head should not be lower than the trunk.

 CN: Physiological adaptation; CL: Synthesize

207. 1. Before paracentesis, the client is asked to void. This is done to collapse the bladder and decrease the risk of accidental bladder perforation. The abdomen is not prepared with an antiseptic cleansing solution. The client is placed in a Fowler's position. The client does not need to be put on NPO status before the procedure.

 CN: Reduction of risk potential; CL: Apply

208. 1. Children who are being abused may demonstrate behaviors such as withdrawal, apparent fear of parents, and lack of an appropriate reaction, such as crying and attempting to get away when faced with a frightening event (an

examination or procedure).

CN: Psychosocial integrity; CL: Analyze

209. 3. The nurse should include teaching the client and family about the physical, physiologic, and psychological effects of substances to educate them about the potential injury, illness, and disability that can result from substance use. Teaching about the role of the family in perpetuating the problem, the family's responsibility for the client, or the reasons that could have led the client to use the substance is inappropriate and based on an erroneous assumption. Including these topics blames the family for the problem and attempts to rationalize the use of the substance.

CN: Psychosocial integrity; CL: Synthesize

210. 2. Postoperative care after a laparoscopic cholecystectomy includes removal of the dressing from the incisional site the day after surgery and allowing the client to bathe or shower. The client can resume a normal diet but may wish to follow a low-fat diet for a few weeks after surgery. Nausea is not expected to last for several days after surgery. The client usually can return to work within 1 week.

CN: Reduction of risk potential; CL: Evaluate

211. 1. In Mexican culture, children are highly valued and are closely protected by godparents. The tradition of the family is all-encompassing, and the **healthcare provider (HCP)**  gains trust and improved compliance rates by including the family in teaching and healthcare matters. Typically, older adults are highly regarded and respected in Asian cultures.

CN: Psychosocial integrity; CL: Apply

212. 2. Many vitamin and mineral deficiencies can result in anemia. All of these vitamins and minerals need to be assessed, preferably through a nutrition assessment. Deficiencies of vitamins A, B₆, and C result in a small cell, microcytic anemia. Folate and vitamin B₁₂ deficiencies result in a large cell, macrocytic anemia. Iron, copper, and vitamin E deficiencies can also result in anemia.

CN: Physiological adaptation; CL: Analyze

213. 3. Women with diabetes mellitus generally have neonates who are large but physically immature. Other common findings in these infants are hypoglycemia, hypocalcemia, hyperbilirubinemia, polycythemia, renal thrombosis, and congestive anomalies. The neonates do not exhibit hypertonia, hyperactivity, or scaly skin.

CN: Health promotion and maintenance; CL: Analyze

214. 2. The imbalance between the client's intake and output indicates that the client may be retaining urine since the removal of his Foley catheter. The nurse's first action is to validate this assumption by assessing for bladder distention. Applying a condom catheter will not relieve urinary retention; condom catheters are meant to be used for incontinence. A urine specimen for a culture is obtained if a urinary infection is suspected, but this is not a priority at this point. Kegel exercises are helpful in controlling urinary dribbling but do not treat retention.

CN: Reduction of risk potential; CL: Synthesize

215. 2. Because of the poor emptying of blood from the atrial chambers, there is an increased risk for clot formation around the valves. The clots become dislodged and travel through the circulatory system. As a result, cerebrovascular accident is a common complication of atrial fibrillation.

CN: Physiological adaptation; CL: Analyze

216. 2. Griseofulvin is associated with photosensitivity reactions. Therefore, the nurse should instruct the parents to have the child avoid intense sunlight. Griseofulvin is best absorbed when administered after a high-fat meal. Treatment with griseofulvin typically lasts for at least 1 month. There are no indications that increased fluid intake affects absorption.

CN: Pharmacological and parenteral therapies; CL: Synthesize

217. 1, 2, 3, 4. To help the client with a borderline personality cope with and control emotions, the nurse assists the client to identify which emotions he or she is experiencing, plans to decrease the number of impulsive acts the client completes, and promotes client use of a journal in which emotions and coping techniques can be recorded. The nurse also encourages the client to delay immediate gratification of impulses. The nurse may use confrontation,

but this is a component of the development of a therapeutic relationship and does not help the client cope and control emotions.

 CN: Psychosocial integrity; CL: Synthesize

218. 2. After cystoscopy with biopsy, the nurse would assess for excessive hematuria, which might indicate hemorrhage caused by the biopsy. Catheters are not routinely inserted after cystoscopy. The nurse would not assess for bladder distention unless the client was having difficulty voiding. Urine cultures are not routinely prescribed after cystoscopy.

 CN: Reduction of risk potential; CL: Analyze

219. 4, 3, 2, 1. The nurse first assesses and manages the physical effects of the eye injury by placing an ice pack on the eye to reduce swelling. Next, the nurse obtains as much information about the situation and the daycare center as possible. The nurse documents all physical assessment findings and information provided by the mother. Because an infant who is 6 months of age should not be in a walker unattended, and black eyes do not occur from falls with walkers, this is a potential child abuse incident; therefore, the nurse reports the incident as such using the agency's reporting structure (usually, social services department reports the incidents to the authorities).

 CN: Management of care; CL: Synthesize

220. 2. The nurse interprets the client's statement as use of the hot disease concept in the Mexican culture, where the belief of a hot and cold balance of the body exists. A hot disease such as an infection is treated with the opposite, a cold food such as milk. The nurse should focus on the cultural differences and be sensitive to the cultural diversity.

 CN: Health promotion and maintenance; CL: Analyze

221. 3. A client who is "getting special messages" (ideas of reference) commonly misinterprets content presented on television as containing messages for the client. Therefore, it is important for the nurse to monitor the client's reactions to television programs.

 CN: Psychosocial integrity; CL: Synthesize

222. 3, 5. Not attending the support group consistently and not taking the

antidepressant may lead to a relapse, and the client needs this information. Bulimia is chronic and intermittent and involves cycles of bingeing, purging, and restrictive eating. Increased socialization and activities promote healthy relationships.

CN: Psychosocial integrity; CL: Evaluate

223. 3. In a low anorectal anomaly, the rectum has descended normally through the puborectalis muscle. In an intermediate anomaly, the rectum is at or below the level of the puborectalis muscle; in a high anomaly, the rectum ends above the puborectalis muscle.

CN: Physiological adaptation; CL: Evaluate

224. 1. It is especially important for the nurse to carefully assess the elderly client for respiratory depression after administering a dose of meperidine. It may be necessary to reduce the dosage to prevent respiratory depression. Dysrhythmias, constipation, and seizures are all potential adverse effects of meperidine, but respiratory depression is most significant in the elderly.

CN: Pharmacological and parenteral therapies; CL: Analyze

225. 2. Pets are discouraged when parents are trying to allergy proof a home for a child with bronchial asthma, unless the pets are kept outside. Pets with hair or feathers are especially likely to trigger asthma attacks. A fish is a satisfactory pet for this child, but the parents should be taught to keep the fish tank clean to prevent it from harboring mold.

CN: Health promotion and maintenance; CL: Synthesize

226. 2. Ascorbic acid (vitamin C) increases iron absorption. Taking iron with a food rich in ascorbic acid, such as orange juice, increases absorption. Milk delays iron absorption. It is best to give iron on an empty stomach to increase absorption. Beta-carotene does not affect iron absorption.

CN: Pharmacological and parenteral therapies; CL: Apply

227. 1. In early renal insufficiency, the kidneys lose the ability to concentrate urine, resulting in polyuria. Oliguria occurs later. Dysuria and hematuria are not associated with renal insufficiency.

 CN: Physiological adaptation; CL: Analyze

228. 1. Sucking provides the infant with a sense of security and comfort. It also is an outlet for releasing tension. The infant should not be discouraged from sucking on the pacifier. Fussiness after feeding may indicate that the infant's appetite is not satisfied. Sucking is not manipulative in the sense of seeking parental attention.

 CN: Health promotion and maintenance; CL: Analyze

229. 1. The ZIFT method requires that fertilization take place outside the body. After fertilization has occurred, the fertilized eggs are transferred by laparoscopy to the open end of the fallopian tube. At least one tube must be patent for this procedure to succeed, so it is not beneficial if the client has bilateral blocked fallopian tubes. Ova and sperm are instilled in the fallopian tube for fertilization when the gamete intrafallopian transfer method is used. With in vitro fertilization, a fertilized ovum is instilled into the vagina to enter the uterus for implantation.

 CN: Health promotion and maintenance; CL: Synthesize

230. 2. The nurse should examine the buccal mucosa, along with the conjunctiva and sclera, nail beds, palms, soles, lips, and tongue to assess for oxygenation in a client with dark skin.

 CN: Reduction of risk potential; CL: Apply

231. 3. The nurse should teach a client who has undergone chest surgery to raise the arm on the affected side over the head to help prevent shoulder ankylosis. This exercise helps restore normal shoulder movement, prevents stiffening of the shoulder joint, and improves muscle tone and power.

 CN: Reduction of risk potential; CL: Synthesize

232. 2. The nurse's first action should be to attempt to replace the tracheostomy tube immediately so that the client's airway is reestablished. Although the nurse may also call for assistance, there should be no delay before attempting reinsertion of the tube. The client is placed in a supine position with the neck hyperextended to facilitate reentry of the tube. The obturator is inserted into the replacement tracheostomy tube to guide

insertion and is then removed to allow passage of air through the tube.

 CN: Reduction of risk potential; CL: Synthesize

233. 1, 2, 4. LPN/VNs  work collaboratively with colleagues in health care to assess, plan, and deliver quality nursing services. The experienced LPN/VN is capable of gathering data and observations including breath sounds and pulse oximetry. Administering medications, such as aerosolized medications, is within the scope of practice for the LPN/LVN. The actions that are within the scope of practice for the professional **RN** include independently completing the admission assessment, initiating the nursing care plan, and evaluating a parent's abilities, as these activities require additional education and skills.

 CN: Management of care; CL: Analyze

234. 1. A general growth parameter is that the birth weight doubles in 6 months and triples in a year. Telling the mother that the baby will eat what he needs is not appropriate. The nurse needs to investigate whether the baby's weight is within the normal parameters of infant weight gain. A bottle-fed baby should not be forced to complete the bottle because this may contribute to obesity.

 CN: Health promotion and maintenance; CL: Synthesize

235. 4. The mechanism of injury is always the most critical information to obtain from a client with a musculoskeletal injury. In the event of a back injury, the mechanism of injury provides the greatest clue as to the extent of injury and the proper treatment plan. The other questions are important but will not give the critical information needed related to this specific problem and injury.

 CN: Physiological adaptation; CL: Analyze

236. 1. Antihypertensive medications such as metoprolol and hydrochlorothiazide work to lower the blood pressure by reducing peripheral resistance or decreasing cardiac output; the effectiveness of these drugs is noted by a lowering of the blood pressure. Vasodilators are used to improve peripheral circulation. Cardiac stimulants and antiarrhythmic drugs are used to increase heart rate. Although cardiac problems can cause dyspnea, the use

of drugs to manage dyspnea depends on the underlying cause.

CN: Pharmacological and parenteral therapies; CL: Evaluate

237. 2. The stored glucose of muscle glycogen is the major fuel during sustained activity. Glucose production slows as the body begins to depend on fat stores for glucose and fatty acids. Protein is not the body's preferred energy source. Fat is a secondary source of energy. Water is not an energy source, although sufficient water is required to engage in aerobic activity without causing dehydration.

CN: Health promotion and maintenance; CL: Apply

238. 3. Typical early signs of rheumatoid arthritis are nonspecific and not necessarily related to specific joint pain. Common early symptoms include fatigue, anorexia, weight loss, and generalized feelings of stiffness. Joint swelling and limitation of movement usually occur later as joint involvement becomes more specific. Dizziness is not a sign of rheumatoid arthritis. Nausea is not typically associated with the disease process but can be related to medications prescribed to treat rheumatoid arthritis.

CN: Physiological adaptation; CL: Analyze

239. 2. NPH insulin should be rolled between the palms to mix it before drawing it up; shaking it will introduce air bubbles into the solution, which can cause inaccurate dosing. The client should draw up the insulin first, store the insulin in a cool place, and inject the insulin at a 90-degree angle.

CN: Pharmacological and parenteral therapies; CL: Evaluate

240. 4. The gene for Duchenne's muscular dystrophy is carried by women and transmitted to their male children. It involves an X-linked inheritance pattern. About one-third of new cases involve mutations.

CN: Physiological adaptation; CL: Apply

241. 4. Infants with intussusception have colic-like abdominal pain caused by the telescoping of the bowel. The nursing priority is to relieve this pain. There are no data to indicate a skin problem or dehydration. Diarrhea or constipation may precede the appearance of currant jelly stools.

CN: Physiological adaptation; CL: Analyze

242. 2 lb or 0.9 kg. One pound or 0.45 kilograms of weight is approximately equivalent to 3,500 cal. Removing 1,000 cal/day results in a 2-lb (0.9-kg) weight loss per week (7,000 cal divided by 7 days). A client who wanted to lose 1 lb (0.45 kg) in a 7-day period would need to cut out 500 cal/day (3,500 cal divided by 7 days). It is unsafe to try to lose more than 2 lb (0.9 kg)/wk.

CN: Health promotion and maintenance; CL: Apply

243. 2. The nurse should notify the **HCP**  that the client is allergic to penicillin before giving the cefazolin. Cephalosporins are contraindicated in clients who are allergic to penicillin. Clients who are allergic to penicillin may have a cross-allergy to cephalosporins.

CN: Pharmacological and parenteral therapies; CL: Synthesize

244. 4, 5. Buspirone is not a benzodiazepine but acts as a serotonin agonist. Serotonin is the neurotransmitter implicated in depression. Buspirone reduces symptoms of worry, apprehension, difficulty with concentration, and irritability. It is not sedating, does not cause a high, takes 1 to 6 weeks to be effective, does not cause muscle relaxation, and does not produce dependence, withdrawal, or tolerance. Full therapeutic benefit takes 3 to 6 weeks.

CN: Pharmacological and parenteral therapies; CL: Evaluate

245. 3. The nurse should document a tearing of tissue with irregular wound edges as a laceration. A contusion or a bruise is a closed wound caused by a blunt object resulting in bleeding in underlying tissue. An abrasion is a superficial wound from a rubbing or a scraping of the surface of the skin such as from a fall. Colonization is a wound containing microorganisms.

CN: Safety and infection control; CL: Apply

246. 1. The major cause of relapse is noncompliance. If the client cannot afford to keep taking the medicines, it is a warning sign to the nurse that the client may be at risk for noncompliance. Therefore, the nurse needs to stress the need for compliance to prevent relapse. If money is a problem, a referral to a social worker may be necessary.

 CN: Psychosocial integrity; CL: Evaluate

247. 2. Epstein's pearls are tiny, hard, white nodules found in the mouth of some neonates. They are considered normal and usually disappear without treatment. Koplik's spots, associated with measles in children, are patchy and bright red with a bluish-white speck in the middle. Precocious teeth are actual teeth that some neonates have at birth. Usually, only one or two teeth are present. *Candida albicans*, or thrush, is not apparent in the mouth immediately after birth but may appear a day or 2 later. This infection is manifested by yellowish-white spots or lesions that resemble milk curds and bleed when attempts are made to wipe them away.

 CN: Health promotion and maintenance; CL: Analyze

248. 3. It is important to explain to the client who is having nausea that the majority of calories should be eaten in the morning because nausea most often occurs in the afternoon and evening. Small, frequent portions are best. Clients with viral hepatitis should select a diet high in calories because energy is required for healing. An intake of adequate carbohydrates can spare the protein because protein places an increased workload on the liver. Changes in bilirubin interfere with fat absorption, so low-fat diets are better tolerated.

 CN: Health promotion; CL: Synthesize

249. 2. The nurse should teach the client how to do isometric exercise, contraction of the quadriceps muscle without movement of joint, to maintain muscle strength. Physical therapy may assist the client later and will then teach the client how to do active exercises and crutch walking if prescribed. The client will be able to move the unaffected limb; the family will not need to assist. If the client will be using crutches, building upper extremity strength will be helpful, but the immediate need is to maintain and develop strength in the quadriceps.

 CN: Health promotion; CL: Synthesize

250. 2. A hyphema is the presence of blood in the anterior chamber of the brain. Hyphema is produced when a force is sufficient to break the integrity of the blood vessels in the eye and can be caused by direct injury, such as

penetrating injury from a small bullet or pellet, or indirectly, such as from striking the forehead on the pavement during an accident. The client is treated by bed rest in a semi-Fowler's position to assist gravity in keeping the hyphema away from the optical center of the cornea.

CN: Basic care and comfort; CL: Apply

251. 3. Urine output should be at least 500 mL in 24 hours (20 mL/h); this client's output has been just 15 mL/h for the past 2 hours requiring further assessment by the nurse. The nurse should first assess all clients and address physiological needs including pain control and safety measures; the nurse should then take time with the client having difficulty coping in order to listen and further determine her needs.

CN: Reduction of risk potential; CL: Synthesize

252. 1. The stationary bicycle is the most appropriate training modality because it is a non-weight-bearing exercise. The time that the individual exercises on the stationary bicycle is increased with improved functional capacity. The other exercise equipment requires exercising while standing.

CN: Health promotion and maintenance; CL: Synthesize

253. 1. The nurse should closely monitor the client admitted with an elevated blood alcohol level for several hours for signs and symptoms of withdrawal, administering sedation as needed; delirium tremens, the most severe form of withdrawal, usually peaks at 48 to 72 hours following the last drink. The client with the chest tube is not in any distress and has no pressing needs. For an older client who has had GI bleeding, a hemoglobin of 13.8 g/dL (138 g/L) is within normal limits. After assessing all clients' needs, the nurse will prepare the client who had an appendectomy for discharge as soon as possible.

CN: Reduction of risk potential; CL: Synthesize

254. 1. Fetal alcohol syndrome is characterized by central nervous system damage, poor growth, and specific facial stigmata. As many as 90% of children with fetal alcohol syndrome have eye abnormalities. Vitamin B₆ and vitamin A deficiencies can affect growth and development but not with these specific effects. Folic acid deficiency contributes to neural tube defects.

 CN: Reduction of risk potential; CL: Analyze

255. 2. Therapeutic serum drug monitoring is not routinely done with ciprofloxacin. This medicine should not be taken with dairy products or other significant sources of calcium such as collard greens, calcium supplements, calcium carbonate antacids, or calcium-fortified juice. Clients may take a missed dose as soon as they remember. If it is very close to the time of the next dose, the missed dose should be omitted. The client should not take a double dose.

 CN: Pharmacology and parental therapies; CL: Evaluate

256. 3. Physical activity is gradually increased after a myocardial infarction while the client is still hospitalized and through a period of rehabilitation. The client is progressing too rapidly if activity significantly changes respirations, causing dyspnea, chest pain, a rapid heartbeat, or fatigue. When any of these symptoms appears, the client should reduce activity and progress more slowly. Edema suggests a circulatory problem that must be addressed but does not necessarily indicate overexertion. Cyanosis indicates reduced oxygen-carrying capacity of red blood cells and indicates a severe pathology. It is not appropriate to use cyanosis as an indicator for overexertion. Weight loss indicates several factors but not overexertion.

 CN: Reduction of risk potential; CL: Analyze

257. 4. The most common noninfectious renal disease in children is acute poststreptococcal glomerulonephritis. Ensuring that children diagnosed with streptococcal infections complete a full course of antibiotics will decrease their risk of developing acute glomerulonephritis. Parents should contact the primary **HCP**  if they suspect a UTI; however, glomerulonephritis is not caused by a UTI. Glomerulonephritis is not a genetic disease and is not contagious, which makes answers 2 and 3 incorrect information.

 CN: Reduction of risk potential; CL: Apply

258. 2, 3, 5. The client who is taking disulfiram is advised to avoid all forms of alcohol including beer, communal wine at church, and cough syrup; these can trigger a serious physical reaction. Aged cheeses and chocolate are to be avoided by the client taking monoamine oxidase inhibitors.

 CN: Pharmacologic and parenteral therapies; CL: Apply

259. 1. In response to hearing a noise, normally hearing infants blink or startle and stop body movements. Shy and withdrawn behaviors are characteristics of older children with hearing impairment. Squealing occurs in 90% of infants by age 4 months. Most infants can say “da-da” by age 9 months.

 CN: Health promotion and maintenance; CL: Evaluate

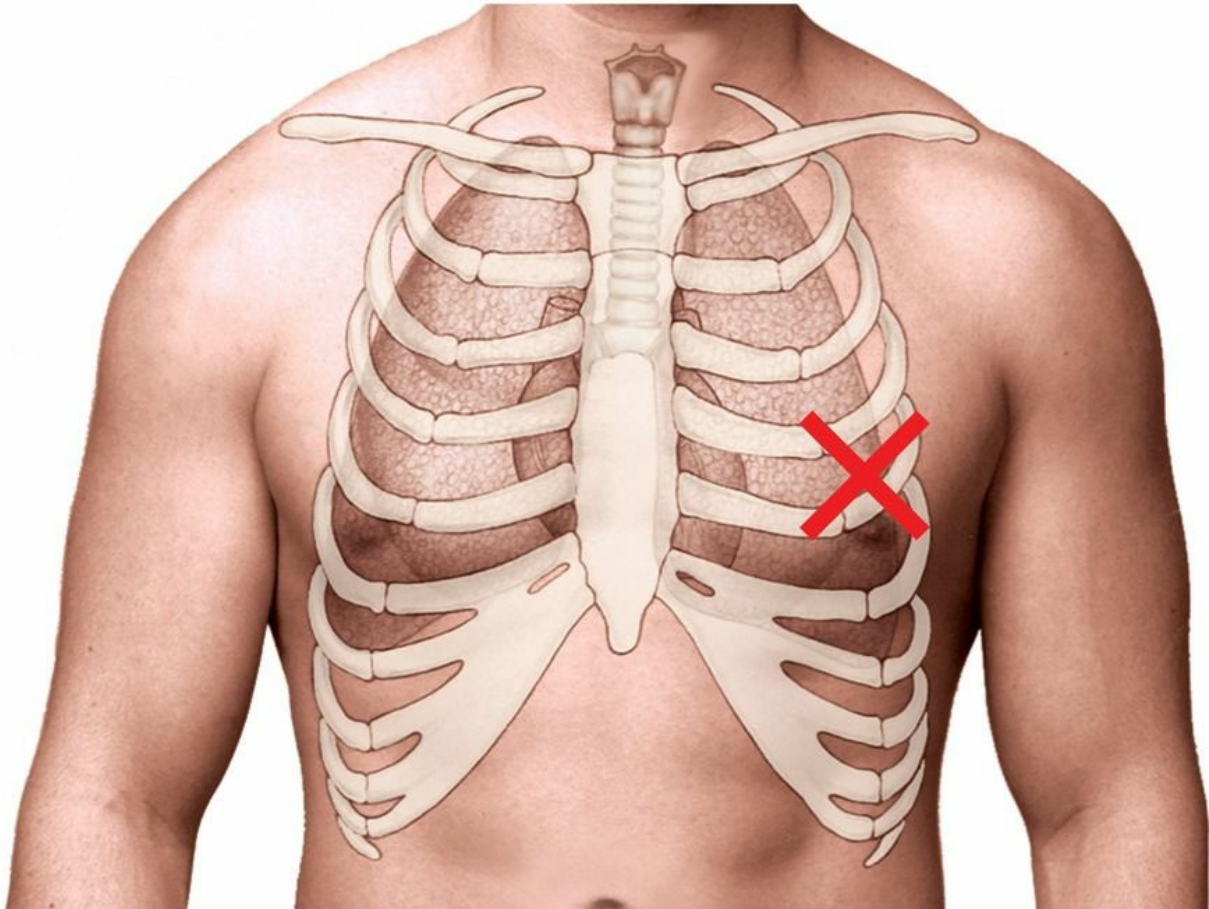

260. 2, 4. Magnesium sulfate decreases muscle contractility and crosses the placenta. Because of this, a neonate who has been exposed to this drug may have decreased muscle tone and decreased respirations. The Moro reflex will be decreased because of the decreased muscle tone. There are no findings that show magnesium sulfate has a direct effect on temperature.

 CN: Pharmacological and parenteral therapies; CL: Analyze

261. 13 mL. 1000 to 1030 = 4 mL (hourly rate 8), 1030 to 1100 = 3 mL (hourly rate 6 mL), 1100 to 1200 = 6 mL (hourly rate 6 mL). $4 + 3 + 6 = 13$.

 CN: Pharmacological and parenteral therapies; CL: Apply

262. S₁ is loudest at the mitral area.

 CN: Health promotion and maintenance; CL: Apply

263. 1. During the third trimester, particularly in the 9th month of pregnancy, the client typically exhibits feelings of vulnerability and fear that the baby will be lost. Confirmation that the fetus is real occurs during the second trimester. Ambivalence is typically seen and resolved during the first trimester. Body image disturbance commonly occurs during the second trimester because of the profound changes that occur to the body during this time.

 CN: Health promotion and maintenance; CL: Analyze

264. 3. The elderly client commonly has vague or atypical responses to medications and diseases that are erroneously attributed to aging. A new cognitive change needs to be investigated and is not an expected change with aging. Changes in a client's behavior should be investigated to see whether there is a relation to excessive sedation. The nurse can interview the family members to obtain information.

CN: Health promotion and maintenance; CL: Apply

265. 2. Infants are sensitive to stress in their caretakers. The best way to handle an anxious infant is to talk quietly, thereby soothing the infant. Limiting holding of the infant to feeding periods interferes with meeting the infant's needs for close contact, possibly compromising his ability to develop trust. Playing music in the room for most of the day and night will make it difficult for the infant to differentiate days from nights. Having a friend take the infant for several days will not necessarily take care of the problem because when the infant returns to the parents, the same behaviors will recur unless the parents makes some changes.

CN: Psychosocial integrity; CL: Synthesize

COMPREHENSIVE

TEST

4

This test has 190 questions. Time yourself as you take the test so you can determine the approximate amount of time it takes to complete this many - questions.

1. A primigravid client at 26 weeks ' gestation asks the nurse what causes heartburn during pregnancy. The nurse should explain to the client that heartburn during pregnancy is usually caused by which factor?

- ☐ 1. increased peristaltic action during pregnancy
- ☐ 2. displacement of the stomach by the diaphragm
- ☐ 3. decreased secretion of hydrochloric acid
- ☐ 4. backflow of stomach contents into the esophagus

2. A client at a follow-up appointment after having a miscarriage 2 weeks previously yells at the nurse, "How could God do this to me? I have never done anything wrong." Which response by the nurse would be **most** appropriate at this time?

- ☐ 1. "God can handle your anger. It is okay."
- ☐ 2. "I know you are angry. It is so hard to lose your baby."
- ☐ 3. "It is not God's fault. It was an accident."
- ☐ 4. "You are a strong person. You will get through this."

3. A client who has been prescribed chemotherapy is worried and wants to take herbal treatments instead. The nurses **best** response to the client is:

- ☐ 1. "You are making a mistake and placing your life in jeopardy."
- ☐ 2. "Herbal treatments are not approved by the government's regulatory agency."
- ☐ 3. "Herbal treatments have not been researched with cancer."
- ☐ 4. "Tell me about your concerns with chemotherapy."

4. A 4-year-old child is admitted for a cardiac catheterization. Which is **most** important to include as the nurse teaches this child about the cardiac catheterization?

- ☐ 1. a plastic model of the heart
- ☐ 2. a catheter that will be inserted into the artery
- ☐ 3. the parents
- ☐ 4. other children undergoing a catheterization

5. A client has a reddened area over a bony prominence. The nurse finds an unlicensed nursing personnel (UAP) massaging this area. The nurse should:

- ☐ 1. reinforce the UAP's use of this intervention over the bony prominence.
- ☐ 2. explain to the UAP that massage is effective because it improves blood flow to the area.
- ☐ 3. inform the UAP that massage is even more effective when combined with the use of lotion.
- ☐ 4. instruct the UAP that massage is contraindicated because it decreases blood flow to the area.

6. A worried mother confides in the nurse that she wants to change healthcare providers (HCPs) because her infant is not getting better. What is the nurse's **best** response?

- ☐ 1. "This primary care provider has been on our staff for 20 years."
- ☐ 2. "I know you are worried, but the primary care provider has an excellent reputation."
- ☐ 3. "You always have an option to change. Tell me about your concerns."
- ☐ 4. "Your infant's condition takes time to heal."

7. A mother who is breast-feeding and has known food sensitivities is asking the nurse what foods she should avoid in her diet. Which foods should the nurse advise the client to avoid? Select all that apply.

- ☐ 1. shellfish
- ☐ 2. eggs
- ☐ 3. peanuts

- ☐ 4. beef
- ☐ 5. lamb

8. A widowed client who is receiving chemotherapy tells the nurse that he does not like to cook for himself. A community resource for this client is:

- ☐ 1. a hospice/palliative care association.
- ☐ 2. a home care/visiting nurses group.
- ☐ 3. a meal delivery service.
- ☐ 4. an association for retirees.

9. After the client has a temporary pacemaker inserted, the nurse should verify documentation on the medical record of:

- ☐ 1. the client's cardiovascular status.
- ☐ 2. the client's emotional state.
- ☐ 3. the type of sedation used.
- ☐ 4. pacemaker rate, type, and settings.

10. The nurse judges that the parent of a 9-month-old infant in a hip spica cast understands how to feed the child when the parent makes which statement?

- ☐ 1. "I can lay my child flat and feed that way."
- ☐ 2. "I will raise my child's head up and leave the hips and legs on a pillow."
- ☐ 3. "I can borrow a special feeding table to use."
- ☐ 4. "It will take two of us, one to hold and one to feed."

11. The nurse is assessing home care needs for a group of clients. Which clients qualify for home care services? The client who: (Select all that apply.)

- ☐ 1. requires monitoring of prothrombin time due to (warfarin) therapy.
- ☐ 2. needs additional instruction regarding preparation of food on a low-sodium diet.
- ☐ 3. has episodes of vertigo that result in falls.
- ☐ 4. has multiple sclerosis with an open, draining lesion on a foot.
- ☐ 5. needs stronger lenses for glasses.

12. Which type of mouth care is **most** appropriate when the nurse is caring

for a client with dentures who has severe stomatitis?

- ☐ 1. using a soft toothbrush or gauze pad to provide oral hygiene
- ☐ 2. rinsing the mouth with a commercial mouthwash before and after each meal
- ☐ 3. cleansing the gums and oral mucosa with an oral swab with an astringent every shift
- ☐ 4. keeping dentures in place to decrease development of edema

13. The nursing staff has finished restraining a client. In addition to determining whether anyone was injured, the staff is mandated to evaluate the incident to obtain which outcome?

- ☐ 1. Coordinate documentation of the incident.
- ☐ 2. Resolve negative feelings and attitudes.
- ☐ 3. Improve the use of restraint procedures.
- ☐ 4. Calm down before returning to the other clients.

14. Two parents who are arguing in their infant's room, with voices raised and getting louder, start to hit each other. The infant is crying. Which action should the staff nurse take **next**?

- ☐ 1. Try to reason with both of the parents.
- ☐ 2. Ask one of the parents to leave the room.
- ☐ 3. Call security to come and break up the fight.
- ☐ 4. Remove the infant from the room.

15. A client asks the nurse why it is necessary to complete an advance directive on admission to the hospital. The nurse's **best** response is:

- ☐ 1. "This will provide a substitute for informed discussion with your healthcare provider (HCP)."
- ☐ 2. "It is your chance to make your wishes known if you ever become incapable of making your own decisions."
- ☐ 3. "Your healthcare provider will make the best decisions for you in an emergency."
- ☐ 4. "Are you worried that extraordinary means will be taken if you are dying?"

16. When witnessing an adult client's signature on a consent form for a

procedure, the nurse verifies that the consent was obtained in an appropriate manner. What information should the nurse verify? Select all that apply.

- ☐ 1. that there was adequate disclosure of information
- ☐ 2. that the client understood the information
- ☐ 3. that there was voluntary consent on the client's part
- ☐ 4. that the client has full awareness of the potential complications
- ☐ 5. that the client's relative, spouse, or legal guardian was present

17. A pregnant woman at 22 weeks' gestation is diagnosed with gonorrhea. The healthcare provider (HCP) prescribes doxycycline. What should the nurse do **first**?

- ☐ 1. Instruct the client about the effects of the drug.
- ☐ 2. Make sure the record notes that the baby must receive eyedrops when born.
- ☐ 3. Have the HCP add a single dose of ceftriaxone.
- ☐ 4. Discuss with the HCP the need to change the prescription.

18. After a client undergoes a contraction stress test that is negative, what should the nurse assess **next**?

- ☐ 1. evidence of ruptured membranes
- ☐ 2. viability status of the fetus
- ☐ 3. indications that contractions have ceased
- ☐ 4. fetal heart rate patterns

19. A 2-month-old infant is at risk for an ileus after surgery to correct intussusception. What should be included in a focused assessment for this complication? Select all that apply.

- ☐ 1. measurement of urine specific gravity
- ☐ 2. assessment of bowel sounds
- ☐ 3. characteristics of the first stool
- ☐ 4. measurement of gastric output
- ☐ 5. bilirubin levels

20. A client with asthma who has wheezing and shortness of breath asks the nurse if it is all right to use the salmeterol inhaler during exercise. What is the nurse's **best** response?

- ☐ 1. “Yes, use the inhaler immediately for these symptoms.”
- ☐ 2. “No, this drug is a maintenance drug, not a rescue inhaler.”
- ☐ 3. “Use the inhaler 5 minutes before you exercise to prevent the wheezing.”
- 4. “This inhaler is for allergic rhinitis, not asthma.”

21. The nurse should assess the child with nephrotic syndrome for which factors? Select all that apply.

- ☐ 1. normal blood pressure
- ☐ 2. generalized edema
- ☐ 3. normal serum lipid levels
- ☐ 4. no red blood cells in the urine
- ☐ 5. elevated streptococcal antibody titers

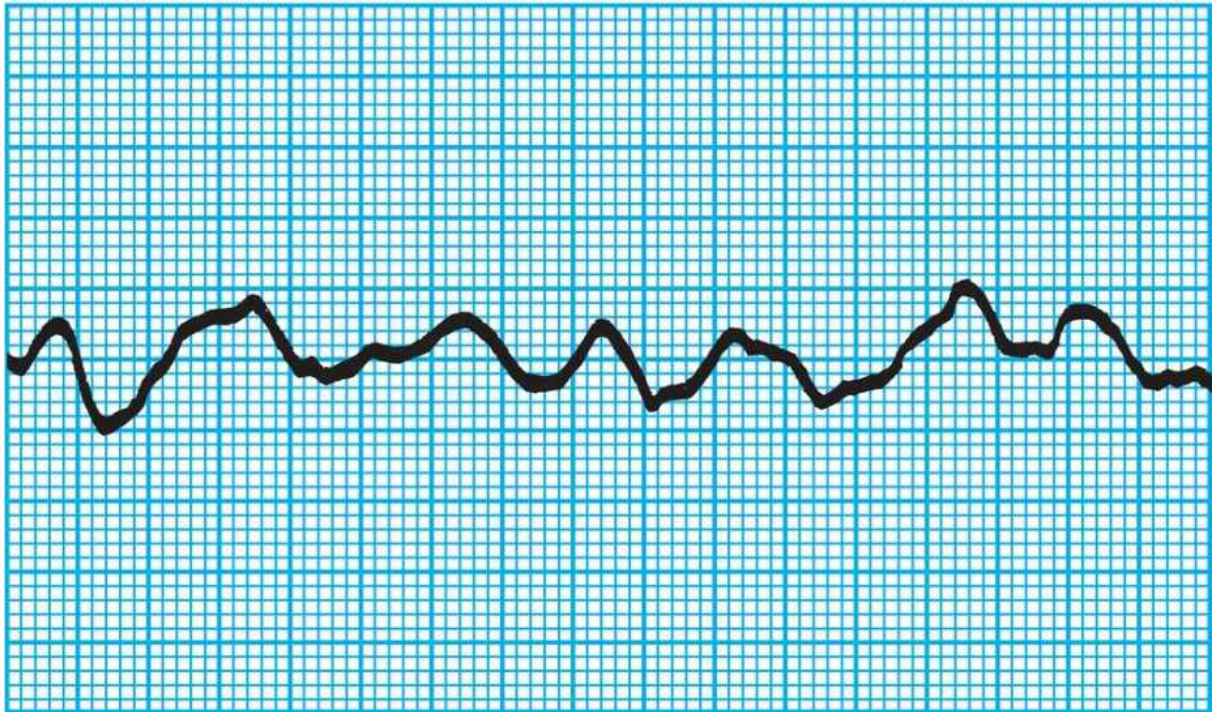

22. A client is receiving spironolactone for treatment of bilateral lower extremity edema. The nurse should instruct the client to make which nutritional modification to prevent an electrolyte imbalance?

- ☐ 1. Increase intake of milk and milk products.
- ☐ 2. Restrict fluid intake to 1,000 mL/day.
- ☐ 3. Decrease foods high in potassium.
- ☐ 4. Increase foods high in sodium.

23. The nurse establishes the goal of preventing the development of a stress ulcer in a burn client. Which would **most** likely contribute to the achievement of this goal?

- ☐ 1. implementing relaxation exercises
- ☐ 2. administering a sedative as needed
- ☐ 3. providing a soft, bland diet
- ☐ 4. administering famotidine as prescribed

24. A nurse is assessing a client with a history of myocardial infarction who is in the surgical unit following a gastric resection. The client has chest pains. The nurse obtains the electrocardiogram (ECG) shown (see figure). What should the nurse do **first**?

- ☐ 1. Administer oxygen.
- ☐ 2. Inspect the client's incision.
- ☐ 3. Call the rapid response team.
- ☐ 4. Reposition the ECG electrodes.

25. The nurse is watching two siblings, ages 7 and 9 years, verbally arguing over a toy. The nurse has counseled the parent before about how to handle this situation. The nurse should judge that the teaching has been effective when the parent takes what action?

- ☐ 1. tells the siblings to stop arguing and shake hands
- ☐ 2. ignores the arguing and continues what she is doing
- ☐ 3. tells the children they will be punished when they go home
- ☐ 4. says they will not go out to lunch now since they have argued

26. A client is diagnosed with genital herpes (herpes simplex virus type 2, or HSV-2). The nurse should instruct the client that:

- ☐ 1. using occlusive ointments may decrease the pain from the lesions.
- ☐ 2. reducing stressful life events may decrease the incidence of herpetic outbreaks.
- ☐ 3. there are no effective drug therapies to manage herpes symptoms.

- ☐ 4. herpes is transmitted to partners only when lesions are weeping.

27. Following an infection, the client is having ototoxic effects of the vestibular branch of the acoustic nerve. The nurse should assess the client for: (Select all that apply.)

- ☐ 1. vertigo.
- ☐ 2. tinnitus.
- ☐ 3. nausea.
- ☐ 4. ataxia.
- ☐ 5. hearing loss.

28. A young adult has been bitten by a human, and the skin on the forearm is broken. The client's last tetanus shot was about 8 years ago. The nurse should prepare the client for:

- ☐ 1. an injection of tetanus toxoid.
- ☐ 2. an application of a corticosteroid cream.
- ☐ 3. closure of the wound with sutures.
- ☐ 4. testing for tuberculosis.

29. A client 6 weeks postpartum is asking the nurse about taking progesterone for birth control. Prior to discussing options, what should the nurse determine? Select all that apply.

- 1. if the client has a sexually transmitted disease
- ☐ 2. how willing her husband is to have her take the drug
- ☐ 3. if the woman is experiencing postpartum depression
- ☐ 4. that the woman is not currently pregnant
- ☐ 5. if the woman is breast-feeding

30. A mother who is visibly upset tells the nurse she wants to take her child home because the child is dying. What would be the nurse's **best** response?

- ☐ 1. "I know how you feel, but the medication will make your child feel better."
- ☐ 2. "I cannot let you do this without calling your healthcare provider (HCP) first."

- ☐ 3. “Can you tell me why you want to take your child home now?”
- ☐ 4. “I can imagine how hard this is for you, but it is not what is best for the child.”

31. Several clients have been admitted to the emergency department. The nurse should assess these clients in which order from first to last? All options must be used.

1. the client who is 12 years of age with a fractured tibia

2. the client who is 8 years of age with small lacerations to legs and arms

3. the client who is 16 years of age with a “sore throat”

4. the client who is 6 months of age with diarrhea and dehydration

32. Which urine output indicates that a 5-month-old weighing 15 lb (6.8 kg) and being treated for dehydration has a normal urine output?

- ☐ 1. 1 to 2 mL/kg/h
- ☐ 2. 4 to 5 mL/kg/h
- ☐ 3. 6 to 8 mL/kg/h
- ☐ 4. 10 to 12 mL/kg/h

33. The nurses in the neonatal intensive care unit are not identifying important clinical changes in the clients that need to be documented. What should the unit director do? Select all that apply.

- ☐ 1. Identify the problem at a staff meeting without placing blame on any individual or group.
- ☐ 2. Ask the unit staff to develop a plan that they think will work for the unit members.
- ☐ 3. Ask an experienced nurse to spend time reorienting newer staff members.
- ☐ 4. Collaborate with the staff development educator to develop a plan.
- ☐ 5. Ask the neonatologist to give a presentation about assessing newborns.

34. A 24-year-old client, diagnosed with acute osteomyelitis in the left leg, has acute pain in the leg that intensifies on movement. The client has a temperature of 101°F (38.3°C) and a reddened, warm area in the midcalf region over the shaft of the tibia. Based on this information, what should the nurse do?

- ☐ 1. Prepare the client for possible left lower leg amputation.
- ☐ 2. Instruct the client to keep the leg immobile.
- ☐ 3. Develop a plan for pain management.
- ☐ 4. Obtain a prescription for fluid replacement.

35. A client has undergone a vasectomy. The nurse instructs the client that he can begin having unprotected intercourse:

- ☐ 1. when desired because sterilization is immediate.
- ☐ 2. as soon as scrotal edema and tenderness resolve.
- ☐ 3. when the sperm count reflects sterilization.
- ☐ 4. after 6 to 10 ejaculations.

36. The nurse is evaluating the outcome of therapy for a client with osteoarthritis. Which indicates goals of therapy have been met?

- ☐ 1. The client's joint degeneration has been arrested.
- ☐ 2. The client is able to self-administer gold compound safely.
- ☐ 3. The client feels better than on hospital admission.
- ☐ 4. The client's joint range of motion has improved.

37. The nurse is assessing an infant diagnosed with bacterial meningitis. The nurse should ask the parent if the infant has which symptoms? Select all that apply.

- ☐ 1. fever
- ☐ 2. vomiting
- ☐ 3. diarrhea
- ☐ 4. poor feeding
- ☐ 5. abdominal pain

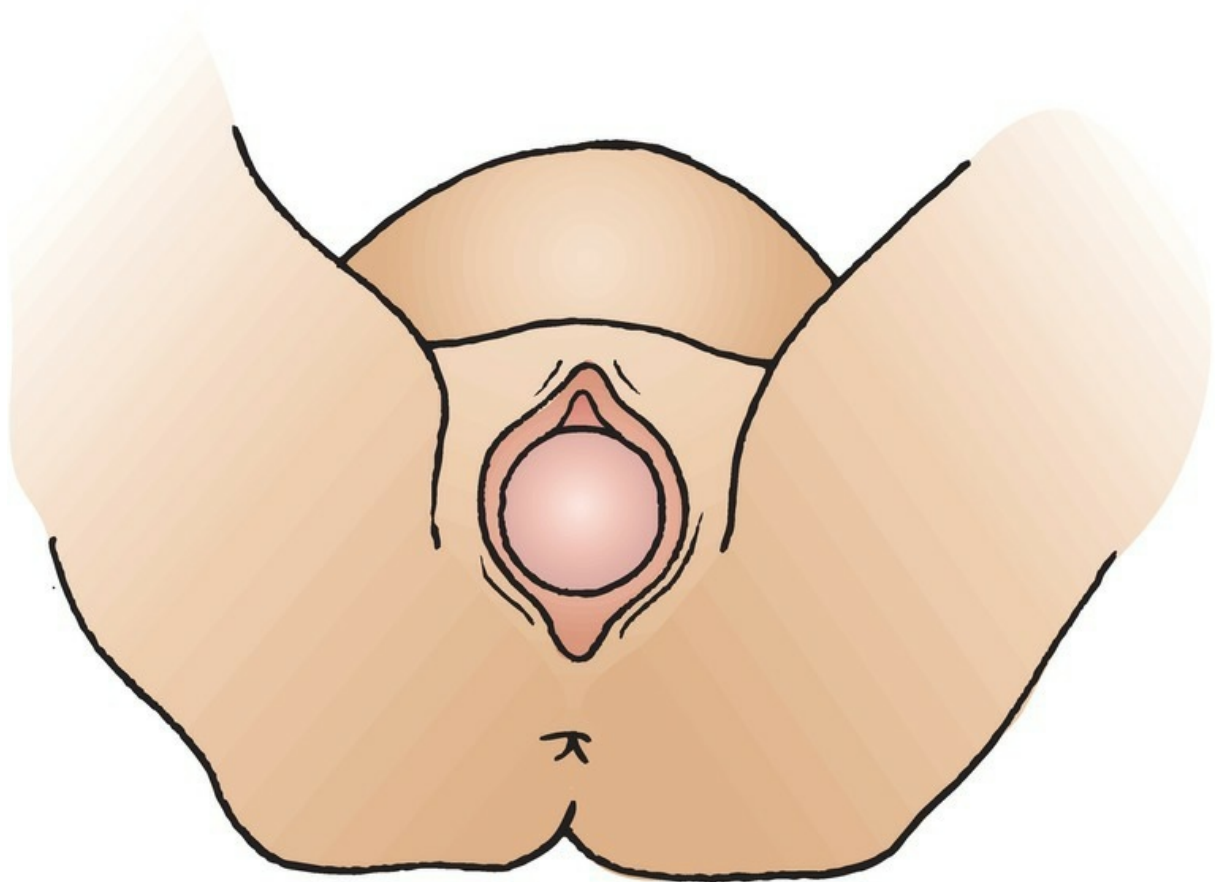

38. To help a client prevent atelectasis and pneumonia after surgery, what should the nurse do?

- ☐ 1. Administer oxygen therapy as needed to maintain adequate oxygenation.
- ☐ 2. Offer pain medication before having the client deep-breathe and use incentive spirometry.
- ☐ 3. Instruct the client to cough, deep-breathe, and turn in bed once every 8 hours.
- ☐ 4. Encourage the client to drink 1,000 mL of fluids in 24 hours.

39. A 7-year-old child is admitted to the hospital with acute rheumatic fever. When discussing long-term care for the child with the parents, the nurse should teach them that a necessary part of this care is:

- ☐ 1. physical therapy.
- ☐ 2. antibiotic therapy.
- ☐ 3. psychological therapy.
- ☐ 4. anti-inflammatory therapy.

40. The nurse is assessing the perineal changes of a woman in the second stage of labor. The figure below represents which perineal change?

- ☐ 1. anterior-posterior slit
- ☐ 2. oval opening
- ☐ 3. circular shape
- ☐ 4. crowning

41. A client is admitted to the hospital with a diagnosis of suspected pulmonary embolism. Prescriptions include oxygen 2 to 4 L/min per nasal cannula, oximetry at all times, and IV administration of 5% dextrose in water at 100 mL/h. The client has increasing dyspnea and has a respiratory rate of 32 breaths/minute. The oxygen flow rate is set at 2 L/min. The nurse should **first**:

1. increase the oxygen flow rate from 2 to 4 L/min.
2. call the healthcare provider (HCP) immediately.
- ☐ 3. provide reassurance to the client.
- ☐ 4. obtain a sample for arterial blood gas analysis.

42. A 10-month-old child has cold symptoms. The mother asks how she can clear the infant's nose. What would be the nurse's **best** recommendation?

- ☐ 1. Use a cool air vaporizer with plain water.
- 2. Use saline nose drops and then a bulb syringe.
- ☐ 3. Blow into the child's mouth to clear the infant's nose.
- ☐ 4. Administer a nonprescription vasoconstrictive nose spray.

43. A nurse is assessing a client with metastatic lung cancer. The nurse should assess the client specifically for:

- ☐ 1. diarrhea.
- ☐ 2. constipation.
- ☐ 3. hoarseness.
- ☐ 4. weight gain.

44. A healthcare provider (HCP) is calling the pediatric unit and asking the nurse to go into the medical record for test results of a fellow pediatrician. How should the nurse respond to this request?

- ☐ 1. Verify that the caller is the HCP of record or has a need to know.
- ☐ 2. Access the medical record, and give the healthcare provider the test results.
- 3. Decline to give the HCP the information requested.
- ☐ 4. Determine whether the nurse can access the medical record.

45. A client is at risk for development of metabolic alkalosis because of persistent vomiting. The nurse should assess the client specifically for:

- ☐ 1. irritability.
- ☐ 2. hyperventilation.
- ☐ 3. diarrhea.
- ☐ 4. edema.

46. Which finding should **first** alert the nurse that a child is hemorrhaging after a tonsillectomy?

- ☐ 1. mouth breathing
- ☐ 2. frequent swallowing

- ☐ 3. requests for a drink
- ☐ 4. increased pulse rate

47. A nurse is caring for a client who is having an allergic reaction to a blood transfusion. In what order should the nurse provide care for this client? All options must be used.

1. Stop the transfusion.

2. Send the blood bag and blood slip to the blood bank.

3. Keep the vein open with normal saline solution.

4. Administer an antihistamine as directed.

48. The nurse is to administer chloramphenicol 50 mg IV in 100 mL of dextrose 5% in water over 30 minutes. The infusion set administers 10 gtt/mL. At what flow rate (in drops per minute) should the nurse set the infusion? Round to the nearest whole number.

_____ gtt/min.

49. A client claims to have a “special mission from God.” The nurse incorporates this religious delusion of grandeur into the client’s plan of care based on the understanding that the **primary** purpose of such a delusion is to provide:

- ☐ 1. survival.

- ☐ 2. comfort.
- ☐ 3. safety.
- ☐ 4. self-esteem.

50. A client who has been vomiting for 2 days has a nasogastric tube inserted. The nurse notes that over the past 10 hours, the tube has drained 2 L of fluid. The nurse should further assess the client for:

- ☐ 1. hypermagnesemia.
- ☐ 2. hypernatremia.
- ☐ 3. hypokalemia.
- ☐ 4. hypocalcemia.

51. When a client is examining her own breast, the nurse should instruct the client that which finding is **normal**?

- ☐ 1. pronounced unilateral venous pattern
- ☐ 2. peau d'orange breast tissue
- ☐ 3. long-term, bilateral nipple inversion
- ☐ 4. breast tissue that is darker than the areolae

52. A child with sickle cell crisis is being discharged. As part of discharge teaching to prevent further crisis, what should the nurse advise the parent to do?

- ☐ 1. Encourage the child to drink lots of liquids.
- ☐ 2. Take the child's temperature every morning.
- ☐ 3. Weigh the child every day.
- ☐ 4. Offer the child a high-protein diet.

53. While assessing a neonate 30 minutes after birth, the nurse observes that the child has a short neck covered with webbing. The nurse should further assess the client for:

- ☐ 1. genetic deviations.
- ☐ 2. cleft palate.
- ☐ 3. Potter's syndrome.
- ☐ 4. neural tube defects.

54. A client has severe diarrhea that has lasted for 2 days. The nurse

should now assess the client for:

- ☐ 1. muscle spasms.
- ☐ 2. thirst.
- ☐ 3. irregular pulse.
- ☐ 4. confusion.

55. The nursing staff on the antepartal unit has leuprolide acetate and medroxyprogesterone acetate in the pharmacy for their clients. The nursing staff observed that the vials are similar in size and shape and could be confused. In order to promote client safety, the nursing staff should take which actions? Select all that apply.

- ☐ 1. Petition the pharmacy to relocate one drug away from the other product.
- ☐ 2. Move the drugs to a new position within the medication administration system during the night shift.
- ☐ 3. Communicate concerns, measures to remedy, and final decisions to all staff.
- ☐ 4. Leave repositioning of drugs to pharmacy staff to resolve.
- ☐ 5. Collaborate with pharmacy staff to develop a location that works well for both groups.

56. When assessing a client's pain, which information is the **most** reliable indicator of the existence and intensity of acute pain?

- ☐ 1. the client's vital signs
- ☐ 2. the client's self-report of pain
- ☐ 3. the nurse's assessment of the client
- ☐ 4. the severity of the condition causing the pain

57. The nurse advises a mother with a 2-year-old child to avoid encouraging excessive milk consumption by the toddler because excess milk consumption can lead to:

- ☐ 1. vitamin C deficiency.
- ☐ 2. iron deficiency.
- ☐ 3. biotin deficiency.
- ☐ 4. folate deficiency.

58. The nurse is caring for a client with a fracture of a long bone. Which symptom is the **earliest** indication of a fat embolism?

- ☐ 1. respiratory distress
- ☐ 2. confusion
- ☐ 3. petechiae
- ☐ 4. fever

59. A client tells the nurse, “Everybody smiles at me because they know that I was chosen by God for this mission.” The nurse interprets this statement as which finding?

- ☐ 1. idea of reference
- ☐ 2. thought insertion
- ☐ 3. visual hallucination
- ☐ 4. neologism

60. The mother of a newborn is voicing concerns about her baby’s ability to hear. What should the nurse tell the mother?

- ☐ 1. Newborns cannot hear well until they are at least 6 weeks old.
- ☐ 2. Her concern is unfounded because hearing problems are rare in newborns.
- ☐ 3. Most American states and Canadian jurisdictions now mandate hearing tests for infants.

4. She can test the baby’s hearing by clapping her hands 24 inches (60 cm) from the infant’s head.

61. The healthcare provider (HCP) changes a client’s current dose of IM meperidine hydrochloride to an oral dosage. The current IM dosage is 75 mg every 4 hours as needed. What dosage of oral meperidine will be required to provide an equivalent analgesic dose?

- ☐ 1. 25 to 50 mg every 4 hours
- ☐ 2. 75 to 100 mg every 4 hours
- ☐ 3. 125 to 140 mg every 4 hours
- ☐ 4. 150 to 300 mg every 4 hours

62. The parent asks the nurse about the causes of most brain injuries in

children. What would the nurse discuss as the major causes? Select all that apply.

- ☐ 1. falls
- ☐ 2. motor vehicle accidents
- ☐ 3. bicycle accidents
- ☐ 4. child abuse
- ☐ 5. tumors

63. To prevent the development of osteoporosis in a client who is immobilized, the nurse should:

- ☐ 1. begin weight-bearing activities as soon as possible.
- ☐ 2. increase the client's calcium intake in the diet.
- ☐ 3. perform passive range-of-motion (ROM) exercises four times a day.
- ☐ 4. teach the client to perform isometric exercises.

64. The mother of a toddler asks the nurse what she should do with her toddler when he has a temper tantrum. Which suggestion would be **most** appropriate?

- ☐ 1. Move the toddler to a time-out chair.
- ☐ 2. Try to talk the toddler out of the tantrum.
- ☐ 3. Leave the toddler alone during the tantrum as long as he is safe.
- ☐ 4. Punish the toddler for having a temper tantrum.

65. A child who is 15 years of age is hospitalized with bacterial meningitis. At 1730, the client's mother reports her child is "burning up." The nurse is reviewing the client's medication administration records in the medical record.

Medication	Time	Reason	Initial
Ibuprofen 200 mg po PRN every 3–4 hours for fever >99°F (37.2°C)	0910	T = 100°F (37.8°C)	LM
	1315	T = 100°F (37.8°C)	LM
	1615	T = 101°F (38.3°C)	LM

The healthcare provider (HCP) has prescribed ibuprofen 325 mg every 3 to 4 hours for temperature over 99°F (37.2°C). The child's temperature at 1730 is 102.5°F (39.1°C). What should the nurse do **first**?

- ☐ 1. Notify the HCP.
- ☐ 2. Initiate tepid sponge bath.
- ☐ 3. Institute seizure precautions.
- ☐ 4. Administer another dose of aspirin.

66. The nurse on the orthopedic unit is receiving a client from the postanesthesia care unit (PACU). A safe “handoff” includes:

- ☐ 1. an e-mail on the intranet from the nurse in the PACU to the receiving nurse on the orthopedic unit.
- ☐ 2. a page from a transporter who is bringing the client to the receiving nurse.
- ☐ 3. interactive communication between the nurse from the PACU and the nurse from the orthopedic unit.
- ☐ 4. delegation of registered nurse (RN) responsibility and accountability to a non-RN on the receiving unit.

67. What should the nurse do to prevent pressure ulcers in an older adult?

- ☐ 1. Clean the skin daily using mild soap and hot water.
- ☐ 2. Perform a systematic skin assessment at least once a day.

- ☐ 3. Massage bony prominences gently every shift.
- ☐ 4. Encourage the client to sit in a chair as much as possible.

68. The nurse is evaluating the pin insertion site of a client's skeletal traction. Which finding indicates a complication?

- 1. presence of crusts around the pin insertion site
- ☐ 2. serous drainage on the dressing
- ☐ 3. slight movement of pin at insertion site
- ☐ 4. no pain felt by the client at insertion site

69. On the night before a 58-year-old wife and mother is to have a lobectomy for lung cancer, she remarks to the nurse, "I am so scared of this cancer. I should have quit smoking years ago. Now I have brought all this fear and sadness on myself and now my family." The nurse should tell the client:

- ☐ 1. "It is normal to be scared. I would be, too. We will help you through it."
- ☐ 2. "Do you feel guilty because you smoked?"
- ☐ 3. "Do not be so hard on yourself. You do not know if your smoking caused the cancer."
- ☐ 4. "It is okay to be scared. What is it about cancer that you are afraid of?"

70. The nurse is caring for an elderly client who has hip pain related to rheumatoid arthritis. The client is practicing appropriate self-care activities when the client chooses to sit in which type of chair?

- ☐ 1. recliner chair with arms to support wrists and hands
- ☐ 2. couch with soft cushions to support thighs
- ☐ 3. straight-back chair with elevated seat
- ☐ 4. curved-back rocking chair

71. The nurse is planning discharge care with the parents of a 16-year-old boy who recently attempted suicide. The nurse should advise the parents to tell the nurse if their son:

- ☐ 1. expresses a desire to date.
- 2. decides to try out for an extracurricular activity.

- ☐ 3. gives away valued personal items.
- ☐ 4. desires to spend more time with his friends.

72. Which response would be **most** appropriate for the nurse when comforting a primiparous client whose critically ill neonate born at 25 weeks dies while the mother is present?

- ☐ 1. "This is probably for the best because his organs were so immature."
- ☐ 2. "You should try to get pregnant again soon to get over this loss."
- ☐ 3. "You can stay with your baby as long as you want and say anything you want."
- ☐ 4. "If you want me to, I can call the chaplain to stay with you."

73. The nurse is developing a care plan for a female child who is 12 years of age and receiving surgery to correct idiopathic scoliosis. Which postoperative problem is a **priority**?

- ☐ 1. pain
- ☐ 2. hypotension
- ☐ 3. prevention of pressure wounds
- ☐ 4. infection control

74. A 32-year-old woman recently diagnosed with Hodgkin's disease is admitted for staging by undergoing a bone marrow aspiration and biopsy. To obtain more information about the client's nutritional status, the nurse should review the results of which test?

- ☐ 1. red blood cell count
- ☐ 2. direct and indirect bilirubin levels
- ☐ 3. reticulocyte count
- ☐ 4. albumin level

75. The nurse teaches a client taking desmopressin nasal spray about how to manage treatment. The nurse determines that the client needs additional instruction when the client says:

- ☐ 1. "I should check for sores in my nose while taking this medication."
- ☐ 2. "I should use the same nostril each time I take the medicine."
- ☐ 3. "I should report nasal congestion."
- ☐ 4. "I should report any signs of respiratory infection."

76. The nurse has a prescription to administer ampicillin 250 mg IM. After reconstituting the ampicillin with sterile water for injection, the solution available is 500 mg/mL. How many milliliters should the nurse administer?

_____ mL.

77. A client is a 43-year-old G2 P1 at 16 weeks' gestation who has completed prenatal testing for chromosomal abnormalities. The results reveal the infant is a female with Down syndrome. The parents are seeking information about this syndrome. What should the nurse tell the parents? Select all that apply.

- ☐ **1.** Down syndrome can occur in mothers of any age.
- ☐ **2.** Down syndrome is correlated with autosomal dominant traits carried by the parents.
- ☐ **3.** Down syndrome is a result of autosomal recessive traits carried by the parents.
- ☐ **4.** Down syndrome depends upon maternal prenatal care since pregnancy began.
- ☐ **5.** Down syndrome occurs more frequently with advanced maternal age.
- ☐ **6.** Down syndrome results from a trisomy of chromosome 21.

78. There has been a fire in an apartment building, and it has spread to seven apartment units. Victims have suffered burns, minor injuries, and broken bones from jumping from windows. Which persons can be safely treated at the scene and transported to a healthcare facility after victims with more emergent problems have been transported first? Select all that apply.

- ☐ **1.** female client who is 5 months pregnant with no apparent injuries
- ☐ **2.** male who is 50 years of age with no injuries, rapid respirations, and coughing
- ☐ **3.** child who is 10 years of age with an apparent simple fracture of the humerus
- ☐ **4.** female who is 20 years of age with first-degree burns on hands and forearms
- ☐ **5.** male who is 75 years of age with second-degree burns on both legs

79. A primiparous non-breast-feeding client at 48 hours postpartum is to

be given medroxyprogesterone before discharge. What information should the nurse include in the teaching plan before administering this medication?

- ☐ 1. There is an increased risk of ovarian cancer with use of this drug.
- ☐ 2. Amenorrhea is common during the first 6 months.
- ☐ 3. Heavy menstrual bleeding may occur.
- ☐ 4. The client may experience periods of increased energy.

80. A nurse is assessing a client who is receiving clozapine. The nurse reviews the medical record. What should the nurse do **next**?

Vital Signs

Date	06/12/15	06/12/15
Time	0800	1200
Temperature	98° F (36.7°C)	98° F (36.7°C)
Pulse	140	148
Respirations	22	24
Blood pressure	120/80	122/84

- ☐ 1. Give the clozapine, and tell the client to lie down.
- ☐ 2. Withhold the clozapine, and tell the client to go to an exercise group.
- ☐ 3. Administer the clozapine, and notify the healthcare provider (HCP).
- ☐ 4. Withhold the clozapine, and notify the HCP.

81. The nurse is instructing the parents of a child with acquired immunodeficiency syndrome (AIDS) how to look for signs and symptoms of infection when the child has a cut or open wound. The nurse should tell the parents to report:

- ☐ 1. erythema around the area.
- ☐ 2. rectal temperature higher than 100.5°F (38°C).

- ☐ 3. tenderness around the area.
- ☐ 4. increased warmth of the skin in the involved area.

82. The nurse is teaching a group of unlicensed assistive personnel (UAP) about providing care to clients with depression. Which approach by one of the UAPs indicates an understanding of the **most** effective approach to a depressed client?

- ☐ 1. cheerful
- ☐ 2. empathetic
- ☐ 3. serious
- ☐ 4. humorous

83. When fluids by mouth are appropriate for the infant after surgery to correct intussusception, the nurse **most** likely would initiate feeding with:

- ☐ 1. cereal-thickened formula.
- ☐ 2. full-strength formula.
- ☐ 3. half-strength formula.
- ☐ 4. oral electrolyte solution.

84. A client is taking paroxetine 20 mg PO every morning. The nurse should monitor the client for which adverse effect?

- ☐ 1. hypertensive crisis
- ☐ 2. sexual problems
- ☐ 3. sleep disturbance
- ☐ 4. orthostatic hypotension

85. The nurse is assessing a client who is in shock. Which neurologic change indicates that the client is in the progressive stage of shock?

- ☐ 1. restlessness
- ☐ 2. confusion
- ☐ 3. incoherent speech
- ☐ 4. unconsciousness

86. A child diagnosed with osteomyelitis will be discharged on IV nafcillin. After teaching the parents about adverse effects that are important to report, which effects as stated by the parents indicate that they understand

the teaching? Select all that apply.

- ☐ 1. sore mouth
- ☐ 2. pain with urination
- ☐ 3. headache
- ☐ 4. stomach upset
- ☐ 5. fever

87. The rapid response team arrives in the room of a client who has had a cardiac arrest. The nurse should **first** apply which piece of monitoring equipment?

- ☐ 1. electrocardiogram (ECG) electrodes
- ☐ 2. pulse oximeter
- ☐ 3. blood pressure cuff
- ☐ 4. Doppler for pulse check

88. A nurse is counseling a client who is depressed. What nursing actions promote trust between the client and the nurse? Select all that apply.

- ☐ 1. Indicate an understanding for the client's feelings as well as for their cause.
- ☐ 2. Listen and encourage the client to say more.
- ☐ 3. Acknowledge hearing what the client said.
- ☐ 4. Maintain eye contact with the client at all times.
- ☐ 5. Stand very close to the client.

89. The nurse is assessing a client for heroin addiction. Which finding indicates the client has used heroin?

- ☐ 1. sclera red and bloodshot
- ☐ 2. pupils small and constricted
- ☐ 3. pupils large and dilated
- ☐ 4. drooping eyelids

90. When performing routine health evaluations in school-age children, which finding would alert the school nurse to pediculosis capitis (head lice)?

- ☐ 1. spotty baldness
- ☐ 2. wheals with scalp blistering

- ☐ 3. frequent scalp scratching
- ☐ 4. dry, scaly patches on the skin

91. When the nurse is assessing the client's abdomen, which finding **best** indicates that a client's peristaltic activity is returning to normal after surgery?

- ☐ 1. The client passes flatus.
- ☐ 2. The client says that she is hungry.
- ☐ 3. Bowel sounds are hypoactive on auscultation.
- ☐ 4. Peristalsis can be felt on abdominal palpation.

92. A client appears flushed and has shallow respirations. The arterial blood gas report shows the following: pH, 7.24; partial pressure of arterial carbon dioxide (Paco₂), 49 mm Hg (6.5 kPa); and bicarbonate (HCO₃), 24 mEq/L (24 mmol/L). These findings are indicative of which acid-base imbalance?

- ☐ 1. metabolic acidosis
- ☐ 2. metabolic alkalosis
- ☐ 3. respiratory acidosis
- ☐ 4. respiratory alkalosis

93. Which action is **most** important when the nurse is planning pain management for a client after a lobectomy for lung cancer?

- ☐ 1. repositioning the client immediately after administering pain medication
- ☐ 2. reassessing the client after administering pain medication
- ☐ 3. reassuring the client after administering pain medication
- ☐ 4. readjusting the pain medication dosage as needed

94. The nurse is evaluating a female client's understanding of how to prevent sexually transmitted infections (STIs). Which statement indicates that the client understands how to protect herself?

- ☐ 1. "I will be sure my partner uses a condom."
- ☐ 2. "I need to be sure to take my birth control pills."
- 3. "I will always douche after sexual intercourse."

- ☐ 4. “I will be sure to take antibiotics to prevent an STI.”

95. While assessing a multigravid client at 10 weeks’ gestation, the nurse notes a purplish color to the vagina and cervix. The nurse documents this as what finding?

- ☐ 1. Goodell’s sign
- ☐ 2. Chadwick’s sign
- ☐ 3. Hegar’s sign
- ☐ 4. melasma

96. A client with bipolar disorder, mania, has flight of ideas and grandiosity and becomes easily agitated. To prevent harmful behaviors, what should the nurse do **initially**?

- ☐ 1. Encourage the client to stay in his room.
- ☐ 2. Seclude the client at the first sign of agitation.
- ☐ 3. Tell the client to seek out staff when feeling agitated.
- ☐ 4. Instruct the client to ask for medication when agitated.

97. The nurse is preparing written information for an older adult who is to manage intermittent self-catheterization. Which strategy will be **most** effective?

- ☐ 1. Use charts to help convey information.
- ☐ 2. Prepare information at a tenth-grade reading level.
- ☐ 3. Use short words.
- ☐ 4. Print the material in a condensed font.

98. The nurse should assess a child with newly diagnosed hyperthyroidism for which signs or symptoms? Select all that apply.

- ☐ 1. weight gain
- ☐ 2. dry skin
- ☐ 3. constipation
- ☐ 4. rapid pulse
- ☐ 5. heat intolerance

99. The nurse is planning care for four mothers and their newborns. After reviewing the clients’ medical records, the nurse should make rounds on

which client **first**?

- ☐ 1. an 18-year-old with an uncomplicated spontaneous vaginal birth 12 hours ago who has abdominal cramps
- ☐ 2. a 35-year-old with an uncomplicated vaginal birth 4 hours ago; the nurse's notes indicated she soaked two peripads over the last 2 hours; fundus is firm
- ☐ 3. a 16-year-old with a caesarean section 4 hours ago, diagnosed with preeclampsia and receiving magnesium sulfate at 2 g/h; reflexes are 2+, and the nurse's notes indicate she has a headache; vital signs are T 99.4°F (37.4°C), P 88, R 20, and BP 128/86 mm Hg
- ☐ 4. an 18-year-old who had a caesarian birth 2 days ago and now has severe breast pain; vital signs are T 99.8°F (37.7°C), P 96, and R 22

100. A nurse is evaluating the proper use of crutches by a client who has fractured the right leg. Which statement indicates the client is using the correct technique?

- ☐ 1. "I move my left leg forward first as I swing forward on my crutches."
- ☐ 2. "I need to increase my arm strength because my arms tingle after I use my crutches."
- ☐ 3. "I padded the tops of my crutches so that I can lean more comfortably on my crutches."
- ☐ 4. "I feel pressure on the palms of my hands when I am walking with my crutches."

101. Which factor is a **priority** when evaluating discharge plans for an older adult after a lower left lobectomy for lung cancer?

- ☐ 1. the distance the client lives from the hospital
- ☐ 2. support available for assisting the client at home
- ☐ 3. the client's ability to do home blood pressure monitoring
- ☐ 4. the client's knowledge of the causes of lung cancer

102. A primiparous client planning to breast-feed her term neonate born vaginally asks, "When will my 'real' milk come in?" The nurse explains to the client that after childbirth, breasts begin to produce milk within what time period?

- ☐ 1. 12 hours
- ☐ 2. 24 hours
- ☐ 3. 2 to 4 days
- ☐ 4. 7 days

103. The nurse is caring for an elderly, debilitated client who has been bedridden for an extended period. Which sign or symptom indicates that the client has hypoxia?

- ☐ 1. chills
- ☐ 2. productive cough
- ☐ 3. confusion
- ☐ 4. pleuritic chest pain

104. A child with rheumatic fever has polyarthritis and chorea. An echocardiogram shows swelling of the cardiac tissue. Which intervention should the nurse include in the child's plan of care?

- ☐ 1. Explain that the chorea will disappear over time.
- ☐ 2. Perform neurologic checks every 4 hours until the chorea subsides.
- ☐ 3. Promote ambulation by administering aspirin every 4 hours.
- ☐ 4. Keep the child in a slightly cool environment.

105. A 19-year-old unmarried college student who is approximately 8 weeks pregnant asks the nurse, "If I have an abortion in the next 2 or 3 weeks, how will it be done?" The nurse instructs the client that at this gestational age, an abortion is usually performed by which technique?

- ☐ 1. dilatation and curettage
- ☐ 2. menstrual extraction
- ☐ 3. dilatation and vacuum extraction
- ☐ 4. saline induction

106. The nurse is performing a respiratory assessment on a client who has a pleural effusion. The nurse would expect that the client has:

- ☐ 1. decreased breath sounds on the affected side.
- ☐ 2. normal bronchial breath sounds.
- ☐ 3. hyperresonance on percussion.

- ☐ 4. wheezing on auscultation.

107. A nurse is caring for a child with intussusception. What is an expected outcome for a goal to relieve acute pain from abdominal cramping?

- ☐ 1. The child exhibits no manifestations of discomfort.
- ☐ 2. The child is very still.
- ☐ 3. The child has a normal bowel movement.
- ☐ 4. The child has not vomited in 3 hours.

108. Gentamicin sulfate 25 mg IM has been prescribed every 6 hours. Gentamicin sulfate 40 mg/mL is available. How many milliliters (to the nearest tenth of an mL) should the nurse administer in each dose? Round to the nearest mL.

_____ mL.

109. Assessment of a 36-year-old woman who has malaise and dysuria reveals a temperature of 100°F (37.8°C) and painful blisters on the outside of her vagina. The client tells the nurse she had intercourse with a new partner 5 days ago. What should the nurse do?

- ☐ 1. Advise the client to ask her partner to use a condom.
- ☐ 2. Encourage the client to increase fluid to 3,000 mL/day.
- ☐ 3. Tell the client to use a lubricant jelly on the blisters.
- ☐ 4. Refer the client to a healthcare provider (HCP).

110. A child with leukemia fails to respond to therapy. Which statement offers the nurse the **best** guide in making plans to assist the parents in dealing with their child's imminent death?

- ☐ 1. Knowing that the prognosis is poor helps prepare relatives for the death of children.
- ☐ 2. Relatives are especially grieved when a child does well at first but then declines rapidly.
- ☐ 3. Trust in health personnel is most often destroyed by a death that is considered untimely.
- ☐ 4. It is more difficult for relatives to accept the death of a 10-year-old than the death of a younger child whose family membership has been short.

111. The nurse is caring for a child receiving a blood transfusion. The child becomes flushed and is wheezing. What should the nurse do **first**?

- ☐ 1. Notify the healthcare provider (HCP).
- ☐ 2. Administer oxygen.
- ☐ 3. Switch the transfusion to normal saline solution.
- ☐ 4. Take the child's vital signs.

112. A client who is allergic to penicillin has a prescription to receive cefazolin. The nurse should **first**:

- ☐ 1. ask if the client has taken cefazolin before without an adverse response.
- ☐ 2. verify the prescription with the healthcare provider (HCP).
- ☐ 3. administer the cefazolin as prescribed.
- ☐ 4. observe the client closely for urticaria.

113. Which nursing intervention will promote successful achievement of Erikson's stage of development for the 3-year-old toddler?

- ☐ 1. Allow the toddler to choose what time to take her antibiotic.
- ☐ 2. Encourage the toddler to assist in removing the dressing on her leg.
- ☐ 3. Allow the toddler to work on an art project that she can complete.
- ☐ 4. Encourage friends to visit the toddler in the hospital.

114. When preparing the teaching plan for a client about lithium therapy, the nurse should teach the client about:

- ☐ 1. maintaining an adequate sodium intake.
- ☐ 2. discontinuing sodium in the diet.
- ☐ 3. buying foods labeled "low in sodium."
- ☐ 4. increasing sodium in the diet.

115. A client who is undergoing radiation therapy develops mucositis. Which action should be included in the client's plan of care?

- ☐ 1. increasing mouth care to twice per shift
- ☐ 2. providing the client with hot tea to drink
- ☐ 3. promoting regular flossing of teeth
- ☐ 4. using half-strength hydrogen peroxide on mouth ulcers

116. A parent calls the Poison Control Center because her 3-year-old has

eaten 10 to 12 chewable acetaminophen tablets. What should the nurse instruct the parent to do?

- ☐ 1. Give the child a large glass of milk.
- ☐ 2. Induce vomiting.
- ☐ 3. Take the child to the emergency department.
- ☐ 4. Monitor the child's respirations for 24 hours.

117. The parent of a preschool-age child tells the nurse that the child is hyperactive and something needs to be done. Which response by the nurse would be **most** appropriate initially?

- ☐ 1. "What makes you think your child is hyperactive?"
- ☐ 2. "What do you think needs to be done?"
- ☐ 3. "How does your child behave normally?"
- ☐ 4. "Does the preschool teacher think your child is hyperactive?"

118. When preparing for the discharge of a newborn after surgery to correct tracheoesophageal fistula (TEF), the nurse teaches the parents about the need for long-term health care because their child has a high probability of developing which complication?

- ☐ 1. recurrent mild diarrhea with dehydration
- ☐ 2. esophageal stricture
- ☐ 3. speech problems
- ☐ 4. gastric ulcers

119. A young adult with Hodgkin's disease has been readmitted to the hospital because of aggressive disease that is unresponsive to multiple therapies. Death appears imminent. A **priority** nursing goal for this client is to:

- ☐ 1. reduce feelings of isolation.
- ☐ 2. reduce fear of pain.
- ☐ 3. reduce fear of more aggressive therapies.
- ☐ 4. reduce feelings of social inadequacy.

120. A client is admitted in early active labor at 39 weeks' gestation with intact membranes. When assessing the fetal heart rate, the nurse locates the heart sounds above the client's umbilicus at midline. The nurse should further

confirm that the fetus is lying in which position?

- ☐ 1. cephalic
- ☐ 2. frank breech
- ☐ 3. face
- ☐ 4. transverse

121. The nurse is caring for a client who has been diagnosed with pernicious anemia. Which statement by the client indicates an understanding of the treatment of pernicious anemia?

- ☐ 1. "I will need to increase my dietary intake of foods that are high in vitamin B12."
- ☐ 2. "I will receive my first injection of vitamin B12 tomorrow, and I will return for a follow-up injection in 1 month."
- ☐ 3. "I understand that the oral form of vitamin B12 is preferred because it is safer and less expensive than the injection form."
- ☐ 4. "I will need to take vitamin B12 replacements for the rest of my life."

122. A client's 1200 blood glucose was inaccurately documented as 310 mg/dL (17.2 mmol/L) instead of 130 mg/dL (7.2 mmol/L). This error was not noticed until 1300. The nurse administered the sliding scale insulin for a blood glucose of 310 mg/dL (17.2 mmol/L). What should the nurse do **first**?

- ☐ 1. Notify the healthcare provider (HCP).
- ☐ 2. Assess for hypoglycemia.
- ☐ 3. Consult with the clinical pharmacist.
- ☐ 4. Call the charge nurse.

123. An older infant who has been injured in an automobile accident is to wear a splint on the injured leg. The mother reports that the infant has become mobile even while wearing the splint. What should the nurse advise the mother to do?

- ☐ 1. Notify the healthcare provider (HCP) immediately to adjust the treatment plan.
- ☐ 2. Confine the infant to one room in the apartment.
- ☐ 3. Keep the infant in the splint at night, removing it during the day.
- ☐ 4. Remove any unsafe items from the area in which the infant is mobile.

124. While preparing a client for surgery, the nurse assesses for psychosocial problems that may cause preoperative anxiety. Which is believed to be the **most** distressing fear a preoperative client is likely to experience?

- ☐ 1. fear of the unknown
- ☐ 2. fear of changes in body image
- ☐ 3. fear of the effects of anesthesia
- ☐ 4. fear of being in pain

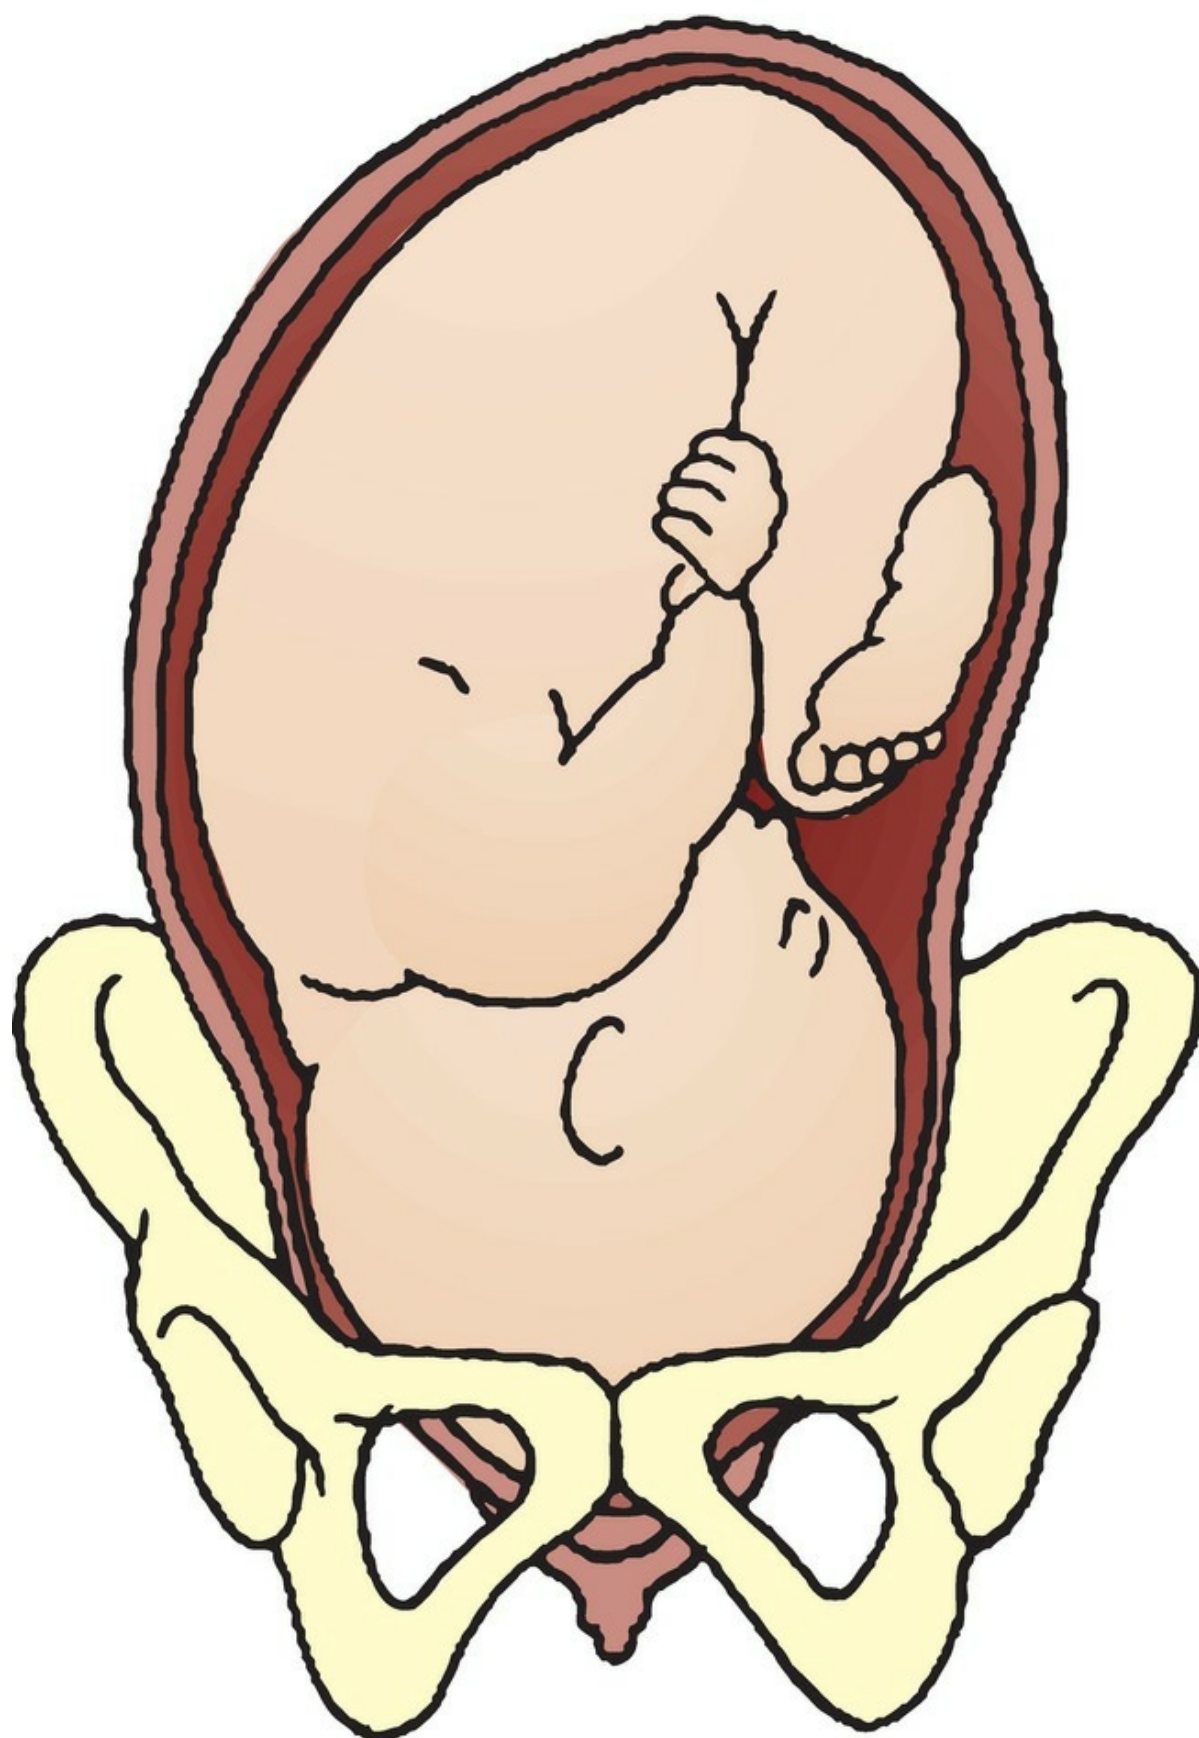

125. A 56-year-old woman is admitted for a modified radical mastectomy. The client appears anxious and asks many questions. The nurse's **best** course of action is to:

- ☐ 1. tell the client as much as she wants to know and is able to understand.
- ☐ 2. delay discussing the client's questions with her until the convalescent phase of her care.
- ☐ 3. delay discussing the client's questions with her until her apprehension subsides.
- ☐ 4. explain to the client that she should discuss her questions with her healthcare provider (HCP).

126. One hour before surgery, the client asks the nurse about the risks of the surgical procedure. Which statement by the nurse is **most** appropriate?

- ☐ 1. "What are your concerns? I can answer any questions that you have."
- ☐ 2. "There are several risks. Did the surgeon tell you about them?"
- ☐ 3. "It is important that your questions are answered and you understand the risks before you have surgery. I will contact the surgeon."
- ☐ 4. "Actually, the risks associated with this procedure are minimal. The surgeon has performed this surgery many times."

127. The nurse is assessing fetal position in a 32-year-old woman in her 8th month of pregnancy. From the figure, the fetal position can be described as:

- ☐ 1. left occipital transverse.
- ☐ 2. left occipital anterior.
- ☐ 3. right occipital transverse.
- ☐ 4. right occipital anterior.

128. A child has a urinary tract infection and is being treated with antibiotics. The nurse should instruct the parents to report which symptom?

- ☐ 1. increased urine output
- ☐ 2. loss of appetite
- ☐ 3. jaundice
- ☐ 4. fever

129. After teaching a mother about the neonate's positive Babinski's reflex, the nurse determines that the mother understands the instructions when she says that a positive Babinski's reflex indicates:

- ☐ 1. possible partial paralysis.
- ☐ 2. possible lower limb defect.
- ☐ 3. immature central nervous system.
- ☐ 4. possible injury to nerves that innervate the legs.

130. The nurse should instruct a client who is taking dexamethasone and furosemide to report:

- ☐ 1. excitability.
- ☐ 2. muscle weakness.
- ☐ 3. diarrhea.
- ☐ 4. increased thirst.

131. A client with a suspected diagnosis of lung cancer has a bronchoscopy with biopsy. Following the procedure, the nurse should:

- ☐ 1. encourage the client to gargle with oral lidocaine to decrease throat irritation.
- ☐ 2. monitor the client for signs of pneumothorax.
- ☐ 3. administer pain medication as needed to relieve mediastinal discomfort.
- ☐ 4. advise the client not to talk until the gag reflex returns.

132. A nurse is preparing to administer 500 mL of an IV solution to a child over 12 hours via tubing that delivers microdrips at 60 gtt/mL. At what rate should the nurse infuse the solution?

_____ gtt/min.

133. Which technique is correct when the nurse administers a subcutaneous injection?

- ☐ 1. Use a 1-inch (2.5-cm) needle for injection.
- ☐ 2. Insert the needle at a 45-degree angle to the skin.
- ☐ 3. Spread the skin tightly at the injection site.
- ☐ 4. Draw 0.2 mL of air into the syringe before administration.

134. An elderly client hospitalized 4 days ago for treatment of acute respiratory distress has become confused and disoriented. The client has been picking invisible items off blankets and has been yelling at the daughter who is not in the room. The family tells the nurse that the client has been treated for anxiety with alprazolam for years, but alprazolam is not on the current medication list. Which safety measures should be implemented? Select all that apply.

- ☐ 1. The client should be placed on withdrawal precautions and treatment started immediately.
- ☐ 2. The client should be placed in soft restraints.
- ☐ 3. A prescription should be obtained to help with the hallucinations.
- ☐ 4. The daughter should not visit until the client is better.
- ☐ 5. The client's medical and mental status should be evaluated frequently and treated as needed.

135. The mother of a 3-year-old child tells the nurse her child is “fussy” and not as “easygoing” as her other children. She is having difficulty feeding the child because he fusses and cries when she serves a meal. The nurse should instruct the mother to:

- ☐ 1. allow the child to determine when feeding should occur.
- ☐ 2. not feed the child if he cries.
- ☐ 3. provide structured feeding times and routines.
- ☐ 4. give the child finger foods and let him eat when he wants.

136. When giving a client a tube feeding, the nurse should:

- ☐ 1. warm the feeding solution before administration.
- ☐ 2. place the client in a left side-lying position.
- ☐ 3. aspirate residual gastric contents before the feeding and discard.
- ☐ 4. verify position of the tube before beginning feeding.

137. A multiparous client 48 hours postpartum who is breast-feeding tells the nurse, “I am having a lot of cramping. This did not happen when I nursed my first baby.” Which would be the nurse’s **best** response?

- ☐ 1. “I will notify your healthcare provider (HCP). It is possible there are some placental fragments remaining.”
- ☐ 2. “I need to check your lochial flow. You may have a clot that is being dislodged.”
- ☐ 3. “You must have gotten a heavy dose of oxytocin. It should wear off soon.”
- ☐ 4. “The cramping is normal and is caused by your baby’s sucking, which stimulates the release of oxytocin.”

138. The mother of a child with moderate diarrhea asks how to manage her child’s illness. What should the nurse suggest?

- ☐ 1. Begin clear liquids for 24 hours.
- ☐ 2. Feed the child bananas, rice, applesauce, and toast.
- ☐ 3. Offer foods that are low in fat.
- ☐ 4. Continue the child’s regular diet.

139. The nurse is performing routine tracheostomy care. Which step would be appropriate for the nurse to include in the performance of the procedure?

- ☐ 1. Remove the inner cannula every 2 hours for cleaning.
- ☐ 2. Secure the tracheostomy ties with a square knot.
- ☐ 3. Use cut gauze under the neck plate to protect the skin.
- ☐ 4. Suction the inner cannula on completion of the procedure.

140. The nurse finds a sealed container of IV 50% dextrose in a sink on the nursing unit. The nurse should:

- ☐ 1. leave it where found and notify the charge nurse.
- ☐ 2. send it to the pharmacy.
- ☐ 3. file an incident report.
- ☐ 4. discard it in a sharps container.

141. To reduce the risk of pressure ulcer formation, which activity should the nurse teach the client who is wheelchair-bound as a result of a spinal cord injury?

- ☐ 1. Bathe daily.
- ☐ 2. Eat a high-carbohydrate diet.
- ☐ 3. Shift your weight every 15 minutes.
- ☐ 4. Move from the bed to the wheelchair every 2 hours.

142. A client in the second stage of labor has had no anesthesia or analgesia. The nurse should assist the client into which position so the client can begin pushing?

- ☐ 1. squatting with the body curved in a C shape
- ☐ 2. side-lying while keeping the head elevated
- ☐ 3. in the knee-chest position while keeping the head down
- ☐ 4. squatting with the back arched

143. A client with antisocial personality disorder tells the nurse, “I punched the guy out because he deserved it, and then the cops arrested me.” Which response would be **most** helpful to the client?

- ☐ 1. “It is wrong to punch others.”
- ☐ 2. “If you punch people out, you will get into trouble.”
- ☐ 3. “I would not do that again if I were you.”
- ☐ 4. “Do not ever do that again; you are an adult.”

144. The nurse is teaching an unlicensed assistive personnel (UAP) about the care of clients with self-mutilation. Which statement by the UAP would indicate teaching about self-mutilation has been effective?

- ☐ 1. “It is a means of getting what the person wants.”
- ☐ 2. “It is a nonserious event that can be ignored.”
- ☐ 3. “It is a way to express anger and rage.”

- ☐ 4. “It is a form of manipulation.”

145. The nurse is obtaining a nursing history of a client suspected of having hepatitis C. The nurse should ask the client if the client has:

- ☐ 1. drunk contaminated water.
- ☐ 2. traveled to India.
- ☐ 3. had a tattoo.
- ☐ 4. eaten shellfish.

146. A client is experiencing symptoms of early alcohol withdrawal. The client’s blood pressure is 150/85 mm Hg, and the pulse is 98 bpm. The nurse should:

- ☐ 1. administer lorazepam.
- ☐ 2. administer an antihypertensive.
- ☐ 3. assign an unlicensed assistive personnel (UAP) to sit with the client.
- ☐ 4. notify the healthcare provider (HCP).

147. Which diet instructions are appropriate when teaching a client in the early stages of cirrhosis about nutritional needs? Select all that apply.

- ☐ 1. “Limit your caloric intake so that you do not become overweight.”
- ☐ 2. “An adequate intake of protein is important to your health.”
- ☐ 3. “I encourage you to eat small, frequent meals.”
- ☐ 4. “Restrict your fluid intake to 1,000 mL/day.”
- ☐ 5. “Limit your alcohol intake to one glass of wine daily.”

148. After a child returns from the postanesthesia care unit after surgery, what should the nurse assess **first**?

- ☐ 1. the IV fluid access site
- ☐ 2. the child’s level of pain
- ☐ 3. the surgical site dressing
- ☐ 4. the functioning of the nasogastric tube

149. To protect a client who has received tissue plasminogen activator (t-PA) or alteplase recombinant therapy, the nurse should:

- ☐ 1. use the radial artery to obtain blood gas samples.
- ☐ 2. maintain arterial pressure for 10 seconds.

- ☐ 3. administer IM injections.
- ☐ 4. encourage physical activity.

150. A client is admitted with acute pancreatitis. The nurse should monitor which laboratory values?

- ☐ 1. decreased urine amylase level
- ☐ 2. increased calcium level
- ☐ 3. decreased glucose level
- ☐ 4. increased serum amylase and lipase levels

151. For the client with a substance abuse problem, which intervention would be **most** helpful to aid the client in dealing with feelings and concerns related to alcohol and drugs?

- ☐ 1. individual therapy
- ☐ 2. group sessions
- ☐ 3. solitary activities
- ☐ 4. recreation

152. A client has cystitis. The nurse should further assess the client for:

- ☐ 1. flank pain.
- ☐ 2. oliguria.
- ☐ 3. nausea and vomiting.
- ☐ 4. foul-smelling urine.

153. A client with acute stress disorder is telling the nurse about the tornado that leveled his house and killed his wife and baby while he was out of town on business. He states, "If only I had been at home, I could have saved them." Which response would be **most** appropriate?

- ☐ 1. "Do not blame yourself; you will only feel worse."
- ☐ 2. "It is not your fault, so stop feeling so guilty."
- ☐ 3. "You might not have been at home."
- ☐ 4. "You could not have prevented the tornado; it just happened."

154. On the first postpartum day, the nurse is caring for a primiparous client who has recently emigrated from Japan to North America and speaks only a little English. The nurse observes that the client has been bottle-

feeding her neonate on occasion, but most of the neonatal care is being performed by the client's mother-in-law. Which action would be **most** appropriate?

- ☐ 1. Notify the social worker because bonding may be affected.
- ☐ 2. Document the unusual maternal behavior in the client's medical record.
- ☐ 3. Determine whether this is a cultural practice for the client and her family.
- ☐ 4. Obtain a prescription to make a home visit after the client's discharge.

155. A client is scheduled for a creatinine clearance test. What should the nurse do?

- ☐ 1. Instruct the client about the need to collect urine for 24 hours.
- ☐ 2. Prepare to insert an indwelling urethral catheter.
- ☐ 3. Provide the client with a sterile urine collection container.
- ☐ 4. Instruct the client to force fluids to 3,000 mL/day.

156. When the nurse is assessing a client's cultural adaptation, which statement is **least** sensitive to the client's needs?

- ☐ 1. "What are some of your favorite foods?"
- ☐ 2. "Describe any health problems in your past."
- ☐ 3. "Please tell me how you would like to be addressed."
- ☐ 4. "Your eyes look dark; is this normal for you?"

157. After several months of taking olanzapine, the client reports that he is no longer hearing voices of any kind. Which statement would confirm that the client is developing insight into his illness?

- ☐ 1. "That olanzapine is the best medicine I have ever had."
- ☐ 2. "I did not realize how sick I could get from a chemical brain imbalance."
- ☐ 3. "My mom is proud of me for staying on my medicines."
- ☐ 4. "I think I may be able to get a little part-time job soon."

158. A client whose job requires extensive use of a computer has developed carpal tunnel syndrome. The nurse can instruct the client to relieve the pain by managing:

- ☐ 1. decreased circulation to the brachial nerve.

- ☐ 2. muscle atrophy resulting from disuse.
- ☐ 3. median nerve compression.
- ☐ 4. progressive flexion contracture of the wrist.

159. A client is admitted to the emergency department following an overdose of barbiturates. What should the nurse do **first**?

- ☐ 1. Assess ventilation and assist ventilation as needed.
- ☐ 2. Monitor the blood pressure.
- ☐ 3. Prepare to administer blood products.
- ☐ 4. Place the client in the Trendelenburg position.

160. A client who is recovering from transurethral resection of the prostate (TURP) experiences urinary incontinence and has decreased the fluid intake because of the incontinence. What would be the nurse's **best** response to the client?

- ☐ 1. "Yes, limiting your fluids can decrease your incontinence."
- ☐ 2. "Limiting your fluids will cause kidney stones."
- ☐ 3. "Drink eight glasses of water a day and urinate every 2 hours."
- ☐ 4. "If your incontinence continues, we will reinsert your catheter."

161. The nurse is teaching a client about preventing toxic shock syndrome (TSS). Which action is a risk factor for toxic shock syndrome?

- ☐ 1. changing tampons every 3 hours
- ☐ 2. avoiding use of deodorized tampons
- ☐ 3. alternating tampons with sanitary pads
- ☐ 4. using only tampons at night

162. A client with a history of cystitis is admitted to the hospital with a diagnosis of pyelonephritis. The nurse should assess the client for:

- ☐ 1. suprapubic pain.
- ☐ 2. dysuria.
- ☐ 3. urine retention.
- ☐ 4. costovertebral tenderness.

163. A woman is taking oral contraceptives. The nurse teaches the client that medications that may interfere with oral contraceptive efficacy include:

- ☐ 1. antihypertensives.
- ☐ 2. antibiotics.
- ☐ 3. diuretics.
- ☐ 4. antihistamines.

164. A 28-year-old female client is prescribed danazol for endometriosis. The nurse should instruct the client to report:

- ☐ 1. headaches.
- ☐ 2. weight loss.
- ☐ 3. increased libido.
- ☐ 4. hair loss.

165. To which unlicensed assistive personnel (UAP) should the nurse assign a male orthodox Muslim client who needs complete morning care?

- ☐ 1. Mary, who has two other clients requiring complete morning care
- ☐ 2. Joe, who has one client requiring complete morning care
- ☐ 3. Jill, who has four clients requiring partial morning care
- ☐ 4. Jim, who has five clients requiring partial morning care

166. A client with chronic renal failure is experiencing central nervous system (CNS) changes caused by uremic toxins. Which nursing approach would be **most** appropriate for addressing these CNS changes?

- ☐ 1. Allow the client to grieve for body image changes.
- ☐ 2. Restrict foods that are high in potassium.
- ☐ 3. Restrict fluid intake to 1,000 mL/day.
- ☐ 4. Assess the client's mental status regularly.

167. The nurse is preparing to give a subcutaneous injection to an elderly, emaciated client. Which needle length and angle should the nurse plan to use to administer the injection safely?

- ☐ 1. a ½-inch (1.3-cm) needle at a 90-degree angle
- ☐ 2. a ⅝-inch (1.6-cm) needle at a 45-degree angle
- ☐ 3. a ⅜-inch (0.95-cm) needle at a 15-degree angle
- ☐ 4. a ⅝-inch (1.6-cm) needle at a 90-degree angle

168. A female client is treated for trichomoniasis with metronidazole. The

nurse instructs the client that:

- ☐ 1. the medication should not alter the color of the urine.
- ☐ 2. she should discontinue oral contraceptive use during this treatment.
- ☐ 3. she should avoid alcohol during treatment and for 24 hours after completion of the drug.
- ☐ 4. her partner does not need treatment.

169. A client is in the advanced stages of osteoarthritis. Which statement best describes the pain that occurs in the advanced stage of the disease?

- ☐ 1. Pain occurs with minimal activity.
- ☐ 2. Crepitation develops and intensifies pain.
- ☐ 3. Joints are symmetrically affected by pain.
- ☐ 4. Fatigue accompanies pain.

170. A family may request to have a client who is Vietnamese transferred to die at home because it is traditionally believed that:

- ☐ 1. it is disloyal to leave their loved one in the hospital.
- ☐ 2. the hospital cannot be trusted.
- ☐ 3. the family can provide more comfort at home.
- ☐ 4. reincarnation will not occur in the hospital.

171. A client has just been admitted with acute delirium of unknown etiology. The client's daughter states that she is worried about her mom because she has never been this sick before. Which would be the **most** helpful statement to make to the daughter?

- ☐ 1. "Please do not worry. We will take good care of your mother."

2. "The healthcare provider (HCP) will prescribe tests to find out what is causing her condition."

- ☐ 3. "We can help you learn how to take care of her after she is discharged."
- ☐ 4. "It helps if you avoid arguing when she talks about seeing people who are not there."

172. A client with Alzheimer's disease is going to live with his daughter who does not work outside of the home. The nurse determines that the

daughter needs further education when she makes which statement?

- ☐ 1. "I have put special locks on all the doors that Dad will not be able to unlock."
- ☐ 2. "Dad said that what he missed most while he was here was using his aftershave."
- ☐ 3. "Dad will be in a bedroom that has nothing for him to trip over getting to the bathroom."
- ☐ 4. "I have taken the knobs off of the stove so he will not be able to turn it on."

173. Allopurinol is prescribed for a client who has chronic gout. Which comment indicates that the client understands how to take the allopurinol?

- ☐ 1. "I will take the medication whenever my joints hurt."
- ☐ 2. "I must take this drug on an empty stomach."
- ☐ 3. "I should drink plenty of fluids when taking allopurinol."
- ☐ 4. "I should not take aspirin when taking allopurinol."

174. The mother calls the nurse to report that her toddler has just been burned on the arm. The nurse should advise the mother to **first**:

- ☐ 1. pack the arm in ice, and then take the child to the closest emergency department.
- ☐ 2. rub the burned area with an antibacterial ointment, and then call the child's healthcare provider (HCP).
- ☐ 3. run cool water over the burned area, and then wrap it in a clean cloth.
- ☐ 4. call the child's HCP immediately, and then wrap the arm in a clean cloth.

175. The nursing assessment of a client with osteomyelitis of the left great toe reveals pain with partial weight bearing, unsteady gait, and general weakness. Based on these data, the nurse should institute which safety measures?

- ☐ 1. bed rest
- ☐ 2. airborne precautions
- ☐ 3. referral to physical therapy
- ☐ 4. falls precautions

176. A client receiving a blood transfusion begins to have chills and headache within the first 15 minutes of the transfusion. The nurse should **first**:

- ☐ 1. administer acetaminophen.
- ☐ 2. take the client's blood pressure.
- ☐ 3. discontinue the transfusion.
- ☐ 4. check the infusion rate of the blood.

177. The family of an older adult wants their mother to have counseling for depression. During the initial nursing assessment, the client denies the need for counseling. Which statement by the client supports the fact that the client may **not** need counseling?

- ☐ 1. "My primary care provider just put me on an antidepressant, and I will be fine in a week or so."
- ☐ 2. "My daughter sent me here. She is mad because I do not have the energy to take care of my grandkids."
- ☐ 3. "Since I have gotten over the death of my husband, I have had more energy and been more active than before he died."
- ☐ 4. "My son got worried because I made this silly comment about wanting to be with my husband in heaven."

178. A client takes isosorbide dinitrate as an antianginal medication. Which statement indicates that the client understands the adverse effects of the drug?

- ☐ 1. "I should take my pulse before taking the medication."
- ☐ 2. "I should take isosorbide dinitrate with food."
- ☐ 3. "I will need to change positions slowly so I will not get dizzy."
- ☐ 4. "It is important that I report any swelling in my ankles."

179. The nurse is working on discharge plans with a client who is diagnosed with intermittent explosive disorder, characterized by sudden angry outbursts. The nurse determines that the client is ready for discharge when the client makes which comment?

- ☐ 1. "I am just not going to let myself get angry anymore."
- ☐ 2. "Drinking does not help, but I like being with my buddies at the bar."

- ☐ 3. “I will be taking valproic acid and propranolol to help stay in control.”
- ☐ 4. “It would help if my mom would stop getting on my case all the time.”

180. The nurse walks into a client’s room to administer the 0900 medications and notices that the client is in an awkward position in bed. What is the nurse’s **first** action?

- ☐ 1. Ask the client to state his or her name.
- ☐ 2. Check the client’s name band.
- ☐ 3. Straighten the client’s pillow behind the back.
- ☐ 4. Give the client his medications.

181. The nurse is performing the initial assessment on a middle-aged woman recently diagnosed with Cushing’s syndrome. The nurse reviews the history and physical (see chart). The nurse should develop a plan with the client to manage which effect? Select all that apply.

History and Physical

A recent ground-level fall resulting in multiple bruises on both arms and left shoulder

A slow-healing laceration on the right hand from a fall 2 weeks prior.

Muscle weakness

Unable to sleep more than 2 to 3 hours at a time

Moon-faced appearance

Oily skin

Recent 20-lb (9.1-kg) weight gain

Vital signs	BP:	148/94
-------------	-----	--------

	Heart rate:	96/strong/ regular
--	-------------	-----------------------

	Respirations:	20/regular/ unlabored
--	---------------	--------------------------

	Pain:	Denies
--	-------	--------

- ☐ 1. low blood volume
- ☐ 2. risk for injury
- ☐ 3. slow healing
- ☐ 4. changes in physical appearance
- ☐ 5. risk for infection

182. A “read-back” procedure has been implemented on a nursing unit to prevent discrepancies in telephone prescriptions and reports. This procedure should be implemented when the:

- ☐ 1. float nurse gives a written report to the oncoming nurse.
- ☐ 2. nurse receives a critical lab value via phone or in person from the lab.
- ☐ 3. lab report shows up on the computerized medical record.
- ☐ 4. unit clerk takes a telephone prescription for a stat lab test.

183. Four clients in a critical care unit have been diagnosed with *Pseudomonas aeruginosa*. The Infection Prevention and Control Department has determined that this is probably a nosocomial infection. Select the **most** appropriate intervention by the nurse. The nurse should:

- ☐ 1. wear an N-95 mask when caring for these clients.
- ☐ 2. initiate transmission-based precautions.
- ☐ 3. initiate contact precautions.
- ☐ 4. ensure that staff does not have artificial fingernails.

184. The nurse is instructing the spouse of a client who had an incision and drainage procedure for an abscess how to care for the wound at home. The nurse should instruct the spouse to:

- ☐ 1. clean the incision and drainage sites simultaneously.
- ☐ 2. clean from the incision site to the drainage site.
- ☐ 3. clean from the drainage site to the incision site.
- ☐ 4. clean each site independently.

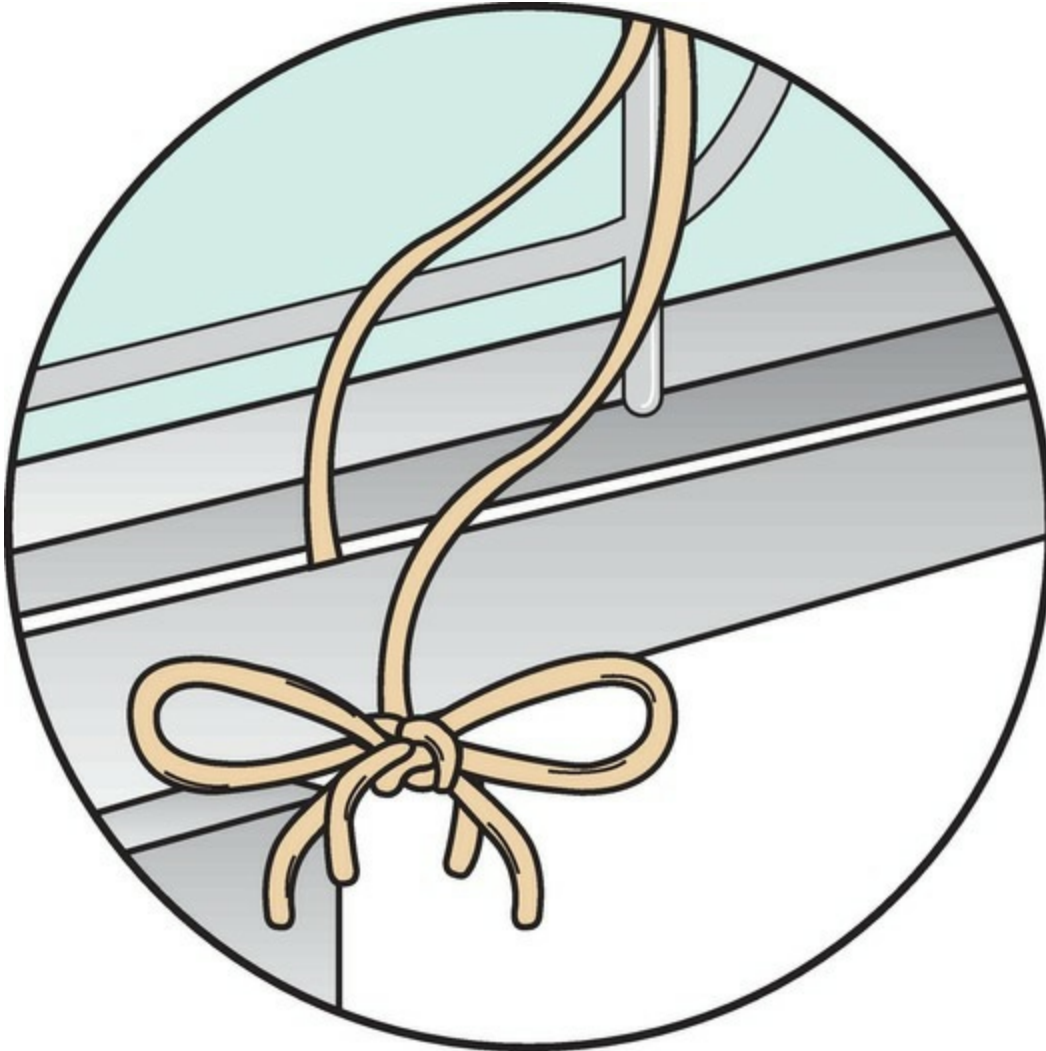

185. After completing initial assessment rounds, which client should the nurse discuss with the healthcare provider (HCP) **first**?

- ☐ 1. a client who was admitted from the emergency department last evening after a blow to the head who is now vomiting and confused as to time and place
- ☐ 2. a client who returned from abdominal surgery last evening and now has a dime-sized bright red spot on the dressing
- ☐ 3. a client who had a right total knee replacement 2 days ago and now is reporting constipation and abdominal discomfort
- ☐ 4. a client admitted for lower extremity vasculitis and wound care who is

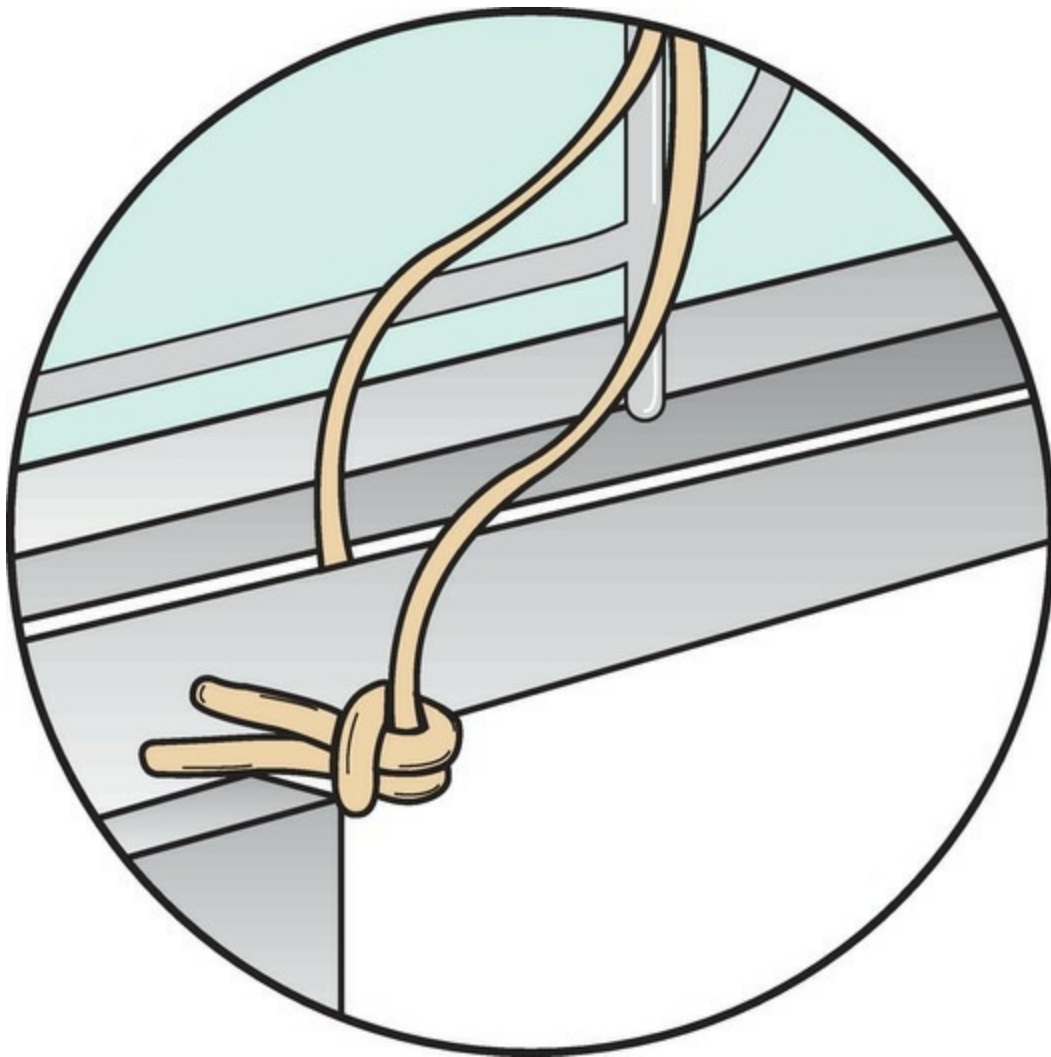

requesting more pain medication before the next dressing change in 2 hours

186. Which is the correct knot used to secure a restraint correctly to the bedframe?

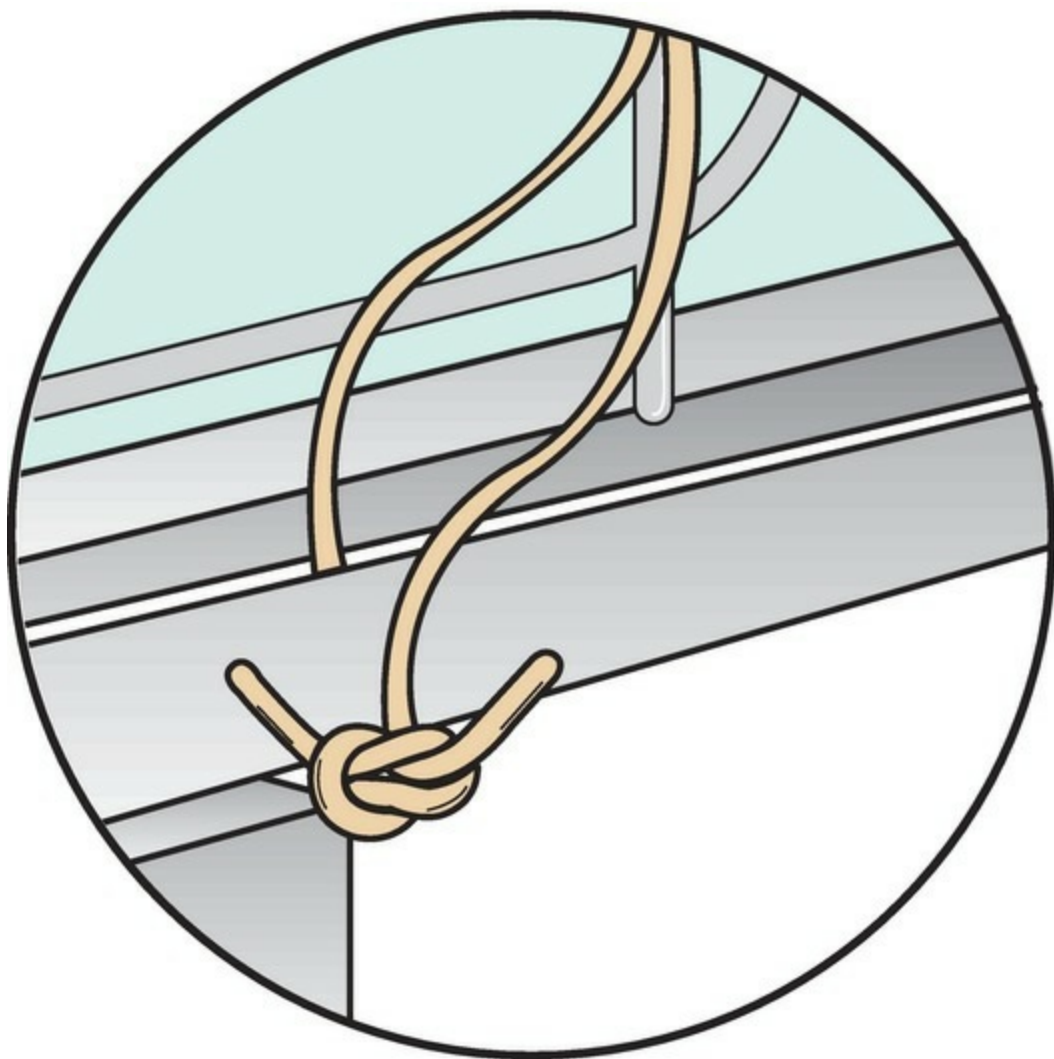

☐ 1.

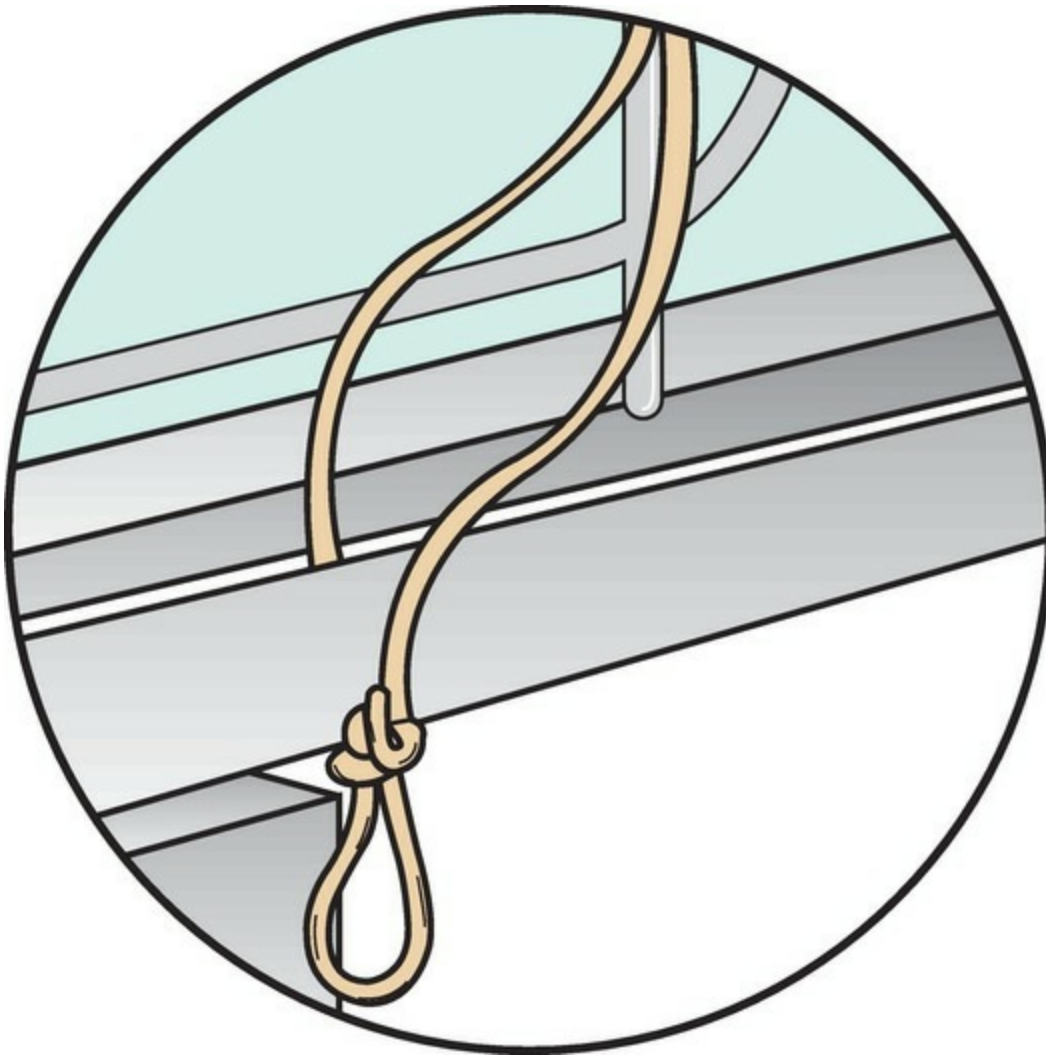

☐ 2.

□ 3.

□4.

187. The obstetrical triage nurse is assessing a client with a term pregnancy. There has not been any change in the cervix for the past 2 hours despite irregular contractions. When discharging the client to her home, the nurse should tell the client to return to the hospital when which conditions occur? Select all that apply.

- ☐ 1. She feels more than three contractions an hour.
- ☐ 2. Contractions become more intense and closer together.
- ☐ 3. She notices vaginal bleeding.
- ☐ 4. She thinks the membranes have ruptured.
- ☐ 5. She notices an absence of fetal movement.
- ☐ 6. She feels the urge to push.

188. The parents of a newborn with Down syndrome are tearful when they

tell the nurse that the diagnosis was a surprise to them. Which statement by the parents indicates that they have some understanding of Down syndrome?

- ☐ 1. “Children with Down syndrome are often fearful of strangers and have difficulty making friends.”
- ☐ 2. “At some point during their life span, children with Down syndrome will need to be institutionalized.”
- ☐ 3. “Children with Down syndrome often become violent when they experience hormonal changes during puberty.”
- ☐ 4. “There is a broad spectrum of mental capabilities and physical characteristics of children with Down syndrome.”

189. A 2-year-old is brought to the emergency department after experiencing a seizure. The child currently has the flu and has had fevers for the last 3 days. The father asks what caused the seizure to occur. The nurse’s **best** response is:

- ☐ 1. “Your child’s seizure was likely caused by the rapid elevation of her temperature.”
- ☐ 2. “The seizure likely occurred because your child’s temperature rose beyond a personal threshold.”
- ☐ 3. “Your child’s seizure was likely caused by the prolonged duration of her fevers.”
- ☐ 4. “The seizure likely occurred because your child’s immune system is not developed.”

190. Thirty minutes ago, a term multigravida was 5 cm dilated, 100% effaced, and –1 station. She is now visibly uncomfortable and states that she needs to get up for a bowel movement. The **best** nursing intervention is:

- ☐ 1. assist the client up to the bathroom.
- ☐ 2. reassure the client that the sensation she is feeling is due to pressure from the fetal head.
- ☐ 3. perform another sterile vaginal exam on the client.
- ☐ 4. notify the healthcare provider (HCP) of the client’s pain.

Answers, Rationales, and Test-Taking Strategies

The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the Content Mastery and Test-Taking Skill Self-Analysis worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in Part 1 of this

1. 4. Heartburn is caused when stomach contents enter the distal end of the esophagus, producing a burning sensation. To avoid heartburn during pregnancy, the client should avoid spicy foods, eat smaller, more frequent meals, and avoid lying down after eating. Peristalsis usually decreases during the latter half of pregnancy. Displacement of the stomach by the uterus, not the diaphragm, may contribute to heartburn. Increased, not decreased, secretion of hydrochloric acid also contributes to heartburn during pregnancy.

 CN: Basic care and comfort; CL: Apply

2. 2. Acknowledging the anger and its source encourages communication about the client's feelings. Although anger at God is common after a loss, the client is displacing the anger that she needs to deal with more directly. Telling the client that the miscarriage was an accident or that she is a strong person and will get through this ignores the client's feelings of anger and loss, thereby cutting off communication.

 CN: Psychosocial integrity; CL: Synthesize

3. 4. Asking the client to speak about his concerns encourages open discussion. Telling the client that he is making a mistake is judgmental of the client's wishes and eliminates opportunities for the client to explore the situation and discuss various treatment options. Saying that herbal treatments have not been approved by the FDA or that they have not been researched is irrelevant, places a value judgment on the client's wishes, and provides no opportunity for discussion.

 CN: Management of care; CL: Synthesize

4. 3. The most important aspect of teaching a preschooler is to have the family members there for support. Preschoolers are able to understand information that is individualized to their level. Including a plastic model of the heart and a catheter as part of the preoperative preparation may be helpful. The other family members will understand the heart model and catheter better than the preschooler will.

CN: Reduction of risk potential; CL: Synthesize

5. 4. Massaging an area that is reddened due to pressure is contraindicated because it further reduces blood flow to the area. In the past, massaging reddened areas was thought to improve blood flow to the area, and some nursing personnel may still believe that massaging the area is effective in preventing pressure ulcer formation. Since massaging a reddened area is contraindicated, the nurse should not encourage the UAP to continue massage or explain that it is effective. The UAP should not massage the area, nor add lotion.

CN: Management of care; CL: Synthesize

6. 3. Asking the mother to talk about her concerns acknowledges the mother's rights and encourages open discussion. The other responses negate the parent's concerns.

CN: Management of care; CL: Synthesize

7. 1, 2, 3. Some providers recommend that breast-feeding mothers avoid consuming potentially allergic foods. The top 6 foods known to cause allergies in children are shellfish, peanuts, eggs, milk, soy, and tree nuts.

CN: Health promotion and maintenance; CL: Apply

8. 3. A meal delivery service would be the most helpful to this client. There are a variety of services, some of them at no cost to the client in which a volunteer brings the meal and visits with the client and is a means to check on elderly persons who live alone. Hospice care involves daily needs for the terminally ill at home, and this client does not need this type of service. Home nursing services typically provide skilled nursing care to clients at home, and this client does not need this level of care. Associations for retired persons advocate for care and services for retirees, but do not provide

services or care.

 CN: Management of care; CL: Apply

9. 1. The cardiovascular status of the client is the first information documented and will validate the effectiveness of the temporary pacemaker. The client's emotional state and the type of sedation are important but not a high priority. The nurse will need to document the pacemaker information (settings of the pacemaker); this will be considered part of the cardiovascular information.

 CN: Management of care; CL: Apply

10. 3. Using a special feeding table or modified high chair is the best method for an infant who is used to sitting up for feedings. The child should not be flat because of the danger of aspiration. Raising the child's head will not work as well as using a feeding table because the child is not used to lying down to eat. Two people are not necessary.

 CN: Health promotion and maintenance; CL: Evaluate

11. 3, 4. The National Association for Home Care (NAHC) defines "home care" as services for people who are recovering, disabled, or chronically ill and who are in need of treatment or support to function effectively in the home environment. The client with multiple sclerosis and an open lesion is at risk for infection and will require assistance with managing the lesion. Prothrombin monitoring is usually done at the clinic or **healthcare provider's (HCP's)**  office. Diet instruction can be accomplished at a healthcare facility or dietitian office. The client with vertigo should be monitored for safety in the home. Clients receiving home care services are usually under the care of a HCP with the focus of care being treatment or rehabilitation. Lenses for glasses can be evaluated at an eye clinic or an ophthalmologist's office; a prescription for stronger lenses could be written.

 CN: Management of care; CL: Evaluate

12. 1. A soft toothbrush or gauze pad should be used to provide oral hygiene at least every 2 hours to promote client comfort and prevent superinfection. Commercial mouthwash is contraindicated because of high alcohol content that is irritating to inflamed mucosa. Oral swabs with an

astrigent should be avoided because they are drying and also can promote bacterial growth. Leaving dentures in place will have no effect on the development of edema. Additionally, further irritation of the oral mucosa may occur if dentures are left in place. Dentures should be removed to aid in relieving the client's discomfort or pain.

 CN: Basic care and comfort; CL: Synthesize

13. 3. Although coordinating documentation, resolving negative feelings, and calming down are goals of debriefing after a restraint, the ultimate outcome is to improve restraint procedures.

 CN: Safety and infection control; CL: Synthesize

14. 4. The situation is escalating, and the nurse's priority is to protect the infant from harm. Therefore, removal of the infant from this situation should be the first action by the nurse. Reasoning at this point or asking one of the parents to leave the room would be ineffective and may serve to further escalate the situation. Calling security is necessary, but only after the nurse has removed the infant from the room.

 CN: Management of care; CL: Synthesize

15. 2. By federal law, all clients entering a hospital or hospice program are offered the chance to make an advance directive, so that their wishes will be known and followed in an emergency. The directive is not a substitute for informed discussion with the **HCP**.  Worry about extraordinary means being taken can be discussed with the client later, but the client needs to be informed that the directive is a federal requirement to protect the client's autonomy.

 CN: Management of care; CL: Synthesize

16. 1, 2, 3, 4. The role of the nurse in witnessing the signing of the consent is to witness that the client is informed of the procedure, understands the information, is aware of potential complications, and is signing of his or her own free will. It is not necessary for a spouse, relative, or guardian to be present.

 CN: Management of care; CL: Apply

17. 4. Doxycycline is contraindicated in pregnancy because it can stain the teeth of the developing fetus when given during the last half of pregnancy. The nurse should withhold the drug and notify the **HCP**  to change the prescription. All neonates are given prophylactic ophthalmic ointment for the prevention of ophthalmia neonatorum, conjunctivitis caused by gonorrhea.

CN: Pharmacological and parenteral therapies; CL: Synthesize

18. 3. The contraction stress test simulates labor and determines the fetal response to the labor process and the mother's contractions. Therefore, determining that contractions have ceased after the test is important. Although spontaneous rupture of membranes is a possibility after a contraction stress test, it is not a typical occurrence. The test should not affect the viability of the fetus. Fetal viability is related to gestational age. A fetus of at least 23 weeks' gestation is considered viable or capable of extrauterine life. Stating that stress test is negative means the fetal heart rate has already been interpreted and has not been found to fall during contractions.

CN: Reduction of risk potential; CL: Synthesize

19. 2, 3, 4. A postoperative ileus is a functional obstruction of the bowel. Assessment of bowel sounds, the first stool, and the amount of gastric output provide information about the return of gastric function. Measurement of urine specific gravity provides information about fluid and electrolyte status; bilirubin levels provide information about liver function, and neither of these tests needs to be included in a focused assessment for ileus.

CN: Reduction of risk potential; CL: Analyze

20. 2. Salmeterol is a beta2-agonist, a maintenance drug that the asthmatic client uses twice daily, every 12 hours. Albuterol is used as the "rescue inhaler" for bronchospasms. Salmeterol can be used to prevent exercise-induced bronchospasms, but it should be taken 30 to 60 minutes before exercise. If the client is taking salmeterol twice daily, it should not be used in additional doses before exercise; twice daily is the maximum dosage. Indications for salmeterol include only asthma and bronchospasm induced by chronic obstructive pulmonary disease.

CN: Pharmacological and parenteral therapies; CL: Synthesize

21. 1, 2, 4. Nephrotic syndrome is characterized by massive proteinuria, hypoalbuminemia, edema, and hyperlipidemia and normal or lower than normal blood pressure. Elevated streptococcal antibody titers are associated with poststreptococcal glomerulonephritis, an immune complex disease.

 CN: Physiological adaptation; CL: Analyze

22. 3. Aldactone is a potassium-sparing diuretic often used to counteract potassium loss caused by other diuretics. If foods or fluids are ingested that are high in potassium, hyperkalemia may result and lead to cardiac arrhythmias. Increasing the intake of milk or milk products does not affect the potassium level. Restricting fluid may elevate all electrolytes due to extracellular fluid volume depletion. By increasing foods high in sodium, water would tend to be retained and so would dilute all electrolytes in the extracellular fluid compartment.

 CN: Health promotion and maintenance; CL: Synthesize

23. 4. Clients with burns are susceptible to the development of Curling's ulcer, a gastroduodenal ulcer that is caused by a generalized stress response. The stress response results in increased gastric acid secretion and a decreased production of mucus. Prevention is the best treatment, and clients are frequently treated prophylactically with antacids and H2 histamine blockers such as famotidine.

 CN: Reduction of risk potential; CL: Synthesize

24. 3. The client has ventricular fibrillation, an arrhythmia that can lead to cardiac arrest. Given the client's history, the nurse should call the **rapid response team**  to initiate interventions to avoid cardiac arrest. After calling the team, the nurse can administer oxygen. Taking time to inspect the incision delays the necessary intervention. This ECG strip does not show loose electrodes.

 CN: Management of care; CL: Synthesize

25. 2. The best approach by the mother is not to interfere. The children need to learn how to solve disagreements on their own. If the parent always intervenes, then the children do not learn how to do this. Siblings will disagree and argue as part of normal development. Punishment, including

telling the children that they will not go out to lunch, is not warranted.

CN: Health promotion and maintenance; CL: Evaluate

26. 2. Managing stressful life events can decrease the incidence of outbreaks of HSV-2. Occlusive ointments should not be applied. Antiviral therapies will not cure herpes, but they can manage symptoms and decrease the incidence of outbreaks. Clients with HSV-2 should use condoms to prevent HSV transmission. Cells can be shed at other times, not only when the vesicles are weeping.

CN: Physiological adaptation; CL: Synthesize

27. 1, 3, 4. The nurse should assess the client for adverse effects affecting the vestibular branch of the acoustic nerve, such as vertigo, nausea and vomiting with motion, and ataxia. Tinnitus, or a ringing in the ears, is a clinical manifestation of altered function of the auditory branch of the eighth cranial nerve, not the vestibular branch. The client will not have hearing loss.

CN: Physiological adaptation; CL: Analyze

28. 1. Tetanus toxoid is indicated, since there has been no booster in the last 5 years. With a human bite, there is a risk of severe infection; application of a steroid cream does not prevent infection. The closure of the wound should be delayed until it is determined that there is no infection, in approximately 24 to 48 hours. Tuberculosis is not transmitted through human bites.

CN: Reduction of risk potential; CL: Apply

29. 3, 4, 5. Before discussing the use of medroxyprogesterone acetate as a birth control option, the nurse should determine if the woman is or has been depressed because medroxyprogesterone acetate can increase depression in a client with depression. The drug can be transmitted in breast milk, and the long-term effects on the baby are not known. Women who are pregnant should not take medroxyprogesterone acetate. Medroxyprogesterone acetate does not treat or prevent sexually transmitted diseases, so this information is not essential when considering its use. Although the husband should be a part of birth control decisions, the final decision is made by the client.

CN: Pharmacological and parenteral therapies; CL: Analyze

30. 3. With a parent who is visibly upset, it is best to try to determine the cause. Therefore, asking the mother about why she wants to take the child home can provide insight into the problem. The nurse cannot stop the mother from taking her child home. However, the HCP 📖 should be notified about the mother's decision, and efforts are needed to explain the ramifications of taking the child home. It is inappropriate for the nurse to say "I know how you feel" or "I can imagine how hard this is" unless the nurse has had the same experience.

🔑 CN: Psychosocial integrity; CL: Synthesize

31. 4, 1, 2, 3. The infant who is 6 months of age with diarrhea is seen first because of risk for further dehydration; the nurse immediately starts an IV infusion. The client who is 12 years of age is seen next; this child is considered to require urgent care but can wait several hours. The client who is 8 years of age can be seen next; he is considered to require nonurgent care and will respond to assessment and first aid. The last client to receive care is the client who is 16 years of age; this client is considered nonurgent and likely will not require the services of the emergency department.

🔑 CN: Management of care; CL: Synthesize

32. 1. Normal urine output for an infant is 1 to 2 mL/kg/h.

🔑 CN: Physiological adaptation; CL: Evaluate

33. 1, 2, 4. All areas concerned with the safety and quality of care need to participate in the decision-making process and arrive at a plan that will meet the needs of the clients on the neonatal care unit. Identifying the problem at a staff meeting is an ideal forum to bring up the need for improvement and education. The staff is an integral part of the development team. The staff educator is an important member of the team and is responsible for orienting new nurses to the unit. Asking an experienced staff member to spend time in reorienting staff members is difficult to do as the nurses have their own clients to care for. Although the unit director can obtain additional information from the healthcare providers (HCPs) about the problem, the nursing staff has responsibility for assuring that they are providing safe and high-quality care.

 CN: Safety and infection control; CL: Synthesize

34. 3. Based on the data given, the nurse should develop a plan with the client to manage the pain. It is not necessary for the client to be completely immobile. There is no clinical indication that the leg will need to be amputated. A temperature of 101°F (38.3°C) would be unlikely to produce a fluid volume deficit in this client.

 CN: Physiological adaptation; CL: Analyze

35. 3. After vasectomy, a sperm analysis will be performed every 4 to 6 weeks. A sperm-free analysis is necessary before the man can be considered sterile. Sperms gradually disappear from the ejaculate. Clients must be informed that conception is possible in the immediate postvasectomy period.

 CN: Physiological adaptation; CL: Apply

36. 4. One outcome criterion for the client with osteoarthritis is improved joint mobility. It is probably not possible to arrest the disease. Gold compound is administered to clients with rheumatoid arthritis, not osteoarthritis. Outcome criteria should be specific; feeling better is too general to be useful.

 CN: Basic care and comfort; CL: Evaluate

37. 1, 2, 4. Classic signs of meningitis in an infant include fever, poor feeding, vomiting, and irritability. Abdominal pain and diarrhea are not usual signs of meningitis; they are more commonly associated with gastroenteritis.

 CN: Physiological adaptation; CL: Analyze

38. 2. Deep-breathing exercises and use of incentive spirometry are more effective when pain is minimal. A client in severe pain tends to limit movement and to breathe shallowly to decrease the pain. Enough pain medication should be given to decrease pain without depressing respirations. Administration of oxygen or increasing fluids will not prevent atelectasis or pneumonia. Deep-breathing exercises and use of incentive spirometry should be done 10 times every hour while awake. The client's position should be changed every 1 to 2 hours to allow for full chest expansion. Ambulation, not just sitting in the chair, should be implemented as soon as **healthcare**

provider (HCP)  approval is obtained.

 CN: Reduction of risk potential; CL: Synthesize

39. 2. A child who has had rheumatic fever is likely to develop the illness again after a future streptococcal infection. Therefore, it is advised that the child receive antibiotic prophylaxis for at least 5 years and sometimes even longer after the acute attack to prevent recurrence.

 CN: Physiological adaptation; CL: Synthesize

40. 4. Crowning occurs when the fetal head is visible. Anterior-posterior slit occurs as the perineum flattens and is followed by an oval opening. As labor progresses, the perineum takes on a circular shape, followed by crowning.

 CN: Physiological adaptation; CL: Apply

41. 1. The first action is to increase the oxygen flow rate from 2 to 4 L/min to help ensure adequate oxygenation for the client. Although it is important to notify the **HCP**  for additional prescriptions and to obtain further assessment data, such as arterial blood gas measurements, it is a priority to support the client's cardiopulmonary system. It would be appropriate to reassure the client while these other interventions are occurring.

 CN: Reduction of risk potential; CL: Synthesize

42. 2. Although a cool air vaporizer may be recommended to humidify the environment, using saline nose drops and then a bulb syringe before meals and at nap and bed times will allow the child to breathe more easily. Saline helps to loosen secretions and keep the mucous membranes moist. The bulb syringe then gently aids in removing the loosened secretions. Blowing into the child's mouth to clear the nose introduces more organisms to the child. A nonprescription vasoconstrictive nasal spray is not recommended for infants because if the spray is used for longer than 3 days, a rebound effect with increased inflammation occurs.

 CN: Reduction of risk potential; CL: Synthesize

43. 3. Hoarseness may indicate metastatic disease to the recurrent laryngeal nerve and is commonly noted with left upper lobe lung tumors.

Diarrhea and constipation are not associated with lung cancer. Weight loss, not weight gain, can be a symptom of extensive disease.

 CN: Physiological adaptation; CL: Analyze

44. 1. The nurse should determine if the **HCP**  is the HCP of record and should have access to the information in the **medical record**.  The medical record is not for public access. The nurse would not give client information to any HCP or refuse to give information without first determining the HCP of record and/or a legitimate need to know. As an employee, the nurse should have access to medical records, but it is not acceptable to enter a medical record without justification.

 CN: Management of care; CL: Synthesize

45. 1. A client with metabolic alkalosis may exhibit irritability or nervousness. Hyperventilation is a clinical manifestation of respiratory alkalosis. Diarrhea is a possible clinical finding in metabolic acidosis. Edema is not specifically associated with an acid-base imbalance.

 CN: Physiological adaptation; CL: Analyze

46. 2. An initial sign of hemorrhaging after a tonsillectomy is swallowing frequently as mucus and blood combine to increase secretions. Mouth breathing is expected after surgery because the child's mouth is very dry and the throat is sore. Because the child has been without fluids for some time, the child usually is thirsty and asks for a drink. Increased pulse rate is a later sign of hemorrhage.

 CN: Reduction of risk potential; CL: Analyze

47. 1, 3, 4, 2. The nurse should first stop the transfusion. The nurse should next keep the IV open at the original blood transfusion site with normal saline at a keep-vein-open rate. Then, the nurse should administer an antihistamine. Last, the nurse should return the blood bag and blood slip to the blood bank for testing.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

48. 33 gtt/min

The flow rate is determined by the rate of infusion and the number of drops

per milliliter of the fluid being administered: $\text{gtt/mL} \times \text{mL/min} = \text{IV flow rate (gtt/min)}$.

Therefore:

$$10 \text{ gtt/mL} \times 100 \text{ mL/30 min} = 33 \text{ gtt/min.}$$

CN: Pharmacological and parenteral therapies; CL: Apply

49. 4. Delusions of grandeur provide the client with an exaggerated sense of self-esteem that is unrelated to the client's actual achievements. Other, less grandiose, religious delusions may provide comfort or meaning for the client. Delusions of persecution are frequently related to safety issues. Delusions of grandeur are not about survival needs.

CN: Psychosocial integrity; CL: Analyze

50. 3. Loss of electrolytes from the gastrointestinal tract through vomiting, diarrhea, or nasogastric suction is a common cause of potassium loss, resulting in hypokalemia. Hypermagnesemia does not result from excessive loss of gastrointestinal fluids. Common causes of hypernatremia are water loss (as in diabetes insipidus or osmotic diuresis) and excessive sodium intake. Common causes of hypocalcemia include chronic renal failure, elevated phosphorus concentration, and primary hypoparathyroidism.

CN: Physiological adaptation; CL: Analyze

51. 3. It is a normal variation for women to have long-term, bilateral nipple inversion. A woman who has a unilateral nipple inversion that is a new change is at risk for a tumor; the weight of the tumor causes pulling on the nipple. A pronounced unilateral venous pattern, peau d'orange breast tissue, and breast tissue darker than the areolae are definite warning signals for breast cancer that must be reported to the **healthcare provider (HCP)**  immediately.

CN: Health promotion and maintenance; CL: Analyze

52. 1. It is important for children with sickle cell disease to drink lots of fluids to help prevent a crisis. Dehydration precipitates sickling and a crisis. Although taking the child's temperature may provide information about the child's status, it will do nothing to prevent a crisis, nor will weighing the

child daily. Offering the child a high-protein diet will not prevent a crisis, nor is it recommended.

CN: Reduction of risk potential; CL: Synthesize

53. 1. The nurse notifies the pediatrician because a short, webbed neck is associated with genetic deviations or chromosomal disorders such as Turner's syndrome. Cleft palate is associated with embryonic developmental failures and an abnormal opening in the palate. Potter's syndrome (renal agenesis) is characterized by an atypical facial appearance consisting of a flat nose, recessed chin, epicanthal folds, low-set abnormal ears, limb abnormalities, and pulmonary hypoplasia. Neural tube defects are associated with spina bifida or myelomeningocele.

CN: Physiological adaptation; CL: Analyze

54. 3. Diarrhea results in electrolyte loss and the nurse should assess the client for signs of hypokalemia. Clinical manifestations of hypokalemia include an irregular pulse, fatigue, muscle weakness, flabby muscles, decreased reflexes, nausea, vomiting, and ileus. Muscle spasms are not seen in hypokalemia. Thirst is a symptom of hypernatremia. Confusion can be seen in hyponatremia and hypocalcemia.

CN: Physiological adaptation; CL: Analyze

55. 1, 3, 5. Notifying the pharmacy of the nursing concerns is an appropriate first action. The nursing staff should work cooperatively with the pharmacy to develop a system that works well for both nursing and pharmacy. Constant communication with all nursing staff during the quality improvement process is integral to the final approval process of both groups. Moving the drugs to a new position within the medication system during an off shift may create errors, as medications are inserted into the system in a certain position. Leaving the decisions to the pharmacy staff eliminates the input provided by nursing, a vital link between medication and the client.

CN: Management of care; CL: Synthesize

56. 2. The client's self-report of pain is the most reliable indicator of the existence and intensity of the pain. Client response to pain is highly individualized and subjective. The nurse must respect the client's self-report.

 CN: Basic care and comfort; CL: Evaluate

57. 2. Excessive milk consumption can lead to the displacement of iron-rich foods in the diet. This can result in iron deficiency anemia. Drinking excess milk will not cause vitamin C, biotin, or folate deficiencies.

 CN: Health promotion and maintenance; CL: Apply

58. 2. Although all the symptoms listed can occur in cases of fat embolism syndrome, confusion is the earliest symptom noted. The confusion is caused by a low arterial oxygen level.

 CN: Physiological adaptation; CL: Analyze

59. 1. An idea of reference is a person's view that other people recognize that she has an important characteristic or power. Thought insertion refers to a person's belief that others, or a specific other, can put thoughts into her mind. Visual hallucinations involve seeing objects or persons not based on reality. A neologism is a word or phrase that has meaning only to the person using it.

 CN: Psychosocial integrity; CL: Analyze

60. 3. The American Academy of Pediatrics and the American College of Obstetrics and Gynecology recommend hearing screening for all newborns. Currently, more than 30 states mandate screening, which is done by otoacoustic emissions or auditory brainstem response. Newborns can hear as soon as the amniotic fluid drains from the ear canal. Even though hearing problems are not common in newborns, the mother's concerns should be addressed. Clapping to elicit a response is crude and unreliable. If done for minimal screening, the distance should be no more than 12 inches.

 CN: Health promotion and maintenance; CL: Apply

61. 4. The equianalgesic dose of oral meperidine hydrochloride is up to four times the IM dose. Meperidine hydrochloride can be given orally, but it is much more effective when given IM.

 CN: Pharmacological and parenteral therapies; CL: Apply

62. 1, 2, 3. Children tend to be impulsive, which contributes to head

injuries. Also, the larger size of the heads of infants and toddlers causes them to fall more easily than do older children. Falls account for one-third of all head injuries. Motor vehicle accidents account for about 80% of all severe head injuries in children. Children aged 5 to 15 are most likely to be involved in bicycle accidents as a result of only about 50% wearing helmets. Child abuse and tumors involve a much smaller number of children.

CN: Health promotion and maintenance; CL: Apply

63. 1. In order to prevent disuse osteoporosis, it is important to implement weight-bearing activities as soon as medically allowed. Increasing the client's calcium intake will not prevent the development of osteoporosis without the inclusion of weight-bearing activity. Passive ROM exercises and isometric exercises do not provide the bone stress necessary to reduce the risk of osteoporosis.

CN: Reduction of risk potential; CL: Synthesize

64. 3. Toddlers have temper tantrums in their attempt to develop autonomy. Toddlers should be left alone as long as they are safe during a tantrum. Moving the child to a time-out chair or punishing the child reinforces the behavior and is to be avoided. Attempting to talk to the toddler also reinforces the behavior. Additionally, at this cognitive level, toddlers do not understand as well as older children do.

CN: Health promotion and maintenance; CL: Synthesize

65. 1. Because the client's temperature continues to rise in spite of recently administering ibuprofen, the nurse notifies the HCP. After notifying the **HCP**, the nurse can bathe the client with tepid water. If the temperature cannot be lowered shortly, the client is also at risk for seizures; the nurse pads the side rails and observes for seizure activity. The nurse cannot administer another dose of ibuprofen without the HCP's orders.

CN: Physiological adaptation; CL: Apply

66. 3. The Joint Commission and Health Council of Canada both mandate interactive handoff communication that allows the opportunity for questioning between the giver and receiver of client information, including up-to-date information regarding the client's care, treatment and services,

current condition, and any recent or anticipated changes. Nurses have primary responsibility and accountability for utilization of all nursing care provided to clients. The nurse retains the right and has the responsibility to refrain from delegating specific activities based on individual client care needs, caregiver expertise, and/or client care program requirements.

 CN: Management of care; CL: Apply

67. 2. Daily skin inspection is essential in preventing pressure ulcers. Hot water is irritating to the skin and should be avoided. Massaging bony prominences is contraindicated and may actually promote skin breakdown. Prolonged, uninterrupted chair sitting should be avoided; the client's position should be adjusted at least every hour.

 CN: Reduction of risk potential; CL: Synthesize

68. 3. Skeletal pins should not be loose and able to move. Any pin loosening should be reported immediately. Slight serous drainage is normal and may crust around the insertion site or be present on the dressing. The pin insertion site should be cleaned with aseptic technique according to facility policy. Pin insertion sites are typically not painful; pain may be indicative of an infection and should be reported.

 CN: Physiological adaptation; CL: Analyze

69. 4. Acknowledging the basic feeling that the client expressed and asking an open-ended question allow the client to explain her fears. Saying, "It is normal to be scared. We will help you through it," does not focus on the client's feelings; rather, it gives reassurance. Asking if the client feels guilty for having smoked assumes guilt, which might be present, but additional information is needed to confirm. Telling the client not to be so hard on herself does not acknowledge the client's feelings at all.

 CN: Psychosocial integrity; CL: Synthesize

70. 3. It is important that clients with rheumatoid arthritis maintain proper posture and body alignment to support joints and decrease pain and stiffness. Clients with hip pain will be most comfortable when sitting in a straight-back chair with an elevated seat. Elevated seats avoid excessive hip flexion and place less stress on the hip joints. A recliner chair will not provide sufficient

support and likely does not have an elevated seat. A couch typically has a low seat and will cause hip flexion. A rocking chair may not provide the correct joint support and is not sufficiently stable.

CN: Basic care and comfort; CL: Evaluate

71. 3. Giving away personal items has consistently been shown to be an indicator of suicidal plans in the depressed and suicidal individual. The other behaviors indicate a return of interest in normal adolescent activities.

CN: Psychosocial integrity; CL: Synthesize

72. 3. When a neonate dies, the mother should be allowed to stay with the baby as long as she wants and say anything she wants. She is grieving and needs time with the neonate. A photograph should be taken in case the mother wants a photograph at a later time. Telling the mother that this is for the best is inappropriate because such a statement discounts the mother's feelings. Advising the mother to get pregnant again to get over the loss is not helpful because the mother needs time to grieve and be with the neonate. The nurse should remain near the mother and not delegate this responsibility to the hospital's chaplain. A chaplain or other religious member can be contacted if the mother desires.

CN: Psychosocial integrity; CL: Synthesize

73. 1. Clients typically have considerable pain for the first few days after surgery and require frequent administration of pain medication, preferably the use of opioids administered intravenously on a regular schedule or patient-controlled analgesia (PCA). The other problems are all possible complications following this type of surgery, but the priority, until noted otherwise, is to provide adequate pain control.

CL: Apply; CN: Pharmacological and parenteral therapies

74. 4. Serum albumin levels help determine whether protein intake is sufficient. Proteins are broken down into amino acids during digestion. Amino acids are absorbed in the small intestine, and albumin is built from amino acids. The red blood cell count, bilirubin levels, and reticulocyte count do not indicate protein intake.

CN: Physiological adaptation; CL: Analyze

75. 2. The client who is taking desmopressin nasal spray should not use the same naris for administration each time. The client should alternate nares every dose. The client should observe for and report promptly signs and symptoms of nasal ulceration, congestion, or respiratory infection.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

76. 0.5 mL

$$500 \text{ mg} / \text{mL} = 250 \text{ mg} / X \text{ mL}$$

$$X = 0.5 \text{ mL.}$$

 CN: Pharmacological and parenteral therapies; CL: Apply

77. 1, 5, 6. Down syndrome is the most common trisomal abnormality. It can occur at any maternal age with the average being 27 years. The risk of bearing a Down syndrome infant increases with advanced maternal age. The syndrome is caused by nondisjunction during the first meiotic cell division, rather than autosomal dominant or recessive traits. There is no association with timing or quality of prenatal care.

 CN: Health promotion and maintenance; CL: Apply

78. 1, 3, 4. The pregnant woman is not in imminent danger or likely to have a precipitous birth. The child who is 10 years of age is not at risk of infection and can be treated in an outpatient facility. First-degree burns are considered less urgent. The male with respiratory distress and coughing is transported first as he is likely experiencing smoke inhalation. The 75-year-old male with second-degree burns should also be transported to a burn center or emergency department.

 CN: Management of care; CL: Synthesize

79. 3. As with other contraceptives that are progestin based, heavy menstrual bleeding may occur. Other adverse effects include rash, acne, alopecia, fluid retention, edema, and sudden loss of vision. Depression and weight gain have been reported. For clients taking this drug, the risk of endometrial or ovarian cancer is decreased. Amenorrhea has been reported in

clients after receiving four injections 3 months apart for 1 year. Depression and loss of energy have been reported.

CN: Pharmacological and parenteral therapies; CL: Create

80. 4. Because clozapine can cause tachycardia, the nurse should withhold the medication if the pulse rate is greater than 140 bpm and notify the **HCP**.

Giving the drug or telling the client to exercise could be detrimental to the client.

CN: Pharmacological and parenteral therapies; CL: Synthesize

81. 2. Fever is a cardinal manifestation of infection in people with AIDS. Because the major physiologic alteration in AIDS is generalized immune system dysfunction, typical indicators of the body's response to infection (e.g., erythema, warmth, tenderness) may be absent.

CN: Physiological adaptation; CL: Synthesize

82. 2. To care effectively for clients with depression, the nurse should teach the importance of demonstrating empathetic concern. Caregivers must accept clients as they are even though many will be angry and negative, acknowledge their emotional pain, and offer to help them work through their pain. For the client who is depressed, using a cheerful demeanor or a humorous, light-hearted approach may be overwhelming because the client will be unable to meet the caregiver's expectations, subsequently leading to decreased self-worth. A serious, business-like affect may threaten the client and inhibit the development of trust.

CN: Management of care; CL: Evaluate

83. 4. When a child is ready to take fluids by mouth postoperatively, clear liquids are given initially. If clear liquids are tolerated, the concentration and amount of oral feedings are gradually increased. This means advancing to half-strength and then to full-strength formula while increasing the amount given with each feeding.

CN: Basic care and comfort; CL: Synthesize

84. 2. The nurse should monitor the client taking paroxetine, a selective serotonin reuptake inhibitor, for sexual problems, such as decreased libido,

impotence, and ejaculatory disturbances, because these adverse effects can occur frequently and lead to medication noncompliance. Sleep disturbances can occur with an SSRI such as paroxetine. However, this client is taking the drug every morning, which would not affect nighttime sleep. Hypertensive crisis is associated with the ingestion of foods rich in tyramine when a client is taking a monoamine oxidase inhibitor. Orthostatic hypotension is a potential adverse effect of tricyclic antidepressants.

CN: Pharmacological and parenteral therapies; CL: Analyze

85. 2. In the progressive stage of shock, the client can display listlessness or agitation, confusion, and slowed speech. Restlessness occurs in the compensatory stage. Incoherent speech and unconsciousness are clinical manifestations of the irreversible stage.

CN: Physiological adaptation; CL: Analyze

86. 1, 4, 5. Common adverse effects of nafcillin include vomiting, diarrhea, sore mouth, fever, and gastritis (stomach upset). Pain with urination and headache are not associated with this drug.

CN: Pharmacological and parenteral therapies; CL: Evaluate

87. 1. The nurse should first apply the ECG electrodes to the client's chest. If the client is found to be in ventricular fibrillation, the immediate priority is to defibrillate the client. Pulse oximetry is not an immediate priority. The client's oxygenation is evaluated in a code situation using arterial blood gas analysis. The client's blood pressure is evaluated after the ECG rhythm has been established. A portable Doppler ultrasound unit may be needed to check for the presence of a pulse or to check the blood pressure in a code situation.

CN: Safety and infection control; CL: Synthesize

88. 1, 2, 3. Active listening facilitates trust. It means that the nurse acknowledges that he or she has heard the client and indicates in his or her own words an understanding of what the client says and the emotions underlying what is said. It also involves encouraging the client to say more. Constant eye contact and standing very close to a client can be unnerving and can hamper trust building.

CN: Psychosocial integrity; CL: Synthesize

89. 2. Heroin causes pinpoint pupils. Marijuana causes the eyes to appear red and bloodshot. Cocaine use causes pupils to dilate. Drooping of the eyelids is not typically associated with the use of any substance.

CN: Pharmacological and parenteral therapies; CL: Analyze

90. 3. A typical sign of pediculosis capitis (head lice) is frequent scratching of the scalp because the condition causes severe itching. Scratch marks are usually easily visible. Because head lice are easily transmitted to others, the child's family members and peers also should be examined for infestation. Spotty baldness, wheals, and scaly lesions are often allergic in nature.

CN: Physiological adaptation; CL: Analyze

91. 1. Passing flatus indicates the return of peristalsis, as does active bowel sounds. Hunger is not the best indicator of peristaltic return. Hypoactive bowel sounds indicate that there is some peristaltic activity, but it is limited and not yet normal. Palpation is not an appropriate method of assessing bowel activity.

CN: Physiological adaptation; CL: Evaluate

92. 3. The pH of 7.24 indicates that the client is acidotic. The Paco₂ value of 49 mm Hg is elevated. The HCO₃ value of 24 mEq/L is normal. The client is in uncompensated respiratory acidosis. Hypoventilation and a flushed appearance are additional clinical manifestations of respiratory acidosis.

CN: Physiological adaptation; CL: Analyze

93. 2. It is essential for the nurse to evaluate the effects of pain medication after it has had time to act. Although other interventions may be appropriate, continual reassessment is most important to determine the effectiveness and need for additional intervention, if any. Repositioning could provide some comfort, but assessment of the client's pain level is essential. Reassuring the client is important, but it will be of no value unless the nurse evaluates the client's pain level. To readjust the pain dosage is appropriate only if titration is prescribed by the **healthcare provider (HCP)** 📖.

CN: Basic care of comfort; CL: Synthesize

94. 1. Barrier contraceptives must be used to protect against STIs. Birth control pills and douching are not effective for prevention of STIs. Prophylactic antibiotics are not used to prevent the acquisition of STIs.

CN: Safety and infection control; CL: Evaluate

95. 2. A purplish blue discoloration of the vagina and cervix is termed Chadwick's sign; it is caused by increased vascularity of the vagina during pregnancy and is considered a probable sign of pregnancy. Goodell's sign, also considered a probable sign of pregnancy, refers to a softening of the cervix during pregnancy. Hegar's sign, also a probable sign of pregnancy, refers to a softening of the lower uterine segment. Melasma, the mask of pregnancy, refers to the pigmentation of the skin on the face during pregnancy. Melasma is considered a presumptive sign of pregnancy.

CN: Health promotion and maintenance; CL: Apply

96. 3. Initially, the nurse would tell the client to seek out staff when feeling agitated or upset to prevent violent episodes. Doing so helps the client to redirect negative feelings in an appropriate manner, such as talking. Encouraging the client to stay in his room is inappropriate because it does not help the client to deal with his feelings. Secluding the client at the first sign of agitation is not indicated and may be perceived by the client as punishment. Instructing the client to ask for medication when agitated would not be the initial course of action. The nurse would interact with the client and direct the client to an activity to decrease his anxiety before intervening with any required medication.

CN: Psychosocial integrity; CL: Synthesize

97. 3. The nurse should use short words, sentences, and paragraphs and avoid medical jargon. Correct terminology should be used when appropriate (e.g., type 1 diabetes, not "sugar diabetes"). The format should be as simple as possible; charts are not necessary and may be confusing to some clients. Information should be prepared at a fifth-grade reading level. The information should be presented in large-sized type.

CN: Psychosocial integrity; CL: Synthesize

98. 4, 5. Rapid pulse, heat intolerance, diarrhea, exophthalmos, and

accelerated linear growth are more characteristic of hyperthyroidism, which is caused by an autoimmune response to thyroid-stimulating hormone receptors. Weight gain, dry skin, and constipation are characteristic of hypothyroidism, which results from a deficiency in secretion of thyroid hormone.

CN: Physiological adaptation; CL: Analyze

99. 2. The criterion for hemorrhage is saturating one pad per hour. The 35-year-old who delivered 4 hours ago had saturated a peripad per hour. Even though her fundus is firm, she may have experienced a cervical laceration, which would be the source of the bleeding. She needs to be evaluated first, based on the bleeding. The 18-year-old who has abdominal cramps is within normal limits for a G2 P2 and is experiencing afterbirth pains normally seen in a multiparous client; she will need pain medication. The 16-year-old status post cesarean section on magnesium sulfate is stable with adequate urinary output and normal reflexes. Her vital signs are within normal limits for a postpartum client. The headache is the one area of concern for this client. The 18-year-old who is 2 days postpartum with breast pain may be experiencing her milk coming in, although it does not indicate whether she is breast- or bottle-feeding; either situation may find a mother with milk developing within her system. The vital signs for this client are slightly elevated, but this may be from the milk coming in and would require nursing evaluation but is not emergent.

CN: Management of care; CL: Synthesize

100. 4. It is normal for the client to feel pressure on the palms of the hands when walking with crutches. The client should move her affected (right) leg forward first as she swings forward with the crutches. Leaning on the crutches can apply pressure to the axillae, leading to neurovascular impairment. If the client's arms are tingling after she uses her crutches, she is probably applying pressure on her axillae when walking.

CN: Reduction of risk potential; CL: Evaluate

101. 2. Because clients are discharged as soon as possible from the hospital, it is essential to evaluate the support for assistance and self-care at home. If the client has support at home, the distance from the hospital may be

irrelevant. The client or support team will monitor vital signs as needed, but blood pressure monitoring is not specifically indicated. It is more important at this point for the client to understand how to manage his care at home, rather than knowing the causes of lung cancer.

 CN: Management of care; CL: Analyze

102. 3. If the client begins breast-feeding early and often after childbirth, the breasts begin to fill with milk within 48 to 96 hours, or 2 to 4 days. The breasts secrete colostrum for the first 24 to 48 hours, which is beneficial to the neonate because of the immunoglobulins contained in colostrum.

 CN: Health promotion and maintenance; CL: Apply

103. 3. The predominant clinical finding in elderly or debilitated clients indicating that they have hypoxia is confusion. Fever and chills, productive cough, and pleuritic chest pain could be indicative of a respiratory tract infection.

 CN: Physiological adaptation; CL: Analyze

104. 1. It is important for the child and family to understand that chorea associated with rheumatic fever is not permanent. Therefore, the nurse should explain that the chorea will disappear over time. It is not necessary to assess the child's neurologic status because the chorea is self-limited and nonprogressive. Because the child has cardiac involvement, ambulation is contraindicated. Aspirin is used primarily as an anti-inflammatory drug and secondarily for pain relief. A slightly cool environment is unnecessary. Environmental temperature does not affect the child's polyarthritis and chorea.

 CN: Physiological adaptation; CL: Synthesize

105. 1. When the gestation is less than 13 weeks, an elective abortion is usually performed by the dilatation and curettage method. Menstrual extraction, or suction evacuation, is the easiest method, but it is used only when the client is between 5 and 7 weeks' gestation. Dilatation and vacuum extraction is used when clients are between 12 and 16 weeks' gestation. Saline induction, used for clients between 16 and 24 weeks' gestation, involves instillation of a hypertonic saline solution into the amniotic sac to

initiate expulsion. Oxytocin infusion may also be used with saline induction.

CN: Health promotion and maintenance; CL: Apply

106. 1. A pleural effusion is a collection of fluid between the pleural layers of the lung. The effusion decreases chest wall movement on the affected side. The nurse should expect the breath sounds to be decreased or diminished over the affected area. Because of the presence of fluid, percussion would elicit dullness, not hyperresonance. The nurse should not expect to hear wheezing on auscultation.

CN: Basic care and comfort; CL: Analyze

107. 1. An expected client outcome for a goal to reduce acute pain related to cramping is that the client exhibits no manifestations of discomfort, such as crying or drawing the legs to the abdomen. Being very still may indicate either a pain state or a state of relaxation, and the nurse would need to assess the client further. Having normal bowel movements and not vomiting are desired outcomes, but the goal here is to relieve the pain.

CN: Physiological adaptation; CL: Synthesize

108. 0.6 mL

$$40 \text{ mg} / \text{mL} = 25 \text{ mg} / X \text{ mL}$$

$$X = 0.6 \text{ mL.}$$

CN: Pharmacological and parenteral therapies; CL: Apply

109. 4. The client is likely exhibiting symptoms of herpes genitalis, which include painful blisters or vesicles that appear 2 to 20 days after transmission of the disease. The client was most likely exposed from her new partner. The client should be referred to an **HCP**  for treatment. Having her partner wear a condom, increasing fluids, or using lubricant jelly will not treat the infection. While having her partner wear a condom will not cure the infection, having future partners wear condoms will help prevent its transmission.

 CN: Management of care; CL: Synthesize

110. 2. It has been found that parents are more aggrieved when optimism is followed by defeat. The nurse should recognize this when planning various ways to help the parents of a dying child. It is not necessarily true that knowing about a poor prognosis for years helps prepare parents for a child's death, that trust in health personnel is destroyed when a death is untimely, or that it is more difficult for parents to accept the death of an older child than that of a younger child.

 CN: Psychosocial integrity; CL: Synthesize

111. 3. The child is having a reaction to the blood transfusion. The priority is to stop the blood transfusion but maintain an open venous access for medication or high fluid volume delivery. Thus, switching the transfusion to normal saline solution would be done first. Since the child is having difficulty breathing, applying oxygen would be the next action. Additionally, vital signs are taken to determine the extent of circulatory involvement. Then the **HCP**  would be notified and, if necessary, the crash cart would be obtained.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

112. 1. A client who has an allergy to penicillin may have a cross-sensitivity to cefazolin, a first-generation cephalosporin, and the drug should be given with caution. The nurse should ask the client whether the client has taken cefazolin before. The nurse should inform the pharmacy of the client's allergy after asking the client about prior use of cefazolin. The medication should not be administered until the nurse first inquires about the client's exposure to cefazolin and then consults the pharmacist or **HCP**.  Observing the client for urticaria is appropriate but is not an initial response.

 CN: Safety and infection control; CL: Synthesize

113. 2. Toddlers are in Erikson's stage of autonomy versus shame and doubt. They want to do things on their own and experience despair when they are not allowed to be independent in areas that they are capable. Allowing the toddler to participate in the dressing change promotes the toddler's independence. Medications must be administered on a schedule to maintain therapeutic levels. Toddlers have short attention spans and would not likely

complete an art project. Toddlers commonly engage in parallel play. Having another toddler visit will not aid in the achievement of Erikson's stage of development.

CN: Psychosocial integrity; CL: Analyze

114. 1. The nurse would teach the client taking lithium and his family about the importance of maintaining adequate sodium intake to prevent lithium toxicity. Because lithium is a salt, reduced sodium intake could result in lithium retention with subsequent toxicity. Increasing sodium in the diet is not recommended and may be harmful. Increased sodium levels result in lower lithium levels. Therefore, the drug may not reach therapeutic effectiveness.

CN: Pharmacological and parenteral therapies; CL: Synthesize

115. 3. Mucositis is an inflammation of the oral mucosa caused by radiation therapy. It is important that the client with mucositis receive meticulous mouth care, including flossing, to prevent the development of an infection. Mouth care should be provided before and after each meal, at bedtime, and more frequently as needed. Extremes of temperature should be avoided in food and drink. Half-strength hydrogen peroxide is too harsh to use on irritated tissues.

CN: Reduction of risk potential; CL: Synthesize

116. 3. Acetaminophen ingestion can cause severe liver disease. The child should be evaluated in the emergency department. The child should not be offered any fluids, and the parents should not attempt to induce vomiting. Assessing the child's respirations for 24 hours will delay needed emergency treatment.

CN: Management of care; CL: Synthesize

117. 1. The best approach by the nurse is to determine why the parent thinks the child is hyperactive. Some children are very active but do not have the necessary defining characteristics of hyperactivity. Asking what the parent thinks needs to be done, how the child behaves normally, and if the preschool teacher thinks the child is hyperactive would be an appropriate follow-up question once more information is gathered from the parent to

determine whether the child indeed is hyperactive.

CN: Physiological adaptation; CL: Synthesize

118. 2. Dilatation at the anastomosis site is needed during the first years of childhood in about 50% of children who have had corrective surgery for TEF. Recurrent mild diarrhea with dehydration is not likely to develop with this surgery. Speech problems can occur if other abnormalities are present to produce them; the larynx and structures of speech are not affected by TEF. Dysphagia and strictures may decrease food intake, and poor weight gain may be noted, but gastric ulcers should not develop from surgery to repair TEF.

CN: Reduction of risk potential; CL: Analyze

119. 1. Terminally ill clients most often describe feelings of isolation because they feel ignored. The terminally ill client may sense any discomfort that family and friends feel in the client's presence. Nursing interventions include spending time with the client, encouraging discussion about feelings, and answering questions openly and honestly. Reducing fear of pain or fear of more aggressive therapies is secondary to lessening the client's feelings of isolation. Reducing feelings of social inadequacy is not relevant to the terminally ill client.

CN: Psychosocial integrity; CL: Synthesize

120. 2. When the fetus is in a breech position, the fetal heart rate most often is located above the umbilicus because the fetal heart is near the top of the mother's uterus. The heart of a fetus in the cephalic position is typically located on either the left or the right side of the client's uterus. Also, because the fetal heart typically is located in the lower portion of the mother's uterus, the sounds would be heard below the umbilicus. With a face presentation, fetal heart sounds are typically located on either the left or the right side of the client's uterus; in addition, because the fetal heart typically is located in the lower portion of the mother's uterus, the sounds would be heard below the umbilicus. When the fetus is in a transverse position, the fetal heart sounds typically would be located below the umbilicus and in the midline.

CN: Health promotion and maintenance; CL: Analyze

121. 4. Clients who have been diagnosed with pernicious anemia are lacking adequate amounts of the intrinsic factor (IF) that is secreted by the gastric mucosa. IF is necessary for the absorption of cobalamin (vitamin B12) in the distal ileum. Without the presence of IF, dietary intake of vitamin B12 is useless because it cannot be absorbed. Treatment of pernicious anemia includes IM injections of cobalamin, at first daily for 2 weeks, then weekly until the anemia is corrected. A maintenance schedule of monthly injections is then implemented. The injections will need to be continued for the rest of the client's life.

CN: Physiological adaptation; CL: Evaluate

122. 2. The nurse should first assess the client because a hypoglycemic reaction is likely to occur. At this time, the nurse also should give the client a fast-acting simple carbohydrate. Then the nurse should notify the **HCP**  for prescriptions to prevent or treat severe hypoglycemia. The nurse could consult the clinical pharmacist until able to contact the HCP, but the first action is to assess the client in order to have accurate information to report. When the situation has been resolved, the nurse should document the incident and report the incident to the charge nurse.

CN: Reduction of risk potential; CL: Synthesize

123. 4. Safety is the priority in caring for this infant. Infants adapt easily, increasing mobility even with a splint in place. Therefore, the mother needs to ensure that the area in which the infant is mobile is safe. There is no need to contact the **HCP**  to alter the treatment plan. Confining the infant to one room may not allow the child to achieve normal development. The child needs different environments for maximum development. The infant needs to wear the splint as prescribed by the HCP to ensure optimal healing.

CN: Safety and infection control; CL: Synthesize

124. 1. Anxiety in a preoperative client may be caused by many different fears, such as fear of the effects of anesthesia, the effects of surgery on body image, separation from family and friends, job loss, disability, pain, or death. However, fear of the unknown is most likely to be the greatest fear because the client feels helpless. Therefore, an important part of preoperative nursing care is to assess the client for anxieties and explore possible causes.

Emotional support can then be offered so that the client is in the best possible psychological condition for surgery.

 CN: Psychosocial integrity; CL: Analyze

125. 1. An important nursing responsibility is preoperative teaching. The recommended guide for teaching is to tell the client as much as she wants to know and is able to understand. Delaying discussion of issues or concerns will most likely increase the client's anxiety. Telling the client to discuss questions with the **HCP**  avoids acknowledging the client's concerns.

 CN: Psychosocial integrity; CL: Synthesize

126. 3. The client must have adequate disclosure of the risks associated with the surgery before signing the **consent**  form. It is the **healthcare provider's (HCP's)**  responsibility to explain the risks of any procedures and to obtain the client's informed consent. If the nurse suspects that the client has not been truly informed, it is the responsibility of the nurse to act as a client advocate and contact the surgeon to provide additional information to the client. It is not appropriate to have the client go to surgery without understanding the risks. The nurse should not minimize the procedure or dismiss the client's concerns.

 CN: Management of care; CL: Synthesize

127. 4. In right occipital anterior lie, the occiput faces the right anterior segment of the woman's pelvis. In left occipital transverse lie, the occiput faces the woman's left hip. In left occipital anterior lie, the occiput faces the left anterior segment of the woman's pelvis. In right occipital transverse lie, the occiput faces the woman's right hip.

 CN: Physiological adaptation; CL: Analyze

128. 4. The nurse should advise the parents to report an increasing fever, which would indicate the infection is not resolving. Increased urine output may occur, but it would be very difficult for the parent to actually determine this and it is not a cardinal sign of increasing infection. The child may have a loss of appetite related to the infection or the medication, but is not indicative of an infection that is becoming worse. The child should not have jaundice from a urinary tract infection that is being treated.

 CN: Physiological adaptation; CL: Synthesize

129. 3. A positive Babinski's reflex in a neonate is a normal finding demonstrating the immaturity of the central nervous system in corticospinal pathways. A neonate's muscle coordination is immature, but the Babinski's reflex does not help determine this immaturity. A positive Babinski's reflex does not indicate a defect in the spinal cord or an injury to nerves that innervate the legs. There is no evidence to suggest partial paralysis. A positive Babinski's reflex in an adult indicates disease.

 CN: Health promotion and maintenance; CL: Evaluate

130. 2. The nurse should instruct the client who is taking dexamethasone and furosemide to observe for signs and symptoms of hypokalemia, such as malaise, muscle weakness, vomiting, and a paralytic ileus, because both dexamethasone and furosemide deplete serum potassium. This combination of drugs does not cause the client to become excitable or have diarrhea or thirst.

 CN: Pharmacological and parenteral therapies; CL: Analyze

131. 2. After a bronchoscopy with a biopsy, the nurse should monitor the client for signs of pneumothorax as well as hemorrhage. The client should not gargle with oral lidocaine; this will not allow the gag reflex to return. The client should not have any mediastinal discomfort after a bronchoscopy; if pain does occur, it should be reported promptly to the **healthcare provider (HCP)**.  It is not necessary to tell the client not to talk until the gag reflex returns.

 CN: Reduction of risk potential; CL: Synthesize

132. 42 gtt/min

The number of drops the client should receive each minute is determined as follows:

500 mL/12 hours = between 41 and 42 mL to be infused each hour

42 mL \times 60 (drop factor) = 2,520 drops to be infused each hour

2,520 drops/60 minutes = 42 drops to be infused every minute.

CN: Pharmacological and parenteral therapies; CL: Apply

133. 2. Subcutaneous injections are administered at an angle of 45 to 90 degrees, depending on the size of the client. Subcutaneous needles are typically $\frac{3}{8}$ to $\frac{5}{8}$ inches in length. The skin should be pinched up at the injection site to elevate the subcutaneous tissue. Air is not drawn into the syringe for a subcutaneous injection.

CN: Pharmacological and parenteral therapies; CL: Apply

134. 1, 3, 5. Especially in the elderly, alprazolam withdrawal requires immediate and aggressive treatment. Hallucinations are frightening for the client and family. Changes in medical and mental status can occur quickly in the elderly, and the client must be monitored closely. Restraints are not indicated for the client and would likely aggravate the confusion and agitation. There is no need to restrict the daughter from visiting at this point.

CN: Pharmacological and parenteral therapies; CL: Create

135. 3. Each child has unique temperaments and energy levels, and parents must adapt parenting strategies for each child. Children who are easily upset do better in structured environments where they can learn what to expect. Easygoing children can manage flexible feeding times. Not feeding the child when he cries will not promote nutrition and does not provide the structure that will help the child learn appropriate eating behaviors. Children who are very active and always “on the go” respond well to eating food that can be carried in their hand, and eating more frequently.

CN: Health promotion and maintenance; CL: Synthesize

136. 4. The position of the tube should be verified before the feeding is

implemented. Warming the solution is not necessary or desirable because it can encourage bacterial growth; however, if the solution has been refrigerated, the nurse can bring the solution to room temperature. The client should be lying down with the head elevated or sitting upright during administration of the feeding. Gastric residual should be aspirated and then reinstalled to prevent electrolyte losses.

CN: Reduction of risk potential; CL: Apply

137. 4. The cramping is caused by the baby's sucking and subsequent stimulation for the release of oxytocin. This cramping is normal. With each subsequent pregnancy, the uterus becomes "stretched" and the release of oxytocin causes the uterus to contract, resulting in the feeling of cramping that can become more severe with each birth. Continued moderate to large amounts of lochia rubra are indicative of retained placental fragments. Cramping indicates that the uterus is contracting and most likely firm. A boggy uterus, continued moderate to heavy lochia, mild vasoconstriction, and restlessness and anxiety suggest delayed postpartum hemorrhage due to subinvolution of the placental site, retained placental tissue, or infection. Most clients receive a standard dose of oxytocin after birth. Oxytocin has a duration of action of 60 minutes. Therefore, the effects of the drug would have worn off by 24 hours postpartum.

CN: Health promotion and maintenance; CL: Synthesize

138. 4. The current recommendations for children experiencing mild to moderate diarrhea are to continue the child's regular diet. With this diet plan, children seem to get well faster. Clear liquids, such as juices, colas, and gelatin, are high in carbohydrates but low in electrolytes, as are foods such as bananas, rice, applesauce, and toast. Foods low in fat also typically lack the electrolytes that the child needs.

CN: Physiological adaptation; CL: Synthesize

139. 2. When performing tracheostomy care, it is important that the tracheostomy ties be securely tied to prevent dislodgment of the tube. It is not necessary to remove the inner cannula every 2 hours for cleaning. Routine cleaning is usually performed every 8 hours. The nurse should use precut tracheostomy dressings under the neck plate to protect the skin surrounding

the stoma. Cutting and using a gauze dressing can cause loose gauze fibers to enter the airway. The inner cannula should be suctioned before cleaning, not afterward.

 CN: Reduction of risk potential; CL: Apply

140. 2. The nurse should send the sealed container of IV 50% dextrose found in the sink to the pharmacy. A concentrated medication such as 50% dextrose could be lethal if inadvertently administered and should not be stored outside the pharmacy. An incident report is not necessary in this situation. The sharps container is not the appropriate method for disposal of this medication.

 CN: Safety and infection control; CL: Synthesize

141. 3. The client who is wheelchair-bound with a spinal cord injury should be taught to make small weight shifts, lifting off the sacral area every 15 minutes. This decreases the risk of pressure ulcer formation. Bathing daily promotes skin cleanliness, but by itself will not prevent pressure ulcer formation. Eating a well-balanced diet that includes proteins and carbohydrates promotes good skin integrity. Moving from the bed to the wheelchair every 2 hours is not desirable because the client should not spend excessive amounts of time in bed. Pressure sores can develop in less than 2 hours.

 CN: Reduction of risk potential; CL: Synthesize

142. 1. Anatomically, the squatting position enlarges the pelvic outlet and uses the force of gravity during pushing. The mother should curve her body into a C shape for the greatest effectiveness. The side-lying, knee-chest, and squatting with arched back positions do not enlarge the pelvic outlet.

 CN: Health promotion and maintenance; CL: Synthesize

143. 2. Saying “If you punch people out, you will get into trouble” helps the client by pointing out the negative consequences of his behavior. Clients with antisocial personality disorder are aggressive, impulsive, and reckless; engage in illegal activities; and lack guilt or remorse. The nurse teaches the client that there are consequences to his irresponsible behavior and that the way to stay out of trouble is to change his behavior. Saying, “It is wrong to

punch others,” is not helpful since the client does not feel guilt or remorse. Saying, “I would not do that again if I were you” or “Do not ever do that again,” is authoritative and scolds the client without helping him.

CN: Psychosocial integrity; CL: Synthesize

144. 3. Self-mutilation is a way to express anger and rage, commonly seen in clients with borderline personality disorder. It typically is a cry for help, an expression of intense anger, helplessness, or guilt. When a client is experiencing numbness or feelings of unreality, self-mutilation induces physical pain that validates the person’s being alive because of the ability to feel the physical pain. Self-mutilation is not a means of getting what the person wants. It is not used as a form of manipulation, although it is often misinterpreted as such. Self-mutilation is a serious behavior that is harmful to the self and cannot be ignored.

CN: Management of care; CL: Evaluate

145. 3. Hepatitis C is transferred by percutaneous exposure, such as tattooing. Hepatitis A is acquired through contaminated water, exposure in underdeveloped countries, or shellfish in contaminated waters.

CN: Physiological adaptation; CL: Analyze

146. 1. Lorazepam, a benzodiazepine, is commonly used to decrease the symptoms of central nervous system irritability in the client who is experiencing early symptoms of alcohol withdrawal. An antihypertensive will not treat the underlying CNS irritability. If the lorazepam is effective, it will not be necessary to have someone sit with the client. At this point, it is not necessary to notify the **healthcare provider (HCP)** .

CN: Management of care; CL: Synthesize

147. 2, 3. Appropriate diet instructions for the client in the early stages of cirrhosis include ensuring an adequate intake of protein and eating small, frequent meals. There is no need to limit protein intake unless the client has evidence of hepatic encephalopathy. Additionally, fluid intake is not restricted unless the client has significant ascites or edema (these typically occur later in the disease). Because of gastrointestinal dysfunction, small, frequent meals are frequently better tolerated than three regular meals.

Clients with cirrhosis should be encouraged to increase their caloric intake instead of restricting it. Alcohol intake in any amount is discouraged.

 CN: Physiological adaptation; CL: Synthesize

148. 3. After surgery, the nurse's initial assessment is the surgical site dressing to determine whether there is any bleeding or drainage. Once this assessment is completed, then the nurse would assess the other areas such as the IV access site, pain, and nasogastric tube function.

 CN: Physiological adaptation; CL: Analyze

149. 1. The nurse should use the radial artery to obtain blood gas samples because it is easier to maintain firm pressure there than on the femoral artery. Nursing interventions to protect the client who has received t-PA or alteplase recombinant therapy include maintaining arterial pressure for 30 seconds because it takes longer for coagulation to occur with the thrombolytic agent on board. IM injections are contraindicated during thrombolytic therapy. The nurse should prevent physical manipulation of the client, which can cause bruising.

 CN: Reduction of risk potential; CL: Synthesize

150. 4. Serum amylase and lipase are increased in pancreatitis, as is urine amylase. Other abnormal laboratory values include decreased calcium level and increased glucose and lipid levels.

 CN: Reduction of risk potential; CL: Analyze

151. 2. For the client with an alcohol or drug problem, group sessions are helpful in dealing with emotions and concerns about alcohol and drugs. Clients with substance abuse problems identify with each other's similar experiences and can best help each other deal with these feelings and emotions. Additionally, the members of the group are able to support and confront each other. Individual therapy is not as helpful as group sessions because group members offer peer support and confrontation when needed. Solitary activities and recreation lead to increased avoidance of the issues that must be faced and dealt with by the client. These are often areas that the client must learn to develop and manage while in recovery.

 CN: Psychosocial integrity; CL: Synthesize

152. 4. Foul-smelling urine is indicative of cystitis. Other symptoms include dysuria and urinary frequency and urgency. Flank pain, nausea, and vomiting indicate pyelonephritis.

CN: Physiological adaptation; CL: Analyze

153. 4. By saying “You could not have prevented the tornado; it just happened” the nurse helps the client to develop an objective perspective and promotes a better understanding of the event. The other statements tell the client how to feel, possibly causing resistance, and thus delay therapeutic healing. Guilt and self-blame will not be decreased.

CN: Psychosocial integrity; CL: Synthesize

154. 3. In many Asian cultures, the 30 days after the birth of the neonate is a time for the mother to heal from the birth. The appropriate action by the nurse is to determine whether this is a cultural practice for this client and her family. If so, the client is behaving within her cultural practices. Teaching should be provided to both the mother and her mother-in-law. There is no indication that bonding is not taking place. Lack of bonding might be indicated if the client did not show any interest in the neonate. Documenting the client’s maternal behavior in her medical record is a routine task. However, the nurse should not assume that this behavior is unusual because it may be reflective of the client’s cultural framework. A home visit is not warranted unless there is evidence of infant neglect or the family needs additional follow-up or teaching.

CN: Health promotion and maintenance; CL: Synthesize

155. 1. A creatinine clearance test is a 24-hour urine test that measures the degree of protein breakdown in the body. The collection is not maintained in a sterile container. There is no need to insert an indwelling urinary catheter as long as the client is able to control urination. It is not necessary to force fluids.

CN: Reduction of risk potential; CL: Synthesize

156. 4. The statement, “Your eyes look dark,” is the least sensitive statement because it points out an obvious difference for no real purpose. The nurse has a reason to ask the client about favorite foods and needs to know

about past health problems. Also, it is appropriate for the nurse to ask the client how he or she wishes to be addressed.

CN: Psychosocial integrity; CL: Analyze

157. 2. Insight into the illness is demonstrated when the client recognizes the relationship between the chemical imbalance and his illness and symptoms. Stating that the olanzapine is the best medicine or that the client's mother is proud of him for staying on his medicines reflects awareness about the effect of medications and the need for compliance. Stating that he may be able to get a part-time job indicates an awareness of his increased capacity for work.

CN: Psychosocial integrity; CL: Evaluate

158. 3. Carpal tunnel syndrome is a condition in which the median nerve becomes compressed in the wrist. The brachial nerve is not affected. Carpal tunnel syndrome may be the result of a systemic disease, such as rheumatoid arthritis or diabetes mellitus, or it may be an occupational hazard for people whose jobs require repetitive hand movements such as someone who works long hours on a computer. It is not a condition resulting from disuse. The wrists do not develop flexion contractures with carpal tunnel syndrome.

CN: Physiological adaptation; CL: Synthesize

159. 1. Barbiturates can cause significant respiratory depression. The nurse's first action is to immediately assess the respiratory status and assist in bag-mask-valve ventilation as needed. Monitoring the vital signs is important, but respiratory care takes precedence over the blood pressure. Without other injury, blood products are not necessary. Placing the client in the Trendelenburg position will put pressure from the abdominal contents onto the diaphragm and further impair breathing.

CN: Pharmacologic and parenteral therapies; CL: Synthesize

160. 3. Clients who have undergone TURP need to be instructed to maintain an adequate fluid intake despite urinary dribbling or incontinence. The client should be advised to drink at least eight glasses of water a day to dilute the urine and help prevent urinary tract infections. Maintaining a voiding schedule of every 2 hours can help decrease incidents of

incontinence. Teaching the client Kegel exercises is also beneficial for strengthening sphincter tone. The nurse should not encourage the client to decrease fluids. It is not necessarily true that a decreased intake will cause renal calculi. Threatening the client with a catheter is not beneficial, and it is not the treatment of choice for a client who is experiencing incontinence from TURP.

 CN: Reduction of risk potential; CL: Synthesize

161. 4. Risk factors for TSS include the use of tampons at night, when the tampon would be in place for 7 to 9 hours. TSS can occur in other situations, but it is commonly associated with women during menses, particularly women who use tampons. The longer the tampon is left in place, the greater the risk for TSS. Changing tampons every 3 hours or more frequently, avoiding use of deodorized tampons, and alternating tampons with sanitary pads are actions that decrease the risk of TSS.

 CN: Reduction of risk potential; CL: Analyze

162. 4. Costovertebral tenderness occurs on the side of the affected kidney in pyelonephritis. Dysuria, suprapubic pain, and urine retention may occur in pyelonephritis but do not specifically support a diagnosis of pyelonephritis. Dysuria, suprapubic pain, and urine retention are symptoms of cystitis, which can lead to pyelonephritis if not treated.

 CN: Physiological adaptation; CL: Analyze

163. 2. Broad-spectrum antibiotics can cause decreased efficacy of oral contraceptives, placing the client at risk for an unplanned pregnancy. When a client is prescribed a course of antibiotics, a backup method of contraception should be used. Antihypertensives, diuretics, and antihistamines do not interfere with oral contraceptive efficacy.

 CN: Pharmacological and parenteral therapies; CL: Apply

164. 1. Adverse effects of danazol include headaches, dizziness, irritability, and decreased libido. Masculinization effects, such as deepened voice, facial hair, and weight gain, also may occur.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

165. 2. The nurse should assign the Muslim male client who needs complete morning care to Joe. Muslim men cannot be cared for by female nurses. The nurse must also consider workload, and Joe has the lightest assignment.

CN: Management of care; CL: Synthesize

166. 4. Central nervous system changes include such symptoms as apathy, lethargy, and decreased concentration. Seizures and coma can also occur. The nurse should assess the client's level of consciousness at regular intervals and maintain client safety. Allowing the client to express feelings related to body image changes and restricting foods high in potassium and fluid intake are all appropriate activities, but they are not related to the central nervous system changes.

CN: Physiological adaptation; CL: Synthesize

167. 3. Elderly individuals have less subcutaneous tissue. An elderly, emaciated client will require a short needle and a shallow angle to avoid hitting an underlying bone. The nurse should choose the shortest subcutaneous needle available and use the least angle.

CN: Pharmacological and parenteral therapies; CL: Apply

168. 3. Metronidazole can cause a disulfiram-like reaction if it is taken with alcohol. Tachycardia, nausea, vomiting, and other serious interaction effects can occur. Flagyl will make the urine a darker color. Oral contraceptives should never be discontinued with trichomoniasis. The partner also requires treatment to prevent retransmission of infection.

CN: Pharmacological and parenteral therapies; CL: Synthesize

169. 1. In the advanced stages of osteoarthritis, pain can occur with minimal activity or even when the client is at rest. Crepitation can be present at any stage of the disease and does not exacerbate pain. Joints are not symmetrically affected by the disease. Symmetric joint involvement and fatigue are characteristics of rheumatoid arthritis.

CN: Physiological adaptation; CL: Analyze

170. 3. The traditional belief of Vietnamese Americans is that the family

can provide more comfort for their loved one at home. It is not seen as being disloyal if their loved one dies in the hospital. The request is not based on a feeling that the hospital cannot be trusted. Vietnamese Americans accept death as a part of life and do not think that reincarnation is prevented in the hospital.

 CN: Psychosocial integrity; CL: Apply

171. 2. It is important for the daughter to know that there is an underlying cause for what her mother is experiencing and that it is treatable. Telling her not to worry is a useless cliché and does nothing to inform the daughter. Talking about care after discharge implies that the delirium is irreversible. Delirium is a reversible condition. Although not arguing with hallucinations is valid, this response ignores the daughter's concern.

 CN: Psychosocial integrity; CL: Synthesize

172. 2. The client with Alzheimer's dementia should not have access to toiletries that could be swallowed (such as aftershave) unless closely supervised. Putting special locks on all the doors is appropriate to prevent wandering, thus maintaining the client's safety. Placing the client in a room that has nothing to trip over is appropriate to reduce the client's risk of falling. Taking the knobs off of the stove is appropriate to prevent possible burns.

 CN: Safety and infection control; CL: Evaluate

173. 3. It is important that the client force fluids to 3,000 mL/day to avoid the development of renal calculi when taking allopurinol. Allopurinol must be taken consistently to be effective in the treatment of gout. The drug should be taken after meals to avoid gastrointestinal distress. Although the client can take aspirin when taking allopurinol, both drugs can cause gastrointestinal irritation, and the practice is not recommended if the client is sensitive to the medications.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

174. 3. The best advice for the nurse to give the child's mother is to run cool water over the burned area to stop the burning process. Then the area should be wrapped in a clean cloth. Once these initial actions are completed,

the mother can call the child's **HCP**.  Packing the arm in ice may cause more damage to the burned area because cold can cause burns just as heat can. For most burns, it is not advised to apply ointment until the area has been evaluated.

 CN: Reduction of risk potential; CL: Synthesize

175. 4. The client is at risk for falling, and the nurse should initiate falls precaution. The client does not require airborne precautions. There is no indication the client needs a referral to physical therapy. The client should be encouraged to maintain mobility.

 CN: Reduction of risk potential; CL: Analyze

176. 3. Chills and headache are signs of a febrile, nonhemolytic blood transfusion reaction, and the nurse's first action should be to discontinue the transfusion as soon as possible and then notify the **healthcare provider (HCP)**.  Antipyretics and antihistamines may be prescribed. The nurse would not administer acetaminophen without a prescription from the HCP. The client's blood pressure should be taken after the transfusion is stopped. Checking the infusion rate of the blood is not a pertinent action; the infusion needs to be stopped regardless of the rate.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

177. 3. Resolving grief and having increased energy and activity convey good mental health, indicating that counseling is not necessary at this time. Taking an antidepressant or having less energy and involvement with grandchildren reflects possible depression and the need for counseling. Wanting to be with her dead husband suggests possible suicidal ideation that warrants serious further assessment and counseling.

 CN: Psychosocial integrity; CL: Evaluate

178. 3. Common adverse effects of isosorbide are light-headedness, dizziness, and orthostatic hypotension. Clients should be instructed to change positions slowly to prevent these adverse effects and to avoid fainting. Ankle swelling is not related to isosorbide administration. The client does not need to take his pulse before taking the medication. The client does not need to take the medication with food.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

179. 3. Valproic acid and propranolol are often prescribed to help manage explosive anger. Recognizing the need for medications indicates readiness for discharge. Not ever getting angry is difficult, impractical, and unrealistic without specific anger management strategies. Drinking does not address anger control and suggests a risk of continued drinking. Blaming others, such as the client's mother, does not address anger control and indicates a lack of responsibility for the client's own behavior.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

180. 3. The nurse should first help the client into a position of comfort even though the primary purpose for entering the room was to administer medication. After attending to the client's basic care needs, the nurse can proceed with the proper identification of the client, such as asking the client his name and checking his armband, so that the medication can be administered.

 CN: Basic care and comfort; CL: Synthesize

181. 2, 3, 4, 5. Cushing's syndrome results from excessive levels of cortisol. Some effects of excessive adrenocortical activity include musculoskeletal changes, and the client may be at risk for injury and falls. There is excessive protein catabolism causing muscle wasting, decreased inflammatory response, and potential for delayed healing and infection. The increased cortisol levels cause a moon-faced appearance to which clients must adjust. The skin becomes thin and fragile, and the client is also at risk for infection. Increased cortisol levels do not cause deficient fluid volume.

 CN: Management of care; CL: Analyze

182. 2. For any verbal or telephone prescription or result, it is important to read back the information to assure its accuracy. It is also important to document that it was read back according to facility policy. It is not necessary to use "read-back" procedures when data are entered on the computerized **medical record**.  The unit clerk is not a licensed healthcare worker and should not take telephone prescriptions. When giving a written report, it is not necessary to "read back," but the nurse should always clarify if there is

any question.

CN: Safety and Infection Control; CL: Apply

183. 4. It is well documented that the subungual areas of the hand harbor bacteria that can be transmitted to others despite aggressive handwashing procedures, and therefore, it is important that the staff on this unit do not have artificial fingernails that could be the source of the infection on this unit. The Joint Commission (TJC), in the 2011 National Patient Safety Goals (NPSG.07.01.01), includes using “the hand cleaning guidelines from the Centers for Disease Control and Prevention or the World Health Organization” to prevent infection. There is no need to institute transmission-based or contact precautions. It is not necessary to wear a mask when caring for these clients.

CN: Safety and infection control; CL: Synthesize

184. 4. The sites should be treated as separate sites to avoid cross-contamination. This adheres to the principle of cleaning from the least contaminated area to the most contaminated area. Each site is considered a separate area for wound care.

CN: Safety and infection control; CL: Apply

185. 1. Any change in level of consciousness (vomiting, severe headache that is not improving or is getting worse, memory changes, confusion, irritability, change in pupils) should be immediately reported to the **HCP**  and further evaluated, especially in a client with head trauma. The nurse should mark a circle around the amount of drainage on a dressing after surgery so it can be monitored and reported to the HCP if it grows in size, but a dime-sized spot is not an immediate priority. Constipation and abdominal discomfort after surgery require attention but are not priority. Obtaining proper pain medication in order to promote wound care and healing must be addressed with the HCP, but it is not the first priority.

CN: Reduction of risk potential; CL: Synthesize

186. 2. In order to prevent injury to a client, restraints must be secured to the bed frame using a slipknot in order to ensure quick release if necessary. A square knot would be secure but would not be easily released in an

emergency. A restraint tied in a bow at the client's side would not be easily released in an emergency. A hitch, although secure, is not easily released in an emergency.

CN: Safety and infection control; CL: Evaluate

187. 2, 3, 4, 5, 6. Because there have been no cervical changes, the client is not in labor. The client should understand to return to the hospital if the contractions become more intense and regular, if she has vaginal bleeding, if she thinks her membranes rupture, if the baby is not moving, or if she has an urge to push. Three contractions an hour would be too infrequent to indicate active labor.

CN: Management of care; CL: Apply

188. 4. The mental abilities of Down syndrome children range from severe intellectual disabilities to low average intelligence. They also exhibit a wide range of physical features including almond-shaped eyes, a small, flat nose, a small mouth with a protruding tongue, and small ears. Many also have a single crease across the palms of their hands, short stubby fingers, and straight hair that is fine and thin. Children with Down syndrome are socially 2 to 3 years behind their peers. Many children with Down syndrome will be capable of living in group homes. They may also continue living with their parents or other family members. Children with Down syndrome are well tempered and very friendly.

CN: Psychosocial integrity; CL: Evaluate

189. 2. Febrile seizures usually occur during the rise in temperature and are related to the peak of the temperature rather than the rapidity or duration of elevation. When children experience febrile seizures, fevers usually exceed 38.0°C (100.4°F). Febrile seizures are not related to the rapidity or duration of elevation. Febrile seizures are most common among children 18 months to 3 years but are not related to the maturity of their immune system.

CN: Physiological adaptation; CL: Analyze

190. 3. This client could have progressed rapidly and is now ready to deliver her infant. A sterile vaginal exam is indicated prior to getting her up to the bathroom to determine if she is fully dilated. If she is ready to deliver,

she could be reassured that the sensation she is feeling is due to pressure from the fetal head. If her cervix exam is unchanged, she may need pain control interventions. The nurses' assessment findings then should be discussed with the client and the **HCP** 📖.

🔑 CN: Reduction of risk potential; CL: Apply

COMPREHENSIVE

TEST

5

This test has 236 questions. Time yourself as you take the test so you can determine the approximate amount of time it takes to complete this many - questions.

1. The nurse has just received the change-of-shift report on clients in the labor, birth, recovery, and postpartum unit. Which of these clients should the nurse assess **first**?

- ☐ **1.** an 18-year-old single primigravid client, in labor for 9 hours, with cervical dilation at 6 cm, 0 station, contractions occurring every 5 minutes, and receiving epidural anesthesia
- ☐ **2.** a 24-year-old primiparous client who gave vaginal birth to a 7-lb, 3-oz (3,260-g) boy 1 hour ago, has a firm fundus and scant lochia rubra, and is attempting to breast-feed
- ☐ **3.** a 26-year-old multigravid client, in labor for 8 hours, with cervical dilation at 8 cm, 1+ station, contractions every 3 to 4 minutes, and receiving no anesthesia
- ☐ **4.** a 30-year-old multipara who gave birth to a 6-lb, 5-oz (2,863-g) girl by cesarean owing to fetal distress 3 hours ago, has a firm fundus and scant lochia rubra, and is receiving morphine by patient-controlled analgesia

2. A nurse has been working with a battered woman who is being discharged and returning home with her husband. The nurse says, "All this work with her has been useless. She is just going back to him as usual." Which statement by a nursing colleague would be **most** helpful to this nurse?

- ☐ **1.** "Her reasons for staying are complex. She can leave only when she is ready and can be safe."
- ☐ **2.** "I know it is frustrating to work with clients who do not follow our advice."

- ☐ 3. “You did your best. You will see her again and have another chance.”
- ☐ 4. “These women almost never leave for good because of their emotional and financial dependency.”

3. The nurse is to administer ergonovine maleate 200 mcg IM. The ampule label reads 0.2 mg/mL. The nurse should administer how many milliliters? Record your answer using a whole number.

_____ mL.

4. An infant is being admitted to the hospital with dehydration secondary to viral gastroenteritis. Which room assignment is the **most** appropriate for this infant?

- ☐ 1. a semiprivate room with an 8-year-old child who has had an appendectomy
- ☐ 2. a semiprivate room with a 10-year-old child with a closed head injury
- ☐ 3. a private room
- ☐ 4. a semiprivate room with a 4-year-old child with leukemia

5. An older adult is being admitted to the hospital after falling from a 6-foot ladder. Which information is **essential** for the nurse to obtain at this time? Select all that apply.

- ☐ 1. symptoms at the time of the fall
- ☐ 2. history of a previous fall
- ☐ 3. location of the fall
- ☐ 4. activity at the time of the fall
- ☐ 5. time of the fall
- ☐ 6. trauma after the fall
- ☐ 7. who was present at the time of the fall

6. The nurse is caring for a client with influenza. The single most effective way to decrease the spread of microorganisms is:

- ☐ 1. washing the hands frequently.
- ☐ 2. having separate personal care items for the client.
- ☐ 3. using disposable equipment.
- ☐ 4. placing the client in isolation.

7. The nurse should be especially alert for what problem when caring for a term neonate, who weighed 10 lb (4,500 g) at birth, 1 hour after a vaginal birth?

- ☐ 1. hypoglycemia
- ☐ 2. hypercalcemia
- ☐ 3. hypermagnesemia
- ☐ 4. hyperbilirubinemia

8. A female client with infertility related to anovulatory cycles is prescribed menotropins. The nurse should assess the client for which possible adverse effect of this medication?

- ☐ 1. pulmonary edema
- ☐ 2. ovarian enlargement
- ☐ 3. visual disturbances
- ☐ 4. breast tenderness

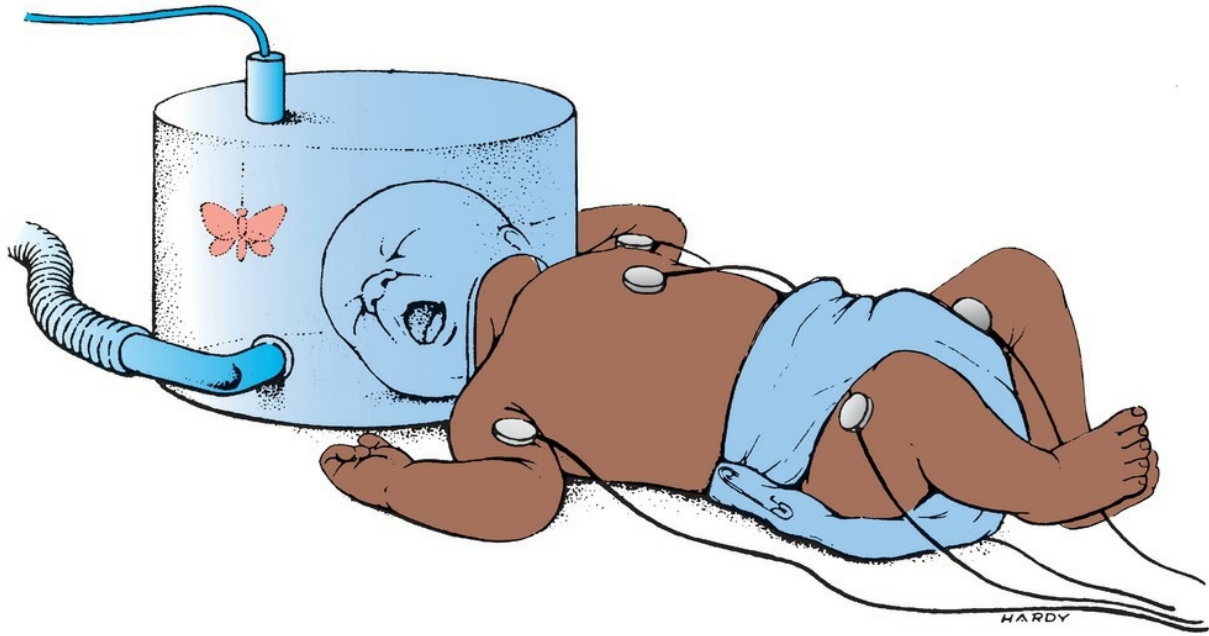

9. An older adult is admitted to the hospital with sudden onset of severe pain in the back, flank, and abdomen. The client reports feeling weak; the blood pressure is 68/31 mm Hg. There has been no urine output. Bilateral leg pulses are weak, although bruit and pulsation are noted at the umbilicus. The nurse should **first**:

- ☐ 1. obtain consent for emergency surgery.
- ☐ 2. assess leg pulses with a Doppler test.
- ☐ 3. palpate the abdomen for presence of a mass.
- ☐ 4. start an IV infusion.

10. The nurse is teaching a client who will be undergoing a lung resection. The client is told that two chest tubes will be placed during surgery. The nurse explains that the purpose of the lower chest tube is to:

- ☐ 1. prevent clots.
- ☐ 2. remove air.
- ☐ 3. remove fluid.
- ☐ 4. facilitate “milking” of the tubes.

11. The nurse is giving care to an infant in an oxygen hood (see figure). Which interventions are indicated? Select all that apply.

- ☐ 1. Assure that the oxygen is not blowing directly on the infant's face.
- ☐ 2. Place the butterfly mobile on the outside of the hood.
- ☐ 3. Immobilize the infant with restraints.
- ☐ 4. Remove the hood for 10 minutes every hour.
- ☐ 5. Encourage the parents to visit the child.

12. A nurse is assessing an 82-year-old for depression. Because of the client's age, the nurse's assessment should be guided by the fact that:

- ☐ 1. sadness of mood is usually present, but it is masked by other symptoms.
- ☐ 2. impairment of cognition usually is not present.
- ☐ 3. psychosomatic tendencies do not tend to dominate.
- ☐ 4. antidepressant therapies are less effective in older adults.

13. A **primary** concern of the hospitalized adolescent is:

- ☐ 1. respect for the need for privacy.
- ☐ 2. allowing parents to visit after hours.
- ☐ 3. wearing a hospital gown.
- ☐ 4. the fear of loss of control when in pain.

14. A 20-year-old single parent brings her 3-year-old son into the emergency department because he "fell." The child has bruises on his face,

arms, and legs; his mother says that she did not witness the fall. The nurse suspects child abuse. While examining the child, the mother says, “Sometimes I guess I am pretty rough with him. I am alone, and I just do not know how to manage him.” The nurse should ask the mother if she would find it helpful to have a referral to:

- ☐ 1. a support group for single parents.
- ☐ 2. a parenting education program.
- ☐ 3. a women’s support group.
- ☐ 4. a support group for abusive parents.

15. The nurse is planning to complete assessments during the last half hour of the shift. Which assessment should be accomplished **first**?

- ☐ 1. a postpartum couplet with the infant who has had transient tachypnea of the newborn (TTN) at birth and now has a respiratory rate of 60 breaths/minute
- ☐ 2. a newly admitted postpartum client who is receiving magnesium sulfate at 3 g an hour initiated 10 hours ago for preeclampsia; her infant ate poorly previously and has not eaten for 4 hours
- ☐ 3. a mother who had a cesarean section and is 6 hours after birth with the baby in special care nursery; the mother has not yet seen her baby
- ☐ 4. a couplet with baby born at 36 weeks’ gestation; the 5-lb (2,268-g) infant had initial blood glucose of 35 mg/dL (1.9 mmol/L) and when taken to the room had a glucose of 46 mg/dL (2.6 mmol/L)

16. An abused child is admitted to the hospital, and the nurse is aware that a court appearance may be necessary. To plan for this eventuality, what should be the **priority**?

- ☐ 1. Remember the parents’ and child’s behavior when the child was admitted.
- ☐ 2. Document physical findings and behaviors observed during the child’s admission.
- ☐ 3. Formulate subjective opinions about the cause of any injuries.
- ☐ 4. Prepare answers to questions that may be asked by the attorneys.

17. A nurse who fails to check a client’s armband before administering medications is:

- ☐ 1. res judicata.
- ☐ 2. negligent.
- ☐ 3. stare decisis.
- ☐ 4. vicariously liable.

18. A female client is experiencing bladder control problems. Which finding indicates the success of nursing interventions to promote urinary continence for this client?

- ☐ 1. continence for 24 hours a day
- ☐ 2. improvement in bladder control
- ☐ 3. self-monitoring for urine retention
- ☐ 4. compliance with drinking and voiding schedule

19. Before administering morphine to a client, the nurse should assess the client's: (Select all that apply.)

- ☐ 1. blood pressure.
- ☐ 2. respiration rate.
- ☐ 3. pulse.
- ☐ 4. temperature.
- ☐ 5. level of consciousness.

20. A client is to receive 1 unit of packed red blood cells over 2 hours. There is 250 mL in the infusion bag. The IV administration infusion set delivers 10 gtts/mL. At what flow rate (in drops per minute) should the nurse run the infusion? Record your answer using a whole number.

_____ gtt/min.

21. A mother states that she is very angry with the healthcare provider (HCP) who diagnosed her child with leukemia. Which statement helps the nurse understand this mother's reaction?

- ☐ 1. Anger is a natural result of a sense of loss and helplessness.
- ☐ 2. Parents of sick children are usually unable to control their anger.
- ☐ 3. Anger is rarely demonstrated by parents when coping with a sick child.
- ☐ 4. The mother cannot overcome her anger in an acceptable manner.

22. Which nursing strategy would be effective in managing a client who

has Alzheimer's disease and wanders?

- ☐ 1. Encourage participation in activities such as board games.
- ☐ 2. Discourage wandering by allowing the behavior at selected intervals.
- ☐ 3. Involve the client in activities that promote walking.
- ☐ 4. Promote safety by restraining the client in a geriatric chair.

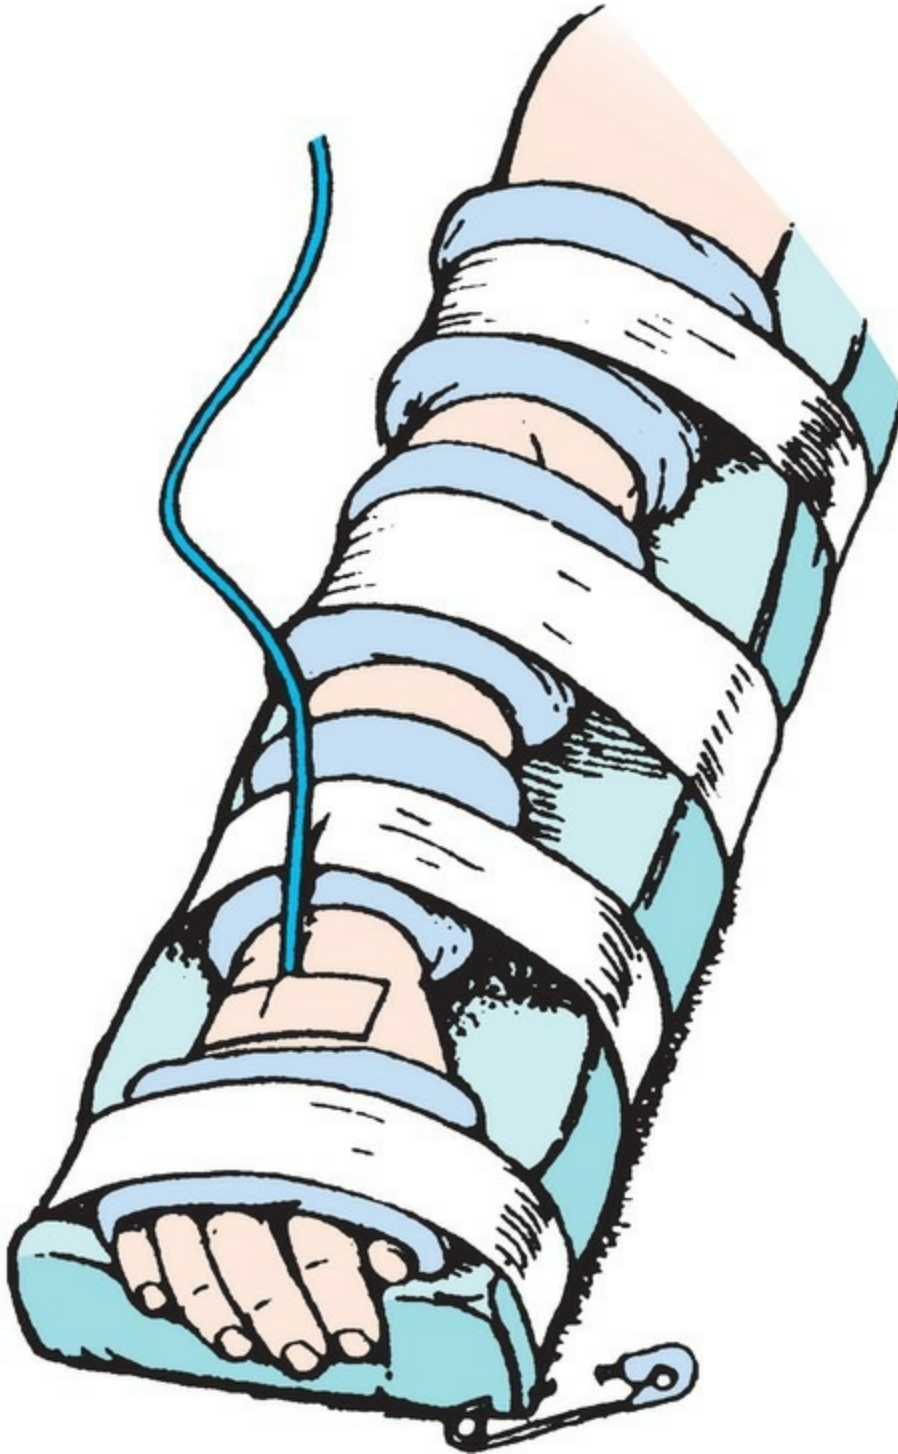

23. A child who had a cast applied to his arm earlier this morning tells the nurse that his fingers are numb. The nurse should:

- ☐ 1. notify the healthcare provider (HCP) who applied the cast.
- ☐ 2. cut the cast to loosen it.
- ☐ 3. assess the circulation to the fingers.
- ☐ 4. ensure that the arm is positioned correctly.

24. A nurse is planning staffing for a nursing unit in which the primary need of the clients is learning how to manage their health problems. Which combination is the ideal mix of staff for this unit?

- ☐ 1. three registered nurses (RNs)
- ☐ 2. one RN and two licensed practical/vocational nurses (LPNs/VNs)
- ☐ 3. one LPN/VN and two unlicensed assistive personnel (UAPs)
- ☐ 4. one RN, one LPN/VN, and one UAP

25. An unlicensed assistive personnel (UAP) is taking care of a child in the arm restraint shown in the figure. To provide care for this child, the nurse should instruct the UAP to:

- ☐ 1. unpin the restraint and perform range-of-motion exercises.
- ☐ 2. unwrap the restraint and bathe the arm using warm water.
- ☐ 3. leave the restraint in its current position.
- ☐ 4. remove one tape at a time while bathing the child's arm.

26. While helping clients brought to a crisis center during a severe flood, the nurse interviews a client whose pregnant wife is missing and whose home has been destroyed. The client keeps talking rapidly about his experience and says, “I cannot see how I can ever rebuild my life.” Which response by the nurse would be **most** appropriate?

- ☐ 1. “If you start organizing your life now, I am sure all will be fine.”
- ☐ 2. “This has been a terrible experience. Tell me more about how you feel.”
- ☐ 3. “Let me note a few of the things you said before you continue with your story.”
- ☐ 4. “Spend some time thinking about this so that we can continue this conversation tomorrow.”

27. A deficiency of which vitamin is thought to be the **first** step in the formation of plaque and oxidative changes in the arteries?

- ☐ 1. vitamin C
- ☐ 2. vitamin A
- ☐ 3. vitamin E
- ☐ 4. vitamin B6

28. Which action should the nurse include in the plan of care for a child with leukemia who has an absolute neutrophil count of $400/\text{mm}^3$ ($0.4 \times 10^9/\text{L}$)?

- ☐ 1. Restrict staff and visitors with active infections.
- ☐ 2. Place the child in strict isolation.
- ☐ 3. Consult with the primary care provider to administer an antiemetic.
- ☐ 4. Increase the child’s oral fluid intake.

29. A client with asthma has been prescribed beclomethasone via metered-dose inhaler. To determine if the client has been rinsing the mouth after each use of the inhaler, the nurse should inspect the client’s mouth for:

- ☐ 1. gingival hyperplasia.
- ☐ 2. oral candidiasis.
- ☐ 3. ulceration.
- ☐ 4. dental caries.

30. The nurse finds a client lying on the floor next to the bed. After returning the client to bed, assessing for injury, and notifying the healthcare provider (HCP), the nurse fills out an incident report. What should the nurse do **next**?

- ☐ 1. Give the incident report to the nurse-manager.
- ☐ 2. Place the incident report on the medical record.
- ☐ 3. Call the family to inform them.
- ☐ 4. Omit mentioning the fall in the medical record documentation.

31. The nurse is caring for four clients in labor. Which client is at **most** risk for a postpartum hemorrhage?

- ☐ 1. a client who is a gravida 4 para 3 with a history of polyhydramnios with this pregnancy
- ☐ 2. a client who is a gravida 1 para 0 at 34 weeks' gestation with mild pregnancy-induced hypertension
- ☐ 3. a client who is a gravida 4 para 0 with diet-controlled gestational diabetes being induced at term
- ☐ 4. a client who is a gravida 2 para 1 term pregnancy with a history of genital herpes

32. The mother of a 2-year-old who has been bitten by the family dog asks the nurse what to do about the bite, which appears to be a minor injury. What should the nurse tell the mother?

- ☐ 1. "You need to take the child to the local urgent care center immediately."
- ☐ 2. "Wash the bite area with lots of running water, and then call your healthcare provider (HCP)."
- ☐ 3. "Determine when the child's latest tetanus vaccine was administered."
- ☐ 4. "Make an appointment to see the child's healthcare provider (HCP) now to start rabies shots."

33. The nurse is discharging a client who has been hospitalized for preterm labor. The client needs further instruction when she says:

- ☐ 1. "If I think I have a bladder infection, I need to see my obstetrician."
- ☐ 2. "If I have contractions, I should contact my healthcare provider"

(HCP).”

- ☐ 3. “Drinking water may help prevent early labor for me.”
- ☐ 4. “If I travel on long trips, I need to get out of the car every 4 hours.”

34. The nurse is conducting a routine risk assessment at a prenatal visit. Which question would be the **best** to screen for intimate partner violence?

- ☐ 1. “Is your partner excited about your pregnancy?”
- ☐ 2. “How safe do you feel in your home?”
- ☐ 3. “Does your partner have an arrest record?”
- ☐ 4. “Does your partner own a gun?”

35. A nurse is obtaining the history of an infant with suspected acute otitis media. What should the nurse ask the parent about?

- ☐ 1. position of the infant when taking a bottle
- ☐ 2. covering of the infant’s ears when out in the cold
- 3. thorough drying of the infant’s ears after a bath
- ☐ 4. immunization status of the infant

36. A 7-year-old has been diagnosed with bacterial meningitis. Who should receive chemoprophylaxis?

- ☐ 1. all children at the school
- ☐ 2. all household contacts and close contacts
- ☐ 3. the entire community
- ☐ 4. household contacts only

37. The mother of a newborn is concerned about the number of persons with heart disease in her family. She asks the nurse when she should start her baby on a low-fat, low-cholesterol diet to lower the risk of heart disease. The nurse should tell her to start diet modifications:

- ☐ 1. at birth.
- ☐ 2. at age 2.
- ☐ 3. at age 5.
- ☐ 4. at age 10.

38. The nurse is preparing to suction a tracheostomy for a client with methicillin-resistant *Staphylococcus aureus* (MRSA) (see figure). The nurse

should:

- ☐ 1. wear a powered air purifying respirator (PAPR) face shield.
- ☐ 2. use goggles that include the hairline.
- ☐ 3. change to a surgical mask.
- ☐ 4. proceed to suction the client's tracheostomy.

39. A client is being treated for severe pediculosis. The nurse should instruct the client to treat the problem in the eyebrows and eyelashes by:

- ☐ 1. applying petroleum jelly to lashes and brows three to four times a day.
- ☐ 2. applying a pediculicide with a cotton-tipped swab to the eyebrows three times a day.
- ☐ 3. applying lindane ointment to the lashes and eyelashes three times a day.
- ☐ 4. applying bacitracin ointment to the lashes and brows three times a day.

40. The nurse is discussing safety and accident prevention with the parent of a 9-month-old. The teaching has been effective when the parent makes which statement?

- ☐ 1. "I make sure that I keep my cleaning supplies locked up."
- ☐ 2. "Sometimes she plays in the bathroom when I am cleaning in there."
- ☐ 3. "Occasionally, she gets under the chair and plays with the telephone cord."
- ☐ 4. "I have found that those child-protective cabinet locks do not work very well."

41. When assessing a child receiving tobramycin sulfate, which findings would indicate that the child is experiencing adverse effects? Select all that apply.

- ☐ 1. increased blood pressure
- ☐ 2. weight gain
- ☐ 3. rash
- ☐ 4. fever
- ☐ 5. ringing in the ears
- ☐ 6. decreased heart rate

42. The nurse instructs the client who is taking gentamicin to monitor renal function. The nurse determines that the client needs additional instruction when the client makes which statement?

- ☐ 1. "I should call you if I notice that I am not urinating as much."
- ☐ 2. "I should call you if my urine looks dark or unusual."
- ☐ 3. "I should call you if my legs swell or I notice my skin looks puffy"

around my eyes.”

☐ 4. “I should call you if I have a fever.”

43. A school-age child is admitted to the hospital with a vasoocclusive sickle cell crisis. How should the nurse prioritize the client’s care? Place interventions in order of highest priority to lowest priority. All options must be used.

1. Administer morphine for the pain.

2. Start oxygen per nasal cannula.

3. Start an IV infusion.

4. Draw blood for electrolyte and pH balance.

44. When teaching a group of parents about the potential for febrile seizures in children, which fact should the nurse include?

☐ 1. The exact cause is known.

☐ 2. The seizures occur as the fever rises.

☐ 3. Children older than age 3 are most at risk.

☐ 4. These seizures commonly occur after immunization administration.

45. A 19-year-old primigravid client is being discharged home after hospitalization for hyperemesis gravidarum and is being referred to home health care. The nurse should develop a discharge plan that includes which

interventions? Select all that apply.

- ☐ 1. Refer the client to a nutritionist for the following day.
- ☐ 2. Ensure that the client has a prescription for an antiemetic.
- ☐ 3. Ask the healthcare provider (HCP) for an anxiolytic prescription.
- ☐ 4. Encourage return to normal routine when the client feels ready.
- ☐ 5. Coordinate follow-up appointment with provider in 6 weeks.
- ☐ 6. Discuss plan of care and discharge instructions with client.

46. The nurse should instruct a woman taking folic acid supplements for folic acid deficiency anemia that:

- ☐ 1. it will take several months to notice an improvement.
- ☐ 2. folic acid should be taken on an empty stomach.
- ☐ 3. iron supplements are contraindicated with folic acid supplementation.
- ☐ 4. oral contraceptive use, pregnancy, and lactation increase daily requirements.

47. The nurse makes a home visit to a primiparous client and her neonate at 1 week after a vaginal birth. Which finding should be reported to the healthcare provider (HCP)?

- ☐ 1. a scant amount of maternal lochia serosa
- ☐ 2. the presence of a neonatal tonic neck reflex
- ☐ 3. a nonpalpable maternal fundus
- ☐ 4. neonatal central cyanosis

48. The nurse is obtaining a health history for a client with osteoporosis. What should the nurse ask the client about? Select all that apply.

- ☐ 1. amount of alcohol consumed daily
- ☐ 2. use of antacids
- ☐ 3. dietary intake of fiber
- ☐ 4. use of vitamin K supplements
- ☐ 5. intake of fruit juices

49. The nurse tells a rape victim that even if she was protected against pregnancy by a contraceptive and has no intention of taking any legal action against her assailant, she should still be checked by a healthcare provider

(HCP) for early detection of:

- ☐ 1. sexually transmitted disease.
- ☐ 2. anxiety reaction.
- ☐ 3. periurethral tears.
- ☐ 4. menstrual difficulties.

50. A hospitalized client fell on the floor and sustained a small laceration on the hand that required stitches. The intern will suture the client's hand at the client's bedside and asks for bupivacaine with epinephrine and a suture kit in order to suture the laceration. The nurse should question:

- ☐ 1. the intern's ability to suture.
- ☐ 2. the client's room as an aseptic environment.
- ☐ 3. bupivacaine with epinephrine as the local anesthetic.
- ☐ 4. the cosmetic effect from not having a plastic surgeon do the suturing.

51. A 5-lb 8-oz (2.5 kg) baby was born 1 hour ago to a 19-year-old primigravida. The **priority** nursing assessments include monitoring the infant for:

- ☐ 1. jaundice and physical assessment.
- ☐ 2. vital signs and gestational age assessments.
- ☐ 3. feedings and vital signs.
- ☐ 4. Apgar and gestational age assessments.

52. When assessing a dark-skinned client for cyanosis, what should the nurse examine?

- ☐ 1. the client's retinas
- ☐ 2. the client's nail beds
- ☐ 3. the client's oral mucous membranes
- ☐ 4. the inner aspects of the client's wrists

53. Betamethasone syrup 0.9 mg has been prescribed. It is available in a 0.6 mg/5 mL solution. How many milliliters should the nurse administer? Record your answer using one decimal place.

_____ mL.

54. A client at 37 weeks' gestation is scheduled for a biophysical profile.

What should the nurse instruct the client to do **before** the test?

- ☐ 1. Drink 1 to 2 L of fluid.
- ☐ 2. Take nothing by mouth after midnight before the test.
- ☐ 3. Plan to remain in the clinic for 4 hours after the test.
- ☐ 4. Eat a high-fiber meal after the test.

55. A 12-year-old boy has depression and posttrauma response. The boy's father is now in jail for molesting him from ages 6 to 9. Given the typical reactions of incest victims, the nurse should assess the child for which behavior? Select all that apply.

- ☐ 1. sexualized play
- ☐ 2. aggression
- ☐ 3. isolation at home
- ☐ 4. running away
- ☐ 5. truancy

56. The nurse has provided an in-service presentation to ancillary staff about standard precautions on the birthing unit. The nurse determines that one of the staff members needs further instructions when the nurse observes which action?

- ☐ 1. use of protective goggles during a cesarean birth
- ☐ 2. placement of bloody sheets in a container designated for contaminated linens
- ☐ 3. wearing of sterile gloves to bathe a neonate at 2 hours of age
- ☐ 4. disposal of used scalpel blades in a puncture-resistant container

57. Which is true regarding delegation of client care responsibilities? Select all that apply.

- ☐ 1. The nurse must know the nursing model that underlies care at the institution.
- ☐ 2. The nurse delegates in accordance with demands on his/her time.
- ☐ 3. The nurse confirms that the unlicensed assistive personnel (UAP) has experience with the delegated activity.
- ☐ 4. The nurse retains the right to determine which tasks are delegated.
- ☐ 5. The nurse must document that the task has been delegated and to

whom.

58. A child with leukemia had been in remission for several years, but death is now imminent. The nurse is assisting the parents as they prepare for the child's death. Which approach will be **most** helpful?

- ☐ 1. Reflect to the parents that the death of a child is more difficult than that of an adult.
- ☐ 2. Help parents understand that grief is stronger when preceded by hope.
- ☐ 3. Recognize that the parents have been prepared for this death since the time of diagnosis.
- ☐ 4. Understand the parent's trust in the healthcare system will be undermined by the death of their child.

59. The client has sore nares while a nasogastric (NG) tube is in place. Which nursing measure would be **most** appropriate to help alleviate the client's discomfort?

- ☐ 1. Reposition the tube in the nares.
- ☐ 2. Irrigate the tube with a cool solution.
- ☐ 3. Apply a water-soluble lubricant to the nares.
- ☐ 4. Have the client change position more frequently.

60. The nurse is instructing a Hindu client to increase protein in the diet. Which foods are appropriate to include in this client's diet? Select all that apply.

- ☐ 1. lentil soup
- ☐ 2. hamburger
- ☐ 3. steak
- ☐ 4. veal cutlet
- ☐ 5. broiled fish sandwich

61. The nurse is evaluating the outcome of therapy for a client with osteoarthritis. Which finding indicates goals of therapy have been met?

- ☐ 1. Joint degeneration has been arrested.
- ☐ 2. The client is able to self-administer gold compound safely.
- ☐ 3. The client feels better than on hospital admission.
- ☐ 4. Joint range of motion has improved.

62. A child with partial- and full-thickness burns is admitted to the pediatric unit. What should be the **priority** at this time?

- ☐ 1. preventing wound infection
- ☐ 2. evaluating vital signs frequently
- ☐ 3. maintaining fluid and electrolyte balance
- ☐ 4. managing the child's pain

63. A normal, healthy infant is brought to the clinic for the first diphtheria, tetanus, and acellular pertussis (DTaP) immunization. Which route is appropriate to administer this vaccine?

- ☐ 1. oral
- ☐ 2. intramuscular
- ☐ 3. subcutaneous
- ☐ 4. intradermal

64. A child has been prescribed diphenhydramine hydrochloride to help control the itching from atopic dermatitis. The nurse should instruct the parents to report which conditions? Select all that apply.

- ☐ 1. weight loss
- ☐ 2. drowsiness
- ☐ 3. thickened bronchial secretions
- ☐ 4. upset stomach
- ☐ 5. bradycardia

65. Assessment of a nulligravid client in active labor reveals the following: moderate discomfort; cervix dilated 3 cm, 0 station, and completely effaced; and fetal heart rate of 136 bpm. What should the nurse plan to do **next**?

- ☐ 1. Assist the client with comfort measures and breathing techniques.
- ☐ 2. Turn the client from the left side-lying position to the right side-lying position.
- ☐ 3. Prepare the client for epidural anesthesia to relieve pain.
- ☐ 4. Instruct the client that internal fetal monitoring is necessary.

66. The nurse observes that a client who has received midazolam for

conscious sedation is having shallow respirations. The nurse should do all **except**:

- ☐ 1. encourage the client to deep-breathe.
- ☐ 2. have respiratory resuscitation equipment in the room.
- ☐ 3. administer oxygen as prescribed.
- ☐ 4. administer naloxone.

67. The nurse is planning to assist the healthcare provider (HCP) with a thoracentesis for a client who has a pleural effusion. Which position would be appropriate for the client to assume?

- ☐ 1. lying supine with the arms extended
- ☐ 2. lying prone with the head supported by the arms
- ☐ 3. sitting upright and leaning on an overbed table
- ☐ 4. side lying with the knees drawn up to the abdomen

68. A child who is 3 years of age has been admitted with diarrhea. He has mild dehydration (<5%). The nurse is reviewing the laboratory report of the stool specimen (see report). Based on the review of the laboratory report from the stool specimen, the nurse should do which action **first**?

Laboratory Results

Test	Result
WBC	Mildly elevated
RBC	Few
Bacteria	Positive for <i>E. coli</i>
Ova and Parasites	Negative

- ☐ 1. Start an IV infusion.
- ☐ 2. Institute enteric precautions.
- ☐ 3. Instruct the family to wash all family bed linens in hot water.

- ☐ 4. Cleanse and protect the anal area.

69. A client has a coxsackie B (viral) or trypanosomal (parasite) infection. The nurse should further assess the client for:

- ☐ 1. myocarditis.
- ☐ 2. myocardial infarction.
- ☐ 3. renal failure.
- ☐ 4. liver failure.

70. The nurse observes which principles when conducting a medication reconciliation? Select all that apply.

- ☐ 1. Medication reconciliation is an important client safety goal.
- ☐ 2. Medication reconciliation is designed to obtain and communicate an accurate list of a client's home medications across the continuum of care.
- ☐ 3. Only nurses or healthcare providers (HCPs) can be involved in medication reconciliation.
- ☐ 4. Medications are considered reconciled if a medication prescription exists that is therapeutically equivalent to the one prior to admission.
- ☐ 5. A medication is considered to be any medication prescribed by a healthcare provider (HCP).

71. A charge nurse asks a newly graduated registered nurse (RN) who normally works on a medical-surgical nursing unit to take care of two clients in the coronary care unit. The nurse has not had experience with taking care of clients on monitors or using the medications that these clients are taking. The new nurse should:

- ☐ 1. accept the assignment and then plan to ask the nurses in the coronary care unit to administer the medications for these clients.
- ☐ 2. explain to the charge nurse about his or her level of experience and express concerns about this assignment.
- ☐ 3. tell the charge nurse that the assignment was to the medical-surgical unit and refuse to go to the coronary care unit.
- ☐ 4. ask the charge nurse if the assignment can be reduced to taking care of one client.

72. The nurse is working in a newborn nursery and caring for several

neonates. What precaution should be taken to prevent an infant abduction?

- ☐ 1. Notify the hospital's security staff about anyone who appears unusual.
- ☐ 2. Take several neonates to their mothers at the same time.
- ☐ 3. Place the infant near the doorway of the mother's room.
- ☐ 4. Contact the hospital's security staff if an exit alarm is triggered.

73. A client has started taking amiodarone. The nurse should inform the client that periodic laboratory tests will be done to monitor the client's:

- ☐ 1. hemoglobin.
- ☐ 2. liver enzymes.
- ☐ 3. creatine kinase (CK) concentration.
- ☐ 4. renal function.

74. The nurse is assessing a teenage girl. According to the figure, the nurse should note that the girl has:

- ☐ 1. kyphosis.
- ☐ 2. lordosis.
- ☐ 3. developmental dysplasia of the hip.
- ☐ 4. scoliosis.

75. A child with type 1 diabetes is admitted to the emergency department with hot and dry skin, rapid and deep respirations, and a fruity odor to her

breath. Which task, when performed by a new graduate registered nurse (RN), requires the RN preceptor to intervene?

- ☐ 1. assessment of the child's vital signs every 15 minutes
- ☐ 2. verification of the child's prescription for IV insulin infusion
- ☐ 3. providing encouragement to the child to drink some orange juice
- ☐ 4. verification of child's glucose by finger stick

76. The unlicensed assistive personnel (UAP) approaches the nurse and states, "The client does not know what caused him to be so depressed. He must not want to tell me because he does not trust me yet." In responding to this staff member, which statement by the nurse will help the UAP understand the client's illness?

- ☐ 1. "Endogenous depression is biochemical and is not caused by an outside stressor or problem. The client cannot tell you why he is depressed because he really does not know."
- ☐ 2. "Endogenous depression can be caused by various stressors. Perhaps the client is not willing to tell you at this time."
- ☐ 3. "Endogenous depression comes from within the person. It is a reaction to a loss. You need to give the client more time to identify the cause or loss."
- ☐ 4. "Endogenous depression usually derives from past childhood conflicts. It really is not important for the client to remember what happened years ago."

77. A child's plan of care lists increasing protein intake as a goal. Which food should the nurse encourage the child to eat?

- ☐ 1. a bacon, lettuce, and tomato sandwich
- ☐ 2. fruit-flavored yogurt
- ☐ 3. nacho chips and cheese sauce
- ☐ 4. crackers with jelly

78. Thirty minutes after a Sengstaken-Blakemore tube is inserted, the client appears to be having difficulty breathing. What should the nurse do **first**?

- ☐ 1. Remove the tube.

- ☐ 2. Deflate the esophageal portion of the tube.
- ☐ 3. Determine whether the tube is obstructing the airway.
- ☐ 4. Increase the oxygen flow rate.

79. A client is admitted to the emergency department with myasthenia crisis. Place interventions in order of highest priority to lowest priority. All options must be used.

1. Check if the client missed a dose of medication.

2. Assess the client for signs of infection.

3. Check the gag reflex.

4. Prepare for intubation.

80. A 10-year-old child is diagnosed with pediculosis. The mother is concerned about the spread of the lice to children who have been in contact with her child. The nurse should instruct the mother to have her child avoid:

- ☐ 1. sharing craft supplies.
- ☐ 2. having contact during a swimming class.
- ☐ 3. sharing batting helmets.
- ☐ 4. showering after football practice.

81. A 24-year-old nulligravid client with a history of irregular menstrual cycles visits the clinic because she suspects that she is “about 6 weeks

pregnant.” An ultrasound is scheduled in 2 weeks. The nurse should instruct the client that this test will be done to:

- ☐ 1. assess gestational age.
- ☐ 2. determine a multifetal pregnancy.
- ☐ 3. identify the gender of the fetus.
- ☐ 4. assess of maternal pelvic adequacy.

82. The nurse is beginning the shift and is assessing the oxygen exchange on a neonate. The nurse reviews the medical record for pulse oximetry reading for the last 8 hours.

Flow Sheets

Pulse Oximetry

Time	0700	0900	1100	1300	1500
Reading	95%	90%	90%	90%	86%

The pulse oximetry reading at 1530 is 75%. What should the nurse do **first**?

- ☐ 1. Administer oxygen via mask.
- ☐ 2. Swaddle the neonate in heated blankets.
- ☐ 3. Reassess the oximetry reading in 30 minutes.
- ☐ 4. Draw blood gases for oxygen and carbon dioxide levels.

83. A client with a history of peptic ulcer disease is admitted to the hospital. Initial assessment reveals that his blood pressure is 96/60 mm Hg, his pulse rate is 120 bpm, and he has vomited coffee-ground-like material. Based on this assessment, what is the nurse’s **priority** action?

- ☐ 1. Administer an antiemetic.
- ☐ 2. Prepare to insert a nasogastric (NG) tube.
- ☐ 3. Collect data regarding recent client stressors.

- ☐ 4. Place the client in a modified Trendelenburg position.

84. As a nurse begins the shift on the obstetrical unit, there are several new admissions. When anticipating priorities for the shift, the client with which condition would be a candidate for induction?

- ☐ 1. preeclampsia
- ☐ 2. active herpes
- ☐ 3. face presentation
- ☐ 4. fetus with late decelerations

85. In the early postoperative period, the nurse notes a bright red, 3" × 5" (7.6 × 12.7 cm) area of drainage on the client's abdominal laparotomy dressing. What should be the nurse's **first** action in response to this observation?

- ☐ 1. Ignore it because drainage is normal.
- ☐ 2. Increase the IV flow rate.
- ☐ 3. Take the client's vital signs.
- ☐ 4. Change the dressing.

86. A 6-year-old client is diagnosed with attention deficit hyperactivity disorder (ADHD). When asking this client to complete a task, what techniques should the nurse use to communicate **most** effectively with him?

1. Obtain eye contact before speaking, use simple language, and have him repeat what was said. Praise him if he completes the task.

- ☐ 2. Fully explain to the client the actions required of him, and offer verbal praise and a food reward for task completion.
- ☐ 3. Explain to the client what he is to do, the consequences if he does not comply, and follow through with praise or consequences as appropriate.
- ☐ 4. Demonstrate to the client what he is to do, have him imitate the nurse's actions, and give a food reward if he completes the task.

87. A 10-year-old child has blood glucose readings during a 24-hour period. Which reading requires the **most** immediate intervention?

- ☐ 1. 50 mg/dL (2.8 mmol/L)
- ☐ 2. 100 mg/dL (5.6 mmol/L)

- ☐ 3. 150 mg/dL (8.4 mmol/L)
- ☐ 4. 200 mg/dL (11.2 mmol/L)

88. A client has massive bleeding from esophageal varices. In what order from **first** to last should the nurse and care team provide care for this client? All options must be used.

1. Control hemorrhaging.

2. Replace fluids.

3. Relieve the client's anxiety.

4. Maintain a patent airway.

89. Which instruction is **most** important for the nurse to include in the teaching plan for a client who is taking phenelzine?

- ☐ 1. Eat a normal amount of salt in the diet.
- ☐ 2. Drink 10 to 12 glasses of water each day.
- ☐ 3. Allow 10 days to achieve therapeutic effects.
- ☐ 4. Avoid foods high in tyramine.

90. The nurse should closely monitor the client with an open fracture for which complication?

- ☐ 1. avascular necrosis
- ☐ 2. compartment syndrome

- ☐ 3. osteomyelitis
- ☐ 4. fat embolism syndrome

91. The nurse develops a health education program about preventing the transmission of hepatitis B. The nurse evaluates that the teaching has been effective when the participants identify which activity to be high risk for acquiring hepatitis B?

- ☐ 1. frequent use of marijuana
- ☐ 2. ingestion of large amounts of acetaminophen
- ☐ 3. sharing needles for drug use
- ☐ 4. ingestion of contaminated seafood

92. An adult client who has been treated with antidepressants for a year has had antianxiety medication added to the treatment regimen. The client says to the nurse, "I have reached the bottom of the barrel now. I have to take both fluoxetine and clonazepam to control my symptoms." What would be the **best** nurse reply to the client?

- ☐ 1. "If the medications work, why worry? Just take them, and be happy they are effective."
- ☐ 2. "I can understand your concern. Those psychiatric medications are pretty potent."
- ☐ 3. "It seems you are concerned your illness may be worsening. Tell me more about that."
- ☐ 4. "You seem to feel guilty about taking psychiatric medication for your illness. There is nothing to feel guilty about."

93. The nurse is assessing a client who has a long history of uncontrolled hypertension. The nurse should assess the client for damage in which area of the eye?

- ☐ 1. iris
- ☐ 2. cornea
- ☐ 3. retina
- ☐ 4. sclera

94. While preparing to provide neonatal care instructions to a primiparous client who gave birth to a term neonate 24 hours ago, what should the nurse

include in the client's teaching plan?

- ☐ 1. Term neonates generally have few creases on the soles of their feet.
- ☐ 2. Strawberry hemangiomas—deep, dark red discolorations—require laser therapy for removal.
- ☐ 3. Milia are white papules from plugged sebaceous ducts that disappear by age 2 to 4 weeks.
- ☐ 4. If erythema toxicum is present, it will be treated with antibiotic therapy.

95. Two days after being placed in a cast for a fractured femur, the client suddenly has chest pain and dyspnea. The client is confused and has an elevated temperature. The nurse should assess the client for:

- ☐ 1. osteomyelitis.
- ☐ 2. compartment syndrome.
- ☐ 3. venous thrombosis.
- ☐ 4. fat embolism syndrome.

96. Which outcome is appropriate for the client with hepatitis B? The client will:

- ☐ 1. adhere to measures to prevent the spread of infection to others.
- ☐ 2. adhere to a low-sodium, low-protein diet.
- ☐ 3. verbalize the importance of using sedatives to provide adequate rest.
- ☐ 4. avoid social activities with friends after discharge from the hospital.

97. A 15-year-old male client on the psychiatric unit shows signs of mild intoxication. When questioned, he states that another client gave him beer, and he refuses to name the client. What should the nurse do **next**?

- ☐ 1. Telephone the client's parents.
- ☐ 2. Call a community meeting.
- ☐ 3. Urge the client to tell who gave him the beer.
- ☐ 4. Call the primary care provider.

98. The client with benign prostatic hypertrophy is being transferred from the emergency department to a surgery unit. Which information should be included in the report from the nurse in the emergency department to the nurse responsible for admitting the client?

- ☐ 1. "A urine specimen was obtained from the client and sent to the laboratory for analysis."
- ☐ 2. "The client was catheterized, and 1,100 mL of urine was obtained. The urine appeared cloudy, and a specimen was sent to the laboratory."
- ☐ 3. "The client is very cooperative. He is comfortable now that his bladder has been emptied. He had no ill effects from catheterization."
- ☐ 4. "The client was in the emergency department for 3 hours because of bladder distention. He is fine now but is being admitted as a possible candidate for surgery."

99. A client has received an overdose of sympathomimetic agents. The nurse should assess the client for which **late** signs of an overdose? Select all that apply.

- ☐ 1. hypotension
- ☐ 2. bradycardia
- ☐ 3. seizures
- ☐ 4. profound pyrexia
- ☐ 5. hypertension

100. While assessing a neonate at 4 hours after birth, the nurse observes an indentation with a small tuft of hair at the base of the neonate's spine. The nurse should document this as what finding?

- ☐ 1. spina bifida cystica
- ☐ 2. spina bifida occulta
- ☐ 3. meningocele
- ☐ 4. myelomeningocele

101. Which client is at **highest** risk for developing a urinary tract infection?

- ☐ 1. a woman who has given vaginal birth to two children
- ☐ 2. a man with an indwelling urinary catheter
- ☐ 3. a man with a past medical history of renal calculi
- ☐ 4. a woman with well-controlled diabetes mellitus

102. A nurse is administering indomethacin to a neonate. What should the nurse do to ensure that the nurse has identified the neonate correctly? Select

all that apply.

- ☐ 1. Ask the parents to confirm that this is their baby.
- ☐ 2. Ask another nurse to confirm that this is the neonate for whom the medication has been prescribed.
- ☐ 3. Check the neonate's identification band against the medical record number.
- ☐ 4. Verify the date of birth from the medical record with the date of birth on the neonate's identification band.
- ☐ 5. Compare the number on the crib with the number on the neonate's identification band.

103. Which statement indicates that the client with a peptic ulcer understands the dietary modifications to follow at home?

- ☐ 1. "I should eat a bland, soft diet."
- ☐ 2. "It is important to eat six small meals a day."
- ☐ 3. "I should drink several glasses of milk a day."
- ☐ 4. "I should avoid alcohol and caffeine."

104. The client with a nasogastric (NG) tube has abdominal distention. What should the nurse do first?

- ☐ 1. Call the healthcare provider (HCP).
- ☐ 2. Irrigate the NG tube.
- ☐ 3. Check the function of the suction equipment.
- ☐ 4. Reposition the NG tube.

105. A male client has been diagnosed as having a low sperm count during infertility studies. After instructions by the nurse about some causes of low sperm counts, the nurse determines that the client needs further instructions when he says low sperm counts may be caused by:

- ☐ 1. varicocele.
- ☐ 2. frequent use of saunas.
- ☐ 3. endocrine imbalances.
- ☐ 4. decreased body temperature.

106. The nurse instills 5 mL of normal saline before suctioning a client's tracheostomy tube. The instillation is effective when:

- ☐ 1. the secretions are thinned.
- ☐ 2. the client coughs.
- ☐ 3. there is minimal friction when the catheter is passed into the tracheostomy tube.
- ☐ 4. there is humidification for the respiratory tract.

107. A client with emphysema is receiving continuous oxygen therapy. Depressed ventilation is likely to occur unless the nurse ensures that the oxygen is administered in which way?

- ☐ 1. cooled
- ☐ 2. humidified
- ☐ 3. at a low flow rate
- ☐ 4. through nasal cannula

108. Before cataract surgery, the nurse is to instill several types of eye drops. The surgeon writes prescriptions for 5 gtts of antibiotic in OD and 3 gtts of topical steroid drops in OD. The nurse should:

- ☐ 1. contact the surgeon to rewrite the prescription.
- ☐ 2. administer the antibiotic in the left eye and the steroid in the right eye.
- ☐ 3. administer both types of drops in the right eye.
- ☐ 4. contact the pharmacist for clarification of the prescription.

109. Which instructions about breast-feeding should the nurse include when counseling the client?

- ☐ 1. Apply ice packs to breasts while nursing.
- ☐ 2. Wrap breasts with ace bandages.
- ☐ 3. Avoid fruit juices with acid.
- ☐ 4. Use a water-based lubricant when having intercourse.

110. A client with rheumatoid arthritis tells the nurse that she feels “quite alone” in adjusting to changes in her lifestyle. The nurse should respond by:

- ☐ 1. referring the client and her husband for counseling to decrease her sense of isolation.
- ☐ 2. suggesting that the client develop a hobby to occupy her time.
- ☐ 3. telling the client about her community’s arthritis support group.

- ☐ 4. recommending that the client discuss her feelings with her minister.

111. Which intervention should the nurse include in the plan of care to ensure adequate nutrition for a very active, talkative, and easily distractible client who is unable to sit through meals?

- ☐ 1. Direct the client to the room to eat.
- ☐ 2. Offer the client nutritious finger foods.
- ☐ 3. Ask the client's family to bring the client's favorite foods from home.
- ☐ 4. Ask the client about food preferences.

112. A client in a group home is very dependent on the staff but is able to make simple decisions. The client asks, "Would you do my laundry? I do not know how the machine works." Which response would be **best**?

- ☐ 1. "Sure, I have time; I can do it for you."
- ☐ 2. "You will have to wait; I do not have time now."
- ☐ 3. "Can your family do it for you?"
- ☐ 4. "Get your laundry; I will show you how the machine works."

113. The nurse is caring for a client with chronic renal failure. The nurse should monitor the client for which adverse effects of hypermagnesemia?

- ☐ 1. flushed skin
- ☐ 2. lethargy
- ☐ 3. severe thirst
- ☐ 4. tremors

114. When determining the parents' compliance with treatment for their infant who has otitis media, the nurse should ask the parents if they are:

- ☐ 1. cleaning the child's ear canals with hydrogen peroxide.
- ☐ 2. administering continuous, low-dose antibiotic therapy.
- ☐ 3. instilling ear drops regularly to prevent cerumen accumulation.
- ☐ 4. holding the child upright when feeding with a bottle.

115. When giving a change-of-shift report, which statement by the nurse is **not** appropriate?

- ☐ 1. "Randi Smith is a 38-year-old female client of Dr. Born with cholecystitis and cholelithiasis."

- ☐ 2. "Mrs. Jones' pain is best relieved in the left lateral Sims' position."
- ☐ 3. "Mr. Levi is just contrary today, and nothing is going to please him."
- ☐ 4. "Mr. Emmert was able to walk around the unit twice today with no dizziness."

116. The nurse is teaching unlicensed assistive personnel (UAP) about caring for a client who is withdrawing from alcohol and street drugs. Which communication technique when observed by the nurse indicates the UAP has understood the instructions? The UAP talks to the client using:

- ☐ 1. matter-of-fact manner and short sentences.
- ☐ 2. cheerful tone of voice, using humor when appropriate.
- ☐ 3. loud voice and giving general comments.
- ☐ 4. clear explanations in a quiet voice.

117. A couple has completed testing and is a candidate for in vitro fertilization. The nurse is reviewing the procedure with them and realizes that further instruction is needed when the woman states:

- ☐ 1. "One of the greatest risks is multiple pregnancies."
- ☐ 2. "I will need to redefine how I view my job if I do become pregnant."
- ☐ 3. "The fertilization procedure can be done anytime during my cycle."
- ☐ 4. "We can use our own eggs and sperm or someone else's."

118. When obtaining the diet history from a client with anemia, the nurse should include questions specifically about which vitamins or minerals that are **most** likely missing in this client's diet? Select all that apply.

- ☐ 1. vitamin B6
- ☐ 2. vitamin K
- ☐ 3. vitamin B12
- ☐ 4. iron
- ☐ 5. vitamin C

119. What is the **primary** goal of nursing care during the emergent phase after a burn injury?

- ☐ 1. Replace lost fluids.
- ☐ 2. Prevent infection.
- ☐ 3. Control pain.

- ☐ 4. Promote wound healing.

120. The nurse assesses for euphoria in a client with multiple sclerosis, looking for what characteristic clinical manifestations?

- ☐ 1. inappropriate laughter
- ☐ 2. an exaggerated sense of well-being
- ☐ 3. slurring of words when excited
- ☐ 4. visual hallucinations

121. The nurse is assessing a client with a burn injury using the “rule of nines” to determine:

- ☐ 1. amount of body surface area burned.
- ☐ 2. rehabilitation needs.
- ☐ 3. respiratory needs.
- ☐ 4. type of intravenous fluids required.

122. When assessing a 2-month-old infant, the nurse feels a “click” when abducting the infant’s left hip. What should the nurse do **next**?

- ☐ 1. Document the finding as normal for a 2-month-old.
- ☐ 2. Check the lengths of the femurs to determine if they are equal.
- ☐ 3. Instruct the mother to keep the leg in an adducted position.
- ☐ 4. Reschedule the child for a follow-up assessment in 3 weeks.

123. Which laboratory tests should the nurse monitor when the client is receiving warfarin sodium therapy?

- ☐ 1. partial thromboplastin time (PTT)
- ☐ 2. serum potassium
- ☐ 3. arterial blood gas (ABG) values
- ☐ 4. prothrombin time (PT)

124. A client who had transurethral resection of the prostate (TURP) 2 days earlier has lower abdominal pain. The nurse should **first**:

- ☐ 1. auscultate the abdomen for bowel sounds.
- ☐ 2. administer an oral analgesic.
- ☐ 3. have the client use a sitz bath for 15 minutes.
- ☐ 4. assess the patency of the urethral catheter.

125. The nurse is ready to administer a partial fill of imipenem-cilastatin in the IV pump when a full partial fill bag of imipenem-cilastatin is found hanging at the client's bedside. The nurse should first:

- ☐ 1. discard the full partial fill of imipenemcilastatin found hanging at the client's bedside.
- ☐ 2. check the identifying information of the full partial fill of imipenem-cilastatin found hanging at the client's bedside.
- ☐ 3. determine when the client received the last dose of the imipenem-cilastatin.
- ☐ 4. administer the new partial fill of imipenem-cilastatin.

126. A client with a moderate level of anxiety is pacing quickly in the hall and tells the nurse, "Help me. I cannot take it anymore." What would be the **best** initial response?

- ☐ 1. "It would be best if you would lie down until you are calmer."
- ☐ 2. "Let us go to a quieter area where we can talk if you want."
- ☐ 3. "Try doing your relaxation exercises to calm down."
- ☐ 4. "I will get some medicine to help you relax."

127. The nurse should plan to teach a client who is taking warfarin sodium to:

- ☐ 1. consult the healthcare provider (HCP) before undergoing a tooth extraction.
- ☐ 2. avoid the use of a toothbrush during oral hygiene.
- ☐ 3. use rectal suppositories to treat constipation.
- ☐ 4. eat green leafy vegetables.

128. A 30-year-old client hospitalized with a fractured femur, which is being treated with skeletal traction, has not had a bowel movement for 2 days. The nurse should:

- ☐ 1. administer a tap water enema.
- ☐ 2. place the client on the bedpan every 2 to 3 hours.
- ☐ 3. increase the client's fluid intake to 3,000 mL/day.
- ☐ 4. perform range-of-motion movements to all extremities.

129. A client is receiving a tube feeding and has developed diarrhea,

cramps, and abdominal distention. What should the nurse do? Select all that apply.

- ☐ 1. Change the feeding apparatus every 24 hours.
- ☐ 2. Use a higher volume of formula because the formula may be too hypotonic.
- ☐ 3. Slow the administration rate.
- ☐ 4. Use a diluted formula, gradually increasing the volume and concentration.
- ☐ 5. Anticipate changing to a lactose-free formula.

130. A 62-year-old client who has smoked two packs of cigarettes for the last 10 years is admitted with a diagnosis of lung cancer. She reports having “no appetite” and exhibits symptoms of anorexia. The client is 5 feet, 8 inches (173 cm) tall and weighs 112 lb (50.8 kg). The client is now scheduled for a left lung lobectomy. The nurse should include which factor when planning to prevent postoperative pulmonary complications?

- ☐ 1. The client tends to keep her real feelings to herself.
- ☐ 2. The client ambulates and can climb one flight of stairs without dyspnea.
- ☐ 3. The client is aged 62.
- ☐ 4. The client’s weight relative to her height is low.

131. When developing the plan of care for a 12-year-old child who is to receive chemotherapy that is associated with nausea and vomiting, the nurse should plan to administer an antiemetic at which time?

- ☐ 1. thirty minutes after the chemotherapy has started, then as needed
- ☐ 2. thirty minutes before the chemotherapy starts, then routinely
- ☐ 3. when the 12-year-old requests medication for nausea, then as needed
- ☐ 4. on starting the chemotherapy infusion, then routinely

132. The membranes of a multigravid client in active labor rupture spontaneously, revealing greenish-colored amniotic fluid. How does the nurse interpret this finding?

- ☐ 1. passage of meconium by the fetus
- ☐ 2. maternal intrauterine infection

- ☐ 3. Rh incompatibility between mother and fetus
- ☐ 4. maternal sexually transmitted disease

133. A client's arterial blood gas values are as follows:

Laboratory Results	
Test	Result
pH	7.24
Paco ₂	35 mmHg (6.7 kPa)
HCO ₃ ⁻	15 mEq/L (15 mmol/L)

The nurse should monitor the client for:

- ☐ 1. metabolic acidosis.
- ☐ 2. metabolic alkalosis.
- ☐ 3. respiratory acidosis.
- ☐ 4. respiratory alkalosis.

134. A client is suspected of having a slow gastrointestinal bleed. The nurse should evaluate the client for which sign?

- ☐ 1. increased pulse
- ☐ 2. nausea
- ☐ 3. tarry stools
- ☐ 4. abdominal cramps

135. The nurse is assessing a client's knowledge about coronary syndrome that was diagnosed 4 years ago. When assessing the client's learning needs, the nurse should take which information into consideration?

- ☐ 1. The client has had the heart condition for 4 years and is probably very knowledgeable about this disease.
- ☐ 2. The client's learning needs may have changed over the course of the illness.

- ☐ 3. The client's condition is presently stable, so there will be fewer learning needs.
- ☐ 4. Clients are usually more motivated to learn about their condition when they are hospitalized.

136. Which suggestion should the nurse give to an adolescent football player with Osgood-Schlatter disease of the left knee?

- ☐ 1. Apply ice on the knee after playing.
- ☐ 2. Use crutches until healing has occurred.
- ☐ 3. Stop playing until healing has occurred.
- 4. Make an appointment with a physical therapist.

137. The nurse instructs a client who is taking iron supplements that:

- ☐ 1. iron supplements should be taken on an empty stomach.
- ☐ 2. a daily bulk laxative such as psyllium hydrophilic mucilloid should be avoided.
- ☐ 3. the stools will become darker.
- ☐ 4. liquid iron supplements will not discolor teeth.

138. What should the nurse teach a client with generalized anxiety disorder to help the client cope with anxiety?

- ☐ 1. cognitive and behavioral strategies
- ☐ 2. issue avoidance and denial of problems
- ☐ 3. rest and sleep
- ☐ 4. withdrawal from role expectations and role relationships

139. After a lobectomy for lung cancer, the nurse instructs the client to perform deep breathing exercises to:

- ☐ 1. decrease blood flow to the lungs for rest and increased surface alveoli ventilation.
- ☐ 2. elevate the diaphragm to enlarge the thorax so that the lung surface area available for gas exchange is increased.
- ☐ 3. control the rate of air flow to the remaining lobe to decrease the risk of hyperinflation.
- ☐ 4. expand the alveoli and increase lung surface available for ventilation.

140. Which is the correct technique when the nurse is applying an elastic bandage to a leg?

- ☐ 1. Increase tension with each successive turn of the bandage.
- ☐ 2. Start at the distal end of the extremity and move toward the trunk.
- ☐ 3. Secure the bandage with clips over the area of the inner thigh.
- ☐ 4. Overlap each layer twice when wrapping.

141. A nulliparous client says that she and her husband plan to use a diaphragm with spermicide to prevent conception. Which should the nurse include as the action of spermicides when teaching the client?

- ☐ 1. destruction of spermatozoa before they enter the cervix
- ☐ 2. prevention of spermatozoa from entering the uterus
- ☐ 3. a change in vaginal pH from acidic to alkaline
- ☐ 4. slowing of the movement of the migrating spermatozoa

142. A client with acquired immunodeficiency syndrome (AIDS) is admitted because of paranoia and visual hallucinations probably related to progressive dementia. The client continues to be restless and have hallucinations. The nurse calls the healthcare provider (HCP) and, after explaining the situation, background, and assessment, recommends that the HCP consider writing a prescription for the client to have:

- ☐ 1. methylphenidate.
- ☐ 2. lorazepam.
- ☐ 3. trazodone.
- ☐ 4. sertraline.

143. The nurse is auscultating the lungs of a client with bacterial pneumonia. Which finding is expected?

- ☐ 1. increased fremitus
- ☐ 2. bilateral expiratory wheezing
- ☐ 3. resonance on percussion
- ☐ 4. vesicular breath sounds

144. A client is admitted with severe abdominal pains and the diagnosis of acute pancreatitis. The nurse should develop a plan of care during the acute phase of pancreatitis that will involve interventions to manage:

- ☐ 1. drug and alcohol abuse.
- ☐ 2. risk for injury.
- ☐ 3. severe pain.
- ☐ 4. ineffective airway clearance.

145. A nurse notices that a newborn has a swelling in the scrotal area. The nurse interprets this swelling as indicative of hydrocele if what else occurs?

- ☐ 1. The swollen bulge can be reduced.
- ☐ 2. The increase in scrotal size is bilateral.
- ☐ 3. The scrotal sac can be transilluminated.
- ☐ 4. The bulge appears during crying.

146. The nurse is screening clients for cancer prevention. Which is the recommended screening protocol for colon cancer in asymptomatic clients who have a low-risk profile?

- ☐ 1. Fecal occult blood testing should be performed annually after age 50 and up to age 75.
- ☐ 2. Digital rectal examinations are recommended every 5 years after age 40.
- ☐ 3. Sigmoidoscopy is recommended if symptoms of colon problems are present.
- ☐ 4. A diet low in saturated fat should be implemented after age 50.

147. A client with diabetes who takes insulin has a blood glucose level of 40. What should the nurse offer the client to begin to raise the blood glucose level? Select all that apply.

- ☐ 1. one-half cup (120 mL) of orange juice
- ☐ 2. one cup (240 mL) of milk
- ☐ 3. one-quarter cup (60 mL) of tuna
- ☐ 4. one tablespoon (15 mL) of peanut butter
- ☐ 5. one slice of bread
- ☐ 6. one-half cup (120 mL) of regular soda

148. An infant with increased intracranial pressure (ICP) on a regular diet vomits while eating dinner. What should the nurse do **next**?

- ☐ 1. Put the child on nothing-by-mouth (NPO) status for 4 hours.

- ☐ 2. Call to report this event to the healthcare provider (HCP).
- ☐ 3. Wait a few minutes, and then refeed the child.
- ☐ 4. Administer the prescribed antiemetic.

149. When preparing to draw up 8 units of a short-acting insulin and 20 units of a long-acting insulin in the same syringe, the nurse should:

- ☐ 1. inject air in the vial with the long-acting insulin first.
- ☐ 2. draw up the long-acting insulin first.
- ☐ 3. draw up either insulin first.
- ☐ 4. use a high-dose insulin syringe.

150. The mother of an infant with iron deficiency anemia asks the nurse what she could have done to prevent the anemia. The nurse should teach the mother that it is helpful to introduce solid foods into the infant's diet at age:

- ☐ 1. 3 months.
- ☐ 2. 6 months.
- ☐ 3. 8 months.
- ☐ 4. 10 months.

151. Following surgery, to evaluate the effectiveness of the client's use of an incentive spirometer, the nurse should determine if the client:

- ☐ 1. has increased circulation in the extremities.
- ☐ 2. is ready to ambulate without pain.
- ☐ 3. has stronger abdominal muscles.
- ☐ 4. can breathe more easily.

152. The nurse is caring for a client who is having an acute asthma attack. The nurse should notify the healthcare provider (HCP) when the client has:

- ☐ 1. loud wheezing.
- ☐ 2. tenacious, thick sputum.
- ☐ 3. decreased breath sounds.
- ☐ 4. persistent cough.

153. The nurse should teach the client who is receiving radiation therapy to:

- ☐ 1. avoid shaving with straight-edge razors.

- ☐ 2. clean the skin daily with antibacterial soap.
- ☐ 3. apply moisturizing lotion before and after each treatment.
- ☐ 4. keep the radiated area covered with a sterile gauze dressing.

154. A client has had a cardiac catheterization. The femoral dressing has a bright bloody drainage. What should the nurse do **first**?

- ☐ 1. Assess the airway.
- ☐ 2. Administer oxygen.
- ☐ 3. Apply pressure to the site.
- ☐ 4. Assess the pulse in the left extremity.

155. The nurse should instruct the parent of a child who is taking valproic acid that the child will need to have what routine blood analyses?

- ☐ 1. complete blood count (CBC) and alkaline phosphate level
- ☐ 2. cholesterol and platelet levels
- ☐ 3. electrolytes and CBC
- ☐ 4. platelet and fibrinogen levels

156. Bacterial conjunctivitis has affected several children at a local day care center. A nurse should advise which measure to minimize the risk of infection?

- ☐ 1. Close the day care center for 1 week to control the outbreak.
- ☐ 2. Restrict the infected children from returning for 48 hours after treatment.
- ☐ 3. Perform thorough handwashing before and after touching any child in the day care center.
- ☐ 4. Set up a conference with the parents of each child to explain the situation carefully.

157. The nurse is evaluating the client's risk for having a pressure sore. Which is the best indicator of risk for the client's developing a pressure sore?

- ☐ 1. nutritional status
- ☐ 2. circulatory status
- ☐ 3. mobility status
- ☐ 4. orientation status

158. A client with acute pancreatitis is put on nothing-by-mouth status, with the intent of not stimulating the pancreas. The client is prescribed an IV infusion of dextrose 5% in half-normal saline solution at 120 mL/h. After 3 days of this regimen, the nurse should observe the client for which adverse metabolic condition?

- ☐ 1. ketosis
- ☐ 2. hyperglycemia
- ☐ 3. metabolic syndrome
- ☐ 4. lactic acidosis

159. While the nurse is assisting a client to ambulate as part of a cardiac rehabilitation program, the client has midsternal burning. The nurse should:

- ☐ 1. stop and assess the client further.
- ☐ 2. obtain the client's blood pressure and heart rate.
- ☐ 3. call for help and place the client in a wheelchair.
- ☐ 4. administer nitroglycerin.

160. The nurse is counseling a client about the prevention of coronary heart disease. Which vitamins should the nurse recommend the client include in the diet to reduce homocysteine levels? Select all that apply.

- ☐ 1. vitamin K
- ☐ 2. vitamin B6
- ☐ 3. folate
- ☐ 4. vitamin B12
- ☐ 5. vitamin D

161. A client has been taking dexamethasone for 2 weeks. The nurse evaluates a client's knowledge as deficient when the client says:

- ☐ 1. "I cannot stop the medication all at one time."
- ☐ 2. "If I forget a dose, it is no big deal; I will just take it when I remember it."
- ☐ 3. "When I get a cold, I need to let my healthcare provider (HCP) know."
- ☐ 4. "I need to watch for an allergic reaction when I first start taking this pill."

162. A 3-month-old has moderate dehydration. The nurse should assess the client for:

- ☐ 1. oliguria.
- ☐ 2. bulging eyes.
- ☐ 3. sunken posterior fontanelle.
- ☐ 4. pale skin color.

163. The nurse is assessing a client who is suspected of being in the early symptomatic stages of human immunodeficiency virus (HIV) infection. Which indications of infection should the nurse detect during this stage?

- ☐ 1. whitish yellow patches in the mouth
- ☐ 2. dyspnea
- ☐ 3. bloody diarrhea
- ☐ 4. raised, hyperpigmented lesions on the legs

164. A primiparous client who is breast-feeding develops endometritis on the third postpartum day. What instructions should the nurse give to the mother?

- ☐ 1. The neonate will need to be bottle-fed for the next few days.
- ☐ 2. The condition typically is treated with IV antibiotic therapy.
- ☐ 3. The client's uterus may become "boggy," requiring frequent massage and oxytocics.
- ☐ 4. The client needs to remain in bed in a sidelying position as much as possible.

165. After instructing a primiparous client who is breast-feeding on how to prevent nipple soreness during feedings, the nurse determines that the client needs further instruction when she makes which statement?

- ☐ 1. "I should position the baby the same way for each feeding."
- ☐ 2. "I should make sure the baby grasps the entire areola and nipple."
- ☐ 3. "I should air-dry my breasts and nipples for 10 to 15 minutes after the feeding."
- ☐ 4. "I should not use a hand breast pump if my nipples get sore."

166. A client who has Ménière's disease is experiencing an acute attack of vertigo. The nurse should:

- ☐ 1. darken the client's room and provide a quiet environment.
- ☐ 2. provide a low-sodium, bland diet.
- ☐ 3. administer an opioid to relieve headache.
- ☐ 4. encourage fluid intake to prevent dehydration.

167. During a home visit to a primiparous client 1 week postpartum who is bottle-feeding her neonate, the client tells the nurse that her mother has suggested that she feed the neonate cereal so he will sleep through the night. What would be the nurse's **best** response?

- ☐ 1. "It is permissible to give the baby cereal if it is thinned with formula."
- ☐ 2. "The time for starting cereal varies, so check with your pediatrician."
- ☐ 3. "Formula is the food best digested by the baby until about 4 to 6 months of age."
- ☐ 4. "If cereal is given too early in life, the undigested food can lead to a need for surgery."

168. When a client reports being allergic to amoxicillin even though the medication administration record and armband do not indicate medication allergies, the nurse should:

- ☐ 1. administer the prescribed medication.
- ☐ 2. withhold the amoxicillin.
- ☐ 3. administer another, similarly acting antibiotic.
- ☐ 4. call the family to verify the client's statement.

169. While assessing a term neonate on a home visit to a primiparous client 2 weeks after a vaginal birth, the nurse observes that the neonate is slightly jaundiced and the stool is a pale, light color. The nurse notifies the healthcare provider (HCP) because these findings indicate which problem?

- ☐ 1. biliary atresia
- ☐ 2. Rh isoimmunization
- ☐ 3. ABO incompatibility
- ☐ 4. esophageal varices

170. To reduce urethral irritation, where should the nurse tape the female client's Foley catheter?

- ☐ 1. inner thigh

- ☐ 2. groin area
- ☐ 3. lower abdomen
- ☐ 4. lower thigh

171. A 6-year-old child has had heart surgery to repair tetralogy of Fallot. When developing the discharge plan, the nurse should include information about:

- ☐ 1. allowing the child to lead a normal, active life.
- ☐ 2. persuading the child to get enough rest.
- ☐ 3. treating tet spells.
- ☐ 4. having the child out of school for a month.

172. A client is recovering from abdominal surgery and has a nasogastric (NG) tube inserted. The expected outcome of using the NG tube is gastrointestinal tract:

- ☐ 1. compression.
- ☐ 2. lavage.
- ☐ 3. decompression.
- ☐ 4. gavage.

173. The nurse teaches the mother of a toddler who has had a cleft palate repair that her child is at risk for developing which problem in the future?

- ☐ 1. hearing problems
- ☐ 2. poor self-concept
- ☐ 3. a speech defect
- ☐ 4. chronic sinus infections

174. The nurse assesses a client who is receiving a tube feeding. Which situation would require prompt intervention from the nurse?

- ☐ 1. The client is sitting upright in bed while the feeding is infusing.
- ☐ 2. The feeding that is infusing has been hanging for 8 hours.
- ☐ 3. The client has a gastric residual of 25 mL.
- ☐ 4. The feeding solution is at room temperature.

175. A client has been taking furosemide for 2 days. The nurse should assess the client for:

- ☐ 1. an elevated blood urea nitrogen (BUN) level.
- ☐ 2. an elevated potassium level.
- ☐ 3. a decreased potassium level.
- ☐ 4. an elevated sodium level.

176. When suctioning the respiratory tract of a client, it is recommended that the suctioning period not exceed how many seconds?

- ☐ 1. 5 seconds
- ☐ 2. 10 seconds
- ☐ 3. 15 seconds
- ☐ 4. 20 seconds

177. An 80-year-old client with severe kidney damage is placed on life support and dialysis. Care decisions are being made by his wife, who is showing signs of early Alzheimer's disease. The client's daughter arrives from out of town with a copy of the client's living will, which states that the client did not want to be on life support. The nurse should:

- ☐ 1. immediately inform the healthcare provider (HCP) about the living will.
- ☐ 2. suggest to the daughter that she discuss her father's wishes with her mother.
- ☐ 3. prepare to remove the client from life support.
- ☐ 4. make a copy of the living will and give it to the client's wife.

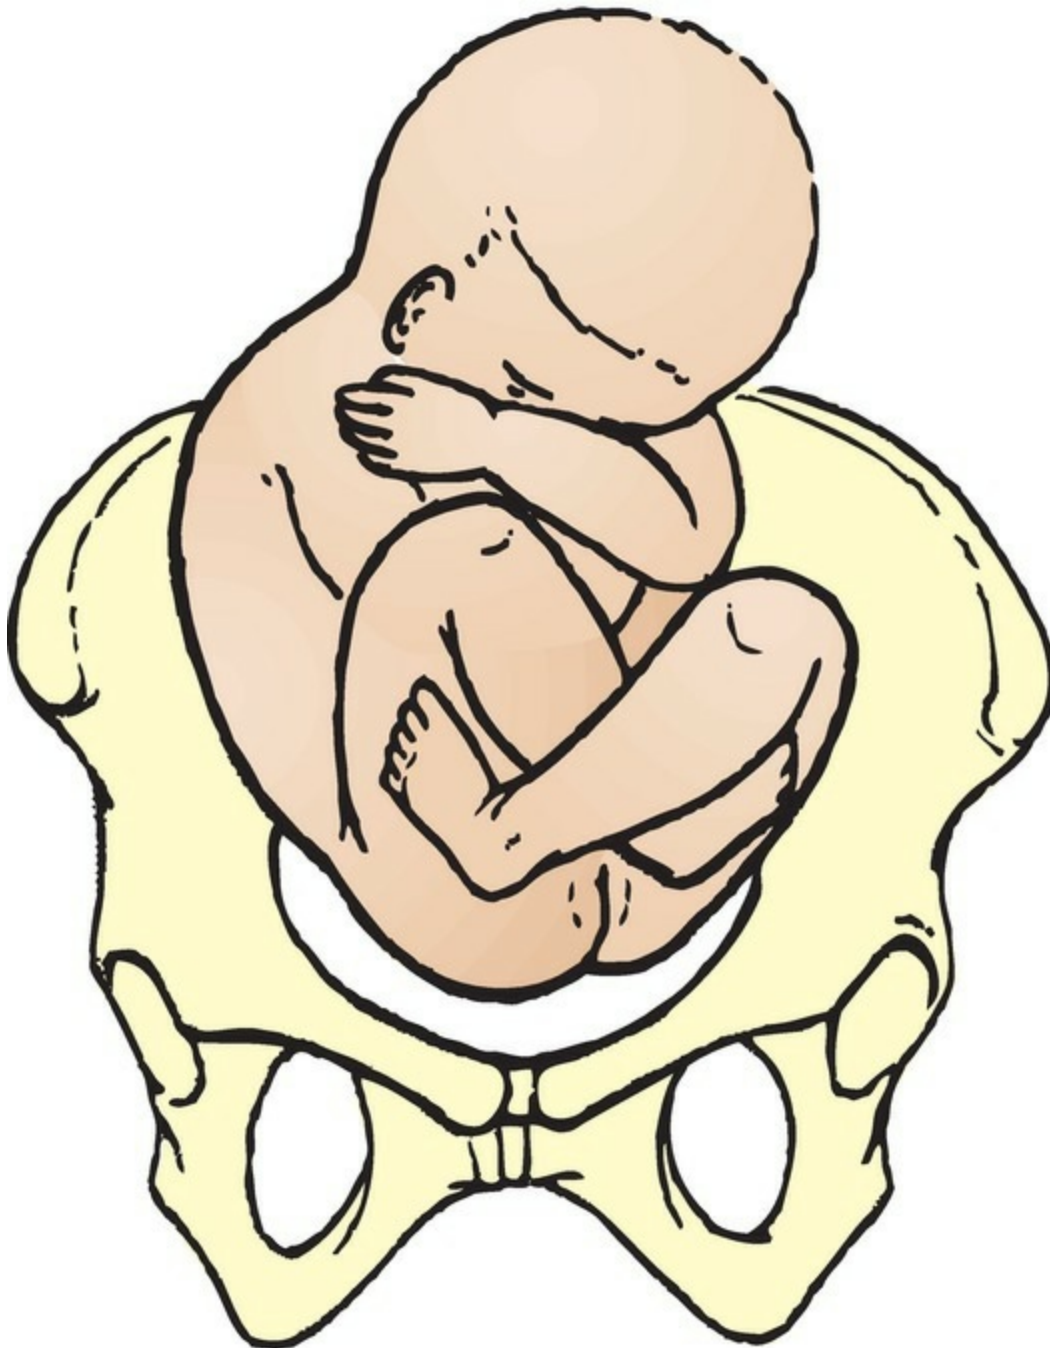

178. Prior to administering plasminogen activator (t-PA) to a client admitted with a stroke, the nurse should verify that the client: (Select all that apply.)

- ☐ 1. is older than 65 years.
- ☐ 2. has had symptoms of the stroke <3 hours.
- ☐ 3. has a blood pressure within normal limits.
- ☐ 4. does not have active internal bleeding.
- ☐ 5. has not had an alcoholic beverage within the last 8 hours.

179. A client with peripheral arterial disease has had surgery for placement of an aortobifemoral bypass graft. Immediately following surgery, what should the nurse do **first**?

- ☐ 1. Elevate the lower extremities.
- ☐ 2. Assist the client to use incentive spirometry.
- ☐ 3. Start the client on a liquid diet.
- ☐ 4. Assess peripheral pulses every 4 hours.

180. How does the nurse identify the type of presentation shown in the figure?

- ☐ 1. frank breech
- ☐ 2. compound breech
- ☐ 3. complete breech
- ☐ 4. incomplete breech

181. Following cardiac bypass surgery, the client has been referred to a cardiac rehabilitation exercise program. The client has type 1 diabetes and has bilateral leg discomfort with walking. The nurse should advise the client to exercise using a stationary bicycle and intermittent training because of the client's:

- ☐ 1. diabetic neuropathy.
- ☐ 2. muscle atrophy.
- ☐ 3. Raynaud's disease.
- ☐ 4. transient ischemic attacks.

182. Which statement indicates that the client with hepatitis B has understood the nurse's discharge teaching?

- ☐ 1. "I will not drink alcohol for at least 1 year."
- ☐ 2. "I must avoid sexual intercourse."
- ☐ 3. "I should be able to resume normal activity in a week or two."
- ☐ 4. "Because hepatitis B is a chronic disease, I know I will always be jaundiced."

183. A client who is taking olanzapine states he is being poisoned and refuses to take his scheduled medication. The nurse states, "If you do not take your medication, you will be put into seclusion." The nurse's statement is an example of which legal concept?

- ☐ 1. assault
- ☐ 2. battery
- ☐ 3. malpractice
- ☐ 4. invasion of privacy

184. A client who has been taking diazepam for 3 months for skeletal muscle spasms and lower back pain has stopped taking the medication 2 days ago because it was no longer helping. Now the pain has increased. The nurse should assess the client for: (Select all that apply.)

- ☐ 1. insomnia.
- ☐ 2. euphoria.
- ☐ 3. bradycardia.
- ☐ 4. diaphoresis.
- ☐ 5. tremor.
- ☐ 6. vomiting.

185. An IV infusion is to be administered through a scalp vein on an infant's head. What should the nurse tell the parents to prepare them for the procedure?

- ☐ 1. It may be necessary to remove a small amount of hair from the infant's scalp.
- ☐ 2. A sedative will be given to help keep the infant quiet.
- ☐ 3. Visiting the infant will be delayed until the infusion has been completed.
- ☐ 4. Holding the infant will be contraindicated while the infusion is being administered.

186. Which nursing goal is **most** important for a client with acute pancreatitis?

- ☐ 1. The client reports minimal abdominal pain.
- ☐ 2. The client regains a normal pattern for bowel movements.
- ☐ 3. The client limits alcohol intake to two to three drinks per week.
- ☐ 4. The client maintains normal liver function.

187. A nurse is caring for a child with type 1 diabetes mellitus at camp. The child is irritable and has a headache. What should the nurse do **first**?

- ☐ 1. Administer 2 oz (60 mL) of orange juice.
- ☐ 2. Notify the healthcare provider (HCP) about the child's status.
- ☐ 3. Check the child's blood glucose level.
- ☐ 4. Send the child back to the planned activities.

188. A client tells the nurse that her bra fits more snugly at certain times of the month and she is concerned this may be a sign of breast cancer. The best response for the nurse is to explain that:

- ☐ 1. a change in breast size should be checked by her healthcare provider

(HCP).

- ☐ 2. benign cysts tend to cause the breast to vary in size.
- ☐ 3. it is normal for the breast to increase in size before menstruation begins.
- ☐ 4. a difference in the size of her breasts is related to normal growth and development.

189. Which beliefs of traditional Chinese medicine found in Asian culture should the nurse consider when planning care for a follower of traditional Chinese medicine?

- ☐ 1. Health is described as harmony between family members.
- ☐ 2. Illness is caused by an imbalance of the yin and yang.
- ☐ 3. Exercise to the point of overexertion can improve health.
- ☐ 4. Illness is caused by a change in eating habits.

190. A client is scheduled for an intravenous pyelogram (IVP). In preparation for the procedure, what should the nurse ask the client?

- ☐ 1. "Have you ever had an IVP before?"
- ☐ 2. "Do you have any allergies?"
- ☐ 3. "When was your last bowel movement?"
- ☐ 4. "Have you ever experienced urinary incontinence?"

191. Which oral contraceptive is considered safe for use while breast-feeding because it will not affect the breast milk supply once breast-feeding has been well established?

- ☐ 1. estrogen
- ☐ 2. estrogen and progestin
- ☐ 3. progestin
- ☐ 4. testosterone

192. The nurse is teaching the client to selfadminister insulin. Learning goals most likely will be attained when they are established by the:

- ☐ 1. nurse and client because both need to be responsible for teaching.
- ☐ 2. healthcare provider (HCP) and client because the HCP is the manager of care and the client is the main participant.
- ☐ 3. client because the client is best able to identify his or her own needs

and how to meet those needs.

- ☐ 4. client, nurse, pharmacist, and HCP so the client can participate in planning care with the entire team.

193. A multigravid client at 36 weeks' gestation who is visiting the clinic for a routine visit begins to sob and tells the nurse, "My boyfriend has been beating me up once in a while since I became pregnant, but I cannot bring myself to leave him because I do not have a job and I do not know how I would take care of my other children." What is the priority action by the nurse at this time?

- ☐ 1. Contact a social worker for assistance and family counseling.
- ☐ 2. Help the client make concrete plans for the safety of herself and her children.
- ☐ 3. Tell the client that she should not allow anyone to hit her or her children.
- ☐ 4. Provide the client with brochures on the statistics about violence against women.

194. Several children were admitted yesterday. In which order of priority from first to last would the nurse assess these children? All options must be used.

1. 3-month-old infant with respiratory syncytial virus and stable vital signs

2. 10-month-old infant with pneumonia and respiratory rate of 50 breaths/minute

3. 3-year-old child with acute pyelonephritis and a temperature of 104.5°F (40.3°C)

4. 6-year-old child with a recent concussion and little change in vital signs

5. 12-year-old child with a fractured femur and lacerated liver

195. Sulfamethoxazole/trimethoprim has been prescribed for a client who has a urinary tract infection. When administering sulfonamides, the nurse should:

- ☐ 1. encourage the client to take the medication with meals.
- ☐ 2. instruct the client to drink at least eight glasses of water a day.
- ☐ 3. measure the client's urine output.
- ☐ 4. instruct the client that the urine may turn reddish orange.

196. A client is admitted with a diagnosis of dementia becomes agitated and violent and has bizarre thoughts. The nurse is reviewing the client's medication record. Which ordered medication would be expected to reduce agitation?

- ☐ 1. tacrine
- ☐ 2. ergoloid
- ☐ 3. diazepam
- ☐ 4. risperidone

197. A client has been diagnosed with multiinfarct (or vascular) dementia (MID). When preparing a teaching plan for the client and family, which action should the nurse indicate as the **most** critical for slowing MID?

- ☐ 1. administering anticoagulants such as warfarin
- ☐ 2. administering benzodiazepines such as lorazepam to decrease choreiform movements
- ☐ 3. managing related symptoms such as depression
- ☐ 4. managing the symptoms by increasing dopamine availability

198. While performing cardiopulmonary resuscitation (CPR) on a 5-year-old child, the nurse palpates for a pulse. Which site is **best** for checking the

pulse during CPR in a 5-year-old child?

- ☐ 1. femoral artery
- ☐ 2. carotid artery
- ☐ 3. radial artery
- ☐ 4. brachial artery

199. A nurse is assessing a client with nephrotic syndrome. The nurse should assess the client for which condition?

- ☐ 1. hematuria
- ☐ 2. massive proteinuria
- ☐ 3. increased serum albumin level
- ☐ 4. weight loss

200. A child with tetralogy of Fallot and a history of severe hypoxic episodes is to be admitted to the pediatric unit. What would be **most** important for the nurse to have at the bedside?

- ☐ 1. morphine sulfate in a syringe ready to administer
- ☐ 2. oxygen tubing and flow meter plugged in
- ☐ 3. blood pressure cuff and stethoscope
- ☐ 4. suction tubing and equipment

201. When assessing pain in a client from Mexico, the nurse should understand the implications of which statement from the client about the pain experience?

- ☐ 1. "Enduring pain is a part of God's will."
- ☐ 2. "This pain is killing me."
- ☐ 3. "I have got to see a healthcare provider (HCP) right away."
- ☐ 4. "I cannot go on in pain like this any longer."

202. A client is voiding small amounts of urine every 30 to 60 minutes. What should the nurse do first?

- ☐ 1. Palpate for a distended bladder.
- ☐ 2. Catheterize the client for residual urine.
- ☐ 3. Obtain a urine specimen for culture.
- ☐ 4. Encourage an increased fluid intake.

203. When making rounds, which client should the nurse assess **first**?

- ☐ 1. a 16-month-old child with periorbital cellulitis who is to be discharged today
- ☐ 2. a 7-year-old child who had an appendectomy yesterday and developed peritonitis
- ☐ 3. a 10-year-old child who has just been admitted in sickle cell crisis
- ☐ 4. a 16-year-old adolescent receiving a 3rd day of chemotherapy

204. Which has the **highest priority** for the care of a client with chronic renal failure?

- ☐ 1. Apply corticosteroid creams to relieve itching.
- ☐ 2. Achieve pain control with analgesics.
- ☐ 3. Maintain a low-sodium diet.
- ☐ 4. Measure abdominal girth daily.

205. The father of an 18-month-old with no previous illness, who has been admitted to a surgery center for repair of an inguinal hernia, tells the nurse that his child is having trouble breathing. The father does not think the child choked. After telling the clerk to call the rapid response team, the nurse should take which actions? Place in order from first to last. All options must be used.

1. Notify the surgeon.

2. Start an intravenous infusion.

3. Assess the effectiveness of the abdominal thrusts.

4. Perform the abdominal thrust maneuver.

5. Listen for breath sounds.

206. The nurse is assessing a child's skeletal traction and notices that the weights are on the floor. What should the nurse do **next**?

- ☐ 1. Raise the weights so that the child can move up in bed.
- ☐ 2. Notify the healthcare provider (HCP) immediately.
- ☐ 3. Put the foot of the bed on blocks.
- ☐ 4. Move the child up in bed.

207. Compared to the food requirements of preschoolers and adolescents, the food requirements of school-age children are not as great because these children have a lower:

- ☐ 1. growth rate.
- ☐ 2. metabolic rate.
- ☐ 3. level of activity.
- ☐ 4. hormonal secretion rate.

208. When assessing a 17-year-old client with depression for suicide risk, which question would be best?

- ☐ 1. "What movies about death have you watched lately?"
- ☐ 2. "Can you tell me what you think about suicide?"
- ☐ 3. "Has anyone in your family ever committed suicide?"
- ☐ 4. "Are you thinking about killing yourself?"

209. Which intervention should the nurse suggest to a parent to relieve itching in a child with chickenpox?

- ☐ 1. generous amounts of fine baby powder
- ☐ 2. oatmeal preparation baths
- ☐ 3. soft towels moistened with hydrogen peroxide
- ☐ 4. cool compresses moistened with a weak salt solution

210. A woman who has preeclampsia is receiving magnesium sulfate 20 g per 500 mL of lactated Ringers via infusion pump. The prescribed rate of infusion is 2 g/h. How many mL/h should the nurse set the infusion pump for? Record your answer using a whole number.

_____ mL/h.

211. Which technique is **best** for the nurse to use in evaluating the parents' ability to administer eardrops correctly?

- ☐ 1. Observe the parents instilling the drops in the child's ear.
- ☐ 2. Listen to the parents as they describe the procedure.
- ☐ 3. Ask the parents to list the steps in the procedure.
- ☐ 4. Ask the parents whether they have read the handout on the procedure.

212. Ibuprofen is prescribed for a client with osteoarthritis. Which instruction about ibuprofen should the nurse include in the client's teaching plan?

- ☐ 1. Report the development of tinnitus.
- ☐ 2. Increase vitamin B12 intake.
- ☐ 3. Take with food or antacids.
- ☐ 4. Have the complete blood count (CBC) monitored monthly.

213. A staff member states, "I do not know why Mary is so depressed. She lives in an exclusive part of town and has gorgeous clothes. Her husband seems to care about her very much. She really has it all." What should the nurse conclude from the staff member's statement?

- ☐ 1. An accurate assessment of the client has been made.
- ☐ 2. The staff member is jealous of the client.
- ☐ 3. There is no reason for the client to be depressed.
- ☐ 4. The staff member needs teaching about major depression.

214. The nurse is instructing the mother of a child with asthma about noting food triggers for asthma attacks. Which food would **most** likely be responsible for causing an allergic reaction?

- ☐ 1. fish
- ☐ 2. tossed salad

- ☐ 3. pork chop
- ☐ 4. oranges

215. Which family should the nurse determine as **most** in need of follow-up?

- ☐ 1. a single mother with a 7-month-old child whose immunizations are delayed
- ☐ 2. a two-parent family whose 3-year-old has a fractured leg from an automobile accident
- ☐ 3. a single parent with a toddler who has third-degree burns over 20% of the body
- ☐ 4. a two-parent family with a foster child who has a history of caustic liquid ingestion

216. After several hours of induction with intravenous oxytocin administered along with a primary intravenous solution of lactated Ringer's solution, assessment of a primigravida at 42 weeks' gestation reveals a fetal heart rate near the baseline at 120 bpm and strong contractions occurring every 2 to 2.5 minutes and lasting 90 to 100 seconds. In what order should the nurse perform the required actions? All options must be used.

1. Position the client in a lateral position.

2. Contact the primary care provider for further prescriptions.

3. Stop the intravenous flow of oxytocin.

4. Administer oxygen at a rate of 8 to 10 L/min.

217. When preparing to administer a tap water enema, in which position should the nurse place the client?

- ☐ 1. supine
- ☐ 2. semi-Fowler's
- ☐ 3. right lateral
- ☐ 4. left Sims'

218. When planning care for a group of clients, the nurse should identify which client as having the **greatest** risk for the development of pressure ulcers?

- ☐ 1. a client who ambulates four times a day
- ☐ 2. a client with an indwelling urinary catheter
- ☐ 3. a client who has a decreased serum albumin level
- ☐ 4. a client with an elevated white blood cell count

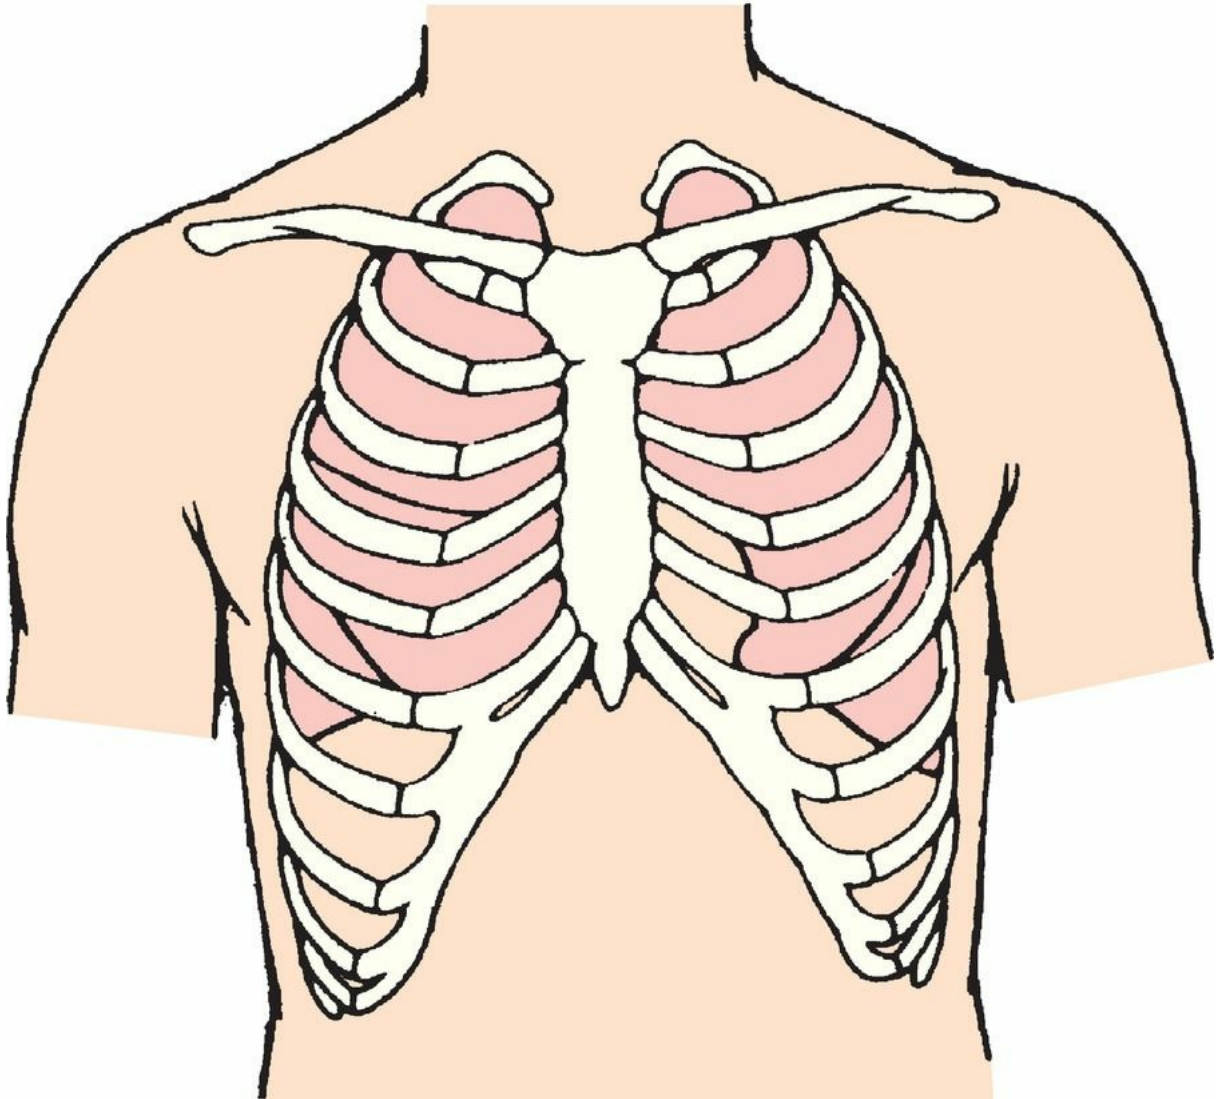

219. A 16-year-old primigravida at 36 weeks' gestation who has had no prenatal care experienced a seizure at work and is being transported to the hospital by ambulance. What should the nurse do upon the client's arrival?

- ☐ 1. Position the client in a supine position.
- ☐ 2. Auscultate breath sounds every 4 hours.
- ☐ 3. Monitor the vital signs every 4 hours.
- ☐ 4. Admit the client to a quiet, darkened room.

220. An adult admitted to the hospital with a hemoglobin of 6.5 g/dL (65 g/L) is experiencing cerebral tissue hypoxia. The nurse should:

- ☐ 1. plan frequent rest periods throughout the day.
- ☐ 2. assist the client in ambulating to the bathroom.
- ☐ 3. check the temperature of the water before the client showers.
- ☐ 4. refer the client to occupational therapy for energy conservation interventions.

221. A nurse is assessing an older adult with pneumonia. Where should the nurse place the stethoscope to listen for breath sounds that will indicate the client is fully oxygenating the lung on the right side?

222. During care, the client suddenly blurts out, “My doctor just told me that I am going to have to have chemotherapy after all; I was hoping to avoid it.” Which is the nurse’s most therapeutic response?

- ☐ 1. “Well, you are under the care of our best oncologist; I am certain the oncologist knows what is best.”
- ☐ 2. “What concerns you most about possible chemotherapy?”
- ☐ 3. “You know, you can get a second opinion before you agree to any of that.”
- ☐ 4. “I understand how you feel. I would feel the same way.”

223. Two parents who are arguing in their infant’s room, with voices raised and getting louder, start to hit each other. The infant is crying. Which

action should the staff nurse take **next**?

- ☐ 1. Try to reason with both of the parents.
- ☐ 2. Ask one of the parents to leave the room.
- ☐ 3. Call security to come and break up the fight.
- ☐ 4. Remove the infant from the room.

224. A hospitalized client is experiencing “fight versus flight,” a stress-mediated physiologic response. As a result, the nurse should assess the client for:

- ☐ 1. increased urinary output.
- ☐ 2. decreased arterial blood pressure.
- ☐ 3. increased blood glucose.
- ☐ 4. decreased mental acuity.

225. The nurse observes an unlicensed assistive personnel (UAP) sharing extensive stories of her own mother’s death with a dying client’s husband. Which statement demonstrates appropriate feedback for the nurse to offer to the UAP?

- ☐ 1. “I thought that was really great how you talked with him; he seemed really scared.”
- ☐ 2. “You provided excellent client education by sharing your stories.”
- ☐ 3. “I think it helps clients to see us as real people, and friends too, when you share your own stories.”
- ☐ 4. “It is probably best to avoid talking about your personal experience very much; keep communication client centered.”

226. Assessment of a primigravida in active labor reveals cervical dilation at 9 cm with complete effacement and the fetus at +1 station. What should the nurse do when the primary care provider prescribes meperidine 50 mg intramuscular (IM) for the client?

- ☐ 1. Administer the medication in the left ventrogluteal muscle.
- ☐ 2. Be certain that naloxone is at the client’s bedside.
- ☐ 3. Ask the primary care provider to validate the dosage of the drug.
- ☐ 4. Refuse to administer the medication to the client.

227. Which nursing action is appropriate when planning care for a client

who is being battered? Select all that apply.

- ☐ 1. Give information about a safe home.
- ☐ 2. Provide a cell phone and the crisis help line telephone number.
- ☐ 3. Help the client displace her feelings.
- ☐ 4. Teach the client about the cycle of violence.
- ☐ 5. Discuss the client's legal and personal rights.

228. Which client is at greatest risk for obtaining inadequate nutrition?

- ☐ 1. the client with diabetic peripheral neuropathy
- ☐ 2. the client recovering from a femur fracture
- ☐ 3. the client who is breast-feeding
- ☐ 4. the client with burns to 45% of the body

229. The use of a patient-controlled analgesia (PCA) pump is effective in which situation?

- ☐ 1. The client achieves a therapeutic level of analgesia.
- ☐ 2. The client does not become dependent on opioids postoperatively.
- ☐ 3. There is decreased cost by decreasing use of intramuscular (IM) injections.
- ☐ 4. The family can assist the client in managing the pain.

230. A client's chest tube is connected to a drainage system with a water seal. The nurse notes that the fluid in the water seal column is fluctuating with each breath that the client takes. The fluctuation means that:

- ☐ 1. there is an obstruction in the chest tube.
- ☐ 2. the client is developing subcutaneous emphysema.
- ☐ 3. the chest tube system is functioning properly.
- ☐ 4. there is a leak in the chest tube system.

231. A client is taking metformin. To prevent lactic acidosis when taking this drug, the nurse should instruct the client to report which symptoms? Select all that apply.

- ☐ 1. hyperventilation
- ☐ 2. muscle discomfort
- ☐ 3. dizziness

- ☐ 4. headache
- ☐ 5. increased hunger
- ☐ 6. tingling in the fingertips

232. The nurse is serving on a task force to update the electronic health record. The task force should ensure that the revisions of the medical record will: (Select all that apply.)

- ☐ 1. aid in client care.
- ☐ 2. serve as a legal document.
- ☐ 3. have sufficient room for charting nurses' notes.
- ☐ 4. facilitate data collection for clinical research.
- ☐ 5. guide performance improvement.
- ☐ 6. be written so the client can understand what is written.

233. The nurse discovers that a hospitalized client with stage 4 esophageal cancer and major depression has a gun in the home. What is the **best** nursing intervention to help the client remain safe after discharge?

- ☐ 1. Give the client the number of a 24-hour crisis phone line for use, if needed.
- ☐ 2. Tell the healthcare provider (HCP) the client is too high risk for discharge at this time.
- ☐ 3. Have the client promise to use the gun only for home protection.
- ☐ 4. Talk with the HCP about requiring gun removal as a condition of discharge.

234. A client with severe osteoarthritis and decreased mobility is moved to an assisted living facility. The nurse notices that the client smells of alcohol, is slurring words, and has six wine bottles in the trash. The client tells the nurse, "Those are my other pain medicines." Which statements by the nurse are **most** appropriate at this point? Select all that apply.

- ☐ 1. "I did not realize you that your pain was not being managed with your current medication."
- ☐ 2. "It is important for me to know how many bottles of wine you drank this week."
- ☐ 3. "I am worried about the amount of wine you are drinking and its

effects on your balance.”

- ☐ 4. “How are you getting all this wine?”
- ☐ 5. “I am calling your healthcare provider (HCP) to have all of us to talk about better pain control without the wine.”

235. Which child **most** needs a referral for developmental language delay?

- ☐ 1. the 1-year-old who does not have three words
- ☐ 2. the 18-month-old who only points to one body part
- ☐ 3. the 2-year-old who only combines two words
- ☐ 4. the 4-year-old who is difficult to understand

236. A client is being admitted with nursing home-acquired pneumonia. The unit has four empty beds in semiprivate rooms. The room that would be **most** suitable for this client is the one with a:

- ☐ 1. 60-year-old client admitted for investigation of transient ischemic attacks.
- ☐ 2. 45-year-old client with an abdominal hysterectomy.
- ☐ 3. 24-year-old client with non-Hodgkin’s lymphoma.
- ☐ 4. 55-year-old client with alcoholic cirrhosis.

Answers, Rationales, and Test-Taking Strategies

The answers and rationales for each question follow below, along with keys () to the client need (CN) and cognitive level (CL) for each question. In addition, you will also see a glossary icon () highlighting specific terminology used on the licensing exam. As you check your answers, use the Content Mastery and Test-Taking Skill Self-Analysis worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12-23 and pages 35-36 in Part 1 of this book.

1. 3. The client who should be assessed first is the multigravid client who has been in labor for 8 hours and whose cervix is 8 cm dilated at 1+ station with contractions every 3 to 4 minutes. A multigravid client typically has a shorter labor than does a primigravid, and this client’s station is 1+, which

means that birth of the fetus is imminent.

CN: Management of care; CL: Synthesize

2. 1. The colleague needs to provide the nurse with information about spouse abuse. Giving information about reasons for staying is useful for decreasing the nurse's frustration. Although expressing empathy is appropriate, it does not help the nurse understand the client's needs and behaviors. Telling the nurse that there will be another chance is not helpful and fails to educate the other nurse about the dynamics of abuse. Although dependence is a problem, women who are abused can overcome this and leave if they have support, not criticism. Saying that abused women almost never leave does not help the nurse understand the client's needs and behavior.

CN: Psychosocial integrity; CL: Synthesize

3. 1 mL

First, convert micrograms to milligrams:

$$200 \text{ mcg} = 0.2 \text{ mg.}$$

Then:

$$0.2 \text{ mg} / X \text{ mL} = 0.2 \text{ mg} / 1 \text{ mL}$$
$$X = 1 \text{ mL.}$$

CN: Pharmacological and parenteral therapies; CL: Apply

4. 3. Viral gastroenteritis may be communicable, and all of the other children are already at risk for infection. The infant should be placed in a private room.

CN: Safety and infection control; CL: Synthesize

5. 1, 2, 3, 4, 5, 6. The acronym SPLATT (symptoms, previous fall, location, activity at the time, time, and trauma) can guide the assessment of an older adult who has fallen. It may be helpful to know if there was someone

with the person when the fall occurred to present a bystander's perspective, but the information is not necessary, and it is more important to get the client to describe in his or her own words what happened.

CN: Management of care; CL: Synthesize

6. 1. The hands spread disease-causing organisms. Frequent handwashing is essential to decrease the spread of microorganisms. Having separate - personal care items for each client does not eliminate the potential for contamination of these items. When practical, using disposable equipment is preferable to sterilization, but it does not override frequent, thorough handwashing for control of infection. Isolating people known to be harboring disease-causing organisms is a cornerstone of infection control, but healthcare personnel must still wash their hands to avoid spreading disease.

CN: Safety and infection control; CL: Synthesize

7. 1. The neonate would be considered large for gestational age (LGA) because the neonate weighs more than 4,000 g (90th percentile). Therefore, the nurse needs to assess for the possibility of complications. Hypoglycemia is a problem for the LGA neonate because glycogen stores are quickly used to maintain the weight. Other common complications for an LGA neonate include hyperbilirubinemia from the bruising and polycythemia, cephalhematoma, caput succedaneum, molding, phrenic nerve paralysis, and a fractured clavicle. However, hyperbilirubinemia would not be evident 1 hour after birth. Hypercalcemia is not usually found in the LGA neonate. Hypocalcemia is common in infants of diabetic mothers. Hypermagnesemia may occur in neonates whose mothers received large doses of magnesium sulfate to treat severe preeclampsia.

CN: Reduction of risk potential; CL: Analyze

8. 2. Ovarian enlargement, hyperstimulation syndrome, febrile reaction, and multiple pregnancies are considered adverse effects of menotropins. If ovarian enlargement occurs, the drug should be discontinued to prevent damage to the ovary. Pulmonary edema is not associated with menotropin use. Visual disturbances and breast tenderness are associated with the use of clomiphene citrate, another drug prescribed for infertility.

CN: Pharmacological and parenteral therapies; CL: Evaluate

9. 4. The symptoms noted are classic symptoms of leaking abdominal aneurysm and shock; the client needs immediate fluid volume replacement. Assessing the pulses with a Doppler will be of no additional diagnostic value. Palpating the abdomen on a client with a suspected abdominal aneurysm is contraindicated and could lead to rupture. After emergency fluid resuscitation, **consent** 📖 for surgery is needed.

🔑 CN: Physiological adaptation; CL: Synthesize

10. 3. Fluid accumulates in the base of the pleura postoperatively. The lower chest tube, called the posterior or lower tube, will drain serous and -serosanguineous fluid that accumulates as a result of the surgical procedure. A larger-diameter tube is usually used for the lower tube to ensure drainage of clots. Air rises, and the anterior or upper tube is used to remove air from the pleural space. The practice of “milking” the tubes to prevent clots is becoming less common; the surgeon’s prescriptions must be followed regarding this procedure.

🔑 CN: Physiological adaptation; CL: Apply

11. 1, 2, 5. When an oxygen hood is used, the nurse should be sure the oxygen source is not directed on the infant’s face to avoid skin irritation. Mobiles can be used to provide visual stimulation, but they should not be placed inside of the hood where they are a potential choking hazard. It is not necessary to restrain the infant unless there is an indication to do so, and the healthcare provider (HCP) 📖 has written the prescription. There should be as little movement in and out of the hood as possible in order to maintain the warm and humid oxygen levels. The nurse should encourage the parents to visit the child and provide verbal and tactile stimulation.

🔑 CN: Physiological adaptation; CL: Synthesize

12. 1. Elderly clients are a high-risk group for depression. The classic symptoms of depression frequently are masked, and depression presents differently in the aging population. Depression in late life is underdiagnosed because the symptoms are incorrectly attributed to aging or medical problems. Impairment of cognition in a previously healthy elderly client or psychosomatic problems may be the presenting symptom of depression. Antidepressant therapy is usually effective.

 CN: Psychosocial integrity; CL: Analyze

13. 4. Fears of the adolescent include body changes and loss of control. The young adolescent is typically concerned about the inability to control body changes and feelings and about embarrassment. The typical adolescent is more concerned about being separated from the peer group than from the family and schoolwork and is realistically worried about experiencing pain and loss of control. The adolescent may prefer to wear her own clothes, but this is not a primary concern. The nurse should respect the client's privacy, but this is not a primary concern for this client.

 CN: Health promotion and maintenance; CL: Apply

14. 2. The mother's statements reveal that she is having problems with parenting. Therefore, a referral to a parenting education program is the most appropriate measure at this time. While support groups such as those for single parents, women, or abuse do not address the need identified by this client.

 CN: Management of care; CL: Synthesize

15. 2. The infant who has not eaten in 4 hours is the highest priority of this group of couplets. The last feeding was 4 hours ago, and the prior poor feeding puts this infant at risk. An assessment of this infant is needed from a safety perspective since the mother had magnesium sulfate. The nurse should question whether the poor feeding may be a result of magnesium sulfate in the newborn's system by evaluating respiratory rate, tone, and current ability to feed. The couplet with an infant with TTN and a respiratory rate of 60 is within normal limits but should have the respiratory rate reevaluated to assure normalcy. The mother who had a cesarean section should be evaluated to determine when she will be able to go to SCN to see her infant. Urgency concerning taking her to the nursery will also depend on the condition of the newborn. The newborn of 36 weeks' gestation is currently within normal blood glucose range, but would need to be monitored frequently because of the small infant size and prior low blood glucose.

 CN: Management of care; CL: Synthesize

16. 2. When dealing with child abuse, the priority is accurate and complete

documentation of physical findings and observed behaviors on the child's record. Court proceedings usually occur sometime after the nurse's involvement with the child and family, and memories fade. Thus, careful documentation of the facts, not hearsay or subjective opinion, is essential. Objective data, not subjective opinions, are key. Preparing answers to questions that may be asked by the attorneys is not a priority for the nurse when the child is admitted. This may become appropriate later.

CN: Management of care; CL: Synthesize

17. 2. The nurse acts in a reasonable and prudent manner to correctly identify a client by checking the client's armband and asking the client's name. Omitting to do so is an act of negligence. *Res judicata* and *stare decisis* are legal doctrines used to guide the courts in making decisions. Vicarious liability is a concept in which the employer is held liable for the nurse's act. It was established after precedent-setting cases in the 1960s.

CN: Management of care; CL: Apply

18. 1. The ultimate goal is to promote urinary continence. Thus, the client being continent for 24 hours a day demonstrates definitive evidence that this goal has been met. Self-monitoring for urine retention is an important aspect of achieving the outcome, but it addresses only one area and does not reflect goal achievement. The same is true for compliance with the drinking and voiding schedule.

CN: Basic care and comfort; CL: Evaluate

19. 2, 5. Morphine can cause respiratory depression, leading to respiratory arrest. Morphine can also decrease levels of consciousness. The nurse should assess the client's respiratory rate before administration and throughout the course of analgesic treatment. The nurse should also assess the client's level of consciousness. Morphine does not affect the blood pressure, pulse rate, or body temperature.

CN: Pharmacological and parenteral therapies; CL: Analyze

20. 21 gtts/min

One unit of packed red blood cells contains 250 mL, and this is to infuse over 2 hours (120 minutes). First, determine the number of mL/min by

dividing 250 mL by 120 minutes:

$$250/120 = 2.1 \text{ mL/minute.}$$

Then, multiply by the drop factor of 10 gtts/mL:

$$2.1 \times 10 = 21 \text{ gtt/minute.}$$

CN: Pharmacological and parenteral therapies; CL: Apply

21. 1. Anger is a natural result of feelings of loss and helplessness in normal, healthy people. It is a natural response to coping with a sick child. Nurses should recognize anger in clients and families. Parents are usually able to control their anger in a socially acceptable manner. Nurses can assist clients and families to overcome helplessness and anger in an acceptable manner.

CN: Psychosocial integrity; CL: Synthesize

22. 3. Supervised activities that promote walking are behavioral management strategies that help a client such as this. The client's cognitive and memory impairment would not be conducive to playing board games. Allowing the behavior at selected intervals would further encourage the client to wander. The client should not be restrained in a chair.

CN: Psychosocial integrity; CL: Synthesize

23. 3. With a new problem of numbness in the fingers, the nurse needs to first assess the circulation to evaluate color, evidence of swelling, and presence of pulses to determine whether there is any circulatory compromise. Once the nurse has evaluated the child's circulatory status, the next action would be to verify the arm's position above the level of the heart. Notifying the **HCP**  would not be done until the child's neurovascular status and position are checked. Cutting the cast would be done only with an HCP's prescription.

CN: Physiological adaptation; CL: Synthesize

24. 1. The ideal staffing for a nursing unit focused on client teaching and learning is to have three registered nurses. It is within the scope of practice

for the **RN**  to assess, plan, implement, coordinate, and evaluate client learning. It is not within the scope of practice for **LPNs/VNs**  and **UAP**  to provide client teaching.

 CN: Management of care; CL: Synthesize

25. 3. The restraint should remain in position. Removing the restraint or untaping the restraint will risk dislodging the IV.

 CN: Safety and infection control; CL: Apply

26. 2. At the time of a major crisis, the client suffering a great loss is best helped by being encouraged to talk about his experience and describe his feelings. Crisis interventions focus on reestablishing emotional equilibrium and preventing decompensation. Telling the client that everything will be fine is a cliché and inappropriate. Asking the client to stop talking so that the nurse can write notes places more emphasis on the nurse's needs than on the client's needs. Telling the client to think more about what happened for further discussion the next day is not helping him with the crisis.

 CN: Psychosocial integrity; CL: Synthesize

27. 3. Vitamin E is a powerful antioxidant that helps to prevent oxidation of the cell membrane. Vitamins C, A, and B6 are helpful in the prevention of heart disease, but vitamin E plays a more important role.

 CN: Health promotion and maintenance; CL: Analyze

28. 1. The child's neutrophil count is low (the normal range is 3,000 to 5,000 cells/mm³ [3 to 5×10^9 /L]), predisposing the child to infection. If an infection occurs, the child will have difficulty combating it. Therefore, staff and visitors should be restricted to those without an active infection. Typically, neutropenic precautions, not strict isolation, would be used to protect the child from exposure to infection. The hospitalized child would be placed in a private room with visitors and staff screened for illnesses. Temperature would be monitored every 4 hours. Low neutrophil counts do not increase the likelihood of vomiting; therefore, an antiemetic is not needed. Increasing the child's oral fluid intake may be necessary; however, doing so is unrelated to the child's neutrophil count.

 CN: Safety and infection control; CL: Synthesize

29. 2. Beclomethasone is an inhaled steroid used for the maintenance treatment of asthma. The steroid can precipitate overgrowth of fungus, such as oral *Candida albicans*. Rinsing the mouth well after each use decreases the incidence of oral fungal infections. Beclomethasone does not cause gingival hyperplasia, ulceration, or caries.

CN: Pharmacological and parenteral therapies; CL: Evaluate

30. 1. The incident report should be given to the nurse-manager. The incident report should not be placed on the medical record 📖 because it is considered a confidential communication and cannot be subpoenaed by a client or used as evidence in lawsuits. It is appropriate, ethical, and legally required that the fall be documented in the medical record. Unless there is a change in the client's condition reflecting an injury from the fall, there is no need to notify the family. If the family does need to be notified, the nurse-manager or the HCP 📖 should place the call.

CN: Management of care; CL: Synthesize

31. 1. The client who has had three prior births and has polyhydramnios has the potential for uterine atony and would be most at risk for a postpartum hemorrhage. The client at 34 weeks with mild pregnancy-induced hypertension would be at minimal risk because the uterus is not extraordinarily distended at this gestation. The gravida 4 para 0 client, who has diet-controlled gestational diabetes, has a risk of hemorrhage from being induced, but her uterus should be able to contract appropriately after the birth as long as there is no history of macrosomia. A history of genital herpes is not a risk factor for a postpartum hemorrhage.

CN: Reduction of risk potential; CL: Analyze.

32. 2. General wound care is appropriate initially. This includes washing the bite area with lots of water because infections occur frequently with animal bites, especially those on the arms or hands. Next, the mother should be advised to follow up with the child's HCP. 📖 A trip to the local care center would be warranted if the bite injury was extensive or there was severe bleeding. Although knowledge of when the child last had a tetanus vaccination is important, the child's wound takes priority. For rabies

injections, there needs to be a history of rabies or unusual behavior in the pet.

CN: Physiological adaptation; CL: Synthesize

33. 4. Traveling is usually discouraged if preterm labor has been a problem as it restricts normal movement. A client should be able to walk around frequently to prevent blood clots and to empty her bladder at least every 1 to 2 hours. Bladder infections often stimulate preterm labor, and to prevent them is of great importance to this client. Contractions that recur indicate the return of preterm labor, and the **HCP**  needs to be notified. Dehydration is known to stimulate preterm labor, and encouraging the client to drink adequate amounts of water helps to prevent this problem.

CN: Reduction of risk potential; CL: Evaluate

34. 2. The act of screening for intimate partner violence is a key intervention to help open doors for at-risk women to discuss ways to improve their safety and well-being. Asking clients how safe they feel in their home is an open-ended, nonjudgmental way to elicit perceptions of safety. Asking if a partner is excited about a pregnancy is not a good screening question because many couples are not excited to learn of an unplanned pregnancy. However, couples with healthy relationships eventually adjust. Having an arrest record and gun ownership do not automatically equate to having a history of violence.

CN: Safety and infection control; CL: Analyze

35. 1. A significant association between feeding position and otitis media exists. Children fed in a supine position have a high incidence of otitis media because of the reflux of milk into the eustachian tubes during feedings. Keeping the infant's ears covered when out in the cold or thoroughly drying the ears after a bath has not been identified as a contributing factor to an infant's development of ear infections. Although the infant's immunization status is always important to ascertain, other factors, such as the position of the infant when taking a bottle, have more impact.

CN: Reduction of risk potential; CL: Analyze

36. 2. Chemoprophylaxis should be given to household contacts and close contacts only. To prevent community outbreaks, chemoprophylaxis with

rifampin 600 mg twice a day for 2 days or a single dose of ciprofloxacin 500 mg is indicated.

 CN: Reduction of risk potential; CL: Synthesize

37. 2. Infants and toddlers younger than age 2 should not be placed on a fat-restricted diet because cholesterol and other fatty acids are required for continued neural growth. After age 2, it is believed that no harm is done by encouraging a child to eat a variety of foods, maintain a desirable body weight, limit saturated fat and cholesterol, and increase fiber.

 CN: Health promotion and maintenance; CL: Apply

38. 4. The nurse is wearing protective personnel equipment appropriate for suctioning the client: goggles, gown, and respirator mask. It is not necessary to wear a PAPR face shield to suction a tracheostomy. A surgical mask does not provide maximum protection.

 CN: Safety and infection control; CL: Apply

39. 1. Petroleum jelly is thought to smother the lice. Lindaine and other pediculicides should not be applied to the face or close to the eyes. Bacitracin ointment will not kill the lice.

 CN: Pharmacological and parenteral therapies; CL: Apply

40. 1. A major goal of safety and accident prevention focuses on having all cleaning supplies and medications locked up as infants become mobile. The child should not play in the bathroom even if the parent is present because the child will think that it is okay to play with these items when the parent is not present. Playing with cords could lead to possible strangulation. The child-protective cabinet locks should work unless they were installed incorrectly or are defective.

 CN: Safety and infection control; CL: Evaluate

41. 3, 4, 5. Common adverse effects of tobramycin include nephrotoxicity, ototoxicity, fever, and rash. Hypertension, weight gain, and decreased heart rate are not associated with this drug.

 CN: Pharmacological and parenteral therapies; CL: Analyze

42. 4. Fever is generally not thought to be a sign of impaired renal function related to long-term use of gentamicin. The client should report signs of decreasing urinary function, such as decreased output, unusual appearance of the urine, or edema.

CN: Pharmacological and parenteral therapies; CL: Evaluate

43. 3, 2, 1, 4. The nurse first starts an IV as dehydration increases sickling of cells; maintaining fluid balance is a priority. The nurse next starts oxygen and then administers morphine for pain; these actions are followed by obtaining a blood sample for laboratory studies.

CN: Physiological adaptation; CL: Synthesize

44. 2. Febrile seizures commonly occur as the fever rises. The exact cause of febrile convulsions is not known. Infants and young toddlers are the age-groups primarily affected. Febrile seizures typically do not follow immunization administration.

CN: Health promotion and maintenance; CL: Apply

45. 1, 2, 4, 6. The nurse case manager should refer the client to a nutritionist so the client is aware of and can be monitored regarding her food intake to assure transition to a normal pregnancy diet with intake of adequate nutrients to support growth and development of the fetus. A PRN (as needed) prescription for an antiemetic is useful to overcome occasional episodes of nausea and vomiting. Encouraging a return to normal activities when the client feels ready gives the client a goal to look forward to, and activity is not contraindicated in hyperemesis when the client feels ready to initiate activity. Discussion of the plan of care and discharge instructions is a standard of care when discharging a client from a healthcare facility. There is no indication for an anxiolytic, and hyperemesis gravidarum typically is not associated with anxiety. Six weeks is too long to wait for a follow-up appointment posthospitalization.

CN: Management of care; CL: Create

46. 4. Oral contraceptive use, pregnancy, and lactation are situations that increase demand for folic acid. With supplementation, a response should cause the reticulocyte count to increase within 2 to 3 days after therapy has

begun. It is not necessary to take folic acid on an empty stomach. A client may safely take both iron and folic acid supplementation.

CN: Pharmacological and parenteral therapies; CL: Synthesize

47. 4. Although acrocyanosis may be present for 24 to 48 hours after birth, central cyanosis of the trunk indicates decreased oxygenation from respiratory distress or another disease state (e.g., cardiac anomalies). This should be reported to the **HCP**  and evaluated further. Maternal lochia serosa in scant amount is a normal finding 1 week postpartum, as is a nonpalpable maternal fundus. Presence of a neonatal tonic neck reflex is a normal finding in a 1-week-old neonate.

CN: Physiological adaptation; CL: Analyze

48. 1, 2, 3, 4. The nurse should ask the client about alcohol use because heavy alcohol use causes fluid excretion resulting in heavy losses of calcium in urine. If the client uses antacids containing aluminum or magnesium, a net loss of calcium can occur. If the client has a high-fiber diet, the fiber can bind up some of the dietary calcium. People with hip fractures have been found to have low vitamin K intakes; vitamin K plays an important role in production of at least one bone protein. Fruit juices do not affect calcium absorption.

CN: Health promotion and maintenance; CL: Analyze

49. 1. The postrape examination is important for detecting the possibility of sexually transmitted disease, which can be spread through rape. The client should also be examined for infection that can result from trauma. Additionally, if the victim or the rapist was not using a contraceptive, postcoital contraceptive methods should be discussed. The information provided does not indicate anxiety or physical injury, such as periurethral tears, and these are not the primary reason for the examination. Menstrual difficulties are not a common result of rape.

CN: Safety and infection control; CL: Synthesize

50. 3. The nurse should question the use of a local anesthetic agent with epinephrine on the hands or feet because the epinephrine is a vasoconstrictor and can cause ischemia and gangrene of extremities. The nurse should suggest that the intern use bupivacaine without epinephrine as the local

anesthetic agent. An intern should be trained in suturing small superficial incisions, and the cosmetic effect should be acceptable. The client's room should be a sufficiently aseptic environment because there is no other client in the room.

 CN: Management of care; CL: Synthesize

51. 3. Infants should be monitored for hypoglycemia, temperature stability, and respiratory distress. The answer that best includes these components is monitoring the infant feedings and vital signs. Apgar assessments are done at 1 and 5 minutes of age, not at 1 hour of age. The gestational age assessment is important for this infant, but, after completion, does not require additional monitoring. The infant should be regularly assessed for jaundice as part of the physical assessment, but this is not the priority assessment at this time.

 CN: Basic care and comfort; CL: Analyze

52. 3. In dark-skinned clients, cyanosis can best be detected by examining the conjunctiva, lips, and oral mucous membranes. Examining the retinas, nail beds, or inner aspects of the wrists is not an appropriate assessment for determining cyanosis in any client.

 CN: Health promotion and maintenance; CL: Analyze

53. 7.5 mL

$$0.9 \text{ mg} / X \text{ mL} \times 0.6 \text{ mg} / 5 \text{ mL}$$

$$X = 7.5 \text{ mL}$$

 CN: Pharmacological and parenteral therapies; CL: Apply

54. 1. A biophysical profile includes a nonstress test; evaluation of fetal breathing movements, gross body movements, and fetal tone; and amniotic fluid volume measurement. Because an ultrasound analysis is used during the test, the client should plan to drink 1 to 2 L of fluid before the test to ensure a full bladder, which provides better visualization of the fetus. The client does not need to be on nothing-by-mouth status before the test. The client does not

need to remain in the clinic for 4 hours after the test. However, if the client were scheduled for a contraction stress test, she would be observed as an outpatient for 1 to 4 hours after the test to make certain that the contractions had stopped. The client does not need to eat a high-fiber meal after the test. A high-fiber meal typically is indicated after certain radiographic procedures, such as an upper gastrointestinal series.

CN: Reduction of risk potential; CL: Apply

55. 1, 2, 4, 5. Children typically act out their feelings (such as depression and anger) in response to incest. Sexualized play, aggression, running away, and truancy are typical acting-out behaviors. Isolation at home is not common for incest victims who are preadolescents.

CN: Psychosocial integrity; CL: Analyze

56. 3. One of the staff members needs further instructions when the nurse observes the staff member wearing sterile gloves to bathe a neonate at 2 hours of age. Clean gloves should be worn, not sterile gloves. Sterile gloves are more expensive than clean gloves and are not necessary when bathing a neonate. Wearing protective goggles during a cesarean birth is a standard blood precaution. Bloody sheets should be placed in a designated container. Scalpel blades, needles, syringes, and other equipment used during birthing should be disposed of safely in appropriate, labeled containers.

CN: Safety and infection control; CL: Evaluate

57. 1, 3, 4. Delegation involves the reassignment or transfer of selected aspects of a job to selected persons in selected situations. Although responsibility for completion of a task or activity can be delegated, accountability for that task remains with the RN. In delegating nursing acts, functions, or tasks, the **RN**  must consider the nursing model to determine the appropriate delegation of assignment. Prior to delegation, the RN validates that the non-RN caregiver has orientation and experience in completion of the activity. The amount of time the nurse has does not direct the delegation procedure; the focus is on the task and capability of the staff to whom the task is delegated. It is not necessary to document that the task has been delegated and to whom; however, the outcome of the task should be documented by the nurse.

 CN: Management of care; CL: Apply

58. 2. Parents often experience greater grief when they have experienced the hope provided by the remission of their child's disease. The nurse allows the parents to express this grief. Reactions to death of a family member are not based on the age of the dying family member. No matter how well prepared the parents may be for the death of their child, it will not make coping with death easier. Family members may displace anger and frustration on the healthcare system and **healthcare providers (HCPs)**,  but death does not necessarily undermine trust.

CL: Analyze; CN: Psychosocial integrity

59. 3. Applying a water-soluble lubricant to the nares helps alleviate sore nares when an NG tube is in place. Repositioning the tube does not eliminate the possibility of irritating the nares. Irrigating the tube with a cool solution or changing positions will not relieve the local irritation from the NG tube.

 CN: Basic care and comfort; CL: Synthesize

60. 1, 5. Hindus do not eat beef. Sufficient protein can be obtained from lentils and fish.

 CN: Health promotion and maintenance; CL: Synthesize

61. 4. One outcome criterion for the client with osteoarthritis is improved joint mobility. It is probably not possible to arrest the disease. Gold compound is administered to clients with rheumatoid arthritis, not osteoarthritis. Outcome criteria should be specific; feeling better is too general to be useful.

 CN: Basic care and comfort; CL: Evaluate

62. 3. Although monitoring vital signs frequently is important, for the first few days the primary concern in burn care is fluid and electrolyte balance, with the goal being to replace fluid and electrolytes lost. With burns, fluid and electrolytes move from the interstitial spaces to the burn injury and are lost. These must be replaced. Once the child's fluid and electrolyte status has been addressed and fluid resuscitation has begun, preventing wound infection is a priority and efforts to control the child's pain can be initiated.

 CN: Reduction of risk potential; CL: Synthesize

63. 2. DTaP vaccine is given intramuscularly, usually with other vaccines. As a killed virus, it can be given to immunocompromised children.

 CN: Pharmacological and parenteral therapies; CL: Apply

64. 2, 3, 4. Diphenhydramine hydrochloride is an antihistamine that blocks the effects of histamine at receptor sites and has atropine-like effects, such as dry mouth, nausea, drowsiness, tachycardia, and thickened bronchial secretions. Weight loss and bradycardia are not adverse effects of this - medication.

 CN: Pharmacological and parenteral therapies; CL: Apply

65. 1. The client's assessment findings indicate that the client is in the latent phase of the first stage of labor. Therefore, the nurse should plan to assist the client with comfort measures and breathing techniques to relieve discomfort. The client can move around, walk, or ambulate at this phase of labor. If the client chooses to remain in bed, a left side-lying position provides the greatest perfusion. It is too early for the client to have an epidural anesthetic. Epidural anesthesia is usually administered when the cervix is dilated 4 to 5 cm. The fetal heart rate is normal, so internal fetal monitoring is not warranted at this time.

 CN: Health promotion and maintenance; CL: Synthesize

66. 4. The nurse does not administer naloxone because naloxone is the antidote for morphine, not midazolam. The benzodiazepine receptor antagonist for midazolam is flumazenil. The nurse can promote oxygenation by encouraging deep breathing and administering oxygen. Resuscitation equipment should be accessible if needed.

 CN: Reduction of risk; CL: Synthesize

67. 3. The client should be seated upright with the arms raised and crossed in front and supported by the overbed table. The client's head should rest on the arms. This position allows for outward expansion of the chest wall and promotes collection of the pleural fluid at the base of the thorax. Supine, prone, and side-lying positions will not allow for sufficient chest expansion.

CN: Reduction of risk potential; CL: Synthesize

68. 2. The stool specimen indicates the client has *E. coli* in his stool. The nurse institutes enteric precautions and ensures that those who come in contact with the child perform good hand hygiene and wear a gown to prevent spread of infection. Restoring fluid balance is a goal of therapy, but because the dehydration is mild, oral rehydration is the first choice for replacing fluids. The nurse also cleanses and protects the anal area from irritation from the diarrhea, but on an ongoing basis and not as the priority for care. It is not necessary for the family to wash all of their bed linens, as only those in contact with the client are contaminated.

CN: Safety and infection control; CL: Synthesize

69. 1. Intracellular microorganisms, such as viruses and parasites, invade the myocardium to survive. These microorganisms damage the vital organelles and cause cell death in the myocardium. The myocardium becomes weak, leading to heart failure; then T lymphocytes invade the myocardium in response to the viral infection. The T lymphocytes respond to the viral infection by secreting cytokines to kill the virus, but they also kill the virus-infected myocardium. Myocardial infarction, renal failure, and liver failure are not direct consequences of a viral or parasitic infection.

CN: Safety and infection control; CL: Analyze

70. 1, 2, 4. A National Patient Safety Goal of the Joint Commission is to accurately and completely reconcile medications across the continuum of care. The requirement is that there is a process for comparing the client's current medications with those prescribed for the client while under the care of the healthcare organization. Clients are most at risk during transitions in care (hand-offs) across settings, services, providers, or levels of care. The development, reconciliation, and communication of an accurate medication list throughout the continuum of care are essential in the reduction of transition-related adverse drug events. The client or client's family is an integral component of medication reconciliation, particularly at the point of admission to, and discharge from, a healthcare facility. Any medications that the client uses, for example, over-the-counter medications, must be included in the reconciliation process.

CN: Safety and infection control; CL: Apply

71. 2. The nurse should not accept an assignment to “float” to another nursing unit for which the nurse does not have experience or adequate preparation. The first step is to discuss the situation with the person making the assignment; if the situation is not resolved, the newly graduated nurse should ask to speak with the supervisor.

CN: Management of care; CL: Synthesize

72. 1. The nurse should notify the hospital’s security staff about anyone who appears unusual. Typically, the abductor is an older woman who wishes to have a baby. The nurse should take only one baby at a time to a mother to prevent the neonate being taken to the wrong mother. Infants should never be left in the hallway. When in the mother’s room, the infant should be placed away from the doorway to prevent or minimize the risk of abduction of the neonate. If an exit alarm is triggered, it is possible that an abductor is running away with an infant. Staff members should investigate the alarm immediately and stop the potential abductor. Hospital security can be alerted if someone is seen exiting the unit carrying a large bag or an infant.

CN: Management of care; CL: Synthesize

73. 2. Amiodarone is metabolized in the liver and excreted in the bile and feces. Liver toxicity has been reported with the use of this drug, so the nurse will want to monitor the client’s liver enzymes. Amiodarone does not affect hemoglobin, CK, or renal function.

CN: Pharmacological and parenteral therapies; CL: Apply

74. 4. The teenage girl has scoliosis, the lateral deviation of the spine. Kyphosis is noted by a forward curvature of the shoulders. Lordosis is an inward curvature of the lower back. Hip dysplasia is noted in older children by pain, but it is usually diagnosed before the child walks by noting excessive gluteal folds and limited hip abduction.

CN: Health promotion and maintenance; CL: Analyze

75. 3. The client is exhibiting symptoms that are consistent with hyperglycemia. The **RN**  does not give any additional glucose. All of the

other interventions are appropriate for this client. The new graduate RN notifies the **healthcare provider (HCP)**  about the assessment findings.

 CN: Management of care; CL: Analyze

76. 1. The cause of endogenous depression is believed to be biochemical and not a reaction to a loss. It is caused by an imbalance or decreased availability of norepinephrine, serotonin, and possibly dopamine, so the client cannot identify a specific outside cause or a loss. Reactive depression is a reaction to a loss or a stressor. It is wrong to consider that lack of trust and slow thinking are reasons why the client will not identify the cause of his depression. Problems and stressors from past childhood conflicts may be present; however, the client can discuss them with the staff when he is willing or able.

CN: Management of care; CL: Synthesize

77. 2. Yogurt is high in protein because it is made from milk. The other choices are much higher in carbohydrates than protein except for bacon, which is higher in fat.

 CN: Reduction of risk potential; CL: Apply

78. 3. If the gastric balloon should rupture or deflate, the esophageal balloon can move and partially or totally obstruct the airway, causing respiratory distress. The client must be observed closely. No direct action should be taken until the condition is accurately diagnosed.

 CN: Reduction of risk potential; CL: Synthesize

79. 4, 3, 2, 1. Clients with myasthenia crisis have severe muscle weakness that may result in respiratory failure requiring mechanical ventilation. The nurse's first action is to focus on assuring an adequate airway by preparing for intubation. The nurse can then assess for a gag reflex for risk of aspiration. Once the airway and risk for aspiration are assured, the nurse can assess the client for infection and medication schedule.

 CN: Physiological adaptation; CL: Synthesize

80. 3. Pediculosis capitis, or head lice, can be spread by close contact or sharing of headgear or combs and brushes with other children. Sharing craft

supplies, swimming, and showering usually do not provide close enough contact to permit transmission.

CN: Safety and infection control; CL: Synthesize

81. 1. In the first trimester, ultrasound scanning typically is prescribed to determine the gestational age. This is especially important for a client with a history of irregular menstrual cycles to establish an accurate birth date. There is no reason at this point in pregnancy to determine whether twins are present. This might be indicated if the fundal height were larger than the gestational age may indicate. Identifying the gender of the fetus is not a reason for an ultrasound examination unless there is a history of sex-linked genetic disorders. Pelvic adequacy can be determined by physical examination. If the client has a borderline pelvis, an ultrasound scan cannot confirm this. Pelvimetry can be done, but it is not performed as frequently as it once was.

CN: Health promotion and maintenance; CL: Apply

82. 1. The oxygen levels for this neonate have dropped during the last 8 hours; the nurse should administer oxygen, as the neonate is not obtaining adequate oxygenation on room air. The recommended pulse oximetry reading in a term neonate is 95% to 100%. Keeping the neonate warm may improve the oxygen saturation if that is the cause of the poor gas exchange, but overheating with warm blankets may increase oxygen demand. Waiting to reassess the neonate could cause the neonate to have inadequate oxygen levels unnecessarily. While blood gases may be drawn, the first action is to administer the oxygen.

CN: Management of care; CL: Synthesize

83. 2. The nurse should prepare to insert an NG tube. The data collected provide evidence that the client is experiencing an upper gastrointestinal bleed secondary to a peptic ulcer. The client will be placed on nothing-by-mouth status, and an NG tube will be inserted to provide gastric decompression and alleviate vomiting. Administering antiemetics is not a priority action for a client who is hypotensive and vomiting coffee-ground emesis. Assessment of client stressors is appropriate after emergency care has been provided and the client stabilized. A modified Trendelenburg position is

inappropriate for clients who are vomiting.

CN: Reduction of risk potential; CL: Synthesize

84. 1. The client with preeclampsia would be a candidate for the induction process because ending the pregnancy is the only way to cure preeclampsia. A client with active herpes would be a candidate for a cesarean section to prevent the fetus from contracting the virus while passing through the birth canal. The woman with a face presentation will not be able to give birth vaginally due to the extended position of the neck. The client whose fetus exhibits late decelerations without oxytocin would be at greater risk for fetal distress with use of this drug. Late decelerations indicate the fetus does not have enough placental reserves to remain oxygenated during the entire contraction. This client may require a cesarean section.

CN: Management of care; CL: Synthesize

85. 3. The sudden onset of bright red drainage of this magnitude needs to be further assessed. Assessing vital signs is an important nursing action to determine whether there have been any changes in the client's status. Additional steps would include reinforcing the dressing and notifying the **healthcare provider (HCP)**.  Increasing the IV flow rate does not address the bleeding. Changing the dressing would be done only if the HCP prescribed it.

CN: Reduction of risk potential; CL: Synthesize

86. 1. Because the client with ADHD is easily distractible, it is important to obtain eye contact before explaining the task. Simple language and having him repeat what he is told are necessary because of his age. Praise encourages the client to repeat the task in the future as well as building the client's self-esteem. A full explanation with verbal praise and a food reward is inappropriate because a food reward increases the chance that he will expect a physical reward for completing tasks. In addition, a full explanation might be too confusing for someone his age. Explaining consequences focuses on punishment, rather than praise. Although demonstration and imitation is an effective teaching method, rewarding with food fosters dependence on food reward for task completion.

 CN: Psychosocial integrity; CL: Synthesize

87. 1. A normal blood is 70 to 110 mg/dL. Hypoglycemia is an immediate concern. When the brain does not have enough glucose, the client will become rapidly unconscious, and, if uncorrected, seizures and death can result. A reading of 100 mg/dL is normal, and no intervention is necessary. Readings of 150 and 200 mg/dL are elevated and could cause complications, but complications from the elevation would not occur as rapidly.

 CN: Reduction of risk potential; CL: Analyze

88. 4, 1, 2, 3. The goal that has the highest priority when a client has a massive bleed from esophageal varices is to maintain a patent airway. The nurse should position the client to prevent aspiration and assess respirations and oxygen saturation. The nurse should then assist the **healthcare provider (HCP)**  in controlling the hemorrhage by using esophageal balloon tamponade. Octreotide may be administered to reduce portal pressure. The third priority is to restore circulating blood volume with blood and IV fluids. Esophageal bleeding is an anxiety-provoking event for the client, and although lifesaving measures are the priority, the nurse and healthcare team should explain procedures to the client and provide reassurance as needed.

 CN: Physiological adaptation; CL: Synthesize

89. 4. A client who is taking phenelzine, a monoamine oxidase inhibitor, needs to avoid foods that are rich in tyramine because this food-drug - combination can cause hypertensive crisis. The client should be given a list of foods to avoid and should report headaches, palpitations, and a stiff neck to the **healthcare provider (HCP)**  immediately. The client does not need to restrict or add salt to the diet. Drinking 10 to 12 glasses of water each day is important to teach the client who is receiving lithium therapy. Antidepressant drugs take 2 to 4 weeks to achieve therapeutic effects.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

90. 3. Clients with open fractures are particularly susceptible to infections. If not treated promptly, these infections can lead to the development of osteomyelitis. Localized symptoms of osteomyelitis include tenderness, swelling, and warmth at the site of infection, as well as unrelieved severe

bone pain. Systemic symptoms include fever, chills, night sweats, and malaise. Avascular necrosis occurs when the blood supply to a bone is interrupted, most commonly in intracapsular hip fractures. Compartment syndrome is most commonly associated with fractures of the distal humerus and proximal tibia; it results from an increase in pressure on the nerves and blood supply within a closed tissue compartment. Fat embolism syndrome is associated most frequently with fractures of the long bones, ribs, and pelvis, which may or may not be open fractures.

CN: Reduction of risk potential; CL: Analyze

91. 3. Sharing needles is associated with increased incidence of blood-borne diseases such as hepatitis B. Hepatitis B is not spread through marijuana use. Acetaminophen taken in large amounts can cause severe hepatic necrosis but does not cause hepatitis B. Contaminated seafood is responsible for transmission of hepatitis A.

CN: Safety and infection control; CL: Evaluate

92. 3. The nurse should confirm the client's concern about taking psychiatric medications. Suggesting that he feels guilty is probably too direct, may not be accurate, and may cut off further discussion. Expressing concern is likely to promote further discussion about the reasons for his concern. Telling the client he is correct feeds any fear or guilt he may feel, and telling him not to worry demeans his concerns.

CN: Psychosocial integrity; CL: Apply

93. 3. The retina is especially susceptible to damage in a client with chronic hypertension. The arterioles supplying the retina are damaged. Such damage can lead to vision loss. The iris, cornea, and sclera are not affected by hypertension.

CN: Physiological adaptation; CL: Analyze

94. 3. Milia are white papules resulting from plugged sebaceous ducts that disappear by age 2 to 4 weeks. Parents should be instructed to avoid scratching them to prevent secondary infection. Term neonates generally have many creases on the soles of their feet. Preterm neonates may have only a few creases due to their immaturity. Strawberry hemangiomas are elevated

areas formed by immature capillaries that will disappear over time. Port-wine stains are deep, dark red discolorations that require laser therapy for removal. Erythema toxicum is a newborn rash or “flea bite” rash that requires no treatment and disappears over time.

CN: Health promotion and maintenance; CL: Synthesize

95. 4. Clients with fractures of the long bones such as the femur are particularly susceptible to fat embolism syndrome (FES). Signs and symptoms include chest pain, dyspnea, tachycardia, and cyanosis. Changes in mental status are caused by hypoxemia and can be the first symptoms noted in FES. The client can also be restless and febrile and can develop petechiae. Osteomyelitis is infection of the bone; signs and symptoms of osteomyelitis do not include respiratory symptoms. Compartment syndrome causes signs of localized neurovascular impairment, not systemic symptoms. Venous thrombosis occurs in the lower extremities and is caused by venous stasis.

CN: Reduction of risk potential; CL: Analyze

96. 1. The client should be taught how to prevent the spread of hepatitis B to others. The client should eat a well-balanced, nutritional diet. There is no need to restrict sodium or protein. Sedatives should be avoided because these are usually detoxified by the liver. It is not necessary for the client to be isolated from family and friends.

CN: Safety and infection control; CL: Evaluate

97. 2. In this situation, the nurse should call a community meeting. The community meeting serves as a forum for clients to voice their opinions about the environment, receive feedback from staff and other clients, and discuss community concerns, including exploring the problems of daily living. The community meeting can be used to increase peer support and handle confrontation when necessary. For adolescents, peer pressure is generally more effective in changing behavior than the staff’s influence. Telephoning the client’s parents or urging the client to tell on his friends is authoritative and may lead to increased mistrust of the staff. Calling a primary care provider is not necessary at this time. Rather, a community meeting would be helpful to discuss the problem.

CN: Management of care; CL: Synthesize

98. 2. A report about the client's condition should be as clear, pertinent, and concise as possible. It should be free of subjective information that could be interpreted differently by different caregivers. The report mentioning that a specimen was sent to the laboratory does not indicate how much urine had been drained from the client's bladder and how the urine appeared. The report describing the client as cooperative is subjective and provides only limited client data. The report that mentions that the client was in the ED for 3 hours does not mention the treatment provided.

 CN: Management of care; CL: Create

99. 1, 3, 4. As the homeostatic responses begin to decompensate, late clinical manifestations from a large overdose of sympathomimetic agents include loss of function of the hypothalamus such as temperature regulation, leading to profound pyrexia, and ectopic brain activity leading to seizures. Hypotension is a late sign that occurs as the vascular system collapses. Hypertension, an earlier sign, precedes hypotension. Tachycardia occurs as a reflex to hypotension, a late sign.

 CN: Pharmacological and parenteral therapies; CL: Analyze

100. 2. A small tuft of hair and an indentation at the base of the neonate's spine is termed spina bifida occulta. This condition usually occurs between the L5 and S1 vertebrae with failure of the vertebrae to completely fuse. There are usually no sensory or motor deficits with this condition. Spina bifida cystica includes meningocele, myelomeningocele, and lipomeningocele. Meningocele is characterized by a saclike protrusion filled with spinal fluid and meninges. Usually, this condition is associated with sensory and motor deficits. Myelomeningocele is characterized by a saclike protrusion filled with spinal fluid, meninges, nerve roots, and spinal cord. With myelomeningocele, there are usually sensory and motor deficits.

 CN: Health promotion and maintenance; CL: Analyze

101. 2. Indwelling catheters are considered to be a major contributor to nosocomial infections. Any client with an indwelling catheter is at high risk for developing a urinary tract infection. A history of previous childbirths does not necessarily predispose a client to urinary tract infections. Clients with a history of renal calculi are not necessarily at risk for developing urinary tract

infections unless the renal calculi recur. Clients with diabetes mellitus are at a higher risk for developing urinary tract infections, but this risk can be decreased by maintaining good control over blood glucose levels.

 CN: Management of care; CL: Analyze

102. 3, 4. The nurse should use at least two sources of identification prior to administering medication to any client, such as the medical record  number and the client's date of birth. It is not safe practice to ask the parent or a nurse to verify the correct neonate. It is also not safe to use the room number or crib number as a source of identification because neonates' locations in the hospital change frequently.

 CN: Safety and infection control; CL: Apply

103. 4. Caffeinated beverages and alcohol should be avoided because they stimulate gastric acid production and irritate gastric mucosa. The client should avoid foods that cause discomfort; however, there is no need to follow a soft, bland diet. Eating six small meals daily is no longer a common treatment for peptic ulcer disease. Milk in large quantities is not recommended because it actually stimulates further production of gastric acid.

 CN: Reduction of risk potential; CL: Evaluate

104. 3. When a client with a NG tube exhibits abdominal distention, the nurse should first check the suction machine. If the suction equipment is functioning properly, then the nurse should take other steps, such as repositioning the tube or checking tube patency by irrigating it. If these steps are not effective, then the **HCP**  should be called.

 CN: Reduction of risk potential; CL: Synthesize

105. 4. Increased, not decreased, body temperature resulting from occupations or infections can contribute to low sperm counts caused by decreased sperm production. Heat can destroy sperm. Varicocele, an abnormal dilation of the veins in the spermatic cord, is an associated cause of a low sperm count. The varicosity increases the temperature within the testes, inhibiting sperm production. Frequent use of saunas or hot tubs may lead to a low sperm count. The temperature of the scrotum becomes elevated, possibly

inhibiting sperm production. Endocrine imbalances (thyroid problems) are associated with low sperm counts in men because of possible interference with spermatogenesis.

CN: Reduction of risk potential; CL: Evaluate

106. 1. The primary purpose of instilling 5 mL of normal saline solution before suctioning a tracheostomy tube is to thin the secretions to be suctioned. The saline may stimulate a cough; however, this is not the reason for using saline. The tracheostomy tube is larger than the suction catheter, so the catheter will easily pass into the tube without lubrication. Humidification is provided by a nebulizer if needed.

CN: Reduction of risk potential; CL: Evaluate

107. 3. The client with emphysema has a chronically elevated carbon dioxide level. As a result, the normal stimulus for breathing in the medulla becomes ineffective. Instead, peripheral pressoreceptors in the aortic arch and carotid arteries, which are sensitive to oxygen blood levels, stimulate respirations. This is in response to low oxygen levels that have developed over time. If the client receives high concentrations of oxygen, the blood level of oxygen will rise excessively, the stimulus for respiration will decrease, and respiratory failure may result. Oxygen is not cooled. Humidification or administration of the oxygen through nasal cannula will not prevent depressed ventilation if the flow rate of the oxygen is too high.

CN: Physiological adaptation; CL: Apply

108. 1. The nurse should not administer drugs without a complete prescription. In this case, the prescription does not contain information about dosage and uses abbreviations that can cause confusion. The surgeon must write a prescription using complete dosages and without abbreviations before the nurse administers the drugs. Relying on the pharmacist for clarification is inappropriate.

CN: Management of care; CL: Synthesize

109. 4. Vaginal tissue can be atrophic while breast-feeding, so the use of a water-based lubricant can help with discomfort and lubrication during intercourse. Ice is applied to decrease breast milk supply, and ace bandages

are only used to dry up breast milk. Fruit juice is a health drink while breast-feeding.

CN: Health promotion and maintenance; CL: Apply

110. 3. The client should be encouraged to join the community arthritis support group so that she can share her feelings with others who are facing similar experiences with this chronic illness and can identify with her concerns. A hobby will not help her resolve her feelings of being alone. Seeking counseling or discussing her feelings with a minister may be helpful, but these activities will not necessarily help the client to understand that there are many individuals who must adjust their lifestyles because of arthritis and that she is not alone.

CN: Health promotion and maintenance; CL: Synthesize

111. 2. For the client who is unable to sit through meals to maintain adequate nutrition, the nurse should offer the client nutritious finger foods and fluids that he can consume while “on the run.” Foods high in protein and carbohydrates, such as half of a peanut butter sandwich, will help to maintain nutritional needs. Adequate fluid intake is necessary, especially if the client has been started on lithium therapy. Directing the client to his room to eat is not helpful because the client will not stay in his room long enough to eat. Asking the client’s family to bring his favorite foods or asking the client about his food preferences is not helpful in ensuring adequate nutrition for the hyperactive client who is unable to sit and eat.

CN: Basic care and comfort; CL: Synthesize

112. 4. Telling the client to get her laundry and then showing her how to use the machine helps keep the client from becoming overly dependent on the nurse, establishes boundaries between the client and the nurse, and promotes positive self-worth. The statement “Sure, I have time; I will do it for you” is not therapeutic because it increases the client’s dependency. Telling the client that she will have to wait because the nurse does not have time dismisses the client and insinuates that the nurse will do the laundry later, thus fostering dependency. Asking “Can your family do it for you?” is not appropriate because the client is capable of doing her own laundry. This statement places responsibility on the family instead of the client.

 CN: Psychosocial integrity; CL: Synthesize

113. 2. Early signs and symptoms of hypermagnesemia include drowsiness, lethargy, nausea, and vomiting. Flushed skin is a sign of hypernatremia. Severe thirst is associated with hyperglycemia. Tremors are associated with hypomagnesemia.

 CN: Reduction of risk potential; CL: Analyze

114. 4. Sitting or holding a child upright for formula feedings helps prevent pooling of formula in the pharyngeal area. When the vacuum in the middle ear opens into the pharyngeal cavity, formula (along with bacteria) is drawn into the middle ear. Cleaning the ear canals does not reduce the incidence of otitis media because the pathogenic bacteria are in the nasopharynx, not the external area of the ears. Continuous low-dose antibiotic therapy is used only in cases of recurrent otitis media, when the child finishes a course of antibiotics but then develops another ear infection a few days later. Although accumulation of cerumen makes it difficult to visualize the tympanic membrane, it does not promote inner ear infections.

 CN: Health promotion and maintenance; CL: Evaluate

115. 3. Calling a client “contrary” is critical in nature and judgmental on the nurse’s part. It is inappropriate for the nurse to make a comment like this at shift report or at any time. The other statements provide important and appropriate information (diagnosis, **healthcare provider’s [HCP’s]**  name, pain relief strategies, and evaluation of ambulation).

 CN: Management of care; CL: Apply

116. 1. The nurse should teach personnel to communicate with clients who are withdrawing from alcohol and street drugs in a calm, matter-of-fact manner, using short sentences and a moderate tone of voice. This approach promotes orientation, reinforces cognitive-perceptual functions, and decreases anxiety. A cheerful tone and humor are inappropriate, possibly leading to misperceptions by the client with cognitive-perceptual impairment. Using general and abstract terms and a loud tone of voice increases anxiety and may lead to misunderstanding. Lengthy explanations delivered with a quiet voice will lead to frustration and increased anxiety.

 CN: Psychosocial integrity; CL: Evaluate

117. 3. The best opportunity for a successful pregnancy is when the normal menstrual cycle is created either naturally or through hormonal augmentation. Implantation can occur only when the levels of estrogen and progesterone are at particular levels. For many women, more than one fertilized egg is placed into the uterus. This increases the risk that more than one embryo will implant and reach maturity. Couples can choose to utilize their own eggs and sperm if they have been determined to be healthy, or they can choose to use donor oocytes and sperm. For many women who utilize in vitro fertilization, a career has taken precedence over having a family, and these women will need to rebalance a career with the demands of pregnancy and parenting.

 CN: Physiological adaptation; CL: Evaluate

118. 1, 3, 4, 5. Vitamins B6, B12, and iron are important in the production of red blood cells. Therefore, the nurse should question the client specifically about food intake that contains these vitamins and minerals. Vitamin C helps iron absorption and plays a small role in red blood cell production. Vitamin K has little role in the production of red blood cells.

 CN: Health promotion and maintenance; CL: Analyze

119. 1. During the emergent phase of burn care, one of the most significant problems is hypovolemic shock. The development of hypovolemic shock can lead to impaired blood flow through the heart and kidneys, resulting in decreased cardiac output and renal ischemia. Efforts are directed toward replacing lost fluids and preventing hypovolemic shock. Preventing infection and controlling pain are important goals, but preventing circulatory collapse is a higher priority. It is too early in the stage of burn injury to promote wound healing.

 CN: Physiological adaptation; CL: Synthesize

120. 2. A client with multiple sclerosis may have a sense of optimism and euphoria, particularly during remissions. Euphoria is characterized by mood elevation with an exaggerated sense of well-being. Inappropriate laughter, slurring of words, and visual hallucinations are uncharacteristic of euphoria.

 CN: Psychosocial integrity; CL: Analyze

121. 1. The “rule of nines” is used to estimate the percentage of the client’s body surface area that was burned. Medical treatment, including fluid volume replacement therapy, is based on the percentage of body surface area burned. Rehabilitation needs are identified after the extent of the burn is established and are directed toward preserving the client’s functional ability. Respiratory needs are determined by the location of the burn and the potential for injury from inhalation in addition to vital signs and oxygenation levels.

 CN: Reduction of risk potential; CL: Analyze

122. 2. The “click” the nurse feels when abducting the femur is made by the head of the femur as it slips into the acetabulum. This is Ortolani’s sign and indicates a dislocated hip. This is not a normal finding for a 2-month-old. The nurse needs to gather additional information by checking for unequal leg lengths and asymmetry of the gluteal and thigh folds. Once the nurse has obtained additional assessment information, the nurse would notify the healthcare provider (HCP) . Usual medical treatment involves keeping the hip joint in an abducted position in a Pavlik harness. The goal of treatment is to keep the head of the femur centered in the acetabulum. Treatment needs to begin as soon as possible. Usually, the earlier treatment is started, the better the outcome.

 CN: Health promotion and maintenance; CL: Synthesize

123. 4. Warfarin sodium interferes with clotting. The nurse should monitor the PT and evaluate for the therapeutic effects of coumadin. A therapeutic PT is between 1.5 and 2.5 times the control value; the PT should be established by the **healthcare provider (HCP)**.  It may also be reported as an international normalized ratio, a standardized system that provides a common basis for communicating and interpreting PT results. The PTT is monitored in clients who are receiving heparin therapy. Serum potassium levels and ABG values are not affected by warfarin.

 CN: Pharmacological and parenteral therapies; CL: Analyze

124. 4. The lower abdominal pain is most likely caused by bladder spasms. A common cause of bladder spasms after TURP is blood clots

obstructing the catheter; therefore, the nurse's first action should be to assess the patency of the catheter. Auscultating the abdomen for bowel sounds would be appropriate after patency of the catheter has been established. The nurse should assess for bladder spasms before administering an analgesic. A sitz bath would not relieve bladder spasms that are caused by an obstructed catheter.

CN: Physiological adaptation; CL: Synthesize

125. 3. The nurse should first determine whether the client received the last dose of imipenemcilastatin. If the client did not receive the last dose, the nurse should notify the **healthcare provider (HCP)**  that the client did not receive the dose, receive prescriptions, document, implement the prescriptions, and complete an incident report. The nurse should not automatically discard the partial fill of imipenem-cilastatin found at the client's bedside until further investigation is done. The nurse should recognize the cost of medications such as imipenem-cilastatin and consult the pharmacist after identifying information on the partial fill bag that was found. After verifying all information, the nurse can administer the new partial fill of imipenemcilastatin so that the client can receive the antibiotic on time.

CN: Safety and infection control; CL: Synthesize

126. 2. For a client with moderate anxiety, the nurse should initially lead the client to a less stimulating environment and help him discuss his feelings. Doing so helps the client to gain control over anxiety that could be overwhelming. Telling the client that it would be best to lie down until he is calmer is not appropriate because the client is too anxious to benefit from this intervention. Suggesting that the client try relaxation exercises could be helpful after the nurse takes the client to a less stimulating environment and allows the client to vent and discuss his feelings. Getting some medication to help the client relax is an intervention that the nurse would carry out later after trying to help the client decrease anxiety through ventilation and relaxation exercises.

CN: Psychosocial integrity; CL: Synthesize

127. 1. Clients who are receiving anticoagulant therapy should consult the **HCP**  before undergoing any dental work that will cause bleeding such as

a tooth extraction. The dentist should also be aware that the client is taking anticoagulants. A soft toothbrush is desirable for oral hygiene if the client is receiving anticoagulant therapy; it helps prevent the gums from bleeding. Rectal suppositories are contraindicated during anticoagulant therapy because their insertion may cause bleeding. Stool softeners may be used instead to prevent straining, which also may promote bleeding. Green leafy vegetables should not be eaten in excess because of their vitamin K content, which may alter the effectiveness of the anticoagulant therapy.

CN: Pharmacological and parenteral therapies; CL: Synthesize

128. 3. Increasing the client's fluid intake to 3,000 mL/day, unless contraindicated, is the most appropriate action. Typically, clients who are - immobilized by skeletal traction are given stool softeners. Treating constipation with diet, increased fluids, and stool softeners is preferred to the administration of an enema. Placing the client on the bedpan will not encourage a bowel movement. Range-of-motion movements maintain joint mobility but do not stimulate peristalsis.

CN: Reduction of risk potential; CL: Synthesize

129. 1, 3, 4, 5. Although about 50% of diarrhea in clients receiving tube feedings is caused by sorbitol-containing medications, the nurse should assess for other possible causes. Diarrhea can occur as a result of bacterial contamination if fresh formula is not used or stored in a refrigerator, or if the feeding apparatus is not changed at least every 24 hours. Lactose intolerance, rapid formula administration, low serum albumin level, and hypertonic solutions may also cause diarrhea. Hypotonic solutions would not be a likely cause of diarrhea, abdominal distention, or cramping.

CN: Basic care and comfort; CL: Synthesize

130. 4. Risk factors for postoperative pulmonary complications include malnourishment, which is indicated by the low weight relative to the client's height. Although keeping feelings inside can be problematic, it would not be considered a postoperative risk for pulmonary complications. The absence of dyspnea on exertion is not indicative of postoperative complications. The client's age does not necessarily place her at increased risk.

CN: Health promotion and maintenance; CL: Analyze

131. 2. Administering an antiemetic before beginning chemotherapy and then routinely around the clock helps prevent nausea and vomiting. Waiting until the client requests it may be too late because nausea is already present.

CN: Pharmacological and parenteral therapies; CL: Synthesize

132. 1. Greenish-colored amniotic fluid is caused by the passage of meconium, usually secondary to a fetal insult during labor. Meconium passage also may be related to an intact gastrointestinal system of the neonate, especially those neonates who are full term or of postdate gestational age. Amnioinfusion may be used to treat the condition and dilute the fluid. Cloudy amniotic fluid is associated with an infection caused by bacteria or a sexually transmitted disease. Severe yellow-colored fluid is associated with Rh incompatibility or erythroblastosis fetalis.

CN: Health promotion and maintenance; CL: Analyze

133. 1. The pH of 7.24 indicates that the client is acidotic. The carbon dioxide level is normal, but the HCO_3^- level is decreased. These findings indicate that the client is in metabolic acidosis. This laboratory report does not indicate that the client is in metabolic alkalosis, respiratory alkalosis, or respiratory acidosis. This laboratory report does not indicate that the client is in metabolic alkalosis, respiratory alkalosis, or respiratory acidosis.

CN: Reduction of risk potential; CL: Analyze

134. 3. Black, tarry stools indicate the presence of a slow upper gastrointestinal bleed. The longer the blood is in the system, the darker it becomes as the hemoglobin is broken down and iron is released. Vital sign changes, such as an increased pulse, are not evident with slow gastrointestinal bleeds. Nausea and abdominal cramps can occur but are not definitive signs of gastrointestinal bleeding.

CN: Physiological adaptation; CL: Analyze

135. 2. This client has lived with the diagnosis of coronary syndrome for 4 years, and, depending on the progression of the illness, the learning needs may have changed. The client may at this time have more questions about the illness and how to manage it. The nurse does not assume that the client is stable and knowledgeable about the illness just because the diagnosis was

made 4 years ago. Clients are sometimes less likely to want to learn during hospitalization because they are not feeling well enough to learn.

CN: Health promotion and maintenance; CL: Synthesize

136. 1. Most adolescents with Osgood-Schlatter disease are able to continue to exercise and use ice afterward. Ibuprofen also may be prescribed. Because Osgood-Schlatter disease is self-limited, crutches or physical therapy is usually unnecessary, and the adolescent usually does not need to stop playing sports. Only in severe cases would the adolescent have to stop playing sports.

CN: Physiological adaptation; CL: Synthesize

137. 3. Iron supplements will darken the stools. Iron supplements should not be taken on an empty stomach because they can cause gastric irritation. Iron is constipating, and a daily bulk-forming laxative should be started prophylactically. A straw should be used when taking liquid iron to avoid discoloring the teeth.

CN: Pharmacological and parenteral therapies; CL: Apply

138. 1. A client with generalized anxiety disorder needs to learn cognitive and behavioral strategies to cope with anxiety appropriately. In doing so, the client's anxiety decreases and becomes more manageable. The client may need assertiveness training, reframing, and relaxation exercises to adaptively deal with anxiety. The nurse should not encourage the client to seek avoidance or denial, but rather be engaged using cognitive and behavioral strategies. The client should not withdraw from role responsibilities or relationships. The client does not need additional rest or sleep.

CN: Psychosocial integrity; CL: Synthesize

139. 4. Deep breathing helps prevent microatelectasis and pneumonitis and also helps force air and fluid out of the pleural space into the chest tubes. It does not decrease blood flow to the lungs or control the rate of air flow. The diaphragm is the major muscle of respiration; deep breathing causes it to descend, thereby increasing the ventilating surface.

CN: Reduction of risk potential; CL: Apply

140. 2. When applying an elastic bandage to a leg, start at the distal end and move toward the trunk in order to support venous return. Tension should be kept even and not increased with each turn to prevent circulatory impairment. Overlapping each layer twice when wrapping can also impair circulation. The clips securing the bandage should be placed on the outer aspect of the leg to avoid creating a pressure point on the other leg.

CN: Reduction of risk potential; CL: Evaluate

141. 1. Spermicidal agents work by destroying the spermatozoa before they enter the cervix. In addition, some spermicides alter the vaginal pH to a strong acidic environment, which is not conducive to survival of spermatozoa. Spermicides do not prevent the spermatozoa from entering the uterus, but the diaphragm or condom is a barrier.

CN: Pharmacological and parenteral therapies; CL: Apply

142. 4. A low dosage of sertraline is helpful in controlling dementia-induced paranoia and hallucinations. Methylphenidate would be indicated for attention deficit hyperactivity disorder. Lorazepam would be prescribed if the client were anxious and agitated. Trazodone would be used if depression were prominent.

CN: Pharmacological and parenteral therapies; CL: Synthesize

143. 1. Increased fremitus can be present in bacterial pneumonia, indicating the presence of pulmonary consolidation. Additional findings would include crackles, bronchial breath sounds, and dullness on percussion. Bilateral expiratory wheezing and resonance on percussion are not present in bacterial pneumonia. Vesicular breath sounds are normal and would not be an expected finding in bacterial pneumonia.

CN: Physiological adaptation; CL: Analyze

144. 3. Acute pancreatitis is very painful; management involves interventions for pain. Although alcohol abuse is often implicated in pancreatitis, drug and alcohol counseling will be an individual consideration. Risk for injury and ineffective airway clearance are not typically associated with acute pancreatitis.

CN: Basic care and comfort; CL: Synthesize

145. 3. A hydrocele, defined as fluid in the processus vaginalis, is determined when the scrotal sac can be transilluminated. A swelling in the scrotal area that can be reduced indicates an inguinal hernia. Both hydroceles and hernias can enlarge the scrotal sac, and both can be either unilateral or bilateral. A hernia typically is more obvious during crying.

CN: Reduction of risk potential; CL: Analyze

146. 1. The screening protocol recommended by the American and Canadian Cancer Societies for early detection of cancer in asymptomatic people includes the following: Beginning at age 50, men and women should have fecal occult blood testing, flexible sigmoidoscopy, or colonoscopy every year until age 75 unless determined otherwise by a **healthcare provider (HCP)**. A diet low in saturated fat and high in fruit and fiber is not a screening protocol but is good dietary advice for all clients.

CN: Health promotion and maintenance; CL: Apply

147. 1, 2, 5, 6. To treat a low blood glucose level, the nurse should provide the client with approximately 15 g of carbohydrate and monitor the blood glucose level within 15 minutes. The orange juice, milk, bread, or soda would provide approximately 15 g of carbohydrate. Meat or fish, such as tuna, does not contain carbohydrate. Processed peanut butter may contain small amounts of carbohydrate, but it is also high in fat and protein. Peanut butter is not a good option to raise a blood glucose level in a timely manner.

CN: Reduction of risk potential; CL: Synthesize

148. 3. Increased ICP can cause vomiting, particularly in children whose fontanelles are closed. An infant with an open anterior fontanelle may have less vomiting because the cranium can respond, expanding with increased ICP. The best course of action is to wait a few minutes and then refeed the child. Putting the child on NPO status may not be helpful because this is not a gastrointestinal problem. Because this is an expected event, notifying the **healthcare provider (HCP)** is not necessary. Antiemetics frequently make a client sleepy, making neurologic checks difficult to interpret.

CN: Physiological adaptation; CL: Synthesize

149. 1. The air is injected into the long-acting insulin first. Air is then

injected into the short-acting insulin, and the short-acting insulin is withdrawn. Then the long-acting insulin is withdrawn. It does matter which insulin is drawn up first because the nurse does not want to contaminate the short-acting insulin with the long-acting insulin. It is not necessary to use a high-dose insulin syringe to prepare 28 units of insulin.

 CN: Pharmacological and parenteral therapies; CL: Apply

150. 2. Solids should be introduced at 6 months. Full-term infants use up their prenatal iron stores within 4 to 6 months after birth. Milk contains insufficient iron.

 CN: Health promotion and maintenance; CL: Apply

151. 4. Incentive spirometry promotes lung expansion and increases respiratory function. When used properly, an incentive spirometer causes sustained maximal inspiration and increased cardiac output. Incentive spirometry does not directly promote circulation in the extremities. Using incentive spirometry will not help relieve pain or strengthen abdominal muscles.

 CN: Reduction of risk potential; CL: Evaluate

152. 3. Diminished breath sounds during an acute asthma attack are a serious sign of airway obstruction, fatigue, and impending respiratory failure. Wheezing, coughing, and the production of sputum indicate the presence of airflow through the lungs and are less ominous symptoms.

 CN: Physiological adaptation; CL: Analyze

153. 1. Clients should use an electric razor, instead of a straight-edge razor, on any skin areas that are receiving radiation. The skin should be cleaned daily with a mild soap, not harsh antibacterials. Lotion should be removed from the skin before any treatment and then reapplied after the treatment. The radiated skin area needs to be kept clean, dry, and open to air.

 CN: Basic care and comfort; CL: Synthesize

154. 3. A moderate amount of bloody drainage could indicate active bleeding. The priority action is to apply pressure to the area and call for help. Assessing the airway or pulse or administering oxygen does not address the

bleeding.

CN: Reduction of risk potential; CL: Synthesize

155. 4. Because valproic acid is associated with thrombocytopenia and hypofibrinogenemia, routine follow-up blood work would consist of monitoring platelet and fibrinogen levels for decreases. A CBC count and serum electrolyte level are not necessary. Aspartate transaminase, not alkaline phosphatase, is routinely monitored to evaluate for hepatic toxicity, a possible but rare effect of valproic acid. Valproic acid has no effect on cholesterol levels.

CN: Pharmacological and parenteral therapies; CL: Apply

156. 3. Bacterial conjunctivitis is very contagious. Attention should be paid to thorough handwashing, a major means of stopping the transmission of the disease. Closing the day care center for 1 week is not necessary because thorough handwashing will stop the spread of the infection. Keeping the children out for 48 hours is not necessary. A child may return to day care after being treated for 24 hours. Although the parents of each child should be told about the outbreak, doing so will not help to curtail or prevent the spread of the infection.

CN: Safety and infection control; CL: Synthesize

157. 3. The client's mobility status is the best indicator of risk for development of a pressure sore. Nutritional and circulatory status are other factors that can contribute to pressure sore development, but immobility, even in the presence of adequate nutrition and circulation, is the leading cause of pressure sores. Disorientation can cause a client to neglect making needed position changes, but the underlying factor will be immobility.

CN: Reduction of risk potential; CL: Analyze

158. 1. Ketosis is an adaptation to prolonged fasting or carbohydrate deprivation. The body takes partially broken-down fat fragments and combines them into ketone bodies, which the brain can then use for energy. Hypoglycemia is more likely to occur than hyperglycemia, although glucagon assists in preventing this. Metabolic syndrome refers to syndrome X, which includes an abnormal lipid profile and a tendency to gain weight in

the abdomen. Lactic acidosis is a metabolic reaction that occurs when oxygen is reduced or not present.

CN: Physiological adaptation; CL: Analyze

159. 1. The nurse should stop and assess the client further. A chair should be available for the client to sit down. Obtaining the client's blood pressure and heart rate are important when exercising. These values can be used to predict when the oxygen demand becomes greater than the oxygen supply. Calling for help is not necessary for the midsternal burning. If the healthcare provider (HCP) 📖 has prescribed nitroglycerin, the nurse can administer it; however, stopping the activity may restore the oxygen balance.

CN: Physiological adaptation; CL: Synthesize

160. 2, 3, 4. Vitamin B6, folate, and vitamin B12 have been shown to reduce homocysteine levels. The effects of vitamins K and D have not been established with regard to homocysteine.

CN: Health promotion and maintenance; CL: Synthesize

161. 2. The statement “If I forget a dose, it is no big deal, I will just take it when I remember it” indicates a knowledge deficit. The nurse should reinforce that the client should take dexamethasone as prescribed and at the same time each day. The drug has to be tapered off and cannot be stopped abruptly. The **healthcare provider (HCP)** 📖 should be notified when the client is under additional stress (e.g., infection, surgery, illness). The client can have an allergic reaction to inactive ingredients contained in dexamethasone.

CN: Pharmacological and parenteral therapies; CL: Evaluate

162. 1. A child with moderate dehydration, described as a loss of 50 to 90 mL/kg of body fluid, would have oliguria, gray skin color, increased pulse rate, and poor skin elasticity. Sunken eyes, not bulging, are a sign of dehydration. The anterior fontanelle may be sunken, but the posterior fontanelle is normally closed by 6 to 8 weeks of age. A child with mild dehydration, described as a loss of <50 mL/kg of body fluid, would have pale skin color, decreased skin elasticity, decreased urine output, and normal or increased pulse rate.

CN: Physiological adaptation; CL: Analyze

163. 1. Oropharyngeal candidiasis, or thrush, is the most common infection associated with the early symptomatic stages of HIV infection. Thrush is characterized by whitish yellow patches in the mouth. Various other opportunistic diseases can occur in clients with HIV infection, but they tend to occur later, after the diagnosis of acquired immunodeficiency syndrome has been made. Dyspnea can be indicative of pneumonia, which is caused by a variety of infective organisms. Bloody diarrhea is indicative of cytomegalovirus infection. Hyperpigmented lesions are indicators of Kaposi's sarcoma.

CN: Physiological adaptation; CL: Analyze

164. 2. Postpartum infection is a leading cause of maternal mortality in the United States. Typical treatment for the condition is IV antibiotic therapy with drugs such as clindamycin, gentamicin, or both. Cultures of the lochia will also be obtained. The neonate can continue to breast-feed as long as the mother desires. A switch to bottle-feeding is not necessary. The uterus tends to be firm, with increased cramping to rid the uterus of the infection. The client should be encouraged to remain in Fowler's position when in bed to allow for drainage of the lochia.

CN: Physiological adaptation; CL: Synthesize

165. 1. The mother needs further instruction when she says "I should position the baby the same way for each feeding." This can contribute to sore nipples. The position should vary for each feeding to prevent repeated pressure on the same area each time. Grasping the entire areola and nipple will help to decrease nipple soreness. Air-drying the breasts and not using a hand pump will help to decrease nipple soreness.

CN: Health promotion and maintenance; CL: Evaluate

166. 1. During an acute attack of vertigo, it is best for the client to lie down in a darkened, quiet room and to avoid sudden position changes. A low-sodium diet may be helpful in decreasing the number of attacks, but it is not recommended during the attack. Headaches are not a component of the vertigo attack. Because vertigo is frequently accompanied by nausea and

vomiting, the client will not want to eat or drink. Fluids are usually administered parenterally to maintain hydration and administer medications.

 CN: Basic care and comfort; CL: Synthesize

167. 3. The American Academy of Pediatrics recommends that all neonates should receive only formula or breast milk for the first 4 to 6 months of life. Cereal will not help the neonate sleep through the night and may result in allergies and other digestive disorders.

 CN: Health promotion and maintenance; CL: Synthesize

168. 2. Once the client has stated that he is allergic to a substance, the nurse would be negligent to ignore the client's statement and administer the substance. The nurse should check the medical record for allergies and call the **healthcare provider (HCP)**  for an alternative antibiotic prescription.

 CN: Management of care; CL: Synthesize

169. 1. Jaundice that persists past the 3rd or 4th day of life and pale, light stools are associated with biliary atresia. Alkaline phosphatase levels will also be elevated. Surgical intervention is necessary to remove the blockage. Rh isoimmunization and ABO incompatibility are associated with neonatal anemia as the red blood cells are hemolyzed by the antibodies. Esophageal varices are associated with cirrhosis of the liver and large amounts of bleeding when the vessels rupture. The child with esophageal varices will exhibit manifestations of anemia such as pallor and may experience hemorrhage and shock.

 CN: Physiological adaptation; CL: Analyze

170. 1. To reduce urethral irritation and allow drainage, the nurse should tape the Foley catheter to a female client's inner thigh. Taping the catheter also prevents excessive traction against the bladder neck. Taping the catheter to the groin or lower abdomen would not allow for proper drainage and would cause urethral discomfort. Taping the catheter to the lower thigh would pull on the catheter and cause urethral irritation.

 CN: Reduction of risk potential; CL: Apply

171. 1. Most parents find it especially difficult to allow a child who was

unable to be normally active before corrective heart surgery to lead a normal and active life after surgery. These parents are less likely to be apprehensive about persuading the child of the need for rest, about postoperative complications, or having the child out of school for a month. Tet spells are no longer expected after the surgical repair.

CN: Physiological adaptation; CL: Synthesize

172. 3. After abdominal surgery, the reason for inserting an NG tube is to decompress the gastrointestinal tract until peristaltic action returns. Compression may be used to control bleeding esophageal varices. Lavage is used to remove substances from the stomach or control bleeding. Gavage is used to provide enteral feedings.

CN: Physiological adaptation; CL: Evaluate

173. 3. The most common long-term problem experienced by children with cleft palate repair is speech problems. These children frequently need speech therapy for a period of time. Hearing problems may occur as a result of chronic ear infections and the placement of myringotomy tubes. A poor self-concept may develop in any child. However, if a child with a cleft palate receives adequate parenting and support, this should not occur. Chronic sinus infections are more commonly associated with asthma, not with this defect.

CN: Physiological adaptation; CL: Apply

174. 2. Feeding solutions that have not been infused after hanging for 8 hours should be discarded because of the increased risk of bacterial growth. Sitting the client upright during the feeding helps prevent aspiration of the feeding. A gastric residual of 25 mL is considered acceptable. A gastric residual of 100 to 150 mL, or a residual >100% of the previous hour's intake, indicates delayed emptying. The feeding solution should be at room or body temperature.

CN: Pharmacological and parenteral therapies; CL: Analyze

175. 3. Furosemide is a loop diuretic and inhibits the reabsorption of sodium and chloride from the proximal and distal renal tubules and the loop of Henle. Furosemide promotes sodium diuresis, resulting in a loss of potassium and serious electrolyte imbalances. Furosemide does not affect the

BUN level.

CN: Pharmacological and parenteral therapies; CL: Analyze

176. 3. Suctioning the respiratory tract for prolonged periods depletes the client's oxygen supply and causes hypoxia. It is recommended that each suctioning period not exceed 15 seconds.

CN: Reduction of risk potential; CL: Apply

177. 2. The most appropriate action is to encourage the daughter to talk to her mother about the end-of-life issues first to reach a consensus or agreement. This is a family decision. Immediately informing the **HCP**  or preparing to remove the client from life support would be premature if the family is not in agreement. Although a copy of the living will should be on the client's medical record, it is up to the daughter to show it to her mother.

CN: Management of care; CL: Synthesize

178. 2, 3, 4. Contraindications for t-PA or alteplase recombinant therapy include current active internal bleeding, 3 hours or longer since the onset of symptoms of a stroke, and severe hypertension. Age >65 years and having had an alcoholic beverage are not contraindications for the therapy.

CN: Pharmacological and parenteral therapies; CL: Analyze

179. 2. The nurse should assist the client to use incentive spirometry every 1 to 2 hours postoperatively to prevent atelectasis and pneumonia. Starting a liquid diet is not the highest priority as the client will have an IV infusion and might have an NG tube; adequate fluid status can be maintained until intestinal function returns. The client's extremities are kept flat or lowered to promote circulation. Elevation of extremities is used to promote venous blood flow. The nurse assesses pulses and vital signs hourly in the early postoperative course.

CN: Physiological adaptation; CL: Synthesize

180. 3. For a complete breech, the buttocks present, the feet and legs are flexed on the thighs, and the thighs are flexed on the abdomen. For a frank breech, the buttocks present with the hips flexed and the legs extended against the abdomen and chest. This is the most common type of breech

presentation. For a compound breech, the buttocks present together with another part, such as a hand. This is a rare occurrence. For an incomplete breech, one or both feet or the knees extend below the buttocks. This can also be termed a single footling or double footling breech.

CN: Health promotion and maintenance; CL: Analyze

181. 1. A common complication of diabetes is diabetic neuropathy. Diabetic neuropathy results from the metabolic and vascular factors related to hyperglycemia. Damage leads to sensory deficits and peripheral pain. Muscle atrophy can result from disuse, but it is not a direct consequence of diabetes. Raynaud's disease is associated with vasospasms in the hands and feet. Transient ischemic attacks involve the cerebrum.

CN: Reduction of risk potential; CL: Analyze

182. 1. It is important that the client understand that alcohol should be avoided for at least 1 year after an episode of hepatitis. Sexual intercourse does not need to be avoided, but the client should be instructed to use condoms until the hepatitis B surface antigen measurement is negative. The client will need to restrict activity until liver function test results are normal; this will not occur within 1 to 2 weeks. Jaundice will subside as the client recovers; it is not a permanent condition.

CN: Reduction of risk potential; CL: Evaluate

183. 1. The nurse's statement exemplifies assault, which is the threat of being touched in an offensive way without consent. Battery is touching another person without consent. Malpractice is care below the standard of care that results in injury. Invasion of privacy is a violation of a person's right to be left alone.

CN: Management of care; CL: Analyze

184. 1, 4, 5, 6. Diazepam is a benzodiazepine that causes symptoms of withdrawal when stopped abruptly. The nurse should assess the client for tremors, agitation, irritability, insomnia, vomiting, sweating, tachycardia, headache, anxiety, and confusion. Euphoria or elevated mood is not a symptom of benzodiazepine withdrawal.

CN: Pharmacological and parenteral therapies; CL: Analyze

185. 1. Parents are typically quick to notice changes in their infant's physical appearance. The removal of the infant's hair may be upsetting to them if they have not been told why it is being done. Hair may be removed on the scalp at the site of needle insertion for IV therapy to provide better visualization and a smooth surface on which to attach tape to secure the needle. Sedatives are not ordinarily prescribed before IV fluid administration. In most instances, it is acceptable for parents to visit their infant while the IV solution is infusing. Holding the infant is encouraged to provide comfort.

CN: Pharmacological and parenteral therapies; CL: Synthesize

186. 1. Abdominal pain can be a significant problem in acute pancreatitis. An expected outcome is to decrease or eliminate the pain the client is experiencing. Patterns of bowel elimination and liver function are not typically affected by pancreatitis. The client should avoid alcohol.

CN: Physiological adaptation; CL: Synthesize

187. 3. The most appropriate initial response by the nurse would be to test the child's blood glucose level. The child's symptoms are consistent with hypoglycemia but could also be used by the child to avoid participation in planned activities. Administering milk or fruit juice during a mild reaction may also be appropriate if testing cannot be done. Notifying the **HCP**  may be appropriate after the child's glucose level has been obtained and emergency treatment has been initiated if the child is experiencing hypoglycemia. Returning the child to previous activities is not appropriate until either testing or administering treatment has been done.

CN: Physiological adaptation; CL: Synthesize

188. 3. Normally, breasts are about the same size. They can vary in size before menstruation due to breast engorgement caused by hormonal changes. It is not necessary for an **HCP**  to check this slight change in breast size. The changes in breast size this client described are most likely caused by hormonal changes, not a benign cyst or normal growth and development.

CN: Health promotion and maintenance; CL: Synthesize

189. 2. Traditional Chinese medicine describes health as the balance of yin and yang. It describes health as harmony between the mind, body, and

soul.

CN: Health promotion and maintenance; CL: Apply

190. 2. Before an IVP, the client should be assessed for allergies, particularly to iodine-based dyes that may be used during an IVP. Shellfish is a source of iodine, so people who are allergic to shellfish should inform the healthcare personnel and ask what type of dye is being used. Asking the client whether he or she has ever had an IVP before can help determine the degree of teaching needed before the procedure, but that is not the most important question. Neither the client's last bowel movement nor urinary incontinence has any relationship to having an IVP.

CN: Reduction of risk potential; CL: Analyze

191. 3. Progestin alone has no effect on breast milk or breast-feeding once the milk supply is well established. Estrogen suppresses milk output. Testosterone is not given as an oral contraceptive.

CN: Pharmacological and parenteral therapies; CL: Apply

192. 4. Learning goals are most likely to be attained when they are established mutually by the client and members of the healthcare team, including the nurse, pharmacist, and the **HCP**. 📖 Learning is motivated by perceived problems or goals arising from unmet needs. The perception of the unmet needs must be the client's; however, the nurse, pharmacist, and HCP help the client arrive at his or her own perception of the need or reason to learn.

CN: Management of care; CL: Evaluate

193. 2. In this situation, the client has indicated that she is not willing to leave the abusive boyfriend because of potential economic concerns and other children in the household. The nurse should explain the cycle of abuse (e.g., tension-building phase, battering incident, and honeymoon phase). The priority intervention is to assist the client to make concrete plans for the safety of herself and her children. The client should identify the safest, quickest routes out of the house and be able to identify where she will go once the cycle of violence escalates. Contacting a social worker at this time is not appropriate because the client is not ready to leave the abusive situation.

The nurse can tell the client that these services are available, but it is up to the client to determine whether a referral is necessary. Telling the client that she should not allow anyone to hit her or her children does not assist the client to make plans for her safety and the children's safety should the violence escalate. The client may have a flat affect or feel extreme humiliation from the abuse. The client may also be feeling that the abuse is her fault. When the client is ready to leave the abusive situation and receive continuous counseling, efforts can be made to increase her self-esteem and prevent additional violence. The client should be made aware of the available services in the community for women who are involved in abusive relationships. The location and phone numbers for available shelters should be provided to the client. Giving her a brochure related to the statistics about violence against women is not helpful and, if found by the abuser, may lead to further violence.

CN: Safety and infection control; CL: Synthesize

194. 5, 4, 3, 2, 1. The child whose condition could change most quickly should be assessed first, and the most stable child should be assessed last. The child with a lacerated liver is at the highest risk for a rapid change in condition. Therefore, this child should be assessed first because the child is at high risk for hemorrhage. The child with a recent concussion should be assessed next because the child is at high risk for increased intracranial pressure, which would be indicated as a change in neurologic status but not necessarily vital signs. The third child to be assessed is the 3-year-old child with pyelonephritis and fever. The fever needs to be acted upon, but this assessment is not as critical as that for the child with a lacerated liver and the child with a concussion. The normal respiratory rate for a 10-month-old infant is 30 breaths/minute. Although the infant is tachypneic, this is expected with pneumonia. Additionally, the infant is not in acute respiratory distress. However, the increased respiratory rate needs evaluation, so the 10-month-old infant should be assessed before the 3-month-old infant with respiratory syncytial virus who has stable vital signs and is not in acute distress.

CN: Management of care; CL: Synthesize

195. 2. The client who is taking sulfadiazine should be instructed to drink at least eight glasses of water a day to prevent the development of

crystalluria. Sulfadiazine should be taken on an empty stomach with a full glass of water. It does not require that the client's urine output be measured and does not affect the color of the urine.

CN: Pharmacological and parenteral therapies; CL: Synthesize

196. 4. Risperidone is ordered for severe agitation and has a rapid response. Ergoloid and tacrine stabilize and may improve the cognitive functioning of clients with dementia. Diazepam is an antianxiety agent that would not have the desired effect on the severe agitation, violence, and bizarre thoughts.

CN: Pharmacologic and parenteral therapies; CL: Analyze

197. 1. MID results from multiple small blood clots in the brain. Therefore, the most critical factor is using anticoagulants to reduce the risk of more infarcts. Administering benzodiazepines such as lorazepam to decrease choreiform movements is associated with Huntington's disease. Although depression is common with MID, managing depression-related symptoms will not slow the progression of MID. Managing symptoms by increasing dopamine availability is appropriate for clients with Parkinson's disease.

CN: Pharmacological and parenteral therapies; CL: Synthesize

198. 2. Checking the carotid artery pulse in a child during CPR provides information about perfusion of the brain. The brachial pulse is checked in an infant because the infant's short and typically fat neck makes it difficult to palpate the carotid pulse. The femoral and radial arteries might indicate perfusion to the peripheral body sites, but the critical need is for adequate circulation to the brain.

CN: Physiological adaptation; CL: Apply

199. 2. Nephrotic syndrome is characterized by massive proteinuria caused by increased glomerular membrane permeability. Other symptoms include peripheral edema, hyperlipidemia, and hypoalbuminemia. Because of the edema, clients retain fluid and may gain weight. Hematuria is not a symptom related to nephrotic syndrome.

CN: Physiological adaptation; CL: Analyze

200. 2. Because the child has a history of severe hypoxic episodes, having oxygen readily available at the bedside is most important. Should the child experience another hypoxic episode, oxygen could be administered easily and quickly. Although morphine causes peripheral dilation, which causes the blood to remain in the periphery, decreasing system volume and oxygen administration is the priority. Typically, a child with tetralogy of Fallot with episodes of hypoxia does not require suctioning.

CN: Physiological adaptation; CL: Synthesize

201. 1. Although individuals differ, the most likely attitude of a Mexican-American client is to bear pain stoically, to endure pain as a part of God's will, and to delay seeking treatment.

CN: Basic care and comfort; CL: Apply

202. 1. When a client voids frequent, small amounts, the nurse should suspect that the client is retaining urine. Palpating for a distended bladder is the first assessment that the nurse should perform to verify this suspicion. Obtaining a prescription to catheterize for residual urine may be appropriate as a follow-up activity. Obtaining a urine specimen for culture is not a first priority. The nurse would not encourage an increased fluid intake until further assessment of the situation is completed.

CN: Physiological adaptation; CL: Synthesize

203. 3. Of the clients listed, the newly admitted client should be assessed first. This is the client who is likely to be unstable and in pain. The child to be discharged today would be considered the most stable and therefore would be assessed last.

CN: Management of care; CL: Synthesize

204. 3. It is appropriate for the client to be on a low-sodium diet to help decrease fluid retention. Dry skin and pruritus are common in renal failure. Lotions are used to relieve the dry skin, and antihistamines may be used to control itching; corticosteroids are not used. Pain is not a major problem in chronic renal failure, but analgesics that are excreted by the kidneys must be avoided. It is not necessary to measure abdominal girth daily because ascites is not a clinical problem in renal failure.

 CN: Reduction of risk potential; CL: Synthesize

205. 5, 4, 3, 2, 1. The most frequent cause of respiratory distress in a toddler with no previous illness is foreign body aspiration. After having the clerk call for the rapid response team, the nurse should assess the child for breaths, and then begin abdominal thrusts. Next, the nurse (or rapid response team if present) should assess the effectiveness of the abdominal thrusts, and then start an intravenous infusion. Finally, the nurse can notify the surgeon.

 CN: Reduction of risk potential; CL: Synthesize

206. 4. The traction weights should be hanging freely to maintain pull. The child needs to be moved up in bed with the weights left untouched to continue countertraction. Then the nurse can determine whether blocks are necessary to maintain the child in the correct position. Raising the weights is inappropriate because doing so interferes with countertraction. The **HCP**  does not need to be notified. The nurse can easily correct the problem by moving the child up in bed.

 CN: Safety and infection control; CL: Synthesize

207. 1. Children ages 6 to 12 have a slower growth rate than do younger children and adolescents. As a result, their food requirements are comparatively less.

 CN: Health promotion and maintenance; CL: Apply

208. 4. Asking whether the client is thinking about killing herself is the most direct and therefore the best way to assess suicide risk. Knowing whether the client has recently watched movies on suicide and death, what the client thinks about suicide, or about previous suicides of family members will not tell the nurse whether the client herself is thinking about committing suicide right now.

 CN: Psychosocial integrity; CL: Synthesize

209. 2. Because of their colloidal properties, oatmeal preparation baths typically help relieve the itching associated with chickenpox. Calamine lotion can be also be used if there are no open lesions. Baby powder is unlikely to relieve itching because it acts primarily to absorb moisture. A soft towel

moistened with hydrogen peroxide is unlikely to relieve itching. Rather, hydrogen peroxide is used to clean wounds. A cool compress moistened with a weak salt solution is unlikely to relieve itching because it does not have any antipruritic properties.

 CN: Basic care and comfort; CL: Synthesize

210. 50 mL/h.

$$X = 500 \text{ mL} / 20 \text{ g} \times 2 \text{ g/h}$$

$$X = 50 \text{ mL/h}$$

 CN: Pharmacological and parenteral therapies; CL: Apply

211. 1. Return demonstrations are the best way to evaluate a person's ability to perform a skill. This technique enables the teacher to observe not only the learner's sequencing of steps of the procedure but also the learner's ability to perform the skill.

 CN: Health promotion and maintenance; CL: Evaluate

212. 3. Ibuprofen should be taken with food or antacids to avoid the development of gastrointestinal distress. Tinnitus is not an adverse effect of ibuprofen; it is a sign of salicylate toxicity. There is no need to increase vitamin B12 intake. The CBC is not typically monitored monthly, although clients should be told to report signs of unusual bleeding because ibuprofen can prolong bleeding time.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

213. 4. The nurse concludes that the staff member needs teaching about depression, specifically the biological basis of major depression, when the staff member states the client has no reason to be depressed because "she really has it all." Major depression, or endogenous depression, is caused by alterations of neurotransmitters, primarily serotonin and norepinephrine. Genetics and hereditary also predispose an individual to develop depression. Therefore, there may not be an external cause or a reason for depression to develop. Depression that occurs from an external cause is known as reactive

depression, and it could be caused by a loss or a life stress.

 CN: Management of care; CL: Analyze

214. 1. In asthma, the airways react to certain external and internal stimuli, including allergens, infections, exercise, and emotions. Food allergens commonly associated with asthma include soy, wheat, egg whites, dairy products, nuts, shellfish, and fish.

 CN: Reduction of risk potential; CL: Apply

215. 3. Toddlers receive burns usually as the result of not being closely supervised. Toddlers are very inquisitive and need constant supervision; therefore, close follow-up is necessary. In addition, the child probably will need some type of wound care requiring involvement of the parent and possibly others. The amount of support available to the single parent of the 7-month-old child is not known. Although immunization schedules need to be adhered to, it is very possible for a 7-month-old to be delayed in receiving immunizations because of illness or other conflicts. An automobile accident can happen to anyone and does not indicate a lack of safety or supervision. A history of caustic liquid ingestion in a foster child may have been from a time before the child began living with the foster parents; it does not indicate a lack of safety or supervision.

 CN: Management of care; CL: Evaluate

216. 3, 1, 4, 2. The nurse first should stop the intravenous flow of oxytocin because the client is exhibiting a hypertonic uterine contraction pattern caused by the oxytocin. Once the oxytocin infusion is stopped, the nurse should place the client in a lateral position to improve placental blood flow to the fetus. The nurse should next administer oxygen and then contact the primary care provider to report the situation and obtain further prescriptions.

 CN: Management of care; CL: Synthesize

217. 4. When administering an enema, the nurse should position the client in a left Sims' position. Placing the client in this position facilitates the flow of fluid into the rectum and colon. It also allows the client to flex the right leg forward, adequately exposing the rectal area.

 CN: Basic care and comfort; CL: Apply

218. 3. Risk factors for the development of pressure ulcers include poor nutrition, indicated by a decreased serum albumin level. According to the *Guidelines for Pressure Ulcers* published by the Agency for Healthcare Research and Quality, other risk factors include immobility, incontinence, and decreased sensation. A client who does not ambulate often can be repositioned frequently to prevent pressure ulcers. Having an indwelling urinary catheter does not normally increase the risk of developing a pressure ulcer unless pressure from the tubing impinges on urethral or other tissue. An elevated white blood cell count does not place a client at risk for pressure ulcers.

 CN: Reduction of risk potential; CL: Analyze

219. 4. Because of her age and report of a seizure, the client is probably experiencing eclampsia, a condition in which convulsions occur in the absence of any underlying cause. Although the actual cause is unknown, adolescents and women older than 35 years are at higher risk. The client's environment should be kept as free of stimuli as possible. Thus, the nurse should admit the client to a quiet, darkened room. Clients experiencing eclampsia should be kept on the left side to promote placental perfusion. In some cases, edema of the lungs develops after seizures and is a sign of cardiovascular failure. Because the client is at risk for pulmonary edema, breath sounds should be monitored every 2 hours. Vital signs should be monitored frequently, at least every hour.

 CN: Management of care; CL: Synthesize

220. 2. Cerebral hypoxia is commonly associated with dizziness. The greatest risk of injury to a client with dizziness is a fall. Frequent rests and energy conservation measures should be included in the client's plan of care, but safety from falls is the greatest need. Checking the shower water temperature is not critical for this client, who will not be showering because of her fall risk.

 CN: Reduction of risk potential; CL: Synthesize

221. The nurse should auscultate the right lower lobe and listen as the

client inhales and exhales. The nurse should be able to hear vesicular breath sounds.

 CN: Physiological adaptation; CL: Apply

222. 2. The most therapeutic nursing response is client centered and goal directed and provides an opportunity for the client to say more, for example, to express additional emotions, needs, or issues. Option 1 is nontherapeutic; it is a false reassurance. Option 3 is also nontherapeutic; the nurse offers a personal opinion of the client's situation. Option 4 is also nontherapeutic; the nurse changes the subject and appears to be uncomfortable discussing the client's concerns.

 CN: Basic care and comfort; CL: Synthesize

223. 4. The situation is escalating, and the nurse's priority is to protect the infant from harm. Therefore, removal of the infant from this situation should be the first action by the nurse. Reasoning at this point or asking one of the parents to leave the room would be ineffective and may serve to further escalate the situation. Calling security is necessary, but only after the nurse has removed the infant from the room.

CN: Management of care; CL: Synthesize

224. 3. Responses to physiologic stress, such as hospitalization, surgery, or pain, are a result of catecholamine release and specifically include increased heart rate and blood pressure, increased bronchiolar dilation, water retention and decreased urinary output, increased blood glucose, and increased mental acuity.

CN: Basic care and comfort; CL: Apply

225. 4. Therapeutic communication is always purposeful, goal directed, and client centered. If self-disclosure is used by the nurse or the **UAP**,  it should be very focused and limited to just enough to support further communication with the client. It is not always helpful (or educational) and often inappropriate to share personal stories with clients.

CN: Management of care; CL: Synthesize

226. 4. The nurse should refuse to administer the medication to the client because of the risk of respiratory depression in the neonate. Meperidine, given IM, peaks in 30 to 60 minutes and lasts 2 to 4 hours. Based on the assessment findings, the client most likely will be giving birth within that time frame, increasing the risk for respiratory depression in the neonate, a serious consequence. Therefore, the nurse should not administer the drug. Naloxone should be readily available whenever narcotics that can result in respiratory depression are used. Asking the primary care provider to validate the dosage is not necessary. For clients in early labor, meperidine can be given IM in dosages ranging from 50 to 100 mg.

CN: Management of care; CL: Synthesize

227. 1, 2, 4, 5. When working with a battered client, the nurse should give information about a safe home and provide a cell phone and information

about the crisis help line. The nurse should also help the client understand the cycle of violence as well as personal and legal rights. The nurse should help the client share and discuss her anger, frustration, guilt, shame, and other feelings. Displacing, that is, placing feelings onto another person or object, is not helpful to the client and is not a healthy way to handle feelings.

 CN: Safety and infection control; CL: Synthesize

228. 4. With illness or injury, there is a need to heal or recover. To accomplish this, the client must consistently consume adequate nutrition (and protein) to maintain a positive nitrogen balance and to experience necessary growth and/or healing. The client with burns has the greatest nutritional needs, due to the extent of the injury. Clients with diabetic neuropathy can be encouraged to follow the diabetic diet plan and manage pharmacological therapy to prevent further neuropathy. The client with a fractured femur is not at risk for inadequate nutrition unless there is also a reason the client is not eating. The client who is breast-feeding needs additional calories, but if the client is eating a well-balanced diet with additional calories, the client is not at risk for obtaining inadequate nutrition.

 CN: Physiological adaptation; CL: Analyze

229. 1. PCA is used to manage postoperative or persistent pain. Clients can control the administration of their own medication within predetermined safety limits; there is not a risk of dependence on opioids when using PCAs is not a concern. Family members who are not authorized agents are cautioned not to push the button for the client because this overrides some of the safety features of the PCA system. The nurse retains the responsibility for monitoring the client. Cost is not the primary factor in pain management.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

230. 3. Fluctuation of fluid with respirations in the water seal column indicates that the system is functioning properly. If an obstruction were present in the chest tube, fluid fluctuation would be absent. Subcutaneous emphysema occurs when air pockets can be palpated beneath the client's skin around the chest tube insertion site. A leak in the system is indicated when bubbling occurs in the water seal column.

 CN: Reduction of risk potential; CL: Apply

231. 1, 2, 3. There is a high risk of lactic acidosis when using metformin; 50% of the cases may be fatal. A black box warning for metformin is to instruct the client to stop the drug and immediately notify the prescriber about unexplained hyperventilation, muscle pain, malaise, dizziness, lightheadedness, unusual sleepiness, unexplained stomach pain, feelings of coldness, slow or irregular heart rate, or other nonspecific symptoms of early lactic acidosis. Headache, hunger, and tingling in the fingertips are not signs of lactic acidosis.

CN: Pharmacological and parenteral therapies; CL: Synthesize

232. 1, 2, 4, 5. The electronic health record should contain sufficient information to identify the client, support the diagnosis, justify treatment, document the client's course and results, and facilitate continuity of care among healthcare providers (HCPs) . The medical record  will facilitate client care, serve as a financial and legal record, aid in clinical research, support decision analysis, and guide professional and organizational performance improvement. The medical record should be compiled concurrently and be completed at the time of discharge. Many disciplines may be authorized to make entries in the medical record. All healthcare personnel will document care on this record. The medical record is not written for clients; if clients need information, the nurse or appropriate healthcare professional can explain the information to them.

CN: Management of care; CL: Synthesize

233. 4. The only action that keeps the client safe is removal of the gun. If the HCP  is considering discharge, the client is medically stable and will not be able to remain in the medical hospital any longer. The client's lack of current suicidal ideation means he cannot be hospitalized for psychiatric reasons. While helpful, the crisis phone line number and the client's promise do not ensure safety.

CN: Safety and infection control; CL: Analyze

234. 1, 2, 3, 5. Acknowledging the client's concern about pain and expressing the nurse's concern about the client's condition are important to help the client open up and gain further assessment of pain in this client. Awareness of the amount of wine consumption in a week will be helpful to

guide which kind of detoxification will be needed. Expressing the nurse's concern about the client's safety is important. How the client is getting the wine is least important because there are so many possibilities, such a weekly shopping trips in the facility van or having friends or family bring it in. Notifying the primary care provider about the situation and arranging for a joint conference are important for the client's safety and recovery.

CN: Safety and infection control; CL: Apply

235. 4. More than 90% of children have speech that is totally intelligible at 4 years of age. Having one word at 1 year is the expectation. Having three words is a 15-month milestone. Pointing to one body part at 18 months and combining two words at 2 years would be a normal finding.

CN: Health Promotion and maintenance; CL: Analyze

236. 1. The client with a possible transient ischemic attack is the only client who has not had surgery and is not immunocompromised. The client with a recent surgery and incision should not be exposed to a client with infection. Clients with cancer or alcoholic cirrhosis are very susceptible to infection, and it would not be safe to expose them to a client with a respiratory infection.

CN: Management of care; CL: Synthesize

COMPREHENSIVE

TEST

6

This test has 265 questions. Time yourself as you take the test so you can determine the approximate amount of time it takes to complete this many questions. This test reflects the maximum number of questions you may receive on the actual licensing exam.

1. A client returns to the recovery room following left supratentorial surgery for treatment of a brain tumor. The nurse should place the client in which position to facilitate venous drainage?

- ☐ 1. lying flat without a pillow with the head turned to the right
- ☐ 2. lying flat with the head elevated on three pillows
- ☐ 3. head of the bed elevated to 30 degrees with the head in a neutral position
- ☐ 4. side-lying on the client's left side

2. After a bronchoscopy with biopsy, the nurse assesses the client. The nurse should report which finding to the healthcare provider (HCP)?

- ☐ 1. green sputum
- ☐ 2. dry cough
- ☐ 3. hemoptysis
- ☐ 4. laryngeal stridor

3. Which activity is **least** effective in preventing sensory deprivation during a client's stay in the cardiac care unit?

- ☐ 1. watching television
- ☐ 2. visiting with family
- ☐ 3. reading the newspaper
- ☐ 4. keeping the door closed to provide privacy

4. A 57-year-old woman with breast cancer who does not speak English is

admitted for a lumpectomy. Her daughter, who speaks English, accompanies her. In order to obtain admission information from the client, what should the nurse do?

- ☐ 1. Ask the client's daughter to serve as an interpreter.
- ☐ 2. Ask one of the unlicensed assistive personnel (UAP) to serve as an interpreter.
- ☐ 3. Use the limited knowledge of the client's language learned in high school along with nonverbal communication.
- ☐ 4. Obtain a trained medical interpreter.

5. The nurse is assessing a child with suspected juvenile hypothyroidism. Which signs or symptoms should the nurse expect this child to manifest?

- ☐ 1. short attention span and weight loss
- ☐ 2. weight loss and flushed skin
- ☐ 3. rapid pulse and heat intolerance
- ☐ 4. dry skin and constipation

6. After discussing preconception needs with a nulliparous client who eats a primarily Asian diet, which client statement indicates the need for further instruction?

- ☐ 1. "I should take folic acid supplements before I get pregnant."
- ☐ 2. "If I become pregnant, I can continue to eat sushi twice a week."
- ☐ 3. "I should continue to steam my vegetables rather than cooking them for a long time."
- ☐ 4. "Eating soy products can increase my protein levels once I am pregnant."

7. A child is receiving amoxicillin for otitis media. Which action should the nurse recommend the mother do when the child develops diarrhea?

- ☐ 1. Begin clear fluids.
- ☐ 2. Withhold food and fluids for 2 hours.
- ☐ 3. Offer yogurt several times a day.
- ☐ 4. Restrict the intake of pizza.

8. A client fears chemotherapy because of the side effects. What is the nurse's **best** response to the client's concerns?

- ☐ 2. “Your health has been excellent. It is unlikely that you will experience serious side effects.”
- ☐ 2. “We will give you medications to prevent the side effects, so you should not be too concerned.”
- ☐ 3. “Each person responds differently to chemotherapy treatments. We will monitor your responses closely.”
- ☐ 4. “You may choose not to take the chemotherapy, but you must understand that this will have an adverse effect on the course of your disease.”

9. A nurse is caring for a client who has undergone a total laryngectomy for laryngeal cancer. What information is important to include in discharge teaching? Select all that apply.

- ☐ 1. Provide humidity at home.
- ☐ 2. Follow a bland diet.
- ☐ 3. Learn how to suction.
- ☐ 4. Have communication rehabilitation with a speech pathologist.
- ☐ 5. Attend a smoking cessation program.

10. The client received electroconvulsive therapy (ECT) an hour ago and now has a headache. Which response by the nurse is **best**?

- ☐ 1. “A headache is common after ECT.”
- ☐ 2. “I will get some acetaminophen for you.”
- ☐ 3. “A nap will help you feel better.”
- ☐ 4. “Eat your breakfast and then let me know how you feel.”

11. The nurse interprets the rhythm strip (see figure) from a client’s bedside monitor as:

- ☐ 1. normal sinus rhythm.
- ☐ 2. sinus tachycardia.
- ☐ 3. ventricular tachycardia.
- ☐ 4. ventricular fibrillation.

12. The nurse is caring for a client who is 12 weeks pregnant and speaks Spanish only. Which interventions should the nurse include in the plan of care at the client's initial visit? Select all that apply.

- ☐ 1. Provide brochures in the client's native language.
- ☐ 2. Refer the client to a high-risk clinic.
- ☐ 3. Discuss cultural differences and emphasize the differences between cultures.
- ☐ 4. Arrange for an interpreter for her appointments.
- ☐ 5. Discuss contraception and options.
- ☐ 6. Review dietary intake and discuss nutrition.

13. When assessing speech development, which child should the nurse refer for further examination?

- ☐ 1. a 4-month-old who laughs out loud
- ☐ 2. a 10-month-old who says "dada" and "mama"
- ☐ 3. a 1-year-old who says three to five words
- ☐ 4. an 18-month-old who only says "no"

14. The client is started on simvastatin as a component of cholesterol management. Which laboratory test needs to be monitored while on this therapy?

- ☐ 1. complete blood count

- ☐ 2. serum glucose
- ☐ 3. total protein
- ☐ 4. liver function tests

15. A family has taken home their newborn and later received a call from the child's healthcare provider (HCP) that the phenylketonuria (PKU) levels for their newborn daughter are abnormally high. Additional testing confirmed the diagnosis of phenylketonuria. The parents refuse to believe the results as no one else in their family has the disease. The nurse explains that the - disease:

- ☐ 1. is carried on recessive genes contributed by each parent.
- ☐ 2. is caused by a recessive gene contributed by either parent.
- ☐ 3. is cured by eliminating dietary protein for this child.
- ☐ 4. will not impact future childbearing for the family.

16. During a postpartum examination, the mother of a 2-week-old infant tearfully tells the nurse she feels very tired and thinks she is not a good mother to her baby. Which statement by the nurse would be **best**?

- ☐ 1. "The hormonal changes your body is experiencing are causing you to feel this way."
- ☐ 2. "Most new mothers feel the same way that you do. I hear that a lot from others."
- ☐ 3. "You need to have your husband and family help you so that you can get some rest."
- ☐ 4. "I am concerned about what you are experiencing. Tell me more about what you are thinking and feeling."

17. The nurse is caring for a client who has severe burns on the head, neck, trunk, and groin areas. Which position would be **most** appropriate for preventing contractures?

- ☐ 1. high Fowler's
- ☐ 2. semi-Fowler's
- ☐ 3. prone
- ☐ 4. supine

18. After transurethral resection of the prostate, the nurse notices that the

client's urine is bright red, has numerous clots, and is viscous. Which nursing action is **most** appropriate?

- ☐ 1. Irrigate the catheter to remove clots.
- ☐ 2. Milk the catheter tube vigorously.
- ☐ 3. Increase the client's fluid intake.
- ☐ 4. Assess vital signs and notify the surgeon.

19. A client is to receive 2 g of metronidazole orally in a single dose. The medication is available in 500-mg tablets. How many tablets should the nurse administer? Record your answer using a whole number.

_____ tablets.

20. A client asks the nurse to help make out a will. The nurse should tell the client:

- ☐ 1. "I am not a lawyer, but I will do what I can for you."
- ☐ 2. "You have a long way to go before you will need to do that. Let us wait on it a while, shall we?"
- ☐ 3. "I do not believe in getting involved in legal matters, but maybe I can find another nurse who will help you."
- ☐ 4. "You need to consult an attorney because I am not trained in such matters. Is there a family lawyer you can call?"

21. After vaginal birth of a term neonate, the nurse determines that the placenta is about to separate when which occurs?

- ☐ 1. The uterus becomes oval shaped.
- ☐ 2. The uterus enlarges.
- ☐ 3. A sudden gush of dark blood occurs.
- ☐ 4. The client expends efforts pushing.

22. When preparing to present a community program about women who are victims of physical abuse, which should the nurse stress about the incidence of battering?

- ☐ 1. Death from battering is rare.
- ☐ 2. Battering is a major cause of injury to women.
- ☐ 3. Lower socioeconomic groups are primarily affected.

- ☐ 4. Physical abuse typically begins early in a relationship well before a woman gets pregnant.

23. A college student is asking the nurse about the student's grandfather, who just received a diagnosis of Huntington's disease. The student wants to know if the student will have the disease too. What should the nurse tell the student? Select all that apply.

- ☐ 1. "Huntington's disease affects men more than women."
- ☐ 2. "Huntington's disease is an autosomal dominant disease."
- ☐ 3. "Huntington's disease does not skip a generation."
- ☐ 4. "Huntington's disease is a treatable disease."
- ☐ 5. "There is a 75% chance you will have the disease."

24. The nurse notices drops of a liquid on the hallway floor of a healthcare facility. What should the nurse do **first**?

- ☐ 1. Place paper towels over the drops of liquid.
- ☐ 2. Don clean gloves and wipe up the drops of liquid.
- ☐ 3. Post "wet floor" signs around the area.
- ☐ 4. Call the Environmental Services Department.

25. A client is admitted with numbness and tingling of the feet and toes after having an upper respiratory infection and flu for the past 5 days. Within 1 hour of admission, the client's legs are numb all the way up to the hips. What should the nurse do **next**? Select all that apply.

- ☐ 1. Call the family to come in to visit.
- ☐ 2. Notify the healthcare provider (HCP) of the change.
- ☐ 3. Place respiratory resuscitation equipment in the client's room.
- ☐ 4. Check for advancing levels of paresthesia.
- ☐ 5. Have the client perform ankle pumps.

26. When assessing a client with heart failure, the nurse should report which findings to the healthcare provider (HCP)? Select all that apply.

- ☐ 1. bibasilar crackles
- ☐ 2. blood pressure 108/62 mm Hg, heart rate 88 beats/minute
- ☐ 3. O2 saturation 94% on room air
- ☐ 4. 2-lb (0.9-kg) weight gain in 5 days

- ☐ 5. urine output of 20 mL/h
- ☐ 6. confusion

27. The nurse is caring for a client with an injury to the thalamus. The nurse should plan to:

- ☐ 1. give higher doses of pain medication.
- ☐ 2. keep patches on the client's eyes to prevent corneal abrasion.
- ☐ 3. monitor the temperature of the bathwater.
- ☐ 4. avoid turning the client.

28. A client with paranoia is having a delusion. While the client is having the delusion, what nursing intervention is **most** indicated?

- ☐ 1. Assist the client to relieve anxiety.
- ☐ 2. Ask the client what is causing the feelings of anxiety.
- ☐ 3. Present reality when the client asks about the delusion.
- ☐ 4. Allow the client to express anger and intense emotions in appropriate ways.

29. When explaining to a pregnant client about the need to take supplemental vitamins with iron during her pregnancy, the nurse should instruct the client to take the iron with which liquid to promote maximum absorption?

- ☐ 1. milk
- ☐ 2. tea
- ☐ 3. hot chocolate
- ☐ 4. orange juice

30. A client with major depression is completing his morning care independently. When the nurse approaches the client with his medication, he tells the nurse that he is a failure as a husband and a father and is worthless. His wife told the nurse previously that the client is a good provider and a wonderful father and husband. Which response by the nurse is **most** appropriate?

- ☐ 1. "You were able to shower and dress without help this morning."
- ☐ 2. "Your wife told me that you are a good husband and father."
- ☐ 3. "You do not have any reason why you should feel that way."

- ☐ 4. “This medication will help your thinking.”

31. The nurse is reviewing laboratory values of a client receiving clozapine. Which laboratory value should the nurse report to the healthcare provider (HCP)?

- ☐ 1. WBC of 3,500/ μ L (3.5×10^9 /L)
- ☐ 2. hemoglobin of 8.2 g/dL (82 g/L)
- ☐ 3. sodium level of 136 mEq/L (136 mmol/L)
- ☐ 4. hyaline casts in the urinalysis

32. Four hours after a cast has been applied for a fractured ulna, the nurse assesses that the client’s fingers are pale and cool and capillary refill is delayed for 4 seconds. How should the nurse interpret these findings?

- ☐ 1. Nerve impairment is developing in the fingers.
- ☐ 2. Arterial blood supply to the fingers is decreased.
- ☐ 3. Venous stasis is occurring in the fingers.
- ☐ 4. The finding is normal for this recovery period.

33. The nurse is planning care for a client who has sustained a spinal cord injury. The nurse should assess the client for:

- ☐ 1. anesthesia below the level of the injury.
- ☐ 2. tingling in the fingers.
- ☐ 3. pain below the site of the injury.
- ☐ 4. loss of vibratory sense.

34. A client who is paraplegic cannot feel the lower extremities and has been positioned on the side. The nurse should inspect which area that is a potential pressure point when the client is in this position?

- ☐ 1. sacrum
- ☐ 2. occiput
- ☐ 3. ankles
- ☐ 4. heels

35. Which interventions are appropriate when developing a plan of care for promoting the development of a preschooler? Select all that apply.

- ☐ 1. Provide anticipatory guidance for parents.

- ☐ 2. Help the parents understand their child's behavior.
- ☐ 3. Identify deviations from normal growth and development patterns.
- ☐ 4. Determine the child's future development.
- ☐ 5. Send the child to a day care center.

36. A child who is 15 years of age is hospitalized with acute glomerulonephritis. The nurse is reviewing the client's urine chemistry laboratory reports as noted below.

Laboratory Results

Test	Result
Potassium	4.0 mEq/L (mmol/L)
Sodium	142 mEq/L (mmol/L)
Chloride	100 mEq/L (mmol/L)
Calcium	12.4 mg/dL (3.1 mmol/L)

Which finding does the nurse draw to the attention of the healthcare provider (HCP)?

- ☐ 1. urine specific gravity
- ☐ 2. protein
- ☐ 3. potassium
- ☐ 4. creatinine

37. A client is exhibiting pressured speech, a labile affect, euphoria, and hyperactivity. The client states, "I am the savior of the city." The family states that the client has hardly slept or eaten for days. Which client need is a **priority** in the nurse's plan of care?

- ☐ 1. physical
- ☐ 2. social

- ☐ 3. spiritual
- ☐ 4. cultural

38. When assessing a neonate's temperature with a disposable digital thermometer, in which location should the nurse place the thermometer?

- ☐ 1. under the neonate's tongue
- ☐ 2. under the neonate's arm
- ☐ 3. into the neonate's rectum
- ☐ 4. into the neonate's ear

39. A neonate is receiving an IV infusion of dextrose 10% administered by an infusion pump. The nurse should verify the alarm settings on the infusion pump at which times? Select all that apply.

- ☐ 1. when the infusion is started
- ☐ 2. at the beginning of each shift
- ☐ 3. when the neonate returns from x-ray
- ☐ 4. when the neonate moves in the crib
- ☐ 5. after the parents have visited

40. A coworker confides in the nurse that she had been a lifelong friend of a client who committed suicide. The coworker states: "We just saw each other last week. I cannot believe she tried to kill herself. She told me she wanted to give me her expensive necklace because our friendship meant so much to her. She seemed really happy and content. I knew she had been feeling down the last few months. I should have known that something was wrong; I should have asked her about suicide." The nurse determines the coworker is **most** likely experiencing:

- ☐ 1. secondary traumatic stress.
- ☐ 2. a boundary violation.
- ☐ 3. compassion fatigue.
- ☐ 4. moral distress.

41. The nurse is caring for a critically ill client with the client's mother and spouse in the room. The spouse begins to shout derogatory comments to the mother, blaming her for her spouse's critical state. What should the nurse do?

- ☐ 1. Try to calm both the mother and spouse by speaking in a soft voice.
- ☐ 2. Step between the mother and spouse stating emphatically, “Stop!”
- ☐ 3. Call the hospital Security Department.
- ☐ 4. Report the details immediately to the supervisor.

42. The nurse walks into the room and finds that a client who has just had surgery is diaphoretic, appears to have no respirations, and has a barely palpable pulse. The nurse should **first**:

- ☐ 1. call a code.
- ☐ 2. open the airway.
- ☐ 3. start rescue breathing.
- ☐ 4. start cardiac compressions.

43. The nurse is planning care for a neonate to prevent neonatal heat loss immediately after birth. To conserve heat and help the infant maintain a stable temperature, the nurse should:

- ☐ 1. nestle the neonate against the crib wall.
- ☐ 2. place the infant skin to skin with the mother.
- ☐ 3. bathe the neonate with warm water.
- ☐ 4. position the neonate lying in an open crib with a diaper on.

44. The nurse observes that the client’s right eye does not close completely. Based on this finding, what should the nurse do?

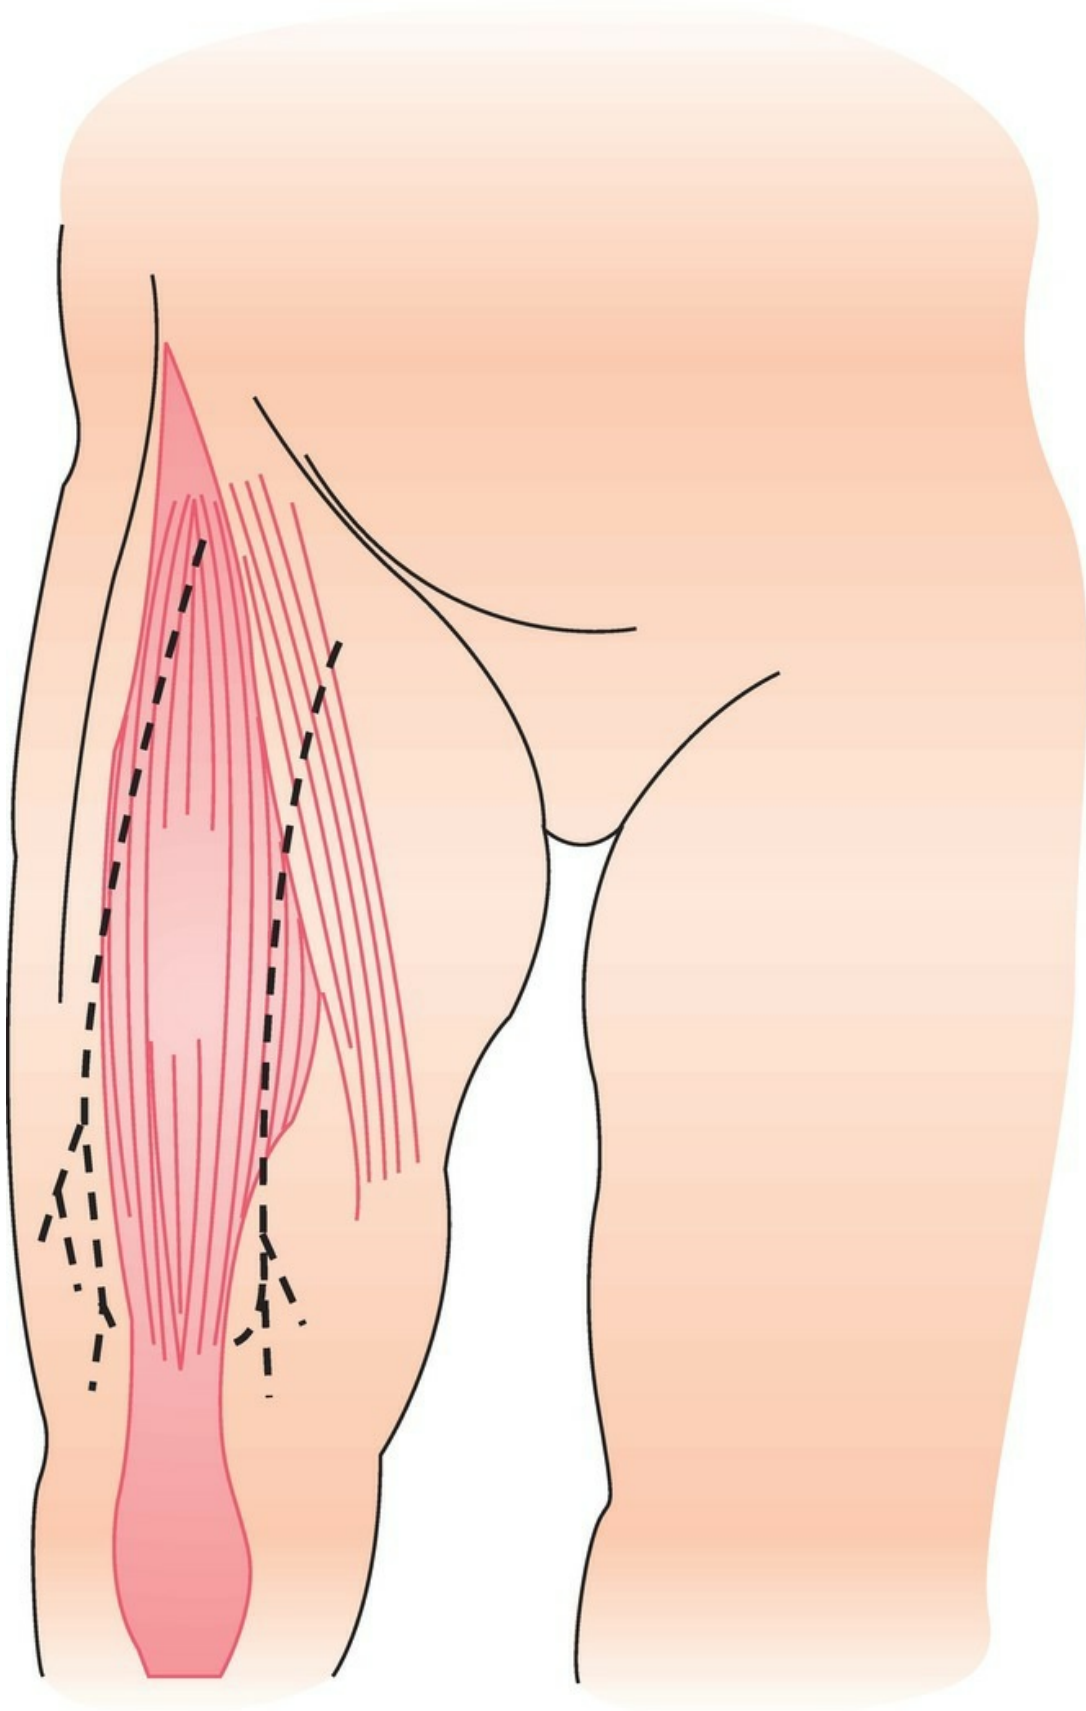

- ☐ 1. Have the client wear eyeglasses at all times.
- ☐ 2. Place an eye patch over the right eye.
- ☐ 3. Instill artificial tears once a day.
- ☐ 4. Cleanse the eye with a clean washcloth every shift.

45. A mother tells the nurse that she wants her 4-year-old to stop sucking her thumb. When developing the teaching plan, which intervention should the nurse suggest?

- ☐ 1. Apply a special medicine that tastes terrible on the thumb.
- ☐ 2. Get the child to agree to stop the thumb-sucking.
- ☐ 3. Remind the child every time the mother sees the thumb in her mouth.
- ☐ 4. Put the child in time-out every time the mother observes thumb-

sucking.

46. The nurse is administering an intramuscular injection to an infant. Indicate the appropriate site for this injection.

47. A 14-year-old with rheumatic fever who is on bed rest is receiving an IV infusion of dextrose 5% administered by an infusion pump. The nurse should verify the alarm settings on the infusion pump at which times? Select all that apply.

- ☐ 1. when the infusion is started
- ☐ 2. at the beginning of each shift
- ☐ 3. when the child returns from x-ray
- ☐ 4. when the child moves in the bed
- ☐ 5. when the child is sleeping

48. A primigravid client at 26 weeks' gestation visits the clinic and tells the nurse that her lower back aches when she arrives home from work. The nurse should suggest that the client perform which exercise?

- ☐ 1. tailor sitting
- ☐ 2. leg lifting
- ☐ 3. shoulder circling
- ☐ 4. squatting

49. A client with diabetes is explaining to the nurse how to care for the feet at home. Which statement indicates that the client understands proper foot care?

- ☐ 1. "When I injure my toe, I will plan to put iodine on it."
- ☐ 2. "I should inspect my feet at least once a week."
- ☐ 3. "It is okay to go barefoot in the house."
- ☐ 4. "It is important to dry my feet carefully after my bath."

50. A nurse is assessing a client who has a potential diagnosis of pancreatitis. Which risk factors predispose the client to pancreatitis? Select all that apply.

- ☐ 1. excessive alcohol use
- ☐ 2. gallstones
- ☐ 3. abdominal trauma
- ☐ 4. hypertension
- ☐ 5. hyperlipidemia with excessive triglycerides

- ☐ 6. hypothyroidism

51. When performing chest percussion on a child, which technique should the nurse use?

- ☐ 1. Firmly but gently strike the chest wall to make a popping sound.
- ☐ 2. Gently strike the chest wall to make a slapping sound.
- ☐ 3. Percuss over an area from the umbilicus to the clavicle.
- ☐ 4. Place a blanket between the nurse's hand and the child's chest.

52. The nurse should assess an older adult who has diminished hearing and vision for:

- ☐ 1. feelings of disorientation.
- ☐ 2. cognitive impairment.
- ☐ 3. sensory overload.
- ☐ 4. social isolation.

53. Which child should be referred for further assessment regarding language development?

- ☐ 1. a 2-year-old who has a vocabulary of 300 words and can combine two or three words in a phrase
- ☐ 2. a 3-year-old who has a vocabulary of 900 words and can make a complete sentence of three or four words
- ☐ 3. a 4-year-old whose speech is understood 50% of the time
- ☐ 4. a 1-year-old who has a vocabulary of eight words and can say "mommy" and "daddy" with specific reference to the correct person

54. To prevent development of peripheral neuropathies associated with isoniazid administration, the nurse should teach the client to:

- ☐ 1. avoid excessive sun exposure.
- ☐ 2. follow a low-cholesterol diet.
- ☐ 3. obtain extra rest.
- ☐ 4. supplement the diet with pyridoxine (vitamin B6).

55. The healthcare provider (HCP) has prescribed nitroglycerin to a client with angina. The client also has closed-angle glaucoma. The nurse contacts the HCP to discuss the potential for:

- ☐ 1. decreased intraocular pressure.
- ☐ 2. increased intraocular pressure.
- ☐ 3. hypotension.
- ☐ 4. hypertension.

56. A nurse is taking a medication history on a client with multiple sclerosis before administering an initial dose of baclofen. What should the nurse check before administering the drug? Select all that apply.

- ☐ 1. presence of muscle weakness
- ☐ 2. history of muscle spasms
- ☐ 3. serum creatinine level
- ☐ 4. serum potassium level
- ☐ 5. blood glucose

57. A client has been taking carbamazepine for 2 years. What should the nurse assess the client for? Select all that apply.

- ☐ 1. bruising
- ☐ 2. sore throat
- ☐ 3. urine retention
- ☐ 4. light-colored stool
- ☐ 5. hydration status

58. The nurse should assess the client with severe diarrhea for which acid-base imbalance?

- ☐ 1. respiratory acidosis
- ☐ 2. respiratory alkalosis
- ☐ 3. metabolic acidosis
- ☐ 4. metabolic alkalosis

59. A nurse is planning care for a client who has heart failure. Which goal is appropriate for a client with excess fluid volume?

- ☐ 1. A weight reduction of 20% will occur.
- ☐ 2. Pain will be controlled effectively.
- ☐ 3. Arterial blood gas values will be within normal limits.
- ☐ 4. Serum osmolality will be within normal limits.

60. A 7-year-old child is admitted to the hospital with the diagnosis of acute rheumatic fever. Which laboratory blood finding confirms that the child has had a streptococcal infection?

- ☐ 1. high leukocyte count
- ☐ 2. low hemoglobin count
- ☐ 3. elevated antibody concentration
- ☐ 4. low erythrocyte sedimentation rate

61. A 12-year-old client says, "Give me my pajamas. I am not putting your silly gown on." An appropriate response by the nurse should be:

- ☐ 1. "I know they are funny, but everyone here wears them."
- ☐ 2. "You do not mean that, now. A big guy like you knows how hospitals are."
- ☐ 3. "You are upset because you feel awkward and embarrassed in these gowns."
- ☐ 4. "You are upset because you think we are unreasonable."

62. After teaching the parents of a 15-month-old child who has undergone cleft palate repair how to use elbow restraints, which statement by the parents indicates effective teaching?

- ☐ 1. "We will keep the restraints in place continuously until our healthcare provider (HCP) says it is okay to remove them."
- ☐ 2. "We can take off the restraints while our child is playing, but we will make sure to put them back on at night."
- ☐ 3. "The restraints should be taped directly to our child's arms so that they will stay in one place."
- ☐ 4. "We will remove the restraints temporarily at least three times a day to check his skin, then put them right back on."

63. The nurse notes that a client is too busy investigating the unit and overseeing the activities of other clients to eat dinner. To help the client obtain sufficient nourishment, which plan would be best?

- ☐ 1. Serve foods that she can carry with her.
- ☐ 2. Allow her to send out for her favorite foods.
- ☐ 3. Serve food in small, attractively arranged portions.

- ☐ 4. Allow her to enter the unit kitchen for extra food as necessary.

64. The nurse should encourage women to have a “Pap test” (Papanicolaou smear) to: (Select all that apply.)

- ☐ 1. detect precancerous and cancerous cells of the uterus.
- ☐ 2. assess the effects of sex hormonal replacement.
- ☐ 3. identify viral, fungal, and parasitic conditions.
- ☐ 4. evaluate the response to chemotherapy or radiation therapy to the cervix.
- ☐ 5. determine a diminished blood flow to the perineal mucous membrane.

65. The nurse is administering prednisone to a preschool child with nephrosis. What should the nurse do to ensure that the nurse has identified the child correctly? Select all that apply.

- ☐ 1. Ask another nurse to confirm that this is the correct dose and correct client for whom the prednisone has been prescribed.
- ☐ 2. Check the child’s identification band against the medical record number.
- ☐ 3. Verify the date of birth from the medical record with the date of birth on the client’s identification band.
- ☐ 4. Compare the room number on the bed with the number on the client’s identification band.
- ☐ 5. Ask the client to state the first name.

66. A client is scheduled to have surgery to relieve an intestinal obstruction. Prior to surgery, the nurse should verify that the client has:

- ☐ 1. discontinued use of blood thinners.
- ☐ 2. followed a low-residue diet.
- ☐ 3. practiced abdominal muscle strengthening exercises.
- ☐ 4. signed a last will and testament.

67. After teaching a client about collecting a stool sample for occult testing, which client statement indicates effective teaching? Select all that apply.

- ☐ 1. “I will avoid eating meat for 1 to 3 days before getting a stool sample.”
- ☐ 2. “I need to eat foods low in fiber a few days before collecting the

sample.”

- ☐ 3. “I will take the sample from different areas of the stool that I have passed.”
- ☐ 4. “I need to send the stool sample to the lab in a covered container right away.”
- ☐ 5. “I can continue to take all of my regular medications at home.”

68. The nurse is preparing to administer propranolol to a client for control of migraine headaches. The client also has a prescription for sumatriptan as needed for a headache. The client’s pulse rate is 56 bpm. What should the nurse do **next**?

- ☐ 1. Contact the healthcare provider (HCP).
- ☐ 2. Assess blood pressure.
- ☐ 3. Administer oxygen.
- ☐ 4. Administer sumatriptan.

69. A client with a history of type 1 diabetes mellitus and chronic obstructive pulmonary disease should have which immunization?

- ☐ 1. influenza
- ☐ 2. hepatitis A
- ☐ 3. measles-mumps-rubella
- ☐ 4. varicella

70. The mother of a toddler diagnosed with iron deficiency anemia asks what foods she should give her child. The nurse should evaluate the teaching as successful when the mother later reports that she feeds the toddler which foods?

- ☐ 1. milk, carrots, and beef
- ☐ 2. raisins, chicken, and spinach
- ☐ 3. beef, lettuce, and juice
- ☐ 4. eggs, cheese, and milk

71. When a child is able to grasp the idea that a ball continues to exist even though the child’s parent placed the ball under a hat, the child is in which stage in the development of logical thinking according to Piaget?

- ☐ 1. sensorimotor

- ☐ 2. preoperational
- ☐ 3. concrete operations
- ☐ 4. formal operations

72. A nurse discusses with parents the procedures that will be performed on their neonate immediately after birth. The nurse determines that the instructions have been understood when the parent states that which procedure will be done to the neonate **first**?

- ☐ 1. The neonate will be suctioned.
- ☐ 2. The neonate will be dried and stimulated to cry.
- ☐ 3. The neonate will be given oxygen.
- ☐ 4. The neonate's umbilical cord will be cut.

73. An infusion of lidocaine hydrochloride is running at 30 mL/h. The dilution is 1,000 mg/250 mL. What dosage is the client receiving per minute? Record your answer using a whole number.

_____ mg/min.

74. A mother tells a nurse that her child has been exposed to roseola. After teaching the mother about the illness, which finding, if stated by the mother as the **most** characteristic sign of roseola, indicates successful teaching?

- ☐ 1. fever and sore throat
- ☐ 2. normal temperature followed by a low-grade fever
- ☐ 3. high fever followed by a drop and then a rash
- ☐ 4. cold-like signs and symptoms and a rash

75. A nurse is instructing a client about using nitroglycerin patches in order to prevent tolerance to the drug. The nurse should instruct the client to:

- ☐ 1. remove the patch every night.
- ☐ 2. use the patch only when chest pain occurs.
- ☐ 3. change the site of the patch every day.
- ☐ 4. apply the patch only on alternate days.

76. A client's abdominal incision eviscerates. The nurse should **first**:

- ☐ 1. take the client's vital signs and call the healthcare provider (HCP).
- ☐ 2. lower the client's head and elevate the feet.

- ☐ 3. cover the incision with a dressing moistened with sterile normal saline solution.
- ☐ 4. start an emergency infusion of IV fluids.

77. The nursing staff has safely and successfully secluded and restrained a client with acute mania who threatened the nurse and threw a chair against the wall in the community room. Which statement by the nurse is **most** helpful to the client at this time?

- ☐ 1. "Threatening others and throwing furniture is not allowed."
- ☐ 2. "You have been restrained until you can manage your behavior."
- ☐ 3. "Since you have been here before, you know what the rules are."
- ☐ 4. "We are only doing this for your own good, so calm down."

78. At what time should the blood be drawn in relation to the administration of the IV dose of gentamicin sulfate?

- ☐ 1. 2 hours before the administration of the next IV dose
- ☐ 2. 3 hours before the administration of the next IV dose
- ☐ 3. 4 hours before the administration of the next IV dose
- ☐ 4. just before the administration of the next IV dose

79. A client is taking 600 mg of valproic acid twice daily. The nurse should assess the client for which adverse effects? Select all that apply.

- ☐ 1. tremors
- ☐ 2. hair loss
- ☐ 3. gastrointestinal upset
- ☐ 4. anorexia
- ☐ 5. weight gain

80. A client has a cerclage placed at 16 weeks' gestation. She has had no contractions, and her cervix is dilated 2 cm. The nurse is preparing the client for discharge. Which statement by the client should indicate to the nurse that the client needs further instruction?

- ☐ 1. "I will need more frequent prenatal visits."
- ☐ 2. "I should call if I am leaking fluid or have bleeding or contractions."
- ☐ 3. "I can have sex again in about 2 weeks."
- ☐ 4. "I can have nothing in my vagina until I am at term."

81. The nurse is admitting a 4-year-old with a possible meningococcal infection. Which type of isolation is indicated?

- ☐ 1. airborne precautions
- ☐ 2. contact precautions
- ☐ 3. droplet precautions
- ☐ 4. standard precautions

82. While preparing to administer medications to a client, the nurse compares the medication in the medication box with the healthcare provider's (HCP) prescriptions and discovers that the HCP has prescribed prednisone 15 mg PO for a client with cirrhosis and the medication in the client's medication box is prednisolone 5 mg. What should the nurse do **next**?

- ☐ 1. Call the pharmacy for prednisone 15 mg.
- ☐ 2. Notify the charge nurse or supervisor.
- ☐ 3. Call the HCP for clarification.
- ☐ 4. Contact the pharmacy about the discrepancy.

83. A parent calls the clinic after her 4-year-old choked on a peanut. The parent reports performing abdominal thrusts and the child is breathing normally now. The nurse should tell the parent to:

- ☐ 1. bring the child to the emergency department to check for airway obstruction.
- ☐ 2. test the child's urine for blood from internal bleeding.
- ☐ 3. call the healthcare provider (HCP) if the child begins to sweat and feels dizzy.
- ☐ 4. observe the child for difficulty breathing because the abdominal thrusts may have caused a pneumothorax.

84. A client is taking nonsteroidal anti-inflammatory drugs (NSAIDs) to manage pain from rheumatoid arthritis. What instruction should the nurse give the client about NSAIDs?

- ☐ 1. Take the prescribed medication with food and fluids.
- ☐ 2. Gradually decrease the medication dosage.
- ☐ 3. Rinse the mouth with water after taking NSAIDs.
- ☐ 4. Avoid driving and using machinery while taking NSAIDs.

85. The nurse is assessing a neonate at 5 minutes after birth. The nurse records the Apgar score based on the findings in the chart below.

Flow Sheets

Apgar at 5 Minutes After Birth

Heart rate	100 bpm
Respirations	Irregular
Color	Pink
Muscle tone	Moving all four extremities
Reflexes	Cough

The nurse compares these findings to the Apgar score obtained at birth, as determined by the findings in the chart below.

Flow Sheets

Apgar at Birth

Heart rate	120 bpm
Respirations	Slow
Color	Blue extremities
Muscle tone	Flexion of extremities
Reflexes	Grimace

What should the nurse do **next**?

- ☐ 1. Notify the neonatologist on call.
- ☐ 2. Continue to assess the neonate.
- ☐ 3. Apply an oxygen mask.
- ☐ 4. Rub the neonate's extremities.

86. It is important for nurses to communicate with clients about their health care because:

- ☐ 1. consumers of health care cannot keep up with rapid advances in science.
- ☐ 2. healthcare services are often specialized and fragmented.
- ☐ 3. the media provides misleading information.
- ☐ 4. clients are more demanding that their rights be respected.

87. The nurse should assess a newborn with esophageal atresia and tracheoesophageal fistula (TEF) for which complications? Select all that apply.

- ☐ 1. copious frothy mucus
- ☐ 2. episodes of cyanosis
- ☐ 3. several loose stools
- ☐ 4. initial weight loss
- ☐ 5. poor gag reflex

88. When developing a teaching plan for a client with an infected decubitus ulcer, the nurse should tell the client that which factor is **most** important for healing?

- ☐ 1. adequate circulatory status
- ☐ 2. scheduled periods of rest
- ☐ 3. balanced nutritional diet
- ☐ 4. fluid intake of 1,500 mL/day

89. The **most** appropriate toys to give to a 5-month-old infant are:

- ☐ 1. plastic toy cars.
- ☐ 2. wooden puzzles.
- ☐ 3. stuffed animals.

- ☐ 4. soft, washable toys.

90. One staff member in a psychiatric unit says to the nurse, “Why are we carrying out suicide precautions for someone who is dying? It is pointless and a waste of time.” The nurse should:

- ☐ 1. assign the staff member to other clients.
- ☐ 2. ask the psychiatric clinical nurse specialist to meet with the staff member.
- ☐ 3. agree with the staff member and discontinue suicide precautions.
- ☐ 4. call for a multidisciplinary staff meeting.

91. The nurse reviews the client’s laboratory report to determine the client’s blood level of valproic acid, which is 35 mcg/mL (243 µmol/L). Based on this report, what should the nurse do first?

- ☐ 1. Withhold the next dose of valproic acid.
- ☐ 2. Notify the healthcare provider (HCP).
- ☐ 3. Give the next dose as prescribed.
- ☐ 4. Take the client’s vital signs.

92. After 2 days on a psychiatric unit, a client is still isolating himself in his room, except for meals. The client says he is uncomfortable around crowds of people. Which nursing intervention is the **most** appropriate initially?

- ☐ 1. Play a game of checkers with the client in his room.
- ☐ 2. Ask the client to attend a group session with the nurse.
- ☐ 3. Invite the client to go for a walk with the nurse and one other client.
- ☐ 4. Talk with the client in a corner of the crafts room.

93. A nurse is caring for a woman who gave birth to a term neonate at 0600. At 1600, the woman has a distended bladder and is reporting pain of 5 on a scale of 1 to 10. The nurse reviews the client’s output record.

Intake and Output

Output Record

Time	0800	1000	1100	1600
	30 mL	50 mL	30 mL	60 mL

What should the nurse do **first**?

- ☐ 1. Apply a warm, moist towel over the bladder.
- ☐ 2. Ask the woman to sit on the toilet while the nurse runs water from the faucet.
- ☐ 3. Administer acetaminophen with codeine.
- ☐ 4. Use an in-and-out catheter to empty the bladder.

94. The nurse observes that a client with a history of panic attacks is hyperventilating. The nurse should:

- ☐ 1. have the client breathe into a paper bag.
- ☐ 2. instruct the client to put his head between his knees.
- ☐ 3. give the client a low concentration of oxygen by nasal cannula.
- ☐ 4. tell the client to take several deep, slow breaths and exhale normally.

95. A client at 40+ weeks' gestation visits the emergency department because she thinks she is in labor. Which is the **best** indication that the client is in true labor?

- ☐ 1. fetal descent into the pelvic inlet
- ☐ 2. cervical dilation and effacement
- ☐ 3. painful contractions every 3 to 5 minutes
- ☐ 4. leaking amniotic fluid clear in color

96. The father of a 3-week-old infant who has developed sepsis says that he feels guilty because he did not realize his infant was sick. Which response by the nurse would be **most** appropriate?

- ☐ 1. “You should have realized something was wrong; he is your son.”
- ☐ 2. “Did you read the booklet on newborns that was sent home with you from the hospital?”
- ☐ 3. “What you are feeling is normal; next time, you will know what to look for.”
- ☐ 4. “Babies can get sick quickly, and parents do not always realize it.”

97. A mother brings a 15-month-old child to the well-baby clinic. She states the child has been taking approximately 18 to 20 oz (540 to 600 mL) of whole milk per day from a bottle with meals and at bedtime. The nurse should suggest that she begin weaning the child from the bottle to avoid risking:

- ☐ 1. malnutrition.
- ☐ 2. anemia.
- ☐ 3. dental caries.
- ☐ 4. malocclusion.

98. The registered nurse (RN) is teamed with a licensed practical/vocational nurse (LPN/VN) in caring for a group of cardiac clients on a pediatric unit. Which action by the LPN/VN indicates the nurse should intervene immediately?

- ☐ 1. The LPN/VN assists a child to the bathroom 2 hours after a cardiac catheterization.
- ☐ 2. The LPN/VN places an infant having a cyanotic episode in a knee-chest position.
- ☐ 3. The LPN/VN checks a child’s apical heart rate prior to administering digoxin.
- ☐ 4. The LPN/VN brings breakfast to a child who is scheduled for an electrocardiogram.

99. A client is taking vancomycin. The nurse should report which possible side effect to the healthcare provider (HCP)?

- ☐ 1. vertigo
- ☐ 2. tinnitus
- ☐ 3. muscle stiffness

- ☐ 4. ataxia

100. The nurse hears a pregnant client yell, “Oh my! The baby is coming!” After placing the client in a supine position and trying to maintain some privacy, the nurse sees that the neonate’s head is being born. What should the nurse do **first**?

- ☐ 1. Suction the mouth with two fingertips.
- ☐ 2. Check for presence of a cord around the neck.
- ☐ 3. Tell the client to bear down with force.
- ☐ 4. Advise the mother that help is on the way.

101. Which goal is a **priority** after surgical repair of a cleft lip?

- ☐ 1. Manage pain.
- ☐ 2. Prevent infection.
- ☐ 3. Increase mobility.
- ☐ 4. Develop parenting skills.

102. A client with heart failure is given a prescription for torsemide. Two days after the drug therapy is started, the nurse evaluates the torsemide as effective when the client:

- ☐ 1. has an improved appetite and is eating better.
- ☐ 2. weighs 7 lb (3 kg) less than the client did 2 days ago.
- ☐ 3. is less thirsty than before the drug therapy.
- ☐ 4. has clearer urine since starting torsemide.

103. Which technique is correct when the nurse is inserting a rectal suppository for an adult client?

- ☐ 1. Insert the suppository while the client bears down.
- ☐ 2. Place the client in a supine position.
- ☐ 3. Position the suppository along the rectal wall.
- ☐ 4. Insert the suppository 2 inches (8 to 10 cm) into the rectum.

104. In caring for the client with hepatitis B, which situation would expose the nurse to the virus?

- ☐ 1. contact with fecal material
- ☐ 2. a blood splash into the nurse’s eyes

- ☐ 3. touching the client's arm with ungloved hands while taking a blood pressure
- ☐ 4. disposing of syringes and needles without recapping

105. A young woman is brought from the emergency department (ED) to the psychiatric unit. ED staff report that she is not answering questions and has been sitting in the same position in the wheelchair for 45 minutes. When her arm was extended to draw blood, she did not move her arm back to a natural position. The client's brother says he found her this way yesterday and could not get her to move on her own. Which nursing interventions have a **high priority** in this case? Select all that apply.

- ☐ 1. Ask her to describe her stressors.
- ☐ 2. Monitor her body positions to prevent injury.
- ☐ 3. Offer her nutritional shakes every 3 hours.
- ☐ 4. Encourage her to talk about her feelings.
- ☐ 5. Assist her to the bathroom every 2 hours.
- ☐ 6. Protect her from intrusions by other clients.

106. The nurse is assessing a group of children in a day care center. Which child warrants further assessment?

- ☐ 1. a child who is 12 months of age who has bruises on one side of the head
- ☐ 2. a child who is 3 years of age with a spiral fracture of the ulna whose mother does not know how the injury occurred
- ☐ 3. a child who is 4 years of age who wears the same clothes to the center every day
- ☐ 4. a child who is 2 years of age who has frequent episodes of untreated conjunctivitis

107. A client who had a total hip placement at 0900 is receiving an autologous blood transfusion that was started at 1100. At the change of shift (1500), the nurse working on the day shift reports that there is 50 mL of the unit of blood remaining to be infused. Which is a **priority** action for the nurse working on the evening shift?

- ☐ 1. Keep the blood transfusing at the same rate.
- ☐ 2. Increase the rate so it will infuse by 1600.

- ☐ 3. Discontinue the blood transfusion at the beginning of the shift.
- ☐ 4. Maintain the current rate, and discontinue the blood transfusion at 1700.

108. A client undergoes a nephrectomy. In the immediate postoperative period, which nursing intervention has the **highest priority**?

- ☐ 1. Monitor blood pressure.
- ☐ 2. Encourage the use of the incentive spirometer.
- ☐ 3. Assess urine output hourly.
- ☐ 4. Check the flank dressing for urine drainage.

109. A client is admitted with fatigue, shortness of breath, pale skin, and dried, cracked lips, tongue, and mouth. The hemoglobin is 9 g/dL (90 g/L), and red blood cell count is 3.5 million cells/mm³ ($3.5 \times 10^{12}/L$). The nurse should instruct the client to:

- ☐ 1. eat foods with good sources of iron.
- ☐ 2. limit fluid intake to 1,000 mL/day.
- ☐ 3. increase the amount of carbohydrates in the diet.
- ☐ 4. eat a serving of fish with high omega 3 content two times a week.

110. When assessing a neonate 1 hour after birth, the nurse observes that the neonate exhibits slight cyanosis when quiet but becomes pink when crying. The nurse is unable to pass a catheter through the left nostril. The nurse notifies the healthcare provider (HCP) because the neonate **most** likely is exhibiting signs and symptoms of what problem?

- ☐ 1. esophageal reflux disorder
- ☐ 2. unilateral choanal atresia
- ☐ 3. respiratory distress syndrome
- ☐ 4. tracheoesophageal fistula

111. A client is receiving digoxin, and the pulse range is normally 70 to 76 bpm. After assessing the apical pulse for 1 minute and finding it to be 60 bpm, the nurse should **first**:

- ☐ 1. notify the healthcare provider (HCP).
- ☐ 2. withhold the digoxin.
- ☐ 3. administer the digoxin.

- ☐ 4. notify the charge nurse.

112. When developing a teaching plan for parents of toddlers about poisonous substances, the nurse should emphasize which safety points? Select all that apply.

- ☐ 1. Toddlers should be adequately supervised at all times.
- ☐ 2. All poisonous substances should be kept out of the reach of children and stored in a locked cabinet if necessary.
- ☐ 3. The difference between pediatric and adult dosages of medicines is significant, and adult dosages given to children can have serious, harmful effects.
- ☐ 4. Syrup of ipecac should be administered following all ingestions of poisonous substances.
- ☐ 5. Following any poisoning, the parents should call the Poison Control Center for instructions for appropriate treatment.

113. A client on a psychiatric care unit has muscle spasms in the neck and stiffness in other muscles, and the eyes are rolling upward. The client had two PRN doses of haloperidol in the last 6 hours. Of the drugs that have been prescribed for the client as needed (see chart), the nurse should administer:

Prescriptions

Lorazepam 1 mg IM
Amantadine 100 mg PO
Diphenhydramine 25 mg PO
Benztrapine 0.5 mg IM

- ☐ 1. lorazepam.
- ☐ 2. amantadine.
- ☐ 3. diphenhydramine.
- ☐ 4. benztrapine.

114. After birth of a male neonate at 38 weeks' gestation, the nurse dries

the neonate and places him under the radiant warmer. The nurse performs this action based on the understanding that one neonatal response to cold stress involves which factor?

- ☐ 1. metabolism of brown adipose tissue
- ☐ 2. decreased utilization of glycogen stores
- ☐ 3. decreased utilization of calorie stores
- ☐ 4. increased shivering to keep warm

115. Twenty-four hours after an appendectomy, a 16-year-old adolescent of Asian ethnicity reports no pain when asked but is frowning and has the legs drawn to the fetal position. The nurse should:

- ☐ 1. administer pain medication.
- ☐ 2. ask the adolescent what is troubling him.
- ☐ 3. discuss the adolescent's behavior with the parents.
- ☐ 4. offer a distracting activity such as a video game.

116. When developing the teaching plan for a primiparous client who is bottle-feeding her term neonate for the first feeding, what information should the nurse include?

- ☐ 1. Fill the entire nipple of the bottle with formula.
- ☐ 2. All term babies have well-developed sucking skills.
- ☐ 3. Bubble the baby after 2 oz (60 mL) of formula have been taken.
- ☐ 4. Propping of the bottle results in too much air being taken in by the baby.

117. Which topic would be **most** important to include when teaching the parents how to promote overall toddler development?

- ☐ 1. Language is the most important achievement.
- ☐ 2. Discipline is critical to appropriate development.
- ☐ 3. Safety is a priority concern for this age-group.
- ☐ 4. Eating habits that follow into adulthood begin now.

118. A client has back pain 10 minutes after a unit of packed red blood cells (RBCs) was started. The client's pulse, blood pressure, and respirations are stable, and similar to vital signs obtained before infusing the RBCs. What should the nurse do? Select all that apply.

- ☐ 1. Turn off the infusion of the packed RBCs.
- ☐ 2. Flush the Y-tubing with normal saline to clear the line.
- ☐ 3. Send the remaining blood to lab.
- ☐ 4. Prepare for cardiopulmonary resuscitation.
- ☐ 5. Obtain a urine specimen to send to the laboratory.

119. A primiparous client at 4 hours after a vaginal birth and manual removal of the placenta voids for the first time. The nurse palpates the fundus, noting it to be 1 cm above the umbilicus, slightly firm, and deviated to the left side, and notes a moderate amount of lochia rubra. The nurse notifies the healthcare provider (HCP) based on the interpretation that the assessment indicates which problem?

- ☐ 1. perineal lacerations
- ☐ 2. retained placental fragments
- ☐ 3. cervical lacerations
- ☐ 4. urine retention

120. While performing a gestational age assessment for a male neonate born vaginally at 37 weeks' gestation, the nurse should assess the neonate for:

- ☐ 1. an anterior transverse crease on the soles.
- ☐ 2. extensive rugae on the scrotum.
- ☐ 3. some cartilage in the earlobes.
- ☐ 4. coarse and silky scalp hair.

121. Two family members are visiting their father who is experiencing acute delirium. They are upset that their father is so disoriented. "He knows who we are, but that is about it. We do not know what to say to him." What should the nurse tell the family? Select all that apply.

- ☐ 1. "Answer his questions simply, honestly, slowly, and clearly."
- ☐ 2. "Correct him when he is hearing and seeing things that are not there."
- ☐ 3. "Occasionally remind him of the time, day, and place when he does not remember."
- ☐ 4. "Include him in your conversation, instead of talking about him while he is present."

- ☐ 5. “Raise your voice a bit so you are sure he hears you.”

122. A 26-year-old is being treated for delirium due to acute alcohol intoxication. The client is restless, does not want to stay seated, and has a staggering gait. What should the nurse do **first**?

- ☐ 1. Place the client in a chair with a waist restraint.
- ☐ 2. Provide one-to-one supervision of the client until detoxification treatment can begin.
- ☐ 3. Ask the client to sit in a chair next to the nurses’ station.
- ☐ 4. Decrease stimuli by putting the client in bed with the room door closed.

123. The nurse is monitoring a client receiving a blood transfusion when the client develops a cough with shortness of breath. The client also has a headache and a racing heart. What should the nurse do first?

- ☐ 1. Slow the infusion rate.
- ☐ 2. Replace the blood with saline.
- ☐ 3. Administer an antihistamine.
- ☐ 4. Place the client flat with the feet elevated.

124. The nurse should seek clarification about which prescription?

- ☐ 1. Give 5,000 units bolus dose of heparin IV push.
- ☐ 2. Give 200,000 units heparin by IV drip, and infuse over 24 hours.
- ☐ 3. Give 40,000 units of heparin by IV drip, and infuse over 24 hours.
- ☐ 4. Give 5,000 units of heparin IV piggyback every 4 to 6 hours.

125. A nurse is analyzing a client’s intake and output. The client has a temperature of 102°F (38.9°C) and is receiving 2,400 mL of IV fluids per 24 hours because the client is to have nothing by mouth. Before planning nursing actions, the nurse should first determine:

- ☐ 1. the client’s body mass index.
- ☐ 2. the amount of insensible fluid loss through the lungs and skin.
- ☐ 3. when the client last ate.
- ☐ 4. the intravenous fluid intake during the last 8 hours.

126. Two toddlers are arguing over a toy in the playroom. The nurse should say to the children:

- ☐ 1. "If you cannot play together, I will have to put you back in your rooms."
- ☐ 2. "Give the toy to me. Now neither of you will have it."
- ☐ 3. "Let me see if I can get both of you a similar toy."
- ☐ 4. "Let one of you play with it for awhile, and then give it to the other."

127. A client has been prescribed digoxin. Which symptom should the nurse tell the client to report as a potential indication of digoxin toxicity?

- ☐ 1. urticaria
- ☐ 2. shortness of breath
- ☐ 3. visual disturbances
- ☐ 4. hypertension

128. A 9-month-old infant whose parents have emigrated from Mexico presents in the clinic with severe dehydration from vomiting. The infant was seen in the clinic just 3 days ago for a well-child visit, but now the family seems very distrustful of the healthcare team. The nurse should ask the parents:

- ☐ 1. "Have you been speaking with a healer?"
- ☐ 2. "Did anything concern you about your last visit?"
- ☐ 3. "Has immigration been causing you problems?"
- ☐ 4. "Are you afraid your baby will be taken from you?"

129. A 4-year-old child continues to come to the nurses' station after being told children are not allowed there. What behavior is the child exhibiting?

- ☐ 1. attention-seeking behavior
- ☐ 2. aggressive behavior
- ☐ 3. resistive behavior
- ☐ 4. exaggerated stress behavior

130. A 5-month-old infant is brought to the emergency department with vomiting and diarrhea, which the parent states started 3 days ago. The nurse should conduct a focused assessment for which signs and symptoms? Select all that apply.

- ☐ 1. decreased or absent tearing

- ☐ 2. dry mucous membranes
- ☐ 3. sunken fontanelle
- ☐ 4. clear, pale yellow urine
- ☐ 5. bounding pulse

131. A client's burn wounds are being cleaned twice a day in a hydrotherapy tub. Which intervention should be included in the plan of care before a hydrotherapy treatment is initiated?

- ☐ 1. Limit food and fluids 45 minutes before therapy to prevent nausea and vomiting.
- ☐ 2. Increase the IV flow rate to offset fluids lost through the therapy.
- ☐ 3. Apply a topical antibiotic cream to burns to prevent infection.
- ☐ 4. Administer pain medication 30 minutes before therapy to help manage pain.

132. A neonate born to a primiparous client at 36 weeks' gestation in a small, rural hospital is to be transferred by ambulance to a level III nursery. To prepare the parents for the transfer, what should the nurse include in the plan of care?

- ☐ 1. Instruct the parents that the neonate is in critical condition.
- ☐ 2. Obtain the mother's consent for the neonate's transfer.
- ☐ 3. Allow the parents to touch the neonate before transfer.
- ☐ 4. Ask the father if he desires to ride in the ambulance during the transfer.

133. A multiparous client gives birth to a neonate at 24 weeks' gestation. After 12 hours, the neonate's condition deteriorates, and death appears likely within the next few minutes. The parents are Roman Catholic, and they request that the neonate be baptized. What action would be **most** appropriate?

- ☐ 1. Contact the hospital chaplain to perform the baptism.
- ☐ 2. Alert the hospital's director that a neonatal death is imminent.
- ☐ 3. Find a healthcare provider (HCP) who is Roman Catholic to perform the baptism.
- ☐ 4. Baptize the neonate, regardless of the nurse's own religious beliefs.

134. A client with bipolar disorder, manic phase, shows little interest in eating. To help the client meet recommended daily allowances of nutrients,

the nurse should:

- ☐ 1. give the client half of a meat and cheese sandwich to carry with him.
- ☐ 2. inform the client that snacks are available only if he eats properly at mealtime.
- ☐ 3. tell the client to sit alone at mealtime so that he won't be distracted by others.
- ☐ 4. teach the client about proper nutrition.

135. A client has bursitis in the subacromial bursa. A nurse determines that the client understands teaching when the client says:

- ☐ 1. "I will apply moist heat to my shoulder for 20 minutes three times each day."
- ☐ 2. "I will lift 30-lb (13.5-kg) weights at least three times each day."
- ☐ 3. "I will apply dry ice to my shoulder for 20 minutes three times each day."
- ☐ 4. "I will perform 360-degree circles with my arms extended at least three times daily."

136. A client has just undergone a lumbar puncture (LP). Which finding should the nurse **immediately** report to the healthcare provider (HCP)?

- ☐ 1. The client's oral intake was 1,200 mL in the past 8 hours.
- ☐ 2. The client required analgesia for headache.
- ☐ 3. A moderate amount of serous fluid was noted on the lumbar dressing.
- ☐ 4. The client is concerned about the test results.

137. The nurse is reviewing the lab report below for a client in hospice care with breast cancer and brain metastasis. According to the information in the chart, what should the nurse do **next**?

Laboratory Results

Test	Result
Potassium	4.0 mEq/L (mmol/L)
Sodium	142 mEq/L (mmol/L)
Chloride	100 mEq/L (mmol/L)
Calcium	12.4 mg/dL (3.1 mmol/L)

- ☐ 1. Document these results on the medical record.
- ☐ 2. Report the elevated potassium level immediately.
- ☐ 3. Report the elevated calcium level immediately.
- ☐ 4. Refrain from reporting the results because the client is in hospice care.

138. A nurse is caring for a primigravid client at 40 weeks' gestation in active labor. Assessments include the following: cervix 5 cm dilated; 90% effaced; station 0; cephalic presentation and FHR baseline 135 bpm, decreases to 125 bpm shortly after onset of 5 uterine contractions and returns to baseline before the uterine contraction ends. Based on this assessment, what action should the nurse take **first**?

- ☐ 1. Position the woman on her left side, and administer oxygen via face mask.
- ☐ 2. Document findings on the woman's medical record, and continue to monitor labor progress.
- ☐ 3. Perform a vaginal exam to rule out umbilical cord prolapse.
- ☐ 4. Notify the healthcare provider (HCP) immediately, and prepare for emergency cesarean section.

139. A child with a cardiac defect assumes a squatting position. The nurse should determine that the position is effective for the child by noting:

- ☐ 1. less energy required to play with toys on the floor.

- ☐ 2. less dyspnea.
- ☐ 3. relief of abdominal pressure.
- ☐ 4. improved muscle tone.

140. A client was brought to the emergency department following a motor vehicle accident and has phrenic nerve involvement. The nurse should assess the client for:

- ☐ 1. alteration in level of consciousness.
- ☐ 2. altered cardiac functioning.
- ☐ 3. ineffective breathing pattern.
- ☐ 4. alteration in urinary elimination.

141. A primigravid client is seen for her first visit in the antenatal clinic and tells the nurse that her brother was born with cystic fibrosis (CF). When teaching the client about this disorder, the nurse should include which information? Select all that apply.

- ☐ 1. Persons of Asian descent have the highest inheritance rates.
- ☐ 2. To inherit CF, each parent must carry a recessive trait for the disease.
- ☐ 3. If both parents carry the trait, each offspring has a 25% chance of inheriting the disease.
- ☐ 4. Fetal testing can occur by checking the shape of the red blood cells.
- ☐ 5. Chorionic villi sampling (CVS) can identify prenatally if their child carries the trait or has the disease.

142. A client with a peritonsillar abscess has been hospitalized. Upon assessment, the nurse determines the following: a temperature of 103°F (39.4°C), body chills, and leukocytosis. The client begins to have difficulty breathing. In what order should the nurse perform the actions? All options must be used.

1. Call the healthcare provider (HCP).

2. Open the airway.

3. Start an IV access site.

4. Explain the situation to the family.

143. The nurse is teaching a client who has deep vein thrombosis caused by a pulmonary embolus, which has now resolved. What should the nurse tell the client?

- ☐ 1. “Report such signs as leg swelling, discomfort, redness, or warmth.”
- ☐ 2. “Sit with your legs lower than the rest of your body.”
- ☐ 3. “Walk at least every other day.”
- ☐ 4. “Limit your fluids to 1 L each day.”

144. A multiparous client and her neonate, who has been cared for in the intensive care nursery for the past 3 days because of being small for gestational age, are to be discharged. Before their release, the mother tells the nurse, “I have been living in my car for the past 2 weeks.” What should the nurse do **next**?

- ☐ 1. Notify the director of the birthing unit.
- ☐ 2. Contact the hospital’s social worker.
- ☐ 3. Contact the client’s healthcare provider (HCP).
- ☐ 4. Notify the client’s family members.

145. A client who is receiving a blood transfusion suddenly experiences chills and a temperature of 101°F (38.3°C). The client also has a headache and appears flushed. In what order from first to last should the nurse perform the actions? All options must be used.

1. Obtain a blood culture from the client.

2. Send the blood bag and administration set to the blood bank.

3. Stop the blood infusion.

4. Infuse normal saline to keep the vein open.

146. The fetus of a multigravid client at 38 weeks' gestation is determined to be in a frank breech presentation. The nurse describes this presentation to the client as which fetal part coming in contact with the cervix?

- ☐ 1. buttocks
- ☐ 2. head
- ☐ 3. both feet
- ☐ 4. shoulder

147. The nurse collects a urine specimen from a client for a culture and sensitivity analysis. What should the nurse do **next**?

- ☐ 1. Send the specimen to the laboratory immediately.
- ☐ 2. Send the specimen with the next pickup.
- ☐ 3. Send the specimen the next time an unlicensed assistive personnel (UAP) is available.
- ☐ 4. Store the specimen in the refrigerator until it can be sent to the laboratory.

148. A client in surgery has an endotracheal tube (ET) in place. The nurse

should call a time-out if which requirements are not in place? Select all that apply.

- ☐ 1. an identification band
- ☐ 2. postoperative pain medication
- ☐ 3. an IV line
- ☐ 4. oxygen administration
- ☐ 5. an anesthetist/anesthesiologist

149. A multiparous client at 16 weeks' gestation is diagnosed as having a fetus with probable anencephaly. The client is a devout Baptist and has decided to continue the pregnancy and donate the neonatal organs after the death of the neonate. Which action by the nurse would be **most** appropriate?

- ☐ 1. Explore his or her own feelings about the issues of anencephaly and organ donation.
- ☐ 2. Contact the client's minister to discuss the client's options related to the pregnancy.
- ☐ 3. Advise the client that the prolonged neonatal death will be very painful for her.
- ☐ 4. Ask the client if she has discussed this with her family.

150. A 3-month-old infant is being discharged on digoxin. The nurse should instruct the parents to report which signs and symptoms? Select all that apply.

- ☐ 1. signs of constipation or painful straining
- ☐ 2. decrease in the amount of infant formula taken or a refusal to take it
- ☐ 3. pulse rate >140 bpm or <100 bpm
- ☐ 4. signs that the infant is not following moving objects
- ☐ 5. sudden vomiting or sudden drowsiness

151. The nurse receives a report of a serum potassium level on an infant of 5.4 mEq/L (5.4 mmol/L). What should the nurse do **first**?

- ☐ 1. Notify the healthcare provider (HCP) of the abnormal level.
- ☐ 2. Call the laboratory to see how the specimen was obtained.
- ☐ 3. Connect the infant to a cardiac monitor.
- ☐ 4. Check the infant's last 24-hour output.

152. A client with suicidal thoughts is admitted to an adult inpatient behavioral health unit. What should the nurse do **first**?

- ☐ 1. Initiate suicide precautions with face-to-face observation of the client at all times.
- ☐ 2. Place the client on suicide watch, and have a family member remain with the client.
- ☐ 3. Question the client further about the suicidal thoughts and plans.
- ☐ 4. Confine the client to his or her room, and post a staff member at the door to observe the client's actions.

153. The nurse is caring for a client who has a history of gastric bypass surgery and is now being seen for her first prenatal visit. Which interventions should be included in the plan of care? Select all that apply.

- ☐ 1. Take a prenatal vitamin with 400 mcg of folic acid.
- ☐ 2. Refer the client to a registered dietician.
- ☐ 3. Draw glucose levels at each prenatal visit.
- ☐ 4. Counsel her she will most likely gain all of her weight back.
- ☐ 5. Check urine at each visit for protein and glucose.
- ☐ 6. Monitor with nonstress tests beginning at 20 weeks.

154. A nurse is planning care for a regressed, chronically ill client diagnosed with schizophrenia. What is the **most** appropriate milieu?

- ☐ 1. confrontation and peer pressure to break down the client's denial
- ☐ 2. reminder that all clients must participate fully in unit self-governance
- ☐ 3. required attendance at group activities with equal participation from all clients
- ☐ 4. nurturance and supportive interaction focusing on individual needs

155. The nurse is assessing a client with irreversible shock. The nurse should document which finding?

- ☐ 1. increased alertness
- ☐ 2. circulatory collapse
- ☐ 3. hypertension
- ☐ 4. diuresis

156. The nurse is caring for a client who has been diagnosed with deep vein thrombosis. When assessing the client's vital signs, the nurse notes an apical pulse of 150 bpm, a respiratory rate of 46 breaths/minute, and blood pressure of 100/60 mm Hg. The client appears anxious and restless. What should be the nurse's first course of action?

- ☐ 1. Notify the healthcare provider (HCP).
- ☐ 2. Administer a sedative.
- ☐ 3. Try to elicit a positive Homans' sign.
- ☐ 4. Increase the flow rate of intravenous fluids.

157. Assessment of a primigravid client in active labor reveals cervical dilation at 9 cm with complete effacement and the fetus at +1 station. What is the **most** appropriate action for the nurse to take when the healthcare provider (HCP) prescribes morphine 2 mg IM for the client?

- ☐ 1. Administer the medication in the left ventrogluteal muscle.
- ☐ 2. Be certain that naloxone is at the client's bedside.
- ☐ 3. Ask the HCP to validate the dosage of the drug.
- ☐ 4. Refuse to administer the medication to the client.

158. A client has been hospitalized with a diagnosis of myasthenia gravis. A friend is visiting the client during lunch. The nurse enters the room after the client recovered from choking on lunch. What should the nurse do **next**?

- ☐ 1. Instruct the client to sit at a 30-degree angle in bed when eating.
- ☐ 2. Tell the client to swallow when her chin is tipped down on her chest.
- ☐ 3. Remind the client to rest after eating.
- ☐ 4. Encourage the client to eat alone.

159. A nurse is assessing a client with a brain injury. What is a client's cerebral perfusion pressure (CPP) when the blood pressure (BP) is 90/50 mm Hg and the intracranial pressure (ICP) is 21? Round to the nearest whole number.

mm Hg.

160. A client with a T2 to T3 spinal cord injury suddenly has a throbbing headache and blurred vision. The client is flushed and sweating on the upper trunk and face, and the hairs on the arms are raised. What should the nurse do

first?

- ☐ 1. Raise the head of the bed.
- ☐ 2. Assess for hypotension.
- ☐ 3. Check the client for a distended bladder.
- ☐ 4. Logroll the client to see if the client is lying on a foreign object.

161. A 17-year-old unmarried primigravida client at 10 weeks' gestation tells the nurse that her family does not have much money and her dad just got laid off from his job. The nurse should **first**:

- ☐ 1. instruct the client in methods for low-cost, highly nutritious meal preparation.
- ☐ 2. determine whether the client qualifies for local assistance programs.
- ☐ 3. refer the client to a social worker for enrollment in a food assistance program.
- ☐ 4. ask the client if she has a job and the amount of income earned.

162. A client has impairments in immediate recall and short-term memory. A nurse is planning for the client's daily activities. Which action by the nurse would be **most** effective?

- ☐ 1. Write out the client's schedule in large print, and show the client where the schedule is placed.
- ☐ 2. Describe each activity and the time of the events at the beginning of the day.
- ☐ 3. Take the client to each activity if the client does not attend on time.
- ☐ 4. Tell the client about each activity 10 minutes before it begins.

163. A 17-year-old male client is being admitted to the adolescent psychiatric unit. He was brought in by the police after beating up two male peers. The client says, "They said I was gay because I had sex with an older neighbor when I was 8 years old. I am not gay!" Which nursing intervention would be appropriate? Select all that apply.

- ☐ 1. Monitor the client's level of anger and potential aggression.
- ☐ 2. Help the client express anger safely.
- ☐ 3. Assist the client in processing his feelings about the sexual abuse.
- ☐ 4. Ask the client if he would like to attend a support group.

- ☐ 5. Discuss the client's attitude about going to jail after discharge.

164. The nurse has been assigned to care for several postpartum clients and their neonates on a birthing unit. Which client should the nurse assess first?

- ☐ 1. a multiparous client at 48 hours postpartum who is being discharged
- ☐ 2. a primiparous client at 2 hours postpartum who gave vaginal birth to a term neonate
- ☐ 3. a multiparous client at 24 hours postpartum whose infant is in the special care nursery
- ☐ 4. a primiparous client at 48 hours postpartum after cesarean birth of a term neonate

165. A client is admitted to the hospital with malaise, headache, and cough followed by fever, chills, dyspnea, chest discomfort, myalgia, anorexia, vomiting, and diarrhea. The healthcare provider (HCP) makes the diagnosis of legionellosis (Legionnaires' disease). The client asks, "How did I get this?" Which response by the nurse is the most accurate?

- ☐ 1. "The bacteria thrive in warm water environments and are inhaled from contaminated water droplets."
- ☐ 2. "You inhaled the bacteria from secondary smoke."
- ☐ 3. "As ceiling fans circulate, bacteria are dispersed into the air."
- ☐ 4. "You may have swallowed contaminated water."

166. A 4-year-old child who has been ill for 4 hours is admitted to the hospital with difficulty swallowing, a sore throat, and severe substernal retractions. The child's temperature is 104°F (40°C), and the apical pulse is 140 bpm. The white blood cell count is 16,000/mm³ (16 × 10⁹/L). What is the **priority** for nursing intervention?

- ☐ 1. infection
- ☐ 2. airway obstruction
- ☐ 3. difficulty breathing
- ☐ 4. potential for aspiration

167. Which baseline laboratory data should be established before a client is started on tissue plasminogen activator or alteplase recombinant?

- ☐ 1. potassium level
- ☐ 2. Lee-White clotting time
- ☐ 3. hemoglobin level, hematocrit, and platelet count
- ☐ 4. blood glucose level

168. A client is scheduled to undergo an upper gastrointestinal (GI) series. The nurse should give the client which instructions in preparation for the test? Select all that apply.

- ☐ 1. "You will need to take a stool softener before the test to promote evacuation of the barium."
- ☐ 2. "Do not eat or drink for 8 hours before the test."
- ☐ 3. "You can expect white stools for about 48 hours after the test."
- ☐ 4. "You will experience mild stomach pain during the test."
- ☐ 5. "It is okay for you to smoke before the test."

169. Which are appropriate identifiers to use when providing care or administering medications or treatments? Select all that apply.

- ☐ 1. room number
- ☐ 2. bed number
- ☐ 3. medical record number
- ☐ 4. name band
- ☐ 5. social security (social insurance) number

170. The nurse interprets the rhythm strip below from a client's bedside monitor as:

- ☐ 1. normal sinus rhythm.
- ☐ 2. sinus tachycardia.

- ☐ 3. atrial fibrillation.
- ☐ 4. ventricular tachycardia.

171. The nurse is preparing to give an IM injection to an underweight client. Which site is the safest because it has the fewest amount of blood vessels and major nerves located in the area?

- ☐ 1. deltoid
- ☐ 2. dorsogluteal
- ☐ 3. vastus lateralis
- ☐ 4. triceps

172. The nurse is planning to teach the client how to properly use a metered-dose inhaler to treat asthma. The nurse should tell the client to:

- ☐ 1. rinse the mouth after each use of a steroid inhaler.
- ☐ 2. inhale quickly when administering the medication.
- ☐ 3. inhale the medication and then exhale through the nose.
- ☐ 4. cough and deep-breathe before inhaling the medication.

173. A client is receiving a transfusion of packed red blood cells. To safely administer the blood, the nurse should:

- ☐ 1. keep the blood refrigerated on the nursing unit until ready to administer.
- ☐ 2. stay with the client during the first 15 minutes to detect signs or symptoms of a reaction.
- ☐ 3. not infuse blood that has been hanging for more than 6 hours.
- ☐ 4. administer the blood quickly to prevent wasting it if the client develops a fever.

174. A client who is receiving a blood transfusion begins to have difficulty breathing. The nurse notes an elevated blood pressure and a cough. Based on these signs, the nurse should prepare to manage which complication?

- ☐ 1. anaphylactic reaction
- ☐ 2. circulatory overload
- ☐ 3. sepsis
- ☐ 4. acute hemolytic reaction

175. The nurse is teaching a client with peptic ulcer disease how to take sucralfate. Which statement indicates that the client understands how to take the medication?

- ☐ 1. "I should take the sucralfate every evening at bedtime."
- ☐ 2. "It is important that I take this drug on an empty stomach."
- ☐ 3. "I should avoid milk products while taking this drug."
- ☐ 4. "I should have my hemoglobin checked monthly while taking sucralfate."

176. The nurse is conducting an admission interview with a client and is assessing for risk factors related to the client's safety. The nurse should include which targeted assessments? Select all that apply.

- ☐ 1. suicide or self-harm ideation
- ☐ 2. incentives that motivate the client
- ☐ 3. recent use of substances of abuse
- ☐ 4. allergic reactions or adverse drug reactions
- ☐ 5. dietary preferences

177. An adult client has bacterial conjunctivitis. What should the nurse teach the client to do? Select all that apply.

- ☐ 1. Use warm saline soaks four times per day to remove crusting.
- ☐ 2. Apply topical antibiotic without touching the tip of the tube to the eye.
- ☐ 3. Wash the hands after touching the eyes.
- ☐ 4. Avoid touching the eyes.
- ☐ 5. Observe isolation procedures by staying in the bedroom until the redness in the eye disappears.

178. A 31-year-old client, G3, T0, P2, Ab0, L0 at 32 weeks' gestation is being admitted to the hospital with contractions of moderate intensity occurring every 3 to 4 minutes per the client report. The client is crying on admission; the history reveals that the client has previously had two nonviable fetuses at 30 weeks' gestation. What nursing action would be the **highest priority** for this client?

- ☐ 1. Assess maternal contraction and fetal heart rate pattern.
- ☐ 2. Reassure the client that this baby will be healthy.

- ☐ 3. Review history of prior fetal demises with client.
- ☐ 4. Prepare for immediate administration of magnesium sulfate.

179. Which actions by the nurse will **most** likely ensure that the correct client receives a medication? Select all that apply.

- ☐ 1. Have the client state his or her name.
- ☐ 2. Check the name on the armband with the name on the medication.
- ☐ 3. Learn to recognize the client.
- ☐ 4. Check the client's room number.
- ☐ 5. Compare the date of birth on the client's medical record to the date of birth on the client's armband.

180. A nurse is counseling a mother with young children after the mother left her abusive husband 6 months ago. The mother says, "My 6-year-old is starting to act just like his father. I just do not know how to handle this." Which response by the nurse is **most** appropriate?

- ☐ 1. "You will have to limit your son's contact with his father."
- ☐ 2. "Counseling for your son would be helpful."
- ☐ 3. "Most boys outgrow these behaviors."
- ☐ 4. "Setting limits on his behavior is all you need to do now."

181. A 40-year-old primigravid client with AB-positive blood visits the outpatient clinic for an amniocentesis at 16 weeks' gestation. The nurse determines that the **most** likely reason for the client's amniocentesis is to determine if the fetus has which problem?

- ☐ 1. cri-du-chat syndrome
- ☐ 2. ABO incompatibility
- ☐ 3. erythroblastosis fetalis
- ☐ 4. Down syndrome

182. The nurse-manager is developing a "read-back" procedure to reduce medication administration errors. Which are purposes of the "read-back" requirement? Select all that apply.

- ☐ 1. to prohibit prescriptions and test results from being communicated verbally or by telephone
- ☐ 2. to make sure that prescriptions and test results that are communicated

verbally or by telephone are clear to the receiver of the information

- ☐ 3. to make sure that prescriptions and test results that are communicated verbally or by telephone are confirmed by the individual giving the information
- ☐ 4. to minimize the risk of nonauthorized personnel from giving prescriptions that are communicated verbally or by telephone
- ☐ 5. to encourage the use of electronic medical records

183. A female client who is hospitalized for an eating disorder weighs 15 lb less than the ideal body weight. Which goal is a **priority** for this client?

- ☐ 1. The client attends all eating disorder support groups.
- ☐ 2. The client eats bigger meals at breakfast.
- ☐ 3. The client gains 1 lb per week.
- ☐ 4. The client reports an improved self-image.

184. A 16-year-old primiparous client has decided to place her baby for adoption. The adoptive parents are on their way to the hospital when the mother says, "I want to see the baby one last time." What should the nurse do?

- ☐ 1. Tell the client that it would be best if she did not see the baby.
- ☐ 2. Allow the client to see the baby through the nursery window.
- ☐ 3. Contact the healthcare provider (HCP) for advice related to the client's visitation.
- ☐ 4. Allow the client to see and hold the baby for as long as she desires.

185. A school nurse interviews the parent of a middle school student who is exhibiting behavioral problems, including substance abuse, following a sibling's suicide. The parent says, "I am a single parent who has to work hard to support my family, and now, I have lost my only son, and my daughter is acting out and making me crazy! I just cannot take all this stress!" Which concern regarding this family has **priority** at this time?

- ☐ 1. the parent's ability to emotionally support the adolescent in this crisis
- ☐ 2. potential suicidal thoughts/plans of both family members
- ☐ 3. the adolescent's anger
- ☐ 4. the parent's frustration

186. A 10-year-old child is admitted with a brain tumor. Which assessment made by the nurse is most critical to report to the child's healthcare provider (HCP)?

- ☐ 1. vomiting after lunch
- ☐ 2. difficulty in recalling the day of the week
- ☐ 3. blood pressure of 102/62 mm Hg
- ☐ 4. 100 mL of concentrated urine voided at one voiding

187. A client with jaundice has poor appetite, nausea, and two episodes of emesis in the past 2 hours. The client reports having spasms in the stomach area. The client does not have pruritus. The nurse should develop a care plan for which health problem **first**?

- ☐ 1. nausea
- ☐ 2. poor appetite
- ☐ 3. jaundice
- ☐ 4. abdominal spasms

188. When planning for risk management for clients who are at risk for development of pressure ulcers, the nurse should **first**:

- ☐ 1. identify at-risk clients on admission to the healthcare facility.
- ☐ 2. place at-risk clients on an every-2-hour turning schedule.
- ☐ 3. automatically place clients in specialty beds.
- ☐ 4. provide at-risk clients with a high-protein, high-carbohydrate diet.

189. The nurse is teaching a 17-year-old girl who has a severe gonorrheal infection. The nurse realizes that the girl understands the implications of her disease when she tells the nurse:

- ☐ 1. "Once I am treated, I will have immunity."
- ☐ 2. "My partner does not need treatment."
- ☐ 3. "I will not have any more problems once I learn to protect myself."
- ☐ 4. "I could have trouble getting pregnant."

190. After teaching the parent of a child with a spica cast about skin care, which parental action would indicate the need for additional teaching?

- ☐ 1. application of powder to the skin under the cast

- ☐ 2. inspection of the cast edges for smoothness
- ☐ 3. application of plastic film to cover the perineal cast area
- ☐ 4. inspection of areas inside the cast

191. The nurse-manager is teaching the staff about the medication reconciliation policy. The nurse teaches the staff that reconciliation is needed to ensure that clients are on the correct medications in which situations? Select all that apply.

- ☐ 1. admission to the hospital
- ☐ 2. transfer to the nursing home
- ☐ 3. transfer of a client from surgery to the surgical unit
- ☐ 4. admission to a home health agency from the hospital
- ☐ 5. move from a double room to a single room on the same unit

192. Sodium polystyrene sulfonate is prescribed for a client following crush injury. The drug is effective if:

- ☐ 1. the pulse is weak and irregular.
- ☐ 2. the serum potassium is 4.0 mEq/L (4.0 mmol/L).
- ☐ 3. the ECG is showing tall, peaked T waves.
- ☐ 4. there is muscle weakness on physical examination.

193. The nurse is teaching a young female about using oxcarbazepine to control seizures. The nurse determines teaching is effective when the client states:

- ☐ 1. "I will use one of the barrier methods of contraception."
- ☐ 2. "I will need a higher dose of oral contraceptive when on this drug."
- ☐ 3. "Since I am 28 years old, I should not delay starting a family."
- ☐ 4. "I must weigh myself weekly to check for sudden gain in weight."

194. A client diagnosed with chronic renal failure is undergoing hemodialysis. Postdialysis, the client weighs 59 kg. The nurse should teach the client to:

- ☐ 1. increase the amount of sodium in the diet to 4 g/day.
- ☐ 2. limit the total amount of calories consumed each day to 1,000.
- ☐ 3. increase fluid intake to 3,000 mL each day.

- ☐ 4. control the amount of protein intake to 59 to 70 g/day.

195. A client was treated for a streptococcal throat infection 2 weeks ago. The client now has been diagnosed with acute poststreptococcal glomerulonephritis. The client asks the nurse how to prevent this infection. What should the nurse tell the client?

- ☐ 1. “See your healthcare provider (HCP) for an early diagnosis and treatment of a sore throat.”
- ☐ 2. “As long as you do not have a fever, it is sufficient to gargle daily with an antibacterial mouthwash.”
- ☐ 3. “You may continue to utilize the previously prescribed antibiotics until they are gone.”
- ☐ 4. “Unscented bar soap may be used in showers.”

196. Assessment of a primigravid client in active labor reveals a cervix dilated to 5 cm and completely effaced, with the fetus at –1 station. The client has indicated that she wants a “natural childbirth” with no analgesia or anesthesia. The healthcare provider (HCP) enters the room and tells the client that it is time for an epidural anesthetic. What would be the nurse’s **best** action at this time?

- ☐ 1. Ask the client if she desires an epidural anesthetic.
- ☐ 2. Tell the HCP that the client desires a “natural childbirth.”
- ☐ 3. Tell the client that her labor will be more comfortable with an anesthetic.
- ☐ 4. Ask the client to discuss this with her husband and then make a decision.

197. A client is ready to be discharged following an inguinal hernia repair. Which criteria must the client meet before the nurse can discharge the client? Select all that apply.

- ☐ 1. The client has transportation home via a taxicab.
- ☐ 2. The client is able to tolerate oral fluids.
- ☐ 3. The client has pain no greater than 5 on a scale of 1 to 10.
- ☐ 4. The client can walk to the bathroom unassisted.
- ☐ 5. The client has voided.

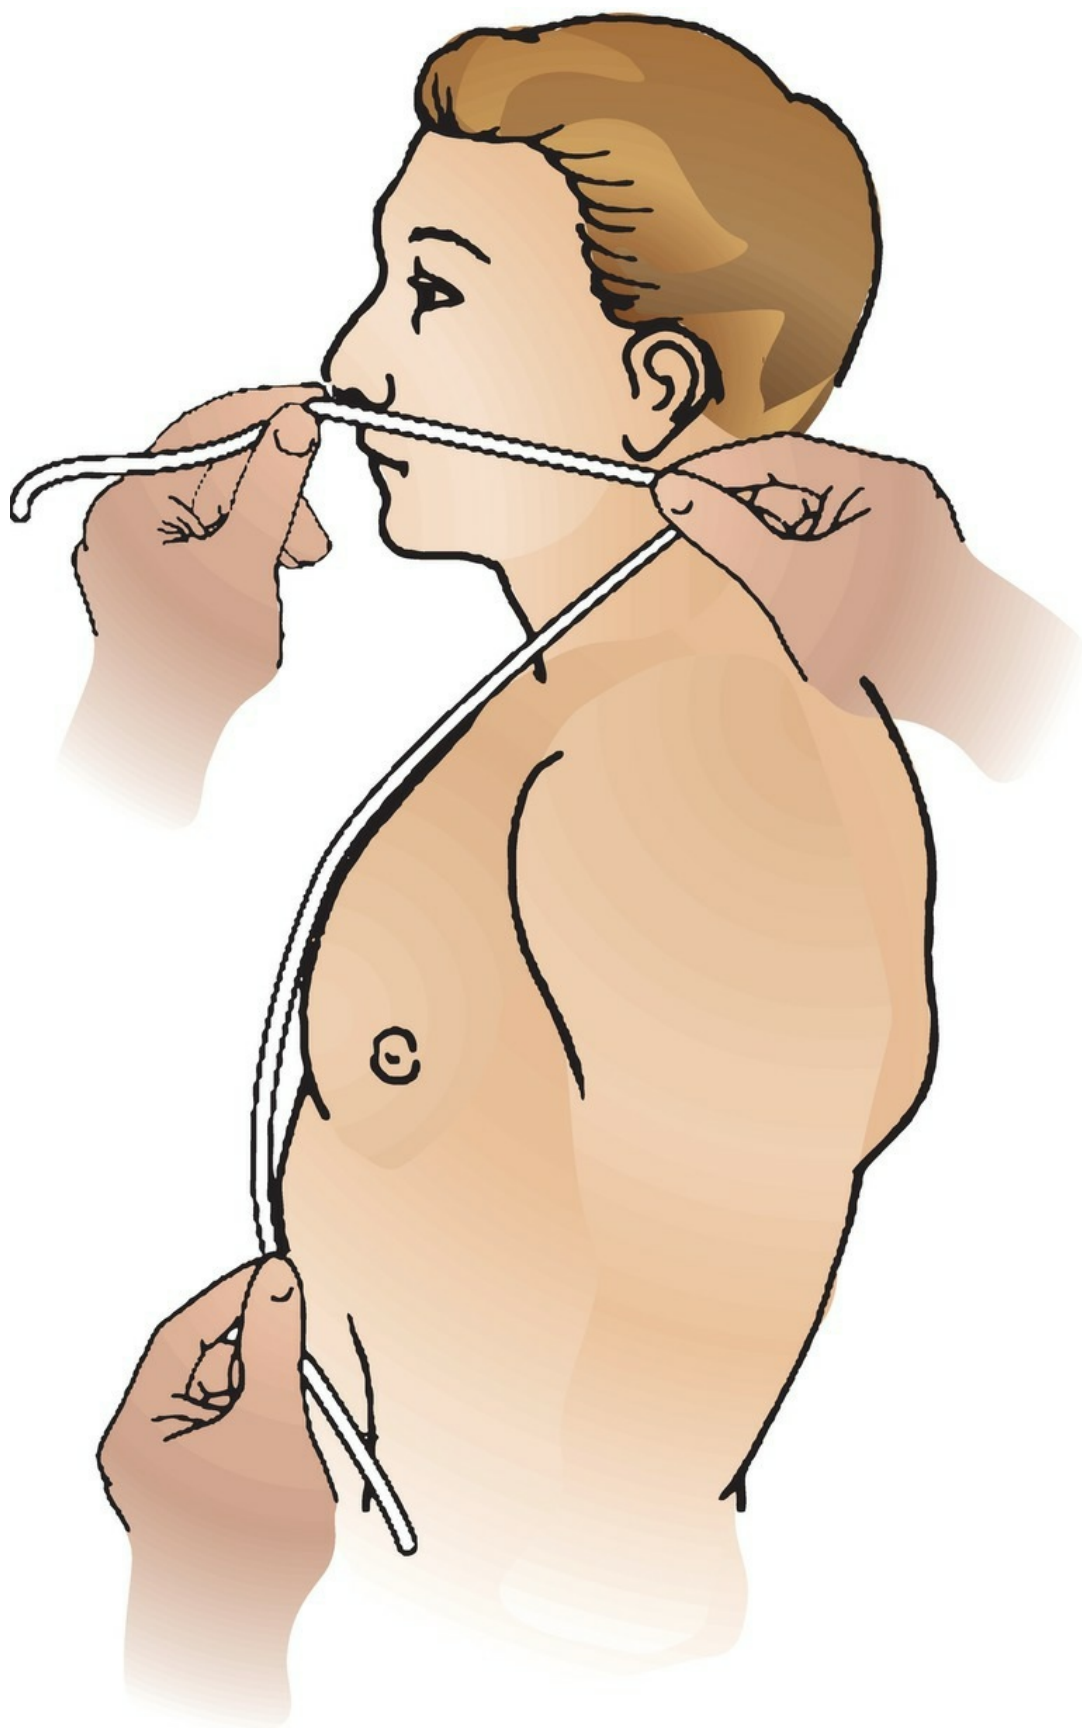

198. The nurse is administering eyedrops to a client with glaucoma. Which is a correct technique for instilling the eyedrops? The eyedrops are placed:

- ☐ 1. in the lower conjunctival sac.
- ☐ 2. near the opening of the lacrimal ducts.
- ☐ 3. on the cornea.
- ☐ 4. on the scleral surface.

199. The nurse is teaching an older adult how to prevent falls. The nurse should tell the client to:

- ☐ 1. turn on bright lights in the room so the client can see items in the room.
- ☐ 2. instruct the client to rise slowing from a supine position.
- ☐ 3. encourage the client not to use assistive devices as they reduce independence.
- ☐ 4. instruct the client not to exercise painful joints.

200. Before inserting a nasogastric (NG) tube in an adult client, the nurse estimates the length of tubing to insert. Identify the point on the illustration where the nurse would end the measurement.

201. The nurse is designing a benchmarking study to gather information about nursing care practices for wound care. Which sources of information are used for benchmarking? Select all that apply.

- ☐ 1. government reports
- ☐ 2. literature reviews
- ☐ 3. standard-setting organizations
- ☐ 4. databases
- ☐ 5. clinical organization recommendations

202. A client scheduled for hip replacement surgery wishes to receive his own blood for the upcoming surgery. The nurse should:

- ☐ 1. document the client's request on the medical record.
- ☐ 2. notify the hematology laboratory.
- ☐ 3. notify the surgeon's office.
- ☐ 4. call the blood bank.

203. A client is using an over-the-counter nasal spray containing pseudoephedrine to treat allergic rhinitis. Which instruction about this medication would be **most** appropriate for the nurse to provide for the client?

- ☐ 1. Prolonged use of nasal spray can lead to nasal infections.
- ☐ 2. Pseudoephedrine is an addictive drug and must be used cautiously.
- ☐ 3. Overuse of pseudoephedrine can lead to increased nasal congestion.
- ☐ 4. A common side effect of pseudoephedrine nasal spray is thrush.

204. A 6-year-old child is admitted for an appendectomy. What is the **most** appropriate way for the nurse to prepare the child for surgery?

- ☐ 1. Explain how to use a patient-controlled analgesia (PCA) pump for pain control.
- ☐ 2. Permit the child to play with the blood pressure cuff, electrocardiogram (ECG) pads, and a face mask.
- ☐ 3. Show the child a video about the surgery.
- ☐ 4. Show the child a visual analog scale (VAS) based on a scale from 0 to 10.

205. The nurse is working on a hospital's birthing unit when a primigravid

client in active labor is to receive morphine. As the nurse enters the medication room, the nurse observes a female coworker slipping a vial of morphine into the side pocket of the uniform. Which action would be **most** appropriate?

- ☐ 1. Contact the hospital's security chief.
- ☐ 2. Notify the supervisor of the unit.
- ☐ 3. Tell the coworker of the incident.
- ☐ 4. Notify the federal drug agents about the incident.

206. Which information should the nurse include when teaching the family and a client who was prescribed benztropine, 1 mg PO twice daily, about the drug therapy?

- ☐ 1. The drug can be used with over-the-counter cough and cold preparations.
- ☐ 2. The client should not discontinue taking the drug abruptly.
- ☐ 3. Antacids can be used freely when taking this drug.
- ☐ 4. Alcohol consumption with benztropine therapy need not be restricted.

207. Which information should the nurse include in a teaching plan that addresses the adverse effects of antipsychotic medication?

- ☐ 1. information about all potential adverse effects
- ☐ 2. research data about rare adverse effects
- ☐ 3. adverse effects that can be seen or felt
- ☐ 4. percentages associated with each adverse effect

208. A client has nephrotic syndrome. To aid in the resolution of the client's edema, the healthcare provider (HCP) prescribes 25% albumin. In addition to an absence of edema, the nurse should evaluate the client for which expected outcome?

- ☐ 1. crackles in the lung bases
- ☐ 2. blood pressure elevation
- ☐ 3. cerebral edema
- ☐ 4. cool skin temperature in lower extremities

209. A client has polycystic kidney disease. The client asks the nurse, "How did I get these fluid-filled bubbles on my kidneys?" How should the

nurse respond to help the client understand risk factors for this disease process?

- ☐ 1. "Secondhand smoke puts you at greater risk for developing cysts."
- ☐ 2. "Exposure to dyes used to color fruits and vegetables increases the risk of polycystic kidney disease."
- ☐ 3. "There is a higher incidence of polycystic kidney disease among blood relatives."
- ☐ 4. "Drinking alcohol daily allows the kidneys to develop cysts."

210. A nurse is administering IV fluids to a dehydrated client. When administering an IV solution of 3% sodium chloride, what should the nurse do? Select all that apply.

- ☐ 1. Measure the intake and output.
- ☐ 2. Inspect the jugular veins for distention.
- ☐ 3. Evaluate the client for neurologic changes.
- ☐ 4. Encourage the client to drink more fluids.
- ☐ 5. Insert an indwelling urinary catheter.

211. The nurse is working on a birthing unit with an unlicensed assistive personnel (UAP). The nurse determines that the UAP understands the type of information to report to the nurse when the UAP reports which information about one of the clients?

- ☐ 1. an episode of nausea after administration of an epidural anesthetic
- ☐ 2. contractions 3 minutes apart and lasting 40 seconds
- ☐ 3. evidence of spontaneous rupture of the membranes
- ☐ 4. sleeping after administration of IV nalbuphine

212. A 9-year-old child is scheduled for an electromyogram. To prepare the child for this procedure, what should the nurse do **first**?

- ☐ 1. Wait until just before the test to tell the child what will be done.
- ☐ 2. Ask the child to draw a picture of the body structures involved.
- ☐ 3. Show the child the equipment that will be used in the test.
- ☐ 4. Verbally explain what will be done during the test.

213. The nurse is planning a program about women's health and cancer prevention for a community health fair. Which information should the nurse

include? Select all that apply.

- ☐ 1. Regular self-exams of the breast and vulva are important self-care activities.
- ☐ 2. Cancer can be prevented by removing precancerous lesions of the vulva, cervix, or endometrium.
- ☐ 3. Girls, age 11 to 12, should receive immunization for human papillomavirus (HPV) to prevent cervical cancer.
- ☐ 4. Smoking cessation reduces the risk of cervical cancer.
- ☐ 5. There is limited evidence that cancer in women is inherited.

214. A 10-year-old client with rheumatic fever is on bed rest. Which diversional activity would be appropriate for the nurse to encourage?

- ☐ 1. watching television with the roommate
- ☐ 2. coloring picture books with the brother
- ☐ 3. keeping up with the school work
- ☐ 4. building a bird house

215. Clients who are receiving total parenteral nutrition (TPN) are at risk for development of which complication?

- ☐ 1. hypostatic pneumonia
- ☐ 2. pulmonary hypertension
- ☐ 3. orthostatic hypotension
- ☐ 4. fluid imbalances

216. The nurse is to administer a bolus starting dose of heparin to a child who is taking penicillin. What should the nurse do? Select all that apply.

- ☐ 1. Check that the dose is appropriate for the child's weight.
- ☐ 2. Note that the onset of the medication will be immediate.
- ☐ 3. Follow the administration of the bolus of heparin with an IV infusion of heparin 10 units/kg/h.
- ☐ 4. Monitor partial thromboplastin time (PTT).
- ☐ 5. Discontinue the penicillin until the PTT is at a therapeutic level.

217. The client is receiving propantheline bromide to treat cholecystitis. The nurse should evaluate the client's response to the medication by observing for which adverse effect?

- ☐ 1. urine retention
- ☐ 2. diarrhea
- ☐ 3. hypertension
- ☐ 4. diaphoresis

218. The nurse is preparing to start an IV infusion. Before inserting the needle into a vein, the nurse should apply a tourniquet to the client's arm to:

- ☐ 1. distend the veins.
- ☐ 2. stabilize the veins.
- ☐ 3. immobilize the arm.
- ☐ 4. occlude arterial circulation.

219. Prochlorperazine is prescribed postoperatively. The nurse should evaluate the drug's therapeutic effect when the client expresses relief from:

- ☐ 1. nausea.
- ☐ 2. dizziness.
- ☐ 3. abdominal spasms.
- ☐ 4. abdominal distention.

220. A 17-year-old client has been admitted to the hospital for a biopsy to confirm the diagnosis of bone cancer. The nurse should assess the client for which conditions? Select all that apply.

- ☐ 1. cough
- ☐ 2. dyspnea
- ☐ 3. pain
- ☐ 4. swelling
- ☐ 5. fever
- ☐ 6. anorexia

221. A nurse on the labor and birth unit transfers a primiparous client and her term neonate to the mother-baby unit 2 hours after the client gave vaginal birth to the neonate. Which information is a **priority** for the nurse to report to the nurse receiving the client on the mother-baby unit?

- ☐ 1. firm fundus when gentle massage is used
- ☐ 2. evidence of bonding well with the neonate

- ☐ 3. labor that lasted 12 hours with a 1-hour second stage
- ☐ 4. temperature of 99°F (37.4°C) and pulse rate of 80 bpm

222. A client who underwent cardiac surgery 2 days ago is recovering well. His wife, who is assisting with his care, says, “He is doing too much. I told him to let me help, but he will not let me.” The nurse says to the wife, “It sounds like you need to feel you can be more helpful to him.” In order to make the nonverbal behavior complement the words, the nurse should:

- ☐ 1. direct the eyes at the client.
- ☐ 2. direct the body and eyes at the wife and client.
- ☐ 3. avoid direct eye contact with the client and wife.
- ☐ 4. shift the eyes back and forth between the client and wife.

223. A nurse is having difficulty establishing a relationship with an aggressive client. What strategy will **most** likely improve the relationship?

- ☐ 1. The nurse and the client agree to work to improve their involvement in the therapeutic relationship.
- ☐ 2. The nurse establishes goals for having only positive interactions with the client.
- ☐ 3. The nurse agrees to be submissive so the client can dominate the relationship.
- ☐ 4. The nurse seeks assistance from colleagues to become more aware of the quality of the interactions and more sensitive to the dynamics of communication.

224. The charge nurse on the postpartum unit has received a report about a client who has just experienced a fetal demise and will be ready for transfer out of the labor unit in about 2 hours. The client has asked her primary nurse if she can stay on the obstetrical unit since she has found support from the nursing staff there. What action should the charge nurse on the postpartum unit take?

- ☐ 1. Request a room for this client on a unit without newborns.
- ☐ 2. Ask the nurse in labor and birth to discharge the mother as soon as she is physically able to leave.
- ☐ 3. Talk to the mother first and decide on a location that is mutually agreeable.

- ☐ 4. Admit the mother to a private room on the postpartum unit.

225. A 12-month-old child is seen in the neighborhood clinic for a regular checkup. Which statement by the child's mother about the influenza vaccine reflects the need for more teaching?

- ☐ 1. "Yearly influenza vaccinations are recommended to begin as early as 6 months of age."
- ☐ 2. "The Haemophilus influenzae vaccine my child has already received helps protect against some forms of influenza."
- ☐ 3. "My child is too young to receive the live attenuated intranasal vaccine."
- ☐ 4. "The first time a child receives the influenza vaccine, a second dose is recommended in 1 month."

226. A nurse is about to conduct a sexual history for a 16-year-old female who is accompanied by her mother. What is an appropriate question for the nurse to ask this client or her mother?

- ☐ 1. "What do you think about having your mother leave the room now?"
- ☐ 2. "Mother, do you think your daughter is sexually active?"
- ☐ 3. "Mother, I am going to ask you to wait a few minutes in the waiting room now so I can complete the health history with your daughter."
- ☐ 4. "The two of you seem like you share everything. I am going to ask questions about sexual history now."

227. A nurse is admitting an older female client to the gynecology surgical unit. When the nurse asks the client what medication she is taking at home, the client responds that she is taking a little red pill in the morning and a white capsule at night for her blood pressure. What action by the nurse is focused on safe, effective care of this client?

- ☐ 1. Consult the pharmacist regarding identification of the medications.
- ☐ 2. Show pictures to the client from the Physician's Desk Reference to identify the medications.
- ☐ 3. Consult the previous medical record from 2 years ago, and notify the healthcare provider (HCP) regarding medications that must be prescribed.
- ☐ 4. Ask a family member to bring the medications from home in the original vials for proper identification and administration times.

228. A client who had undergone an abdominal hysterectomy is in the recovery room. The surgeon has prescribed a 250-mL bolus of normal saline over 1 hour to replace blood loss. The IV solution infusing in the client was 1,000 mL normal saline with 40 mEq of potassium chloride at 100 mL/h. What should the nurse do? Select all that apply.

- ☐ 1. Increase the IV infusion rate to 250 mL/h for 1 hour.
- ☐ 2. Add 250 mL of normal saline to the current infusion bag, and continue at 100 mL/h.
- ☐ 3. Connect a 250-mL bag of normal saline to the Y-connector, and calculate to infuse over 1 hour.
- ☐ 4. Contact the healthcare provider (HCP) regarding continuation of the primary IV infusion during the bolus infusion.
- ☐ 5. Administer the normal saline bolus via an IV infusion pump.

229. The nurse is caring for several neonates in the newborn nursery. Precautions that should be taken to prevent an infant abduction include which measure?

- ☐ 1. Notify the hospital's security staff about anyone who appears unusual.
- ☐ 2. Take several neonates to their mothers at the same time.
- ☐ 3. Place the infant near the doorway of the mother's room.
- ☐ 4. Contact the hospital's security staff if an exit alarm is triggered.

230. Clozapine therapy has been initiated for a client with schizophrenia who has been unresponsive to other antipsychotics. The client states, "Why do I have to have a blood test every week?" Which response by the nurse would be **most** appropriate?

- ☐ 1. "Weekly blood tests are necessary to determine safe dosage and to monitor the effect of the medication on the blood."
- ☐ 2. "Weekly blood tests are done so that you can receive another week's supply of the medication."
- ☐ 3. "Your healthcare provider (HCP) will want to know how well you are progressing with the medication therapy."
- ☐ 4. "Everyone taking clozapine has to go through the same procedure because it is required by the drug company."

231. The nurse administers an intradermal injection to a client. Proper technique has been used if the injection site demonstrates:

- ☐ 1. minimal leaking.
- ☐ 2. no swelling.
- ☐ 3. tissue pallor.
- ☐ 4. evidence of a bleb.

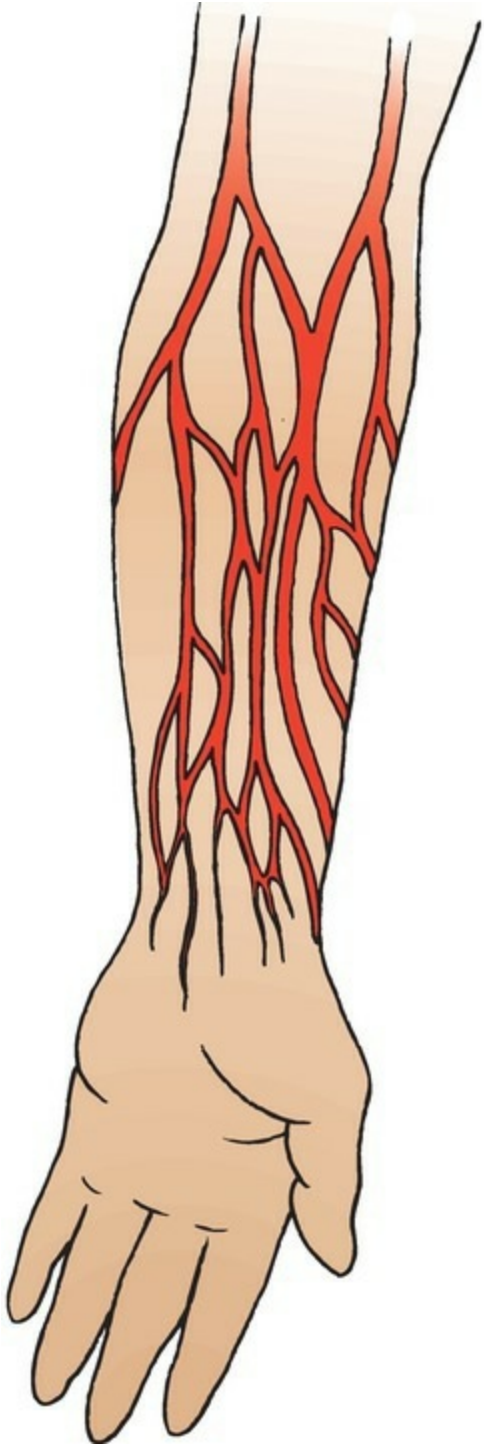

232. The sudden onset of which sign indicates a potentially serious complication for the client receiving an IV infusion?

- ☐ 1. noisy respirations
- ☐ 2. pupillary constriction
- ☐ 3. halitosis
- ☐ 4. moist skin

233. The nurse is planning to start a blood transfusion. Which solution should the nurse select to prime the tubing when preparing to administer the blood?

- ☐ 1. lactated Ringer's solution
- ☐ 2. normal saline
- ☐ 3. 5% dextrose in half-normal saline
- ☐ 4. 5% dextrose in water

234. When preparing to insert an IV catheter to administer fluids to a client who is going to surgery, the nurse selects the median cubital vein. Identify the location of the median cubital vein on the illustration.

235. The mother of a 28-year-old client who is taking clozapine states, “Something is wrong. My son is drooling like a baby.” What response by the nurse would be **most** helpful?

- ☐ 1. “I wonder if he is having an adverse reaction to the medicine.”
- ☐ 2. “Excess saliva is common with this drug; here is a paper cup for him to

spit into.”

- ☐ 3. “Do not worry about it; this is only a minor inconvenience compared to its benefits.”
- ☐ 4. “I have seen this happen to other clients who are taking clozapine.”

236. The healthcare provider (HCP) is calling in a prescription for ampicillin for a neonate. What should the nurse do? Select all that apply.

- ☐ 1. Write down the prescription.
- ☐ 2. Ask the HCP to come to the hospital and write the prescription on the medical record.
- ☐ 3. Repeat the prescription to the HCP over the telephone.
- ☐ 4. Ask the HCP to confirm that the prescription is correct.
- ☐ 5. Ask the nursing supervisor to cosign the telephone prescription as transcribed by the nurse.

237. The nurse is planning care for a client who has been experiencing a manic episode for 6 days and is unable to sit still long enough to eat meals. Which choice will **best** meet the client’s nutritional needs at this time?

- ☐ 1. Offer a green salad topped with chicken pieces.
- ☐ 2. Offer a peanut butter sandwich.
- ☐ 3. Offer a bowl of vegetable soup.
- ☐ 4. Offer to have the family bring in favorite foods.

238. Which medication should the nurse anticipate administering in the event of a heparin overdose?

- ☐ 1. warfarin sodium
- ☐ 2. protamine sulfate
- ☐ 3. vitamin K
- ☐ 4. atropine sulfate

239. The nurse has administered aminophylline to a client with emphysema. The medication is effective when there is:

- ☐ 1. relief from spasms of the diaphragm.
- ☐ 2. relaxation of smooth muscles in the bronchioles.
- ☐ 3. efficient pulmonary circulation.

- ☐ 4. stimulation of the medullary respiratory center.

240. The nurse is conducting health assessments for school-age children. A characteristic behavior of a 7-year-old girl is that she:

- ☐ 1. likes to play only with other girls.
- ☐ 2. prefers to play with her sister.
- ☐ 3. prefers to play team games.
- ☐ 4. likes to play alone.

241. A nurse is planning care for a 7-year-old who is hospitalized for a hernia repair. The nurse should assess the client for which fear common in this age-group?

- ☐ 1. separation from parents
- ☐ 2. trying something new
- ☐ 3. injury and pain
- ☐ 4. opposite-sex relationships

242. When teaching a client with bipolar disorder who has started to take valproic acid about possible side effects of this medication, the nurse should instruct the client to report which side effect?

- ☐ 1. increased urination
- ☐ 2. slowed thinking
- ☐ 3. sedation
- ☐ 4. weight loss

243. A woman who gave birth to a healthy baby 6 hours ago is having cramps in her legs. Upon further assessment, the nurse identifies leg pain on dorsiflexion. The nurse should:

- ☐ 1. tell the woman to massage the area.
- ☐ 2. apply warm compresses to the area.
- ☐ 3. instruct the woman on how to do ankle pumps.
- ☐ 4. notify the healthcare provider (HCP).

244. After instructing a 40-year-old woman about osteoporosis after menopause, the nurse determines that the client needs further instruction when the client makes which statement?

- ☐ 1. “A standard serving of yogurt is the equivalent of one glass of milk.”
- ☐ 2. “Women who do not eat dairy products should consider calcium supplements.”
- ☐ 3. “Women of African descent are at the greatest risk for osteoporosis.”
- ☐ 4. “Estrogen therapy at menopause can reduce the risk of osteoporosis.”

245. A young adult is hospitalized with a seizure disorder. The client, who is in a bed with padded side rails, has a tonic-clonic seizure. In what order from first to last should the nurse take the actions? All options must be used.

1. Loosen clothing around the client’s neck.

2. Turn the client on his or her side.

3. Clear the area around the client.

4. Suction the airway.

246. A client with metastatic cancer of the liver tells the nurse about being concerned about the prognosis. The nurse should:

- ☐ 1. provide information for the client to consider a liver transplantation.
- ☐ 2. assure the client that the prescribed medications will shrink all tumor sites.
- ☐ 3. explain the effects of chemotherapy.
- ☐ 4. place emphasis on providing symptomatic and comfort measures.

247. The nurse delegates the care of a multiparous client who gave birth to a viable term neonate vaginally 30 hours ago and is preparing to be discharged to a licensed practical/vocational nurse (LPN/VN). The nurse should instruct the LPN/VN to notify the nurse if the client exhibits which sign or symptom?

- ☐ 1. pulse rate of 100 bpm
- ☐ 2. oral temperature of 99°F (37.2°C)
- ☐ 3. large amounts of perspiration
- ☐ 4. frequent voiding in large amounts

248. A client with obsessive-compulsive disorder washes the hands multiple times daily and is late for meals and milieu activities. What is **most** appropriate for the nurse to do initially?

- ☐ 1. Totally eliminate the client's ritual.
- ☐ 2. Allow the client to decide whether to attend meals and activities.
- ☐ 3. Inform the client that absence from meals and activities is not permitted.
- ☐ 4. Remind the client about meal and activity times so that the ritual can be completed on time.

249. A client with osteoarthritis purchased a copper bracelet to wear and tells the nurse that there is less pain now. Which response by the nurse is **most** appropriate?

- ☐ 1. Tell the client that copper is best applied as copper-lined gloves.
- ☐ 2. Warn the client not to spend any more money on quackery such as bracelets.
- ☐ 3. Instruct the client to remove the bracelet because the copper in it can interfere with salicylate metabolism.
- ☐ 4. Acknowledge that the client feels better, but encourage the client to continue with the prescribed therapy.

250. A woman with a history of a left radical mastectomy is being admitted for abdominal surgery. The woman has a swollen left arm. The nurse should:

- ☐ 1. take the blood pressure only in the unaffected arm.

- ☐ 2. start an IV line in the affected arm.
- ☐ 3. encourage a dependent position of the affected arm.
- ☐ 4. allow blood draws in the affected arm.

251. A 36-month-old child weighing 20 kg (44 lb) is to receive ceftriaxone 2 g IV every 12 hours. The recommended dose of ceftriaxone is 50 to 75 mg/kg/day in divided doses. The nurse should:

- ☐ 1. administer the medication as prescribed.
- ☐ 2. administer half the prescribed dose.
- ☐ 3. call the laboratory to check the therapeutic serum level of ceftriaxone.
- ☐ 4. withhold administering the ceftriaxone and notify the child's healthcare provider (HCP).

252. The nurse has provided an in-service presentation to ancillary staff about standard precautions on the birthing unit. The nurse determines that one of the staff members needs further instructions when the nurse makes which observation?

- ☐ 1. use of protective goggles during a cesarean birth
- ☐ 2. placement of bloody sheets in a container designated for contaminated linens
- ☐ 3. wearing of sterile gloves to bathe a newborn at 2 hours of age
- ☐ 4. disposal of used scalpel blades in a puncture-resistant container

253. The nurse has completed breast-feeding discharge instructions and determines the mother understands when she makes which statements? Select all that apply.

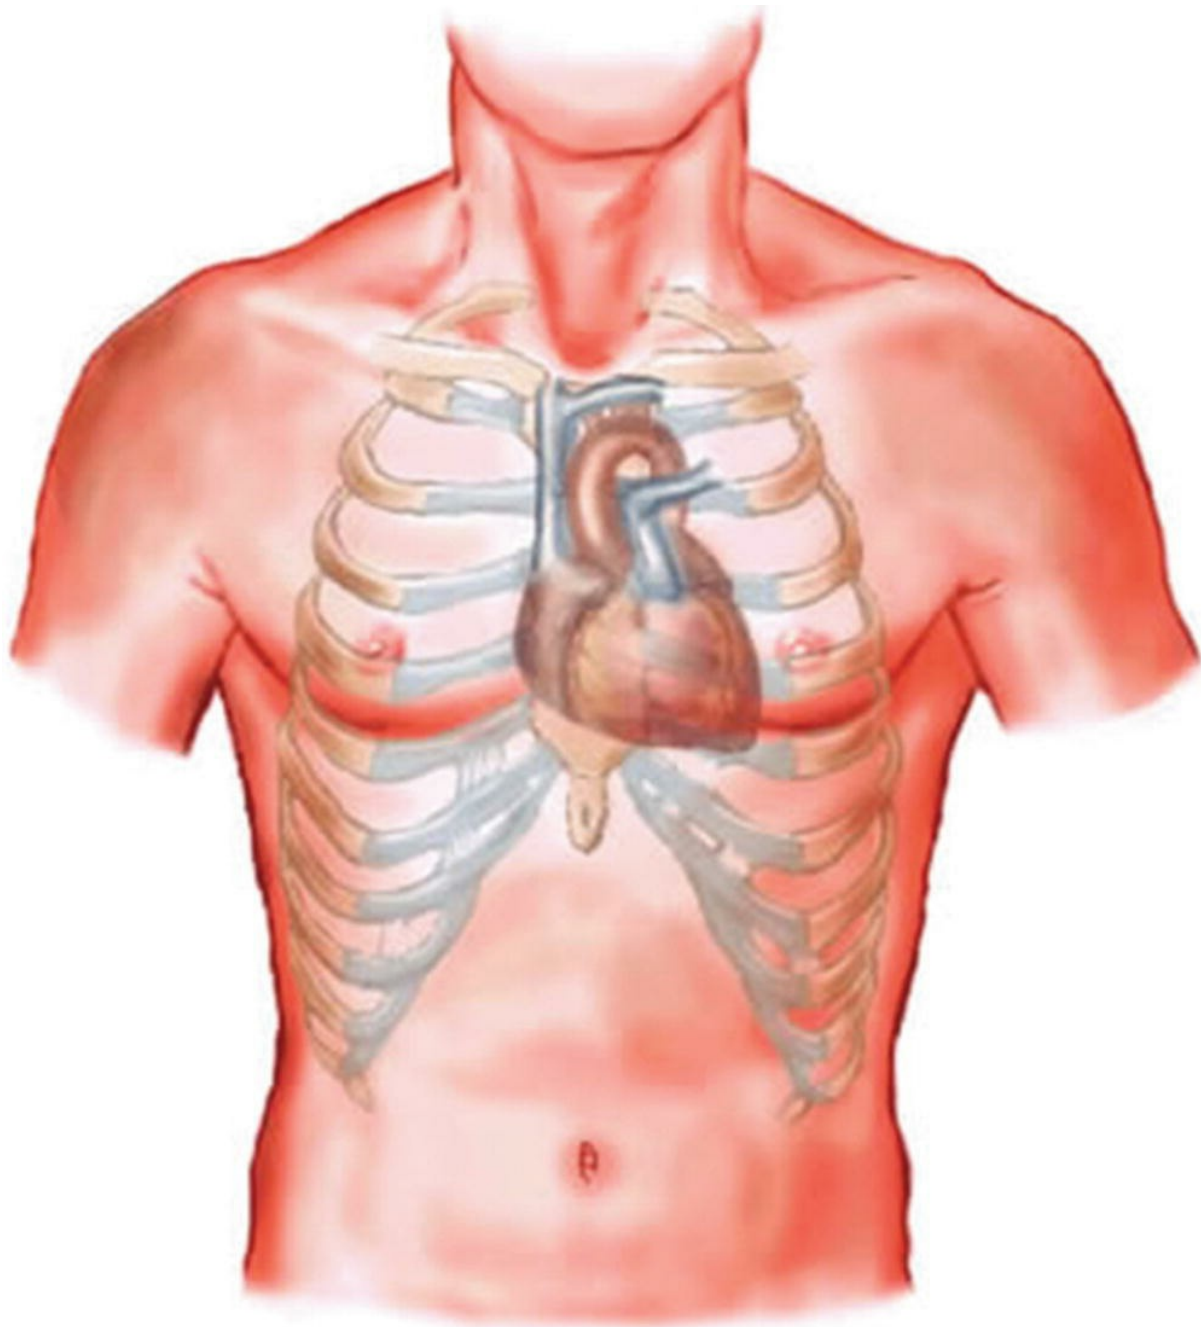

- ☐ 1. "My calorie intake will need to increase by 1,000 calories per day."
- ☐ 2. "Any drugs that I take may pass through to my breast milk."
- ☐ 3. "Babies should have six to eight wet diapers per day after the first 3 days of life."
- ☐ 4. "I have the phone number for the lactation consultant if I have questions."
- ☐ 5. "Babies should be satisfied from the feeding for 5 to 6 hours after daytime feedings."

254. The healthcare provider's (HCP's) prescription for an intravenous

infusion is 3% normal saline to infuse at 125 mL/h. The client's most recent sodium level is 132 mEq/L (132 mmol/L). The nurse should:

- ☐ 1. hang 0.9% normal saline at 125 mL/h.
- ☐ 2. start the IV solution as prescribed.
- ☐ 3. consult the prescriber about the prescription.
- ☐ 4. hang the IV solution prescribed at 62 mL/h.

255. The nurse is auscultating for an aortic murmur. Indicate where the nurse should place the stethoscope to **best** evaluate the presence of this murmur.

256. After a nasogastric (NG) tube has been inserted, the nurse can **most** accurately determine that the tube is in the proper place when:

- ☐ 1. the client is no longer gagging or coughing.
- ☐ 2. the pH of the aspirated fluid is measured.
- ☐ 3. thirty milliliters of normal saline can be injected without difficulty.
- ☐ 4. a whooshing sound is auscultated when 10 mL of air is inserted.

257. A client has been diagnosed with early alcoholic cirrhosis. The client should be taught that which behavior could potentially reverse the pathologic changes occurring in the liver?

- ☐ 1. Do not become fatigued.
- ☐ 2. Avoid drinking alcohol.
- ☐ 3. Eliminate smoking.
- ☐ 4. Eat a high-carbohydrate, low-fat diet.

258. A client is admitted to the emergency department with sudden onset of chest pain. Which prescriptions should the nurse implement **immediately**? Select all that apply

- ☐ 1. Provide oxygen.
- ☐ 2. Administer nitroglycerin.
- ☐ 3. Administer aspirin.
- ☐ 4. Insert a Foley catheter.
- ☐ 5. Administer morphine.
- ☐ 6. Administer acetaminophen.

259. Which measure should the nurse institute to help minimize joint pain in a child with rheumatic fever?

- ☐ 1. massaging the affected joints
- ☐ 2. applying ice to the affected joints
- ☐ 3. limiting movement of the affected joints
- ☐ 4. encouraging progressive weight bearing

260. To reduce the possibility of catheter-related urinary tract infections (CAUTIs), the nurse should:

- ☐ 1. use sterile technique when providing catheter care.
- ☐ 2. ensure that clients who are incontinent have indwelling urinary catheters.
- ☐ 3. minimize urinary catheter use and duration of use in all clients.
- ☐ 4. clean the periurethral area with antiseptics.

261. A client is admitted to the emergency department (ED) experiencing syncope. The nurse speaks with the family concerning the client's condition

and current medications. The client's family states that the client takes several medications and has brought all the client's medications with them. To determine the correct medications required for this client, the nurse performs which step of the required process to ensure safe administration of medications?

- ☐ 1. verification
- ☐ 2. clarification
- ☐ 3. documentation
- ☐ 4. reconciliation

262. An elderly client admitted with new-onset confusion, headache, poor skin turgor, bounding pulse, and urinary incontinence has been drinking copious amounts of water. Upon reviewing the lab results, the nurse discovers a sodium level of 122 mEq/L (122 mmol/L). What actions should the nurse take? Select all that apply.

- ☐ 1. Encourage fluids to 2,000 mL in 24 hours.
- ☐ 2. Keep partial side rails up.
- ☐ 3. Restrict fluids to 800 mL in 24 hours.
- ☐ 4. Tell the family they may get the client up to walk in the halls.
- ☐ 5. Prepare to insert a Foley catheter.
- ☐ 6. Notify the healthcare provider (HCP).

263. Following the creation of an ileostomy, a client states, "I am really worried about how I am going to manage this thing." The **first** action of the nurse should be to:

- ☐ 1. remind the client to focus energy on getting healthy.
- ☐ 2. determine the client's exact concerns about the ileostomy.
- ☐ 3. arrange a meeting with the client's case manager.
- ☐ 4. encourage the client's spouse to talk with the client.

264. A client who is being treated for nonhealing diabetic foot ulcers tells the nurse angrily, "I am so frustrated with my doctors. The wound care doctor tells me this will not heal and I need to have my toes amputated and another doctor tells me I need to keep going with the antibiotics and dressing changes so I can save my foot. I just want to go home!" After listening to the client's

concerns, the nurse should:

- ☐ 1. contact the client's case manager to set up a care conference.
- ☐ 2. assure the client that the healthcare providers (HCPs) know what they are doing.
- ☐ 3. remind the client of the responsibilities for health habits regarding diabetes.
- ☐ 4. review the healthcare providers' (HCPs') progress notes with the client.

265. While making rounds, the nurse enters a client's room and finds the client on the floor between the bed and the bathroom. In which order of priority from first to last should the nurse take the actions? All options must be used.

1. If no acute injury, get help, and carefully assist the client back to bed.

3. Assess the client's current condition and vital signs.

2. Document as required by the facility.

4. Notify the client's healthcare provider (HCP) and family.

Answers, Rationales, and Test-Taking Strategies

The answers and rationales for each question follow below, along with

keys () to the client need (CN) and cognitive level (CL) for each question. As you check your answers, use the Content Mastery and Test-Taking Skill Self-Analysis worksheet (tear-out worksheet in back of book) to identify the reason(s) for not answering the questions correctly. For additional information about test-taking skills and strategies for answering questions, refer to pages 12–23 and pages 35–36 in Part 1 of this book.

1. 3. The head of the bed should be elevated 30 degrees to promote venous drainage and decrease intracranial pressure. The client's head should be in a midline, or neutral, position. Clients with supratentorial surgery should be positioned on the nonoperative side to prevent displacement of the cranial contents by gravity.

 CN: Reduction of risk potential; CL: Synthesize

2. 4. Laryngeal stridor is characteristic of respiratory distress from inflammation and swelling after bronchoscopy. It must be reported immediately. Green sputum indicates infection and would occur 3 to 5 days after bronchoscopy. A mild cough or hemoptysis is typical after bronchoscopy. If a tissue biopsy specimen was obtained, sputum may be blood streaked for several days.

 CN: Reduction of risk potential; CL: Analyze

3. 4. Keeping the client's door closed is likely to contribute to feelings of isolation and sensory deprivation. Such activities as watching television, visiting with a relative, and reading a newspaper help prevent sensory deprivation and yet do not require physical effort.

 CN: Psychosocial integrity; CL: Synthesize

4. 4. A trained medical interpreter is required to ensure safety, accuracy of history data, and client confidentiality. The medical interpreter knows the client's rights and is familiar with the client's culture. Using the family member as interpreter violates the client's confidentiality. Using the **UAP** and limited Spanish and nonverbal communication do not ensure accuracy of interpretation and back-translation into English.

 CN: Management of care; CL: Synthesize

5. 4. Clinical manifestations of juvenile hypothyroidism include dry skin, constipation, sparse hair, and sleepiness. Short attention span, weight loss, moist flushed skin, rapid pulse, and heat intolerance suggest hyperthyroidism.

CN: Physiological adaptation; CL: Analyze

6. 2. The client needs further instructions when she says, “If I become pregnant, I can continue to eat sushi twice a week.” Raw fish, including tuna, should be avoided while the client is pregnant because of the risk of contamination with mercury and other potential teratogens. Folic acid - supplements taken before the client gets pregnant and during pregnancy can help reduce the risk of neural tube defects. Steaming vegetables reduces the risk that vitamins will be lost in the cooking water. Soy products can increase the client’s protein levels.

CN: Health promotion and maintenance; CL: Evaluate

7. 3. Diarrhea is a common adverse effect of amoxicillin because the drug kills normal intestinal bacteria. Yogurt with live cultures helps restore the normal intestinal flora. Restricting the child to clear fluids will not help stop the diarrhea or recolonize the intestine. Withholding food and fluids for 2 hours is suggested when a child vomits. Pizza tends to be spicy and aggravates the diarrhea, but restricting its intake will not help the underlying problem.

CN: Basic care and comfort; CL: Synthesize

8. 3. It is normal for the client who is beginning chemotherapy to be anxious and fearful about possible side effects. It is important that the nurse listen to the client’s concerns, correct any misconceptions, and explain the supportive care that will be provided during the chemotherapy treatments. The client needs to understand that individuals do respond differently to the treatments, and the experience may be very different from those of other people. A previously excellent health record does not necessarily ensure that the client will not experience side effects. Medications may lessen but not prevent the side effects, so client concerns should not be dismissed. Telling the client that he or she will die if treatment is refused does nothing to allay fears and concerns.

 CN: Psychosocial integrity; CL: Synthesize

9. 1, 3, 4, 5. Home care for a client with a total laryngectomy should include a high-humidity environment, laryngectomy tube care and suctioning, speech rehabilitation, and smoking cessation. The client is not restricted to a bland diet.

 CN: Management of care; CL: Create

10. 2. Administering acetaminophen to the client with a post-ECT headache is the best action. Stating a headache is common after ECT and that napping will help the client feel better may be true, but it does not offer the client pain relief. Telling the client to eat breakfast and then to let the nurse know how the client feels conveys a lack of understanding to the client and dismisses the client's concern.

 CN: Basic care and comfort; CL: Synthesize

11. 3. This rhythm is ventricular tachycardia, which is characterized by an absent P wave and a heart rate of 140 to 220 bpm. Ventricular tachycardia requires immediate intervention, usually with lidocaine.

 CN: Physiological adaptation; CL: Analyze

12. 1, 4, 6. Providing culturally sensitive care includes providing printed material in the client's native language. There is nothing to indicate that this client is a high-risk pregnancy. Discussing cultural differences is not a priority or important at the first visit. Clients need to have an interpreter for each prenatal visit to translate and interpret questions. Contraceptive options are not a priority for the first prenatal visit. Reviewing dietary intake and discussing nutrition are important components of early prenatal care.

 CN: Health promotion and maintenance; CL: Create

13. 4. An 18-month-old child should be able to say 10 or more words. Lack of speech development may indicate a lack of social stimulation, a hearing deficiency, or developmental delay. Referring the child for an evaluation may increase the child's chance of reaching the child's potential. A 4-month-old child with a healthy central nervous system and normal mental development should be able to laugh out loud if the child's

environment has been caring and the child's needs are met safely and consistently. Children at age 10 months should be able to say the words "dada" and "mama" in response to the appropriate person. A 1-year-old child should have the ability to speak three to five words plus "mama" and "dada."

CN: Health promotion and maintenance; CL: Analyze

14. 4. Liver function tests, including aspartate transaminase (AST), should be monitored before therapy, 6 to 12 weeks after initiation of therapy or after dose elevation, and then every 6 months. If AST levels increase to three times normal, therapy should be discontinued. Simvastatin does not influence serum glucose, complete blood count, or total protein. Serum cholesterol and triglyceride levels should be evaluated before initiating therapy, after 4 to 6 weeks of therapy, and periodically thereafter.

CN: Health promotion and maintenance; CL: Analyze

15. 1. Phenylketonuria is a disease that is carried on the recessive genes of each parent. In order to be transmitted to a newborn, the infant inherits a recessive gene from each parent. Control of the disease is by reduction of the amino acid phenylalanine, which is present in all protein foods. The disease cannot be cured, but controlled. With each pregnancy, there is a 25% chance a child will inherit the disease.

CN: Reduction of risk potential; CL: Apply

16. 4. The nurse should convey empathy and invite the client to share more about her thoughts and feelings so that the nurse can assess the mother for possible postpartum depression, which usually occurs between 2 weeks and 3 months after the baby's birth but also can occur later. Postpartum depression is a mood disorder with symptoms of tearfulness, mood swings, despondency, feelings of inadequacy, inability to cope with the baby, and guilt about performance as a mother. Postpartum depression commonly goes undetected because of poor recognition and lack of knowledge. Hormonal changes during and after childbirth may account for some of the symptoms; however, the nurse should not assume that that is the case. Stating the client's husband and family should help her is an assumption that they are not and dismisses the client's concerns. Saying most new mothers feel the same way minimizes the client's concerns and decreases the likelihood of further

disclosure by the client.

CN: Psychosocial integrity; CL: Synthesize

17. 4. Supine in extension is the position most likely to prevent contractures. Clients who have experienced burns will find a flexed position most comfortable. However, flexion promotes the development of contractures. The high Fowler's and semi-Fowler's positions create hip flexion. The prone position is contraindicated because of head and neck burns. In clients with head and neck burns, pillows should not be used under the head or neck to prevent neck flexion contractures.

CN: Reduction of risk potential; CL: Synthesize

18. 4. Blood clots are normal after transurethral resection of the prostate, but bright red urine can indicate a hemorrhage. The nurse should assess the client's vital signs and notify the surgeon. Irrigation of the catheter may help remove clots, but it does not decrease bleeding. Milking a urinary catheter or increasing fluid intake is not effective for controlling bleeding or decreasing clots.

CN: Reduction of risk potential; CL: Synthesize

19. 4 tablets

$$1,000 \text{ mg} = 1\text{g}$$

$$2\text{g} = 2,000 \text{ mg}$$

$$2,000 \text{ mg} \div 500 \text{ mg} = 4$$

CN: Pharmacological and parenteral therapies; CL: Apply

20. 4. A will is an important legal document. It is best to have one prepared with the help of an attorney. It would be unwise to help the client or to seek another nurse's help because a nurse is not a lawyer. Asking the client to delay preparing the will just avoids the problem.

CN: Management of care; CL: Synthesize

21. 3. A sudden gush of dark blood, a lengthening of the umbilical cord, a smaller uterus, and changing of the uterus to a round or spherical shape are impending signs of placental separation. Pushing effort from the client is not a reliable indicator for impending placental separation, nor is it necessary for placental expulsion.

CN: Health promotion and maintenance; CL: Analyze

22. 2. Battering is a major cause of injury to women. Although battering occurs in all socioeconomic groups, it may appear to be more common in members of lower socioeconomic groups because they are more likely to use emergency department services. Many women experience battery for the first time when they become pregnant. Death from battering is not rare.

CN: Psychosocial integrity; CL: Create

23. 2, 3. Huntington's disease, or Huntington's chorea, is an autosomal dominant genetic neurologic disease that affects descendants of an affected person at a 50% rate. Huntington's disease does not skip generations and affects men and women equally. Huntington's disease is genetically transmitted on chromosome 4, and death usually results from respiratory complications related to aspiration.

CN: Physiological adaptation; CL: Apply

24. 2. Liquids found on the floor should be removed immediately. The nurse should first put on gloves and then wipe up the liquid. Following removal, Environmental Services should be contacted to thoroughly cleanse the floor with a disinfectant solution. Placing paper towels over the drops is a safety hazard. "Wet floor" signs will be posted after the floor is cleansed by Environmental Services.

CN: Safety and infection control; CL: Synthesize

25. 2, 3, 4. A client who has been admitted for numbness and tingling in the lower extremities that advances upward, especially after having a viral infection, has clinical manifestations characteristic of Guillain-Barré syndrome. The **HCP**  must be notified of the change immediately because this disease is progressively paralytic and should be treated before paralysis of the respiratory muscles occurs. The nurse must assess the client

continuously to determine how fast the paralysis is advancing. The family does not need to be called in to visit until the client is stabilized and emergency equipment is placed at the bedside. Performing ankle pumps will not relieve the numbness or change the course of the disease.

CN: Management of care; CL: Synthesize

26. 5, 6. The nurse reports signs of decreased tissue perfusion to the **HCP**;  these include a decrease in urine output and confusion. Crackles, edema, and weight gain are monitored closely, but are not as high a priority as decreasing tissue perfusion. Vital signs and oxygen saturation are within normal limits.

CN: Physiological adaptation; CL: Synthesize

27. 3. The spinal cord connects the brain to the periphery. The thalamus is located in the midbrain and integrates all sensory impulses except olfaction. The afferent impulses are received and then transmitted from the thalamus. Destruction or interruption of the neurosensory pathway results in loss of communication between the two systems. Monitoring the temperature of the bathwater is important because the client cannot feel whether the water is too hot or too cold. Damage to the thalamus does not result in loss of the corneal reflex. Loss of position and vibratory sense usually occurs with degeneration of the posterior column of the spinal cord; therefore, turning every 2 hours is critical to prevent skin breakdown related to increased capillary pressure. The nurse can give only the prescribed dosage of pain medication.

CN: Physiological adaptation; CL: Synthesize

28. 3. When a client is experiencing delusion, the nurse should present reality. The nurse should tell the client that he or she does not hear the voice, see the image, or experience whatever other manifestation of the delusion that the client is experiencing. The client with paranoia is delusional, related to anxiety states, but cannot manage the anxiety at this moment. Allowing expressions of anger or other intense emotions may be harmful to the client or others. Nurses should avoid “why” questions, because such questions tend to make the client defensive.

CN: Management of care; CL: Synthesize

29. 4. Absorption of supplemental iron and nonmeat sources of iron is enhanced by combining them with meat or a good source of vitamin C. An acidic environment enhances iron absorption. Therefore, taking the iron on an empty stomach or with orange juice would be most effective. If gastrointestinal upset occurs, the client may take the drug with meals. However, doing so reduces iron absorption by 40% to 50%. Because milk interferes with the absorption of iron, the client should avoid taking the iron with milk. Tea has been shown to interfere with the absorption of iron. Therefore, the client should avoid taking the iron with tea. Hot chocolate, a milk product, interferes with iron absorption. Thus, the client should avoid taking the iron with hot chocolate.

CN: Basic care and comfort; CL: Synthesize

30. 1. Stating “You were able to shower and dress without any help this morning” points out a visible, realistic accomplishment and strength to the client with self-deprecatory statements, thereby helping to increase the client’s self-worth. The statements “Your wife told me that you are a good husband and father” and “You do not have any reason why you should feel this way” are not helpful because logical statements are ineffective in changing the thinking of a client who is depressed. The client may agree with what the nurse states but be just as depressed because intellectual understanding does not help the severely depressed client. The statement “This medication will help your thinking,” although true, does not recognize the client’s accomplishment and will have no positive effect on his self-esteem.

CN: Psychosocial integrity; CL: Synthesize

31. 1. A low WBC may indicate the development of agranulocytosis, a serious life-threatening side effect of clozapine, and should be reported immediately. While a hemoglobin of 8.2 mg/dL is low, it is not life threatening. The sodium level of 136 mEq/L (136 mmol/L) is normal. Hyaline casts are usually caused by dehydration and indicate the need for more fluids.

CN: Management of care; CL: Synthesize

32. 2. The pallor and cool temperature of the fingers and the decreased

return time for capillary refill indicate decreased arterial blood supply to the fingers. These findings are not normal for any time in the recovery process. Nerve impairment includes numbness, tingling, and impaired movement of the fingers. Signs of venous stasis include edema and reddening of the fingers, not pallor and cool temperature.

CN: Physiological adaptation; CL: Analyze

33. 1. The spinal cord connects the brain to the periphery. Destruction or interruption of the neurosensory pathway results in loss of communication between the two systems. Transection of the spinal cord renders the individual in a complete state of anesthesia below the level of injury. Tingling in the fingers may be related to spinal cord disease or to improper positioning of the extremity. Loss of position and vibratory sense usually occurs when the individual has degeneration of the posterior column of the spinal cord.

CN: Physiological adaptation; CL: Analyze

34. 3. Common pressure points in the side-lying position include the ears, shoulders, ribs, greater trochanter, medial and lateral condyles, and ankles. The sacrum, occiput, and heel are pressure points in the supine position.

CN: Basic care and comfort; CL: Analyze

35. 1, 2, 3. Goals for promoting healthy development in preschoolers include anticipatory guidance, helping parents understand their child's behavior, identifying deviations from the norm, and assessing parent-child interaction. No one can assess or determine the child's future development, and trying to do so can limit the potential the child may achieve. Although learning to interact with others is important, sending the child to a day care center is not essential to promote healthy development. The nurse can encourage the parents to provide opportunities for the child to play with others.

CN: Psychosocial integrity; CL: Create

36. 1. The nurse verifies that the **HCP**  has noted the elevated specific gravity. Clients with glomerulonephritis have concentrated urine from oliguria caused by the inflammation of the glomeruli. The other laboratory

results are in normal range.

CN: reduction of risk potential; CL: Analyze

37. 1. The client's physical needs are a priority in the nurse's plan of care. The lack of fluid and caloric intake can lead to dehydration and cardiac collapse. The lack of sleep and rest can lead to exhaustion and death. Social, spiritual, and cultural needs are important client needs but not as important as the physical needs during an acute manic episode.

CN: Psychosocial integrity; CL: Synthesize

38. 2. The correct method of assessing a neonate's temperature is to place the thermometer under the neonate's arm for an axillary reading. The oral route is not appropriate for obtaining the temperature in a neonate, because the neonate is unable to close the mouth around the thermometer, thus leading to an inaccurate reading. Additionally, inserting a thermometer into a neonate's mouth may cause trauma to delicate tissues. Rectal temperatures may be indicated in some circumstances, but they are generally to be avoided in neonates because of the risk of injury to or perforation of the delicate rectal mucosa. Only a specialized tympanic membrane device should be used to obtain a temperature reading via the ear. Inserting a disposable digital thermometer into the neonate's ear may cause trauma to the delicate tissues.

CN: Basic care and comfort; CL: Apply

39. 1, 2, 3. The alarm settings on infusion pumps should be verified at the time the infusion is started, at the beginning of each shift, and when the client is moved. The neonate can move in bed, but if the alarm is triggered, the nurse should verify the settings. Unless the neonate has moved or been taken out of the crib, it is not necessary to check alarm settings after the parents visit.

CN: Safety and infection control; CL: Apply

40. 4. Moral distress occurs when one is unable to act because of internal or external constraints. The nurse is not able to change the way she interacted with her friend the last time she saw her and is feeling anguish. Secondary traumatic stress is distress that is a result of hearing firsthand traumatic experiences of another. A boundary violation is behavior by a professional

that has violated the limits of a professional-client relationship. Compassion fatigue is disengagement on the part of the caregiving professional.

 CN: Management of care; CL: Analyze

41. 3. Contacting the Security Department is a proactive response in a situation that may become more volatile. A soft voice by the nurse may not even be heard in this situation. To state “Stop!” in this situation is not helpful and does not deal with the escalating risk. Once Security has been notified, the nurse should also report the incident to the supervisor.

 CN: Management of care; CL: Synthesize

42. 2. The most appropriate immediate response is to open the airway. The nurse then should look, listen, and feel for respirations. Noting none, the nurse calls a code and attempts ventilations with a bag mask or mask with a one-way valve until the full code team responds. Using standard precautions with the mask protects the nurse from exposure to possible client microorganisms.

 CN: Physiological adaptation; CL: Synthesize

43. 2. Thermoregulation of the neonate is a critical intervention for the nurse caring for neonates. The preferred method of thermoregulation for healthy term newborns is to place them skin to skin with the mother. Wrapping and placing a hat on the newborn is another way to conserve heat and prevent heat loss. With the neonate lying against a crib wall, heat transfers away from the infant to the cooler surface (conduction). If the neonate is wet, the warmer water on the surface of the neonate evaporates to the cooler air (evaporation). If the neonate is lying in an open crib with a diaper on, the body naturally loses heat to the surrounding cooler air as it radiates from the warm body to the cooler room (radiation).

 CN: Management of care; CL: Synthesize

44. 2. When the blink reflex is absent or the eyes do not close completely, the cornea may become dry and irritated. Placing a patch over the eye is the most appropriate intervention to prevent eye injury. Making sure the client wears eyeglasses at all times will not help protect the eye from injury. Instilling eye drops once a day will not adequately relieve the potential for

injury from a dry and irritating ocular environment. A normal saline solution should be used to moisten the eye, not tap water.

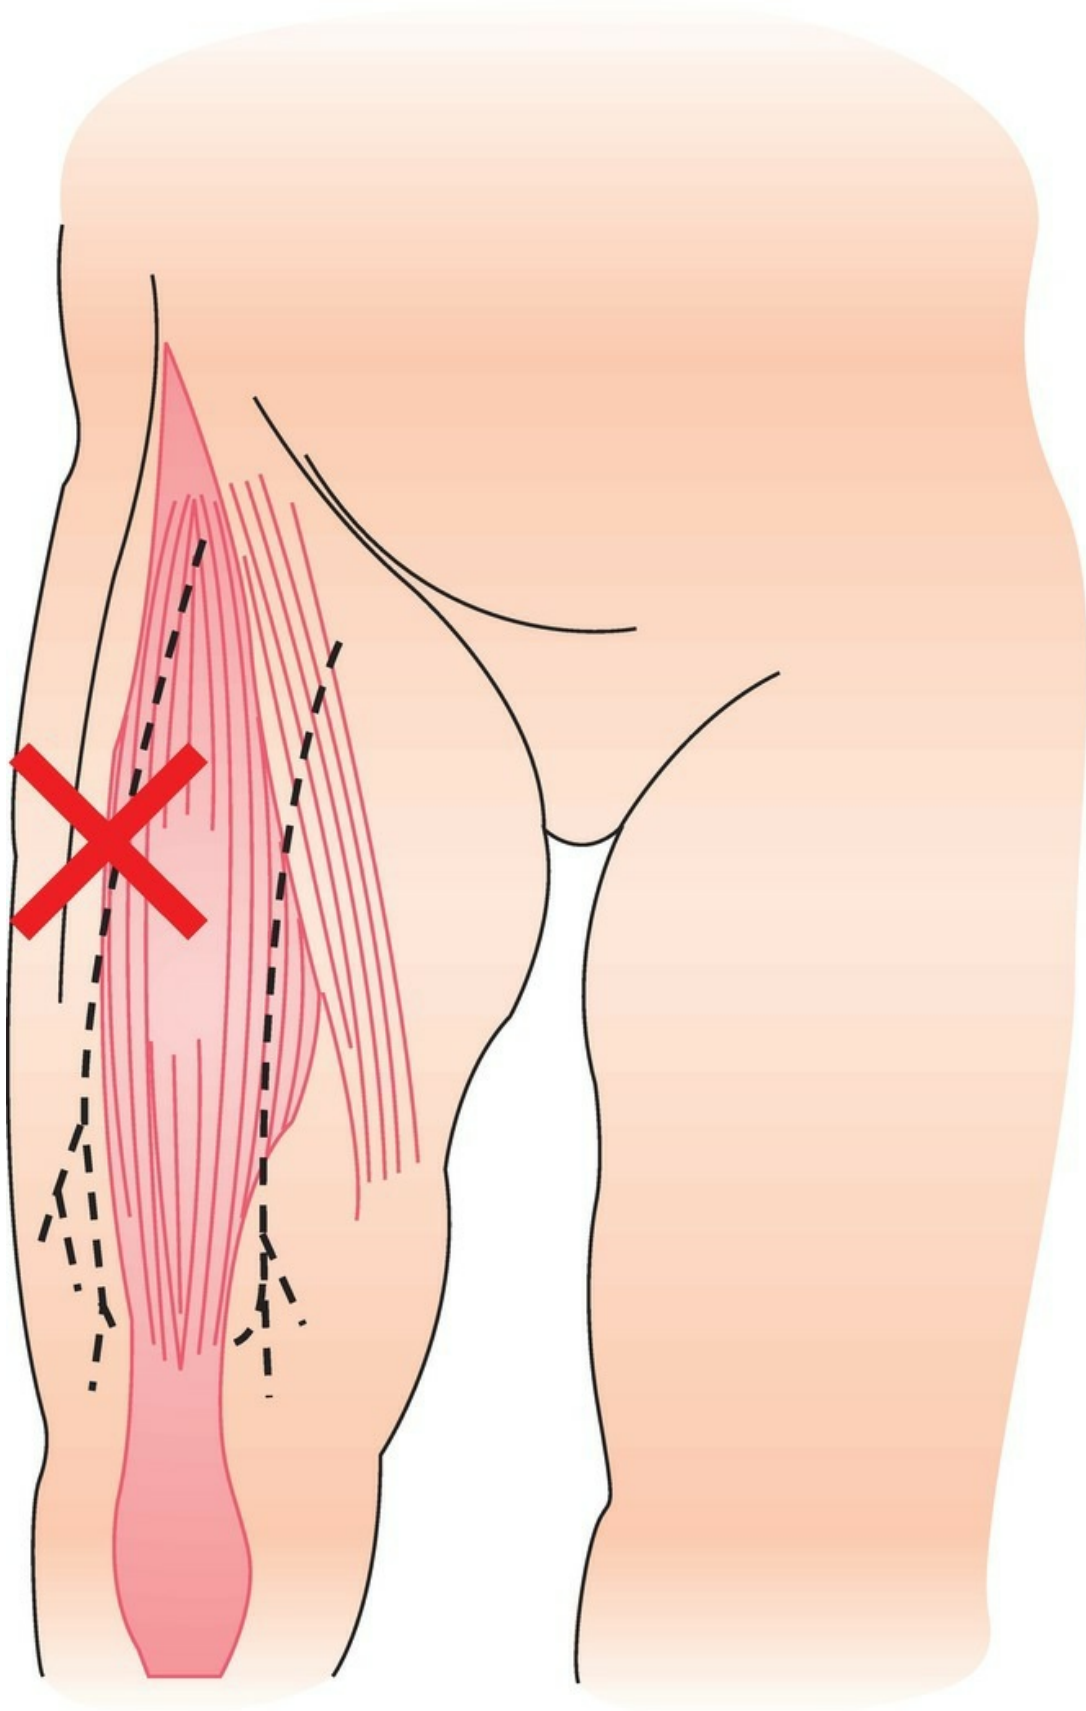

CN: Health promotion and maintenance; CL: Synthesize

45. 2. A 4-year-old is old enough to be able to cooperate and stop the behavior. Therefore, the first step is to obtain the child's cooperation. When this has occurred, then the mother makes sure it is okay to remind the child when the behavior is viewed. Using a substance that does not taste good is not effective as the child may suck it off and does not promote health behavior. The mother also should be encouraged to praise the child when she sees her not engaging in the behavior; "time-out" is considered a punishment and does not promote the desired behavior.

CN: Health promotion and maintenance; CL: Create

46. The vastus lateralis in the thickest part of the anterolateral thigh is a safe injection site for infants. The needle should be inserted at a 90-degree angle to the long axis of the femur.

CN: Safety and infection control; CL: Apply

47. 1, 2, 3. The alarm settings on infusion pumps should be verified at the time the infusion is started, at the beginning of each shift, and when the client is moved. The child can move in bed or sleep, but if the alarm is triggered, the nurse should verify the settings.

CN: Safety and infection control; CL: Apply

48. 1. Tailor sitting, also referred to as cobbler's or butterfly pose, is an excellent exercise that helps to strengthen the client's back muscles and also prepares the client for the process of labor. The client should be encouraged to rest periodically during the day and avoid standing or sitting in one position for a long time. Leg lifts are helpful for leg aches. Shoulder circling exercises are helpful for neck and upper backaches. Squatting is not helpful for alleviating lower backaches.

CN: Basic care and comfort; CL: Synthesize

49. 4. It is important to dry the feet carefully after a bath to prevent a fungal infection. Clients with diabetes should seek medical attention when they injure their toes or feet to prevent complications. Iodine is highly toxic to the tissues. Clients with diabetes should inspect their feet daily and should wear shoes that support their feet while in the house.

CN: Reduction of risk potential; CL: Evaluate

50. 1, 2, 3, 5. Pancreatitis, a chronic or acute inflammation of the pancreas, is a potentially life-threatening condition. Excessive alcohol intake and gallstones are the greatest risk factors. Abdominal trauma can potentiate inflammation. Hyperlipidemia is a risk factor for recurrent pancreatitis. Hypertension and hypothyroidism are not associated with pancreatitis.

CN: Reduction of risk potential; CL: Analyze

51. 1. The nurse should firmly yet gently strike the chest wall with the hand cupped to make a hollow popping sound. A slapping sound indicates that an incorrect technique is being used. The area over the rib cage is percussed to loosen mucus from the underlying lung passages. The child should wear a thin piece of clothing (T-shirt) over the chest area to protect the

skin without diminishing the effect of the percussion.

CN: Reduction of risk potential; CL: Analyze

52. 4. Social isolation is a concern for an older adult who has diminished hearing and vision. Feeling disoriented may be related to cognitive problems rather than diminished hearing and vision. Diminished hearing and vision is related to the aging process and does not result in impairment of the older adult's thought processes. The client with impaired hearing and vision is unlikely to experience sensory overload.

CN: Psychosocial integrity; CL: Synthesize

53. 3. At age 4, a child's speech should be understood most of the time even by people who do not know the child. According to the Denver Developmental Screening Examination, a child aged 2 years should have a vocabulary of 300 words, be able to combine two or three words, and ask for what he or she wants by name. By age 3, the child should have a vocabulary of 900 words and can use a complete sentence of three or four words. A 1-year-old has a vocabulary of at least eight words and can reference people and objects.

CN: Health promotion and maintenance; CL: Analyze

54. 4. Isoniazid competes for the available vitamin B6 in the body and leaves the client at risk for developing neuropathies related to vitamin deficiency. Supplemental vitamin B6 is routinely prescribed to address this issue. Avoiding sun exposure is a preventive measure to lower the risk of skin cancer. Following a low-cholesterol diet lowers the individual's risk of developing atherosclerotic plaque. Rest is important in maintaining homeostasis but has no real impact on neuropathies.

CN: Pharmacological and parenteral therapies; CL: Synthesize

55. 2. Nitroglycerin causes vasodilation, which results in increased intraocular pressure. The vasodilatory effects of the medication can trigger an attack, causing pain and loss of vision. Hypotension is a common side effect of nitroglycerin, which dilates the blood vessels, but is not a concern in the client with glaucoma.

CN: Pharmacological and parenteral therapies; CL: Synthesize

56. 1, 2, 3, 5. The nurse should ask the client with multiple sclerosis about areas of muscle weakness because baclofen may increase the weakness. The nurse should ask the client about a history of muscle spasms. Baclofen is effective against involuntary spasms resistant to passive movement for clients with multiple sclerosis and paralysis. Baclofen is not effective against the spasticity of cerebral origin, such as with cerebral palsy and Parkinson's disease. The nurse should ask the client about the client's liver and renal function because baclofen is metabolized and excreted by these organs. The nurse should check the laboratory values reflecting the function of the kidneys and liver, which include serum creatinine and blood urea nitrogen levels. The nurse should also check blood glucose levels because baclofen can increase blood glucose. Clients with diabetes taking antidiabetic medication may need to adjust the dosage. Potassium is not affected by the drug, so the nurse does not need to check the serum potassium level.

CN: Pharmacological and parenteral therapies; CL: Apply

57. 1, 2, 4. The nurse should assess the client for signs of bone marrow depression, manifested by bruising or unusual bleeding, and signs of infection such as a sore throat. The nurse should also assess the client for signs of hepatic dysfunction, such as light-colored stool or dark-colored urine. Although the nurse may want to check the client's urinary function and hydration status, urine output and hydration are not specific monitoring needs related to long-term use of carbamazepine.

CN: Pharmacological and parenteral therapies; CL: Analyze

58. 3. A client with severe diarrhea loses large amounts of bicarbonate, resulting in metabolic acidosis. Metabolic alkalosis does not result in this situation. Diarrhea does not affect the respiratory system.

CN: Reduction of risk potential; CL: Analyze

59. 4. Serum osmolality indicates the water balance of the body. A normal plasma osmolality between 275 and 295 mOsm/kg (mmol/kg) indicates that the fluid volume excess has been resolved. A weight reduction of 10% may not necessarily return the client to a state of normal serum osmolality. Clients with excess fluid volume do not necessarily have pain or abnormal arterial blood gas values.

 CN: Reduction of risk potential; CL: Synthesize

60. 3. Exactly why rheumatic fever follows a streptococcal infection is not known, but it is theorized that an antigen-antibody response occurs to an M protein present in certain strains of streptococci. The antibodies developed by the body attack certain tissues such as in the heart and joints. Antistreptolysin O titer findings show elevated or rising antibody levels. This blood finding is the most reliable evidence of a streptococcal infection.

 CN: Reduction of risk potential; CL: Analyze

61. 3. The nurse uses active listening, in which the client's feelings are reflected back to him. Telling the client that everyone wears them does not consider the client's feelings. Telling the client that what he said is not what he meant discounts the validity of his statement. Interpreting the reason for the client being upset as the rule being unreasonable does not take into account how it affects the client personally.

 CN: Psychosocial integrity; CL: Synthesize

62. 4. Elbow restraints help to keep the child from placing fingers or any other object in the mouth that would cause injury to the operative site. The restraints are worn at all times except when they are removed to check the skin. Because of the risk for skin breakdown, the restraints are removed periodically during the day to assess the child's underlying skin. It is advisable to remove only one restraint at a time while keeping hold of the child's hand on the unrestrained side. Toddlers are quick and usually want to explore the area in the mouth that the surgery has made feel different. The restraints should be in place at all times during sleep and play to prevent inadvertent injury to the operative site. Taping the restraints directly to the skin is not advised because skin breakdown can occur when tape is reapplied to the same area over several weeks. The restraints can be fastened to clothing to keep them from slipping.

 CN: Safety and infection control; CL: Evaluate

63. 2. Because the client is very active, it would be best to give her food she can carry with her and eat as she moves. Neither allowing the client to send out for her favorite foods nor serving food in small, attractively arranged

portions will address her need to be active. Allowing the client in the unit kitchen is impractical, and she most likely would be too busy to eat anyway.

CN: Basic care and comfort; CL: Synthesize

64. 1, 2, 3, 4. The purposes of the Pap (Papanicolaou) smear include to detect precancerous and cancerous cells of the cervix; to assess the effects of sex hormonal replacement; to identify viral, fungal, and parasitic conditions; and to evaluate the response to chemotherapy or radiation therapy to the cervix.

CN: Health promotion and maintenance; CL: Apply

65. 2, 3. The nurse should use at least two sources of identification before administering medication to any client. The identification can include the **medical record**  number and the client's date of birth. It is not necessary to check the client and dose for this drug with another nurse. It is also not safe to use the room number or bed number as a source of identification as clients' locations in the hospital are frequently changed. The nurse should not assume that the client will give a correct first name.

CN: Safety and infection control; CL: Apply

66. 1. Nurses should verify that clients having surgery discontinued use of any blood thinners to prevent postoperative bleeding. Prior to bowel resection, the client should follow a high-residue diet with increased fluids. Abdominal tightening exercises are not necessary before this surgery. Clients may write a will before surgery, but the nurse does not have to inquire about it.

CN: Reduction of risk potential; CL: Synthesize

67. 1, 3. When a client collects stool for occult blood, the nurse should instruct the client to avoid eating meat, especially red meat, for 1 to 3 days before the sample collection because meat eliminated in the stool can lead to false-positive results. Eating foods high in fiber a few days before sample collection may be recommended because doing so improves the chances of finding occult blood if a lesion is present. The client should take stool samples from different sites of the stool for a better sample. The stool sample should be covered to protect everyone from body secretions. The specimen

does not have to be sent to the laboratory immediately. Some medications, herbs, foods, and activities can lead to false results of the occult testing. For example, iron pills, turnips, and horseradish lead to false-positive results. Vitamin C leads to false-negative results. Some anti-inflammatory drugs and aspirin should be avoided due to antiplatelet properties that increase the risk of gastrointestinal bleeding.

 CN: Reduction of risk potential; CL: Evaluate

68. 2. One of the actions of propranolol, a drug used in the treatment of migraine headaches, is to inhibit arterial vasodilation. The nurse should assess the client's blood pressure to evaluate overall circulatory response to the medication. Until the nurse determines the client's blood pressure, there is no immediate need to contact the **HCP**.  There is no immediate need to administer oxygen. The client has not indicated pain; it is not necessary to administer the sumatriptan at this time.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

69. 1. The client with diabetes and a chronic respiratory condition is most at risk for influenza and should receive the vaccine yearly. Diabetes and chronic respiratory conditions do not increase the risk of hepatitis A. An adult client is not as likely to need the measles-mumps-rubella or varicella immunizations, but titers can be checked if the client has not had childhood immunizations or the disease.

 CN: Reduction of risk potential; CL: Apply

70. 2. Good sources of dietary iron include red meats, poultry, green leafy vegetables, and dried fruits such as raisins. Milk products are poor sources of iron. Carrots are high in vitamin A.

 CN: Reduction of risk potential; CL: Evaluate

71. 1. During the tertiary circular reaction stage of the sensorimotor stage (12 to 18 months of age), the infant comes to understand causality and object permanence, recognizing that objects placed out of sight continue to exist. During the preoperational stage (ages 2 to 6), the child's perception is based on how he or she views an event. The concrete operational stage (ages 6 to 12) is the beginning of concrete, logical thinking. During the formal

operational stage (ages 13 to 18), the child is able to perform abstract reasoning.

CN: Health promotion and maintenance; CL: Analyze

72. 2. The neonate will be simultaneously dried and stimulated to cry immediately upon birth. If the neonate does not cry as a result of these measures, the ABCs (airway, breathing, and circulation) of cardiopulmonary resuscitation will be followed. Positioning the neonate and suctioning or clearing the airway ensure that the airway is clear so that the first breath the neonate takes is air, rather than fluid or particulate matter. Breathing will be stimulated once the airway is clear, and then heart rate will be validated either apically or through the cord. The cord may be cut in order to hand the neonate to the mother for nursing. In many instances, the infant is placed on the mother's abdomen before the cord is cut.

CN: Health promotion and maintenance; CL: Evaluate

73. 2 mg/minute

First, calculate the concentration of mg/mL:

$$\frac{\overset{4}{\cancel{1,000}} \text{ mg}}{\underset{1}{\cancel{250}} \text{ mL}} = 4 \text{ mg / mL.}$$

Next, multiply the number of milligrams per milliliter by the pump setting in milliliters per hour:

$$\frac{4 \text{ mg}}{1 \cancel{\text{ mL}}} \times \frac{30 \cancel{\text{ mL}}}{1 \text{ h}} = 120 \text{ mg/h.}$$

Next, divide the milligrams per hour by 60 to obtain milligrams per minute:

$$120 \text{ mg/h} \div 60 \text{ minutes} = 2 \text{ mg/min.}$$

CN: Pharmacological and parenteral therapies; CL: Apply

74. 3. Children with roseola have a high fever for 3 days, which drops suddenly. Then a nonpruritic rash appears, typically lasting for 1 to 2 days. High fever followed by a rash is a characteristic sign. Associated symptoms include cold symptoms, cough, and lymphadenopathy.

CN: Physiological adaptation; CL: Evaluate

75. 1. The client may become tolerant of the antianginal effects of nitrates. Removing nitrates for 8 hours each day is usually effective in preventing tolerance. Nitrate patches should not be used on an as-needed basis. Sites should be rotated daily to prevent skin irritation, but this is not related to tolerance. Removing the patch for only 8 hours is sufficient to prevent tolerance, and skipping days could impact the drug's effectiveness.

CN: Pharmacological and parenteral therapies; CL: Apply

76. 3. When an incision eviscerates, it is a medical emergency. The nurse's first response is to apply a sterile dressing that has been moistened with sterile normal saline solution. The client should also be placed in semi-Fowler's position to release any tension on the abdominal area. Vital signs should be taken, and an IV line may be started for emergency treatment; however, the first action is to protect the wound and abdominal contents.

CN: Reduction of risk potential; CL: Synthesize

77. 2. The nurse should tell the client in a simple, matter-of-fact manner the purpose of the restraints to help the client understand why restraints are necessary. Long explanations and interactions with the acutely manic and agitated client are not appropriate or therapeutic at this time because the client with a high level of anxiety has difficulty focusing and processing. Saying "Threatening others and throwing furniture is not allowed" could lead the client to believe he is being punished. Reminding the client that the client has "been here before and knows what the rules are" and "We are only doing this for your own good, so calm down" are condescending and verbalizing the expectation that the client can control the illness.

CN: Psychosocial integrity; CL: Synthesize

78. 4. To determine how low the gentamicin serum level drops between doses, the trough serum level should be drawn just before the administration of the next IV dose of gentamicin sulfate.

CN: Pharmacological and parenteral therapies; CL: Apply

79. 1, 2, 3, 5. Anorexia or loss of appetite is not associated with valproic acid. Adverse effects include tremors, transient hair loss, gastrointestinal upset, and weight gain.

CN: Pharmacological and parenteral therapies; CL: Analyze

80. 3. Intercourse commonly stimulates uterine contractions. The prostaglandins found in semen can also initiate contractions. After placement of a cerclage for advanced dilation and contractions, the client is considered at high risk for preterm birth and should be seen by her healthcare provider (HCP) more frequently. The client should call the HCP immediately if she sees signs of complications, such as leaking fluid (rupture of membranes), vaginal bleeding, and contractions (particularly with a cerclage in place). Anything in the vagina may initiate contractions and the labor process.

CN: Reduction of risk potential; CL: Evaluate

81. 3. Meningococcal infections are spread through close mucous membrane or respiratory contact with large respiratory droplets. Meningococcal infections are not spread by small airborne organisms or contact with a person's skin or contaminated items. Standard precautions, used when touching body fluids, are not sufficient to prevent the spread of meningitis.

CN: Safety and infection control; CL: Apply

82. 3. The nurse should contact the **HCP** for clarification of the prescription. The nurse must be vigilant when comparing medication in the medication box to the prescription; prednisolone, for example, is three to five times more potent than prednisone. The nurse cannot make a pharmacy substitution change without prescriptive authority. The prednisolone is not returned until a clarification prescription is obtained to determine the substitution drug and dosage is correct. It is not necessary to contact the charge nurse or supervisor, as the nurse must first clarify the prescription

with the HCP. The nurse reports the incident according to agency policy and notifies all involved of the change in the prescription.

CN: Pharmacological and parenteral therapies; CL: Synthesize

83. 1. The nurse should instruct the mother to bring the child to the emergency department. If aspirated, nuts may swell leading to an airway obstruction after the initial event; endoscopy may be required to remove remaining fragments. Bleeding from trauma to internal organs after abdominal thrusts is rare. There are no signs of shock to suggest anaphylaxis. There is no indication of the presence of a pneumothorax.

CN: Physiological adaptation; CL: Synthesize

84. 1. Gastric upset is an adverse effect of NSAIDs. Taking these drugs with food and fluids minimizes this effect. The dosage of NSAIDs does not need to be tapered. Because NSAIDs do not cause drowsiness or stomatitis, the client does not need to restrict driving or rinse the mouth.

CN: Pharmacological and parenteral therapies; CL: Synthesize

85. 2. The neonate's Apgar score has been improving since birth. (The birth score is 6; the current score is 9.) The nurse should continue to assess the neonate. There is no indication that oxygen is needed since the color is improving, and stimulating the baby is not necessary as the baby is now flexing the extremities.

CN: Management of care; CL: Synthesize

86. 2. Managing clients' health involves many specialized areas, such as respiratory therapy, medicine, laboratory, social services, and technical monitoring. One of the significant roles of the nurse is to ensure clear communication with the client and among the healthcare team. Due to expanded media coverage of healthcare issues, clients may be more aware of healthcare issues, but may not be able to determine if the information is accurate or pertains to them. Because of increasing numbers of media sources, both digital and print, it is difficult for consumers to keep up with all of the advances in the science of health care. Clients are more aware of their rights because of media exposure and information disseminated by healthcare facilities. However, respect for the client's rights should be the nurse's

concern as well, and communication should not be impacted by a client's knowledge or demand for those rights.

CN: Health promotion and maintenance; CL: Apply

87. 1, 2. The initial signs of esophageal atresia and TEF include lots of frothy mucus and unexplained episodes of cyanosis usually caused by overflow of mucus from the esophagus. Loose stools and poor gag reflex are not signs of TEF. Initial weight loss is common in newborns and not related to TEF.

CN: Reduction of risk potential; CL: Analyze

88. 1. Adequate circulatory status is the most important factor in the healing process of an infected decubitus ulcer. Blood flow to the area must be present to bring nutrients and prescribed antibiotics to the tissues. Rest and a balanced diet are essential to health maintenance but are not the priority for healing an infected decubitus ulcer. A fluid intake of 2,000 to 3,000 mL/day, if not contraindicated, is recommended to provide hydration to the client's tissues.

CN: Reduction of risk potential; CL: Synthesize

89. 4. Soft, washable toys are appropriate for infants, who tend to place everything in their mouths. These toys are not harmful. Plastic toys cannot be manipulated by a child of this age, and the child would put the car in the mouth, which may not be safe due to small parts that may be swallowed or aspirated. Games and puzzles are too advanced for a 5-month-old, and the child could put the pieces in the mouth and swallow them. Some stuffed animals have eyes that can be swallowed or aspirated.

CN: Reduction of risk potential; CL: Apply

90. 4. The nurse should call for a multidisciplinary staff meeting because there is a need for staff members to share their feelings of anger, frustration, and grief. Because nurses focus on saving human lives, any feelings of hopelessness regarding a dying client can interfere with the client's care and management. Assigning the staff member to other clients ignores the staff member's need to work through feelings. Calling the clinical nurse specialist to deal with the staff member does nothing to help other staff. The psychiatric

clinical nurse specialist would be included in the staff meeting to help the entire staff deal with their feelings. Agreeing with the staff member and discontinuing suicide precautions is highly inappropriate.

 CN: Management of care; CL: Synthesize

91. 3. The nurse should give the next dose as prescribed because the blood level is 35 mcg/mL, which is lower than the normal range of 50 to 100 mcg/mL. Withholding the next dose, notifying the **HCP**,  and taking the client's vital signs are not indicated in this situation.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

92. 3. Going for a walk with the nurse and another client is a more gradual introduction to being with others. The goal is to gradually encourage interaction with others; playing games in the client's room promotes continued isolation. Going to a group session and participating in crafts are exposing the client to large groups too rapidly.

 CN: Psychosocial integrity; CL: Synthesize

93. 4. The client is not emptying her bladder after repeated attempts. The nurse should now use an in-and-out catheter to empty the bladder. While the other comfort measures may be helpful, this client has not completely emptied her bladder since childbirth and will be at risk for a urinary tract infection and postpartum hemorrhage.

 CN: Management of care; CL: Synthesize

94. 1. The best way to ease symptoms caused by hyperventilation is to have the client breathe into a paper bag. This helps to raise carbon dioxide level, which encourages deeper, slower breathing. The symptoms of hyperventilation will not be alleviated by having the client put his head between his knees, giving the client low concentrations of oxygen, or having the client take deep, slow breaths and exhaling normally.

 CN: Basic care and comfort; CL: Synthesize

95. 2. True labor is present when cervical dilation and effacement occur. Fetal descent into the pelvic inlet is an indication that labor will begin soon. However, for a nulligravid client, this may take 1 to 2 weeks. Painful

contractions every 3 to 5 minutes may be Braxton Hicks contractions. Contractions that disappear when the client lies down are a sign of false labor. Although leaking amniotic fluid should be reported, it is not a sign of true labor.

CN: Health promotion and maintenance; CL: Analyze

96. 4. The signs and symptoms of sepsis in a neonate, such as changes in appearance and behavior, are almost imperceptible. Often, the parents' only problem is that the neonate does not look "right." Fever and localized response, which are clues to infections in older children, are often absent in the neonate. Telling the father that he should have realized something was wrong is condescending and serves only to further the father's guilt feelings. Asking the father whether he read the booklet from the hospital implies that the father is at fault. One experience would not necessarily ensure that the father would be able to detect sepsis another time.

CN: Psychosocial integrity; CL: Synthesize

97. 3. Nursing bottle caries occur when a child is routinely given a bottle of milk or juice at nap and bedtime. When teeth become coated in sugar before sleep, the lack of activity in the child's mouth for several hours during sleep allows the sugar to convert to acid, leading to decay. A child drinking 18 to 20 oz of whole milk in a day should not be malnourished, although she may lack essential vitamins and iron. Anemia may occur if she is only drinking milk because it contains no iron; however, the mother indicates she is eating meals. Regardless, children of this age should be taking no more than 16 oz of milk per day, and most children at this age should be drinking from a cup. The mother should be instructed to wean the child to a cup one feeding at a time until the child is completely weaned to a cup for all feedings. The last bottle-feeding to be replaced is usually the night bottle. Malocclusion of the teeth does not occur at 15 months. If the child were to continue to suck on a bottle until age 4 years or later, then malocclusion may occur.

CN: Health promotion and maintenance; CL: Apply

98. 1. Because the femoral artery is usually used as the access site during a cardiac catheterization, children are required to remain on bed rest (with the

head only slightly elevated) for several hours after the procedure to avoid arterial bleeding at the site. A knee-chest position is the correct position for an infant during a cyanotic episode as it will create peripheral resistance to the extremities, shunting blood to the heart. The apical heart rate is assessed prior to administering this medication; administration can be performed by an experienced LPN/VN, although medication is checked with the RN 📖 prior to administration. Because echocardiography is noninvasive, there is no need to withhold meals before this procedure.

🔑 CN: Management of care; CL: Analyze

99. 2. The client should report tinnitus because vancomycin can affect the acoustic branch of the eighth cranial nerve. Vancomycin does not affect the vestibular branch of the acoustic nerve; vertigo and ataxia would occur if the vestibular branch were involved. Muscle stiffness is not associated with vancomycin.

🔑 CN: Pharmacological and parenteral therapies; CL: Analyze

100. 2. In an emergency in which the neonate's head is already being born, the first action by the nurse should be to check for the presence of a cord around the neonate's neck. If the cord is present, the nurse should gently remove it from around the neck. The mother should be told to breathe gently and avoid forceful bearing-down efforts, which could lead to lacerations. Although blood and bodily fluid precautions are always present in client care, this is an emergency. If possible, the nurse should put on gloves. Suctioning the mouth can be done after the nurse has checked that the cord is not around the neonate's neck. Telling the mother that help is on the way is not reassuring because emergency medical technicians may take some time to arrive. Birth is imminent because the neonate's head is emerging.

🔑 CN: Reduction of risk potential; CL: Synthesize

101. 2. After surgery, the most important nursing goal is to prevent infection. Surgery involves an incision, which places the infant at risk for infection. The infant with this type of procedure does have discomfort, which can be relieved with acetaminophen, and managing pain is important but not the priority. The infant may be in arm restraints or have the cuff of the sleeve pinned to the diaper or pants. It is important that the infant not touch the

incision line or disrupt the sutures, but the infant is not at risk for problems related to immobility. There is no indication that the parents need to improve their skills, but the nurse can support the family as they would be reacting normally with a first reaction of shock.

CN: Reduction of risk potential; CL: Analyze

102. 2. The primary reason to give a diuretic to a client with heart failure is to promote sodium and water excretion through the kidneys. As a result, the excessive body water that tends to accumulate in a client with heart failure is eliminated, which causes the client to lose weight. Monitoring the client's weight daily helps evaluate the effectiveness of diuretic therapy. Clients should be advised to weigh themselves daily. An increased appetite or decreased thirst does not establish the effectiveness of the diuretic therapy, nor does having clearer urine after starting torsemide.

CN: Pharmacological and parenteral therapies; CL: Evaluate

103. 3. The client should be placed in a side-lying position and encouraged to take a deep breath during the insertion of the suppository. Placing the suppository along the rectal wall promotes absorption of the medication and helps avoid placing it into a stool mass. The nurse should insert the suppository 3 to 4 inches into the rectum of an adult client.

CN: Reduction of risk potential; CL: Apply

104. 2. Hepatitis B virus is spread through contact with blood, body fluids contaminated with blood, and such body fluids as cerebrospinal, pleural, peritoneal, and synovial fluids; semen; and vaginal secretions. The risk of transmission of hepatitis B through feces is low. Touching the client without gloves is acceptable when there is no danger of contact with blood or body fluids. Recapping a used needle is a common source of needlestick injuries; needles should be properly disposed of uncapped.

CN: Safety and infection control; CL: Apply

105. 2, 3, 5, 6. Safety and physiological needs are crucial initially for a client who is unable to meet her own needs. Identifying her stressors and feelings will be important later when she is responding to questions and her environment.

 CN: Psychosocial integrity; CL: Synthesize

106. 2. Signs of child abuse include injury with a history that is inconsistent with the nature of the injury, or unusual injuries for the age of the child. A spiral fracture of a child is always investigated as potential child abuse as this injury is often due to twisting of an extremity. It is not unusual for a child who is learning to walk to have bruises. Wearing the same clothes is not an indication of abuse or neglect. The child with conjunctivitis requires health care, but having frequent episodes is not an indication of abuse or neglect.

 CN: Reduction of risk potential; CL: Analyze

107. 3. In most agencies, it is a policy to discard the autologous blood after 4 hours of transfusing, due to an increased risk of infection. Increasing the infusion rate could cause fluid overload. Monitoring blood transfusions is a serious nursing responsibility, and because it is the change of shift, there is increased risk of error.

 CN: Safety and infection control; CL: Synthesize

108. 3. After a nephrectomy, a specific aspect of immediate postoperative management includes monitoring urine output at least hourly. Monitoring blood pressure and encouraging the use of incentive spirometry are other important considerations, but because of the surgical disruption of the urinary system, urine output is a priority. Measurement of urine output should also include an estimation of the amount of urine drainage on the flank dressing.

 CN: Reduction of risk potential; CL: Synthesize

109. 1. The client is demonstrating signs of anemia and should increase the iron in the diet. Foods such as red meats, beets, and cabbage are good sources of iron. The client should not limit the fluid intake to 1,000 mL/day, but should maintain an adequate fluid intake of about 3,000 mL/day. Carbohydrates will not provide the necessary dietary intake of iron. While fish is a healthy choice, beef, lamb, and iron-rich vegetables are more important in the diet at this time.

 CN: Health promotion and maintenance; CL: Synthesize

110. 2. Infants are obligatory nose breathers except when crying. The observation that the infant has slight cyanosis when quiet but becomes pink when crying and the inability to pass a catheter through the left nostril suggest that the neonate is exhibiting symptoms of unilateral choanal atresia. With this condition, one of the nasal passages is blocked by an abnormality of the septum. Surgical intervention is necessary to open the nostril. Typically, a neonate with esophageal reflux disorder exhibits episodes of apnea and vomiting after eating. Respiratory distress syndrome commonly occurs in preterm neonates who lack surfactant to maintain lung expansion. Common findings include sternal retractions, tachypnea, grunting respirations, nasal flaring, cyanosis, pallor, hypotonia, and bradycardia. A neonate with tracheoesophageal fistula commonly exhibits cyanosis during feedings and vomiting.

CN: Reduction of risk potential; CL: Analyze

111. 2. The nurse's initial response should be to withhold the digoxin. The nurse should then notify the **HCP**  if the apical pulse is 60 bpm or lower because of the risk of digoxin toxicity. The charge nurse does not need to be notified, but the nurse needs to document the notification and follow-up in the **medical record**.

CN: Pharmacological and parenteral therapies; CL: Synthesize

112. 1, 2, 3, 5. Safety measures for poisonous substances include close supervision of children, safely storing toxic substances, teaching proper dosages and differences between adult and child doses, and the proper way to contact the Poison Control Center for instructions. Poison Control should be notified as soon as the poisoning has occurred and airway and circulation have been assessed. Poison Control will direct any further treatment. Syrup of ipecac is rarely used today in the treatment of ingested substances due to the potential for aspiration. It is contraindicated in cases of arsenic poisoning, seizures, and the ingestion of petroleum or corrosive substances.

CN: Safety and infection control; CL: Create

113. 4. Dystonic adverse effects of haloperidol, especially oculogyric crises, are painful and frightening. IM benztropine is the fastest and most effective drug for managing dystonia. Lorazepam is an antianxiety

medication and is not effective for treatment of dystonia. Although amantadine and diphenhydramine can be used for extrapyramidal symptoms, oral medications do not work as quickly, and amantadine may worsen psychotic symptoms.

CN: Pharmacological and parenteral therapies; CL: Synthesize

114. 1. Neonates burn brown adipose tissue (fat) as a response to cold stress. In addition, there is increased utilization of glycogen and calorie stores. Hypoglycemia may result from becoming stressed by a cold environment. Neonates do not have the ability to shiver.

CN: Health promotion and maintenance; CL: Apply

115. 1. While the adolescent is denying pain, he is displaying objective signs of pain. Adults of Asian ethnicity typically display stoic behavior, and the 16-year-old most likely would try to conform to this cultural norm. The nurse should administer an analgesic and assure the client that taking medication will speed the recovery process. The nurse must also reassess the client after administering the pain medication and document the response. The reassessment is typically done 30 minutes after a parenteral analgesic and an hour after an oral analgesic. People who identify with the Asian culture infrequently report concerns, and, therefore, asking the client about what is troubling him is unlikely to provide the nurse with additional information. The adolescent's behavior is consistent with postoperative pain. If the parents are stoic, discussing the adolescent's behavior may not be productive. At this stage of treatment, distractions can be used in conjunction with medication, but should not be substituted for them.

CN: Basic care and comfort; CL: Synthesize

116. 1. Formula should fill the entire nipple of the bottle while the baby is sucking. This decreases the amount of air taken in by the baby; taking in too much air can lead to regurgitation. Not all babies at term are born with well-developed sucking skills. Some neonates are sleepy and do not suck well. For the first feeding, the baby should be bubbled after taking one-fourth to one-half ounce of formula and then again when the infant has finished the feeding. Bottle propping can lead to aspiration, decreased infant bonding, and aspiration of formula. However, it is not associated with the intake of too

much air.

CN: Health promotion and maintenance; CL: Synthesize

117. 3. Because of toddlers' high energy and poor impulse control, safety is a priority concern for this age-group. Language is important in toddler development, but not the most important at this time. While parents should set clear guidelines for behavior, the priority for toddlers is ensuring safety. Diet habits should be developed at this time, but the most important subject to teach parents of toddlers is safety.

CN: Safety and infection control; CL: Synthesize

118. 1, 3, 4, 5. When a client begins to have back pain with administration of blood, the nurse should suspect a hemolytic reaction, and the blood transfusion should be stopped immediately. Any remaining blood and the tubing should be sent to the lab. The nurse should prepare for a reaction from mild to severe, including the need for cardiopulmonary resuscitation, because even a small amount of mismatched blood can lead to a major reaction. The nurse should obtain a urine specimen to send to the laboratory to check for hemoglobin because RBC hemolysis filters through the kidneys from the reaction. The nurse should stop the IV line with the Y-tubing for the blood and not flush the line with saline so that the client does not receive any more blood. The tubing should be changed so that a tube without blood can be used for infusions.

CN: Pharmacological and parenteral therapies; CL: Synthesize

119. 2. At 4 hours postpartum, the fundus should be midline and at the level of the umbilicus. Whenever the placenta is manually removed after birth, there is a possibility that all of the placenta has not been removed. Sometimes, small pieces of the placenta are retained, a common cause of late postpartum hemorrhage. The client is exhibiting signs and symptoms associated with retained placental fragments. The client will continue to bleed until the fragments are expelled. Perineal and cervical lacerations are characterized by bright red bleeding and a firmly contracted fundus at the level that is expected. Urine retention is characterized by a full bladder, which can be observed by a bulge or fullness just above the symphysis pubis. Also, the client's fundus would be deviated to one side and boggy to the

touch.

CN: Reduction of risk potential; CL: Analyze

120. 3. A neonate born at 37 weeks' gestation will have some cartilage in the earlobes, fine and fuzzy hair, scant to moderate rugae in the scrotum, and a breast nodule diameter of 4 mm. Neonates born before 36 weeks' gestation will have only an anterior transverse crease on the soles of the feet. Extensive rugae on the scrotum are a typical finding in neonates born at 39 weeks' gestation or later. Coarse and silky scalp hair typically is found in neonates that are born at 39 weeks or later.

CN: Health promotion and maintenance; CL: Analyze

121. 1, 3, 4. Clear communication is crucial for a client with delirium. The family must include the client in all conversations and keep him oriented to time and place. It is inappropriate to argue with a client's hallucinations because they are real to the client. Speaking more loudly will not help this client hear more distinctly and may increase the client's confusion.

CN: Management of care; CL: Synthesize

122. 2. One-to-one supervision provides safety until appropriate detoxification can be given. Restraints are the last intervention after less restrictive alternatives have been tried. It is unlikely that the client can cooperate with staying in a chair. Putting the client in bed in his or her room puts the client at risk for falling, and a closed door prevents close observation.

CN: Safety and infection control; CL: Synthesize

123. 1. The nurse should recognize that the client's clinical manifestations indicate fluid overload and decrease the infusion rate so the client's circulation can handle the extra fluid. Antihistamines are used for allergic reactions. The nurse should place the client in an upright position with the feet down so that blood or fluid volume can drain to the lower extremities and relieve some of the extra fluid load on the heart. The nurse does not need to replace the blood with another type of fluid because the client's response is not a blood transfusion reaction.

CN: Pharmacological and parenteral therapies; CL: Synthesize

124. 2. 200,000 units of heparin is too large of a dose. Heparin may be given in a 5,000-unit bolus dose IV; then 20,000 to 40,000 units infused over 24 hours with a dose adjusted to maintain desired APTT, or 5,000 to 10,000 units IV piggyback every 4 to 6 hours.

 CN: Pharmacological and parenteral therapies; CL: Apply

125. 2. Insensible fluid loss is invisible vaporization from the lungs and skin and assists in regulating body temperature. The amount of water loss is increased by accelerated body metabolism, which occurs with increased body temperature. The client's body mass index does not directly influence calculating fluid therapy.

 CN: Management of care; CL: Analyze

126. 3. A toddler has not developed the concept of sharing, so two similar toys must be provided to prevent disagreements. Playing together in harmony is not the developmental level of a toddler. They play side by side, but not together. Threatening to put the children in their rooms does not solve the problem, nor does taking away the toy.

 CN: Health promotion and maintenance; CL: Synthesize

127. 3. Visual disturbances are a symptom of digoxin toxicity. These disturbances can include double, blurred, or yellow vision. Cardiovascular manifestations of digoxin toxicity include bradycardia hypotension, other dysrhythmias, and pulse deficit. Gastrointestinal symptoms include anorexia, nausea, and vomiting.

 CN: Pharmacological and parenteral therapies; CL: Analyze

128. 2. In order to reestablish trust, the nurse should first try to determine if something happened at the last visit that was upsetting for the family. Dislocation of a body part can be seen as a source of illness among persons of Mexican ethnicity. At a well-child visit, the healthcare provider (HCP)  would have palpated the fontanelle. If it is now sunken from dehydration, the parents may blame the provider for the illness. This belief is referred to as caida de la mollera. The family may have talked with a traditional healer, but following this line of questioning first may appear that the nurse considers the healer as an adversary. Asking about immigration makes a stereotypical

assumption. Asking if the family is afraid the baby will be taken from them may be suggesting something the family has never considered and may cause unnecessary distress.

CN: Psychosocial integrity; CL: Synthesize

129. 1. The child wants attention from the nurse, even if the behavior is met by a negative response. Aggression, resistance against authority, and exaggerated stress are behaviors that can be associated with a 4-year-old. However, coming to the nurses' station after being told not to do so is not an example of these behaviors.

CN: Psychosocial integrity; CL: Analyze

130. 1, 2, 3. Clinical manifestations of dehydration include decreased tearing; dry mucous membranes; sunken fontanelles; weight loss; behavioral changes; scanty, concentrated urine; and a thready, fast pulse. Clear, pale yellow urine would indicate adequate hydration. A bounding pulse would indicate fluid volume excess.

CN: Physiological adaptation; CL: Analyze

131. 4. Hydrotherapy wound cleaning is very painful for the client. The client should be medicated for pain about 30 minutes before the treatment in anticipation of the increased pain the client will experience. Wounds are debrided, but excessive fluids are not lost during the hydrotherapy session. However, electrolyte loss can occur from open wounds during immersion, so the sessions should be limited to 20 to 30 minutes. There is no need to limit food or fluids 45 minutes before hydrotherapy unless it is an individualized need for a given client. Topical antibiotics are applied after hydrotherapy.

CN: Reduction of risk potential; CL: Create

132. 3. When a neonate is being transferred to a neonatal care center (level III nursery), the parents should be allowed to see and touch the neonate, if possible, before transfer. The parents should be given the location and telephone number of the unit to which the neonate is being transferred. This helps to keep the parents informed. The parents are already aware of the neonate's condition and should recognize that it is critical if the neonate is being transferred to a neonatal care center. The parents have signed **consent**

 for treatment on admission, and in most states another consent is not necessary. Asking whether the father would like to ride in the ambulance with the neonate during the transfer is inappropriate. Most ambulances or transferring vehicles (e.g., helicopters, airplanes) do not allow family members to accompany the ill client. Space in the motor vehicle, helicopter, or plane is limited. In addition, most transferring vehicles do not have insurance to cover family members should an accident occur during transfer.

 CN: Management of care; CL: Synthesize

133. 4. Tenets of the Roman Catholic Church hold that it is acceptable for anyone, regardless of religious belief, to baptize a neonate. For Roman Catholic families, baptism ensures entry into heaven. Local practice may vary, and in some situations, the parents may prefer to have a Roman Catholic person perform the rites; however, this person may not be available until after the death. The parents may wish to have a priest contacted for grief support. Notification of the hospital's director is not necessary.

 CN: Management of care; CL: Synthesize

134. 1. The best nursing intervention is giving the client finger foods high in protein and calories that he can eat while he paces or walks. Informing the client that snacks are available if he eats properly at mealtime is inappropriate because the client is too busy and distracted to sit and eat an entire meal. Telling the client to sit alone at mealtime to decrease distractions will not help him, because the client is in a manic state, is easily distracted, and needs to move. Teaching the client about proper nutrition ignores his need for adequate intake. The client would be unable to focus on the nurse's teaching.

 CN: Basic care and comfort; CL: Synthesize

135. 1. Moist heat is a nonpharmacologic pain management strategy that may alleviate pain and reduce the dose of analgesic, if required. Heat dilates blood vessels and decreases inflammation. Lifting and circular exercises will aggravate the already-inflamed joint. Cold constricts blood vessels, and dry ice is not used on the body.

 CN: Basic care and comfort; CL: Evaluate

136. 3. For an LP, a needle is inserted into the subarachnoid space to

obtain a specimen of spinal fluid for diagnostic testing. Fluid on the lumbar dressing indicates cerebrospinal fluid (CSF) leakage and must be reported to the **healthcare provider (HCP)**  immediately. The client should be encouraged to drink fluids after an LP to facilitate production of CSF. It is normal to have a mild headache due to the removal of CSF samples for laboratory analysis. Although the concerns of the client should be discussed with the HCP at some point, the CSF leakage is a priority and should be reported immediately.

 CN: Reduction of risk potential; CL: Analyze

137. 3. The normal calcium level is 9.0 to 10.5 mg/dL. Hypercalcemia is commonly seen with malignant disease and metastases. The other laboratory values are normal. Hypercalcemia can be treated with fluids, furosemide, or administration of calcitonin. Failure to treat hypercalcemia can cause muscle weakness, changes in level of consciousness, nausea, vomiting, abdominal pain, and dehydration. Although the client is on hospice care, she will still need palliative treatment. Comfort and risk reduction are components of hospice care.

 CN: Reduction of risk potential; CL: Synthesize

138. 2. The nurse would document these findings as “early” decelerations. Early decelerations are thought to be the result of vagal nerve stimulation caused by compression of the fetal head during labor. They are considered normal physiologic response to labor and do not require any intervention. Early decelerations do not require position change or oxygen, as they are not a sign of fetal distress. Variable decelerations are thought to be due to umbilical cord compression. Early decelerations are not emergent and do not require immediate reporting to the **healthcare provider (HCP)**  or preparing for cesarean section.

 CN: Management of care; CL: Synthesize

139. 2. A child with a cardiac defect finds that squatting decreases venous return and workload to the heart and increases comfort and blood flow to the lungs. Squatting traps blood in the lower extremities so less blood is returned to the right atrium. Squatting does not make it easier for the child to play with toys. Squatting does not relieve abdominal pressure; it may even increase it

slightly. Squatting has no effect on muscle tone. When done by a child with a cardiac defect, it is not meant as an exercise but is a compensatory process used to reduce dyspnea.

CN: Physiological adaptation; CL: Evaluate

140. 3. The diaphragm is the major muscle of respiration; it is made up of two hemidiaphragms, each innervated by the right and left phrenic nerves. Injury to the phrenic nerve results in hemidiaphragm paralysis on the side of the injury and an ineffective breathing pattern. Consciousness, cardiac function, and urinary elimination are not affected by the phrenic nerve.

CN: Management of care; CL: Analyze

141. 2, 3, 5. Cystic fibrosis is most common in those of the Caucasian race. As an autosomal recessive disease, for an infant to be affected, each parent must carry a recessive trait. If both parents carry the trait, each offspring has a 25% chance of inheriting the disease, a 50% chance of being a carrier, and a 25% chance of being unaffected. The shape of red blood cells is altered with sickle cell disease rather than CF. CVS testing can identify whether a fetus is or is not affected.

CN: Health promotion and maintenance; CL: Create

142. 2, 3, 1, 4. An open airway is essential to survival. The nurse should first ensure an open airway. Next, the nurse should start an IV and then notify the **HCP**. 📖 Finally, the nurse should inform the family of the situation and, if appropriate, allow them to remain with the client.

CN: Management of care; CL: Synthesize

143. 1. Prevention of another pulmonary embolus is important; the nurse should teach the client to observe for signs of clot formation to prevent a potentially fatal episode and maintain cardiopulmonary integrity and adequate ventilation and perfusion. Elevation of the lower extremities, not lowering them, promotes venous return to the heart. Ambulation must be done several times each day. Limiting fluid intake increases blood viscosity, promoting clot formation.

CN: Health promotion and maintenance; CL: Synthesize

144. 2. When a client is being released from the hospital with her neonate and the nurse learns that the client is homeless, the nurse should contact the hospital's or unit's social worker. Social workers have access to resources to assist the client to find temporary shelter in emergencies. The director of the birthing unit does not need to be notified. The director's responsibilities are primarily administrative. The client's **HCP** 📖 can be notified once the social worker has offered assistance to the client. The HCP may cancel the release of the neonate until temporary housing is located. Notifying the client's family is inappropriate. The client may not have any immediate family members, or there may be some stress between the client and family.

🔑 CN: Management of care; CL: Synthesize

145. 3, 4, 1, 2. The client is experiencing a septic reaction to the blood transfusion. The nurse's first action is to stop the infusion and notify the **healthcare provider (HCP)** 📖 and blood bank. The nurse then uses an infusion of normal saline to keep the vein open. Next, the nurse obtains a sample of the client's blood for a blood culture, and last, the nurse sends the blood bag and the administration set to the blood bank for culture.

🔑 CN: Pharmacological and parenteral therapies; CL: Synthesize

146. 1. In a frank breech, the buttocks alone are at the cervix, while the knees are extended to rest on the chest. In a cephalic presentation, the head is the fetal body part first coming in contact with the cervix. Both feet at the cervix is termed double footling breech. In a shoulder presentation, one of the shoulders (actually the acromion process) presents to the cervix. Typically, the fetus is lying horizontally (transverse lie).

🔑 CN: Health promotion and maintenance; CL: Apply

147. 1. A specimen for culture and sensitivity should be sent to the laboratory promptly so that a smear can be taken before organisms start to grow in the specimen.

🔑 CN: Reduction of risk potential; CL: Apply

148. 1, 3, 4, 5. The nurse is responsible for the client's safety in the operating room. The nurse should call a **time-out** 📖 if the client is not properly identified with an identification band. In addition, an IV line and

oxygen should always be established when an ET tube is placed. This practice applies whenever a client's airway is compromised enough for intubation to occur, not only in the operating room environment. An anesthetist or anesthesiologist should be present during surgery to manage the airway. Postoperative pain medication is administered in the recovery room.

CN: Safety and infection control; CL: Synthesize

149. 1. Anencephaly is a neural tube defect that is not compatible with life, although some infants with anencephaly live for several days before death occurs. When the client has decided to continue the pregnancy and donate the neonatal organs after the death of the neonate, the nurse should remain nonjudgmental. The nurse should explore his or her feelings about the issue of anencephaly and organ donation. The nurse should not make judgments about the client's position, nor should the nurse try to persuade the client to terminate the pregnancy. Contacting the client's minister to explore the client's options is not appropriate. As a devout Baptist, the client probably has already discussed the matter with her minister. Telling the client that the neonatal death will be prolonged and painful to her is not helpful. Death may occur very soon after birth. Contacting the client's family members is not appropriate. The client may wish not to discuss the matter with her family.

CN: Management of care; CL: Synthesize

150. 2, 3, 4, 5. Anorexia is commonly the first indication of digoxin toxicity. Arrhythmias are also common with digoxin toxicity. Although bradycardia is the most common sign of toxicity, other tachycardic arrhythmias can occur. A normal pulse rate for a 3-month-old child at rest is about 120 bpm. Blurred vision can be associated with digoxin toxicity and may be detected in an infant if he or she stops following moving objects. Sudden vomiting or drowsiness can be associated with digoxin toxicity. Constipation is not associated with digoxin toxicity and is not an adverse effect of digoxin.

CN: Pharmacological and parenteral therapies; CL: Synthesize

151. 2. If the specimen was from a fingerstick and not a venous sample, the potassium level can be falsely elevated. Because the finger is squeezed to

obtain the sample, cells may have been broken from the pressure of squeezing. When the cells break, they release potassium, which will falsely elevate the potassium level in the result. Calling the **HCP**  without first checking the source of the sample would not give the HCP accurate and complete information. A cardiac monitor would not be necessary if the potassium level is falsely elevated. The last 24-hour output would only indicate that the infant is voiding in an adequate amount. This may or may not have an influence on the infant's potassium level.

 CN: Reduction of risk potential; CL: Synthesize

152. 3. The level of lethality of a client's suicidal thoughts depends on the presence or absence of a plan. If the client has a plan, the nurse must know what it is and whether or not the client has access to the means to complete suicide. The initiation of suicide precautions is necessary whenever a client threatens suicide, but first it is important to discover more information about what the client is thinking and planning. Unless the client has at his or her disposal the means to harm himself or herself or is constantly trying to harm himself or herself with objects on the unit, placing the client on a suicide watch or confining the client to his or her room is an overreaction to the client's disclosure of suicidal ideation.

 CN: Safety and infection control; CL: Synthesize

153. 1, 2, 5. Prenatal care includes a general supplementation of 400 mcg of folic acid, and clients with a history of gastric bypass should be referred to a dietician to determine adequate nutrient intake. All pregnant clients have their urine routinely checked for protein and sugar. There is no indication for checking glucose levels at each prenatal visit in clients who have undergone gastric bypass. Gastric bypass clients are not at risk of gaining all of their weight back. No evidence supports implementing stress tests at 20 weeks.

 CN: Health promotion and maintenance; CL: Create

154. 4. Due to the client's psychosis and difficulties coping, a positive, supportive environment is essential to limit further regression and help the client engage in her own treatment. Confrontation and peer pressure are the type of milieu more suited to a chemically dependent client. While involvement in self-governance can be therapeutic, forcing a psychotic client

to participate in self-governance before he or she is ready could actually hinder treatment and recovery. Although group activities are commonly required in treatment programs, a client who is very disturbed or confused is not forced to attend. Also, the client must participate when and how the client feels comfortable, rather than mandating a specific amount of participation. Equal participation by clients does not ensure a therapeutic milieu or speed the client's recovery.

 CN: Psychosocial integrity; CL: Synthesize

155. 2. Severe hypoperfusion to all vital organs results in failure of the vital functions and then circulatory collapse. Hypotension, anuria, respiratory distress, and acidosis are other symptoms associated with irreversible shock. The client in irreversible shock will not be alert.

 CN: Reduction of risk potential; CL: Analyze

156. 1. Pulmonary embolism is a potentially life-threatening complication of deep vein thrombosis. The client's change in mental status, tachypnea, and tachycardia indicate a possible pulmonary embolism. The nurse should promptly notify the **HCP**  of the client's condition. Administering a sedative without further evaluation of the client's condition is not appropriate. There is no need to elicit a positive Homans' sign; the client is already diagnosed with deep vein thrombosis. Increasing the IV flow rate may be an appropriate action but not without first notifying the HCP.

 CN: Reduction of risk potential; CL: Synthesize

157. 4. The nurse should refuse to administer the medication to the client because of the risk of respiratory depression in the neonate. Morphine, given IM, peaks in 30 to 60 minutes and lasts 4 hours. Based on the assessment findings, the client most likely will be delivering within that time frame, increasing the risk of respiratory depression in the neonate, a serious consequence. Therefore, the nurse should not administer the drug. Naloxone should be readily available whenever opioids that can result in respiratory depression are used. Asking the **HCP**  to validate the dosage is not necessary.

 CN: Management of care; CL: Synthesize

158. 2. Bending the chin down toward the chest decreases the risk of food entering the trachea and causing aspiration into the lungs. The client should sit up at a 90-degree angle when eating. Although eating and talking increase the risk of aspiration as well as muscle fatigue, the nurse should encourage the client to have visitors but avoid talking while chewing and swallowing. The client should rest before eating because muscle fatigue can contribute to choking.

CN: Reduction of risk potential; CL: Synthesize

159. 42 mm Hg

To obtain CPP, use this formula:

CPP = mean arterial pressure (MAP) – ICP.

To obtain the MAP, use this formula:

$$\text{MAP} = [\text{systolic BP} + (2 \times \text{diastolic BP})] \div 3$$

$$\text{MAP} = [90 + (2 \times 50)] \div 3 = 63.3$$

$$\text{CPP} = 63.3 - 21 = 42.3 \text{ mm Hg.}$$

CN: Physiological adaptation; CL: Apply

160. 1. The client with a spinal cord injury above T6 who suddenly experiences clinical manifestations of autonomic stimulation, such as flushing, sweating, and piloerection, is demonstrating life-threatening autonomic dysreflexia. The cluster of manifestation results from noxious stimuli, such as a full bladder, or lying on a foreign object, such as a plastic cap or crinkled paper, which the client cannot feel. As soon as the noxious stimulus is removed, the manifestations begin to subside. When the client demonstrates clinical manifestations of autonomic dysreflexia, the nurse should first elevate the head of the bed immediately to decrease the intracerebral pressure caused by the hypertension that developed from autonomic stimulation. The nurse can next check for a distended bladder or foreign object. The client's blood pressure will be elevated; the nurse should assess vital signs frequently.

CN: Management of care; CL: Synthesize

161. 3. The nurse should refer the client to a social worker for assistance in enrolling in the WIC program. This program provides assistance for foods such as milk, cereal, and infant formula. Instructing the client in low-cost, highly nutritious meal preparation will not meet the client's need for additional funds for food. Determining whether the client qualifies for state assistance is part of the role of the social worker, not the nurse. Asking the client if she has a job and the amount of income earned is not within the role of the nurse. The social worker can determine whether the family income guidelines are met for state and federal assistance.

CN: Management of care; CL: Synthesize

162. 4. Telling the client about one activity at a time with 10 minutes' notice gives the client time to prepare for that activity. Writing out the schedule does not ensure that the client will remember to look at it. It is overwhelming to explain an entire day's schedule all at once to a client diagnosed with dementia. Leading a client to an activity after the fact doesn't allow the client to prepare.

CN: Psychosocial integrity; CL: Synthesize

163. 1, 2, 3, 4. Safety of others is a priority, and the nurse must monitor the client's anger and potential for aggression. The nurse should also find safe ways for the client to express the client's anger and any other feelings about the abuse. A referral to a support group is appropriate because anger management groups are one way to assist the client in learning to manage anger. Nothing about jail is mentioned in the question. Discussion of jail does not help the client address the client's issues with anger and the abuse causing the anger.

CN: Management of care; CL: Synthesize

164. 2. The primiparous client at 2 hours postpartum who delivered a term neonate vaginally should be assessed first because this client is at risk for postpartum hemorrhage. Early postpartum hemorrhage typically occurs during the first 24 hours postpartum. Once the nurse has assessed the client's fundus, lochia, and vital signs, a determination about the stability of the client

can be made. After this assessment, the nurse can provide care to the other clients, who are of lesser priority than the newly delivered primiparous client.

 CN: Management of care; CL: Synthesize

165. 1. Legionellosis is a pneumonia caused by the bacterium *Legionella pneumophila* that thrives in water that is 95°F to 115°F (35°F to 46°C). When a building's hot water plumbing has water at this temperature, the bacteria thrive; then they may be transmitted via inhalation from air conditioning, showers, spas, and whirlpools. The bacteria are not transmitted via smoke or ceiling fan blades or by swallowing contaminated water.

 CN: Health promotion and maintenance; CL: Synthesize

166. 2. The child's signs and symptoms in conjunction with the acute onset suggest possible croup or epiglottitis. The priority diagnosis at this time is airway obstruction. The airway may become completely occluded by the epiglottis at any time. Although the child has an infection, and the client has respiratory distress, the immediate priority is to establish and maintain a patent airway. No evidence is provided to support the potential for aspiration.

 CN: Reduction of risk potential; CL: Analyze

167. 3. The baseline laboratory data that are established before a client is started on tissue plasminogen activator or alteplase recombinant include hematocrit, hemoglobin level, and platelet count.

 CN: Reduction of risk potential; CL: Apply

168. 2, 3. The client should be instructed not to eat or drink for 8 to 12 hours before the test. Stools will be white for up to 72 hours following the procedure as the barium is eliminated from the body. Laxatives and fluids will be encouraged after the procedure to help prevent barium impaction, but the client will not be given stool softeners or laxatives before the procedure. The client should not experience pain during the procedure. The nurse should also instruct the client to stop smoking at midnight the night before the test.

 CN: Reduction of risk potential; CL: Apply

169. 3, 4. A National Patient Safety Goal of the Joint Commission is to improve the accuracy of client identification; to attain that goal, healthcare

personnel must use at least two client identifiers when providing care, treatment, or services. The medical record  number and name as printed on the client's name band are appropriate identifiers. Because the client can change rooms and beds, these are not to be used as identifiers. Social security number is not used as an identifier for healthcare or treatment purposes.

 CN: Safety and infection control; CL: Apply

170. 3. This rhythm is atrial fibrillation. It is characterized by an irregular QRS interval, no definite P waves before the QRS waves, and a ventricular rate >100 bpm.

 CN: Reduction of risk potential; CL: Analyze

171. 3. The vastus lateralis site is the preferred IM site for all ages because it does not have any major nerves or blood vessels located near it. The deltoid and dorsogluteal muscles have major nerves and blood vessels located nearby. The triceps is not an acceptable muscle for IM injections because it is not well developed in most clients.

 CN: Pharmacological and parenteral therapies; CL: Apply

172. 1. Clients should be instructed to rinse their mouths after using a steroid inhaler to avoid developing thrush. Clients should also be instructed to inhale slowly through the mouth and then hold the breath as they count to 10 slowly. It is not necessary for the client to cough and deep-breathe before using the inhaler.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

173. 2. The nurse should stay with the client during the first 15 minutes of a blood transfusion because this is when reactions are most likely to occur. Blood products should never be refrigerated on the nursing unit. Blood that has not been infused after 4 hours should not be infused. The blood should be infused over the specific time prescribed by the **healthcare provider (HCP)**.  If a fever develops, the transfusion should be stopped immediately, and the blood reaction policy of the facility should be followed.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

174. 2. The symptoms of difficulty breathing, elevated blood pressure, and

cough are indicative of circulatory overload. Circulatory overload occurs when blood is infused more rapidly than the circulatory system can accommodate. Anaphylactic reactions are manifested by urticaria, wheezing, and shock. Sepsis begins with a rapid onset of chills and fever. Acute hemolytic reaction is typically manifested by chills, fever, low back pain, and flushing.

CN: Pharmacological and parenteral therapies; CL: Analyze

175. 2. Sucralfate should be taken on an empty stomach 1 hour before or 2 hours after meals and at bedtime. It is usually taken four times a day. There is no need to avoid milk products while taking the drug. Sucralfate does not affect hemoglobin levels.

CN: Pharmacological and parenteral therapies; CL: Evaluate

176. 1, 3, 4. When assessing client safety, the nurse assesses suicide thoughts or plan, recent use of illicit drugs (as they may cause impaired judgment or thought processes), and previously experienced allergic reactions and adverse reactions to medications. Note that safety involves many aspects of care. Incentives and diet preferences (allergies would be previously noted) are not directly related to safety, although they may be part of an overall assessment.

CN: Reduction of risk potential; CL: Synthesize

177. 1, 2, 3, 4. The client with conjunctivitis can use warm soaks to remove crusting. The nurse should teach the client to dispose of the soaks by wrapping them in a separate bag to avoid spreading bacteria. Topical antibiotics are used to treat the infection. The client should avoid contaminating the tip of the medication dispenser. Bacterial conjunctivitis requires containing the spread of the infection. The client should avoid touching the eyes. If the client does touch the eyes, the client should wash the hands after touching the eyes. The client does not need to be isolated.

CN: Reduction of risk potential; CL: Create

178. 1. The physical aspects of care have a higher priority than do the psychosocial aspects. The client report is part of the electronic **medical record**,  but the maternal contraction pattern and the fetal heart rate

pattern must be completed immediately upon admission to establish a baseline. The need for a tocolytic agent cannot be determined until the maternal fetal unit has been assessed. Assessment of the circumstances and etiologies of the prior fetal demises are important but are not of the highest importance. The psychosocial aspects are very important in the care of this client and can briefly be discussed as the physical aspects of assessment are being completed, but in-depth psychosocial care will need to wait until the physical aspects have been completed.

CN: Safety and infection control; CL: Synthesize

179. 2, 5. Two sources of identification must be confirmed before administering medication to a client. A source of information can be the client's record number, name, or date of birth, as noted on the client's armband. A client may be confused or hard of hearing and may give a wrong name or answer to a wrong name; thus, having the client state his or her name or respond to his or her name is not safe practice. Client recognition is not sufficient identification for administering medication. Clients change rooms frequently, so a room number is not a source of identification for administering medication.

CN: Pharmacological and parenteral therapies; CL: Apply

180. 2. Children who witness domestic violence commonly grow up to be victims or abusers. Counseling helps interrupt the pattern of violence in families. Limiting contact between the father and child does not address the child's behavior, and outgrowing violent behaviors is not likely without other interventions. Setting limits on violent behaviors alone does not address the child's feelings and needs.

CN: Psychosocial integrity; CL: Synthesize

181. 4. Because of the client's age, the amniocentesis is most likely being done to evaluate for Down syndrome (trisomy 21). Women older than 35 years are at higher risk for having a child with Down syndrome. Cri-du-chat syndrome is a genetic disorder involving a short arm on chromosome 5. This disorder is not associated with mothers who are older than 35 years. The client is AB positive, so the amniocentesis is not being done for ABO incompatibility, in which the mother is type O and the fetus is type A, B, or

AB. The amniocentesis is not being done to detect erythroblastosis fetalis because the mother is Rh positive.

CN: Reduction of risk potential; CL: Analyze

182. 2, 3. A National Patient Safety Goal of the Joint Commission is to improve the effectiveness of communication among caregivers. The requirement for verbal or telephone prescriptions, or for telephonic reporting of critical test results, is to verify the complete prescription or test result by having the person receiving the information record and “read back” the complete prescription or test result. Effective communication that is timely, accurate, complete, unambiguous, and understood by the recipient reduces error and results in improved client safety. “Read-back” procedures are not intended to discourage or prohibit telephone communications among **healthcare providers (HCPs)**  or to promote use of electronic **medical records**.  Safety procedures, such as provider identification codes, are in place for HCPs to give verbal or telephone prescriptions.

CN: Safety and infection control; CL: Apply

183. 3. The actual desired weight gain of 1 lb per week is the most measurable goal for the client. Attending all eating disorder support groups is a goal, but is not as important as actual weight gain. The client can eat a larger meal at breakfast and then not eat sufficient food and over exercise for the remainder of the day. The client’s improved self-image is important, but actual weight gain is again a priority.

CN: Physiologic adaptation; CL: Synthesize

184. 4. The nurse should allow the client to see and hold the baby for as long as she desires. Such activities provide memories for the mother and assist in the grieving process. There is a possibility that the client may change her mind about the adoption. In most states, there is a defined period (6 months to 1 year or longer) before an adoption becomes final. If the client changes her mind about the adoption, the nurse should accept the client’s decision and notify the **HCP**  and social worker. Telling the client that it would be best if she did not see the baby is imposing the nurse’s value system on the client. Allowing the client to see the baby through the nursery window is inappropriate because the client should be allowed to touch and hold the

baby. Contacting the HCP for advice related to the client's visitation is not necessary.

 CN: Management of care; CL: Synthesize

185. 2. The parent's expression of stress and grief and the adolescent's behavior and drug use could be preludes to suicide, especially since another member of the family succeeded in suicide. Suicide attempts are more likely in families in which there has been a previous suicide attempt or suicide death, especially for young people. The parent's ability to emotionally support the adolescent in this crisis has been compromised, but the safety of both supersedes this concern. Assuring the client's and parent's safety is more important than dealing with anger or frustration at this point. Though the emotional states of both the parent and the child are important, one is not more important than the other.

 CN: Safety and infection control; CL: Analyze

186. 2. A decrease or change in the level of consciousness is an early indication of increased intracranial pressure (ICP) and should be reported to the child's **HCP**  as soon as possible to try and control the pressure so that it does not increase further. Vomiting can be a sign of increased ICP that occurs with a brain tumor, but it usually occurs unrelated to food and in the morning upon arising. Blood pressure increases with a brain tumor due to pressure on the brain stem. Concentrated urine is a sign of dehydration and is not related to the signs of a brain tumor.

 CN: Physiological adaptation; CL: Analyze

187. 1. The nurse should first plan to relieve the nausea and vomiting; if these continue, the client is at risk for dehydration and electrolyte imbalance. The client's poor appetite is likely related to the underlying health problem and is not the priority; the nausea may adversely affect the appetite, and relieving the nausea may allow the client an opportunity to eat and drink. The client has jaundice but does not have uncomfortable symptoms such as pruritus. The abdominal spasms may be related to nausea and vomiting and can be assessed again when the nausea and vomiting have stopped.

 CN: Reduction of risk potential; CL: Analyze

188. 1. All clients who are at risk for pressure ulcer development should be identified on admission to healthcare facilities so that preventive actions can be implemented by the nursing staff. These preventive actions need to be individualized to the client, so automatic placement of all at-risk clients on an every-2-hour turning schedule, a specialty bed, or a high-protein, high-carbohydrate diet is not appropriate.

CN: Reduction of risk potential; CL: Apply

189. 4. With a severe gonorrheal infection, scarring of the fallopian tubes may occur, and becoming pregnant may be difficult or impossible. If the girl's partner is not treated, she can be reinfected. There is no immunity against gonorrhea, and, if exposed again, the girl can again become infected. Although a condom may provide some protection against contracting gonorrhea, it is not an adequate protection against the condition and will not help clear up an existing infection. It is only with proper antibiotic administration that the condition can be eradicated.

CN: Safety and infection control; CL: Evaluate

190. 1. Powder should not be applied to the skin beneath the cast because powder can cause irritation and skin breakdown. The parent would need further teaching about avoiding this measure. Checking the smoothness of the cast edges, covering the cast around the perineum, and inspecting inside the cast are all appropriate actions for the child with a spica cast to help prevent skin breakdown.

CN: Basic care and comfort; CL: Evaluate

191. 1, 2, 3, 4. The goal of “medication reconciliation” is to ensure that clients are on the right medication after any transfer, admission, or discharge. It is not necessary to reconcile the medications if the client moves to a different room on the same floor. It is estimated that more than half of medication errors occur during these transitions, and medication reconciliation can reduce errors by 70% or more. The Joint Commission requirements mandate medication reconciliation programs.

CN: Pharmacological and parenteral therapies; CL: Apply

192. 2. Following crush injury, serum potassium rises to high levels.

Sodium polystyrene sulfonate is a potassium binding resin. The resin combines with potassium in the colon and is then eliminated, and serum potassium levels should come back to normal. Normal serum potassium is 3.5 to 5.3. Weak, irregular pulse and tall peaked T waves on ECG are signs of hyperkalemia, and muscle weakness is a sign of hypokalemia.

 CN: Pharmacological and Parenteral Therapies; CL: Evaluate

193. 1. An alternative or additional method of birth control must be used since oxcarbazepine reduces the effectiveness of oral contraceptives. Higher doses of oral contraceptives will not help in achieving this purpose, but the client needs an additional or alternative method of birth control. The client does not need advice about when to start her family. A side effect of oxcarbazepine may be weight gain, but it is typically gradual.

 CN: Pharmacological and Parenteral Therapies; CL: Apply

194. 4. Hemodialysis clients have their protein requirements individually tailored according to their postdialysis weight. The protein requirement is 1.0 to 1.2 g/kg body weight per day. Hence, for a 59-kg weight, the amount of protein will be 59 to 70 g/day. Sodium should be restricted to 3 g/day. The client should obtain sufficient calories; if calories are not supplied in adequate amount, the body will use tissue protein for energy, which will lead to a negative nitrogen balance and malnutrition. Fluid intake needs to be restricted. The fluid amount is restricted to 500 to 700 mL plus the urine output.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

195. 1. Acute poststreptococcal glomerulonephritis usually follows a streptococcal throat or skin infection by 1 to 2 weeks. Streptococcus-type infections require medical intervention with antibiotics. Antibacterial mouthwashes do not kill streptococci. Previously prescribed antibiotics may not be effective against streptococci, and may also be expired. Bar soap fragrance has no impact on its ability to kill bacteria that reside on the skin.

 CN: Health promotion and maintenance; CL: Synthesize

196. 1. To be a true client advocate, the nurse should ask the client if she desires an epidural anesthetic even though the client has indicated a desire for

“natural childbirth.” The client has a right to change her mind and also a right to refuse treatment. The client, not the nurse, should be the one to tell the **HCP** 📖 that she does not want an epidural anesthetic; the nurse should support the client’s decision. Although telling the client that her labor will be more comfortable with an anesthetic provides the client with information, a statement such as this can be viewed as an attempt to change the client’s mind. The client may wish to discuss this situation with her husband, but she does not have to do so.

🔑 CN: Management of care; CL: Synthesize

197. 2, 4, 5. In order to meet the criteria for discharge from same-day surgery, the postoperative client must be able to take fluids by mouth, walk without hypotension, void, and be escorted by a responsible adult who will drive the client home. Transportation home via a taxicab is not a sufficient escort to assist a client home after surgery. The client may be discharged with severe pain as long as the client can ambulate safely. The nurse should make sure the client has a prescription for pain medication.

🔑 CN: Safety and infection control; CL: Evaluate

198. 1. Eyedrops are correctly instilled by placing them in the lower conjunctival sac. Eyedrops should not be placed near the lacrimal ducts, to decrease the chance of the medication’s being systemically absorbed. Placing the drops on the cornea or sclera is uncomfortable for the client and may cause the medication to run out of the eye socket instead of being absorbed.

🔑 CN: Pharmacological and parenteral therapies; CL: Evaluate

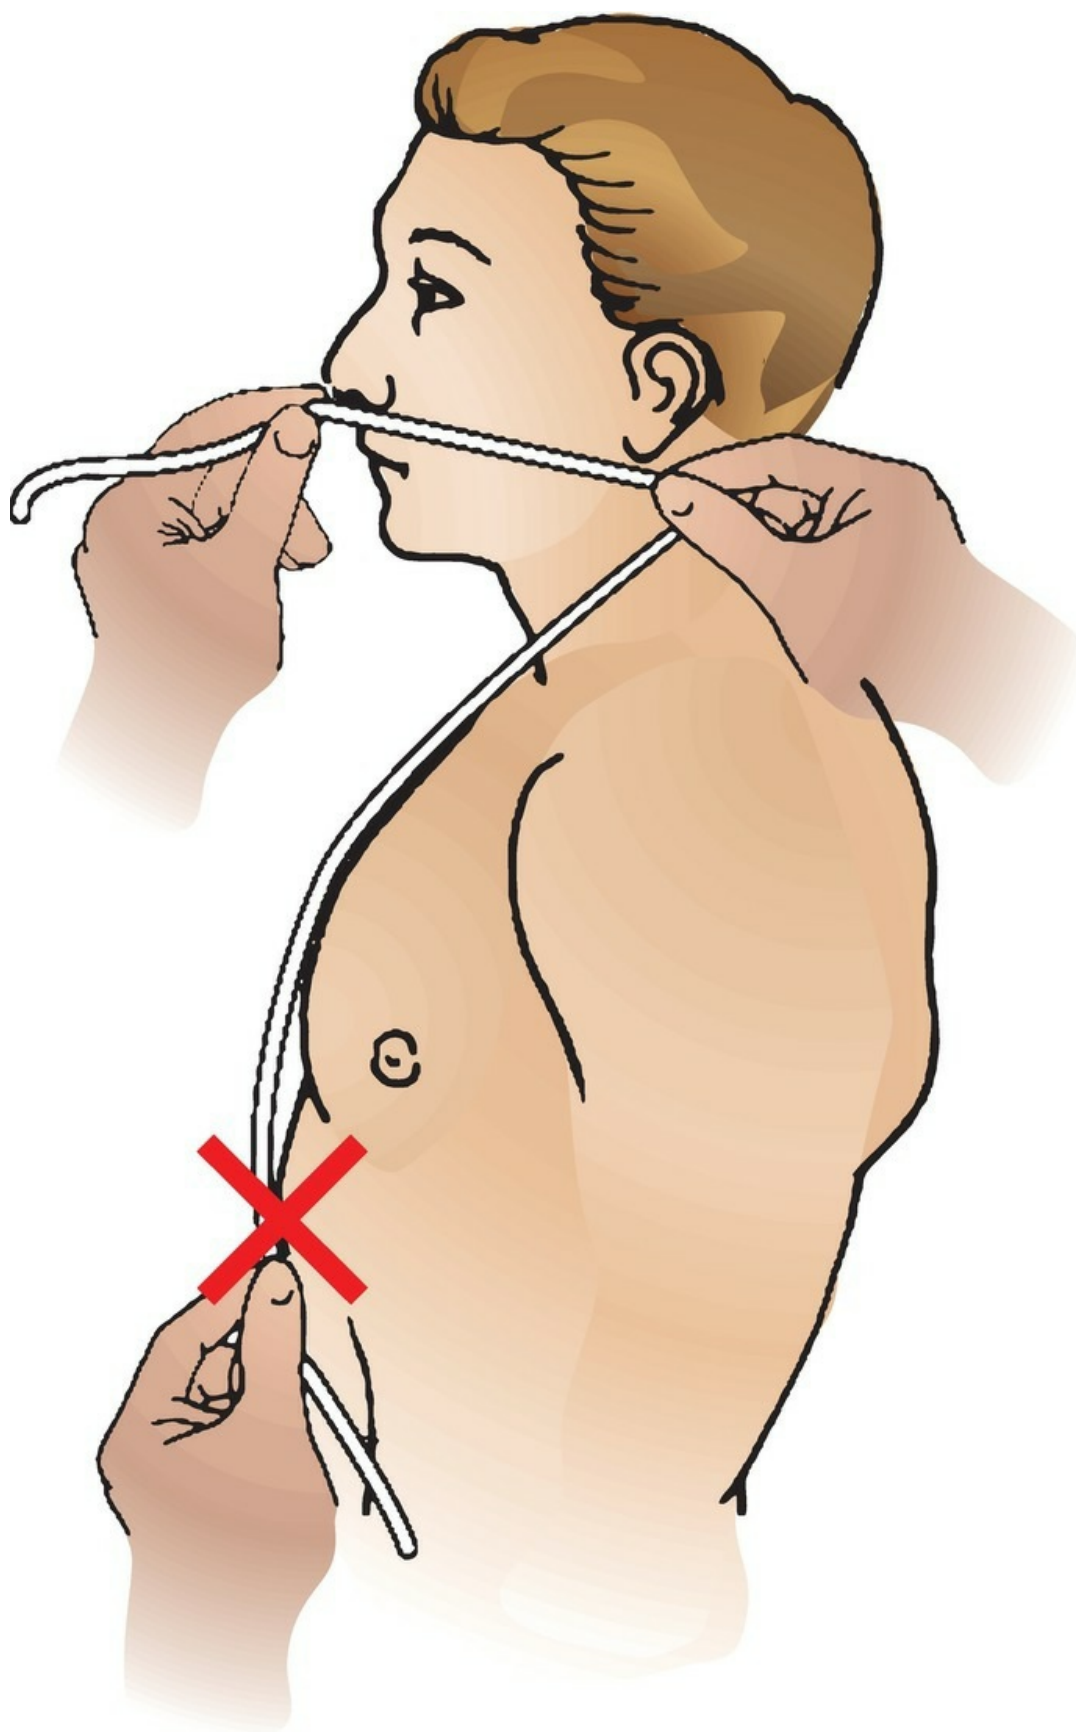

199. 2. Normal age-related changes can predispose older adults to falling and include vision, hearing, cardiovascular, musculoskeletal, and neurological changes. One of the most common problems facing older adults is the loss of tissue elasticity that affects the arteries. This loss of elasticity results in a decrease in tissue recoil and leads to changes in blood pressure with position changes. When they rise too quickly from a supine position, they feel light-headed and dizzy and can fall. The nurse should instruct clients to change positions slowly and to dangle the legs a few minutes when arising from a supine position. When aging, the lens of the eye becomes sensitive to very bright light that can cause a glare and visual disturbances

that can lead to falls. Rooms should be well lit, but not with bright lights that cause a glare. Neurological changes are seen in impaired reflexes and thus postural instability. This loss of postural stability leads to falls. The need of assistive devices (hand rails, cane, walkers) helps reduce falls and promote independence. If joint pain develops and remains untreated, it can cause older adults to become sedentary or immobile. This disuse of muscles contributes to muscle weakness and falls. Nursing interventions should be directed at encouraging regular ambulation and joint movement (range of motion).

CN: Reduction of risk potential; CL: Synthesize

200. When measuring for NG tube insertion, the nurse would end the measurement at the xiphoid process.

CN: Safety and infection control; CL: Apply

201. 1, 2, 3, 4. Benchmarking is a technique for learning from the success of others in an area where care improvement is desired by comparing the data from others with the data about the nursing problem for which improvement is sought. Sources of information for benchmarking include literature reviews, databases, unions, standard-setting organizations, local organizations, universities, the government, staff or customer interviews, and questionnaires. A recommendation from a clinical organization does not necessarily indicate that success has been attained.

CN: Management of care; CL: Apply

202. 3. The nurse should call the surgeon's office so that arrangements can be made for the client to donate a unit of his blood for possible future autotransfusion. This must be done in sufficient time before surgery so that the client is not at risk for being anemic at the time of the scheduled procedure. The client's request must be scheduled through the surgeon's office because the surgeon has ultimate responsibility for the client. The nurse can document that the surgeon's office was notified of the client's request. Notifying the hematology laboratory or blood bank is not an appropriate response.

CN: Pharmacological and parenteral therapies; CL: Synthesize

203. 3. Overuse of nasal spray containing pseudoephedrine can lead to rhinitis medicamentosa, which is a rebound effect causing increased swelling and congestion. Use of pseudoephedrine nasal spray does not cause infections or thrush. Pseudoephedrine is not addictive.

CN: Pharmacological and parenteral therapies; CL: Synthesize

204. 2. The best way to teach a child about surgery is through play. The nurse can let the child handle the items that will be used for monitoring, such as the blood pressure cuff and the ECG pads. The child will become more familiar with the face masks he sees the surgical team wearing in the operating room after playing with one and wearing it before surgery. A child of this age-group does not understand detailed explanations of how to use equipment, such as a PCA, a VAS, or even a video. The pain scale that

should be used for children is the FACES scale.

CN: Basic care and comfort; CL: Synthesize

205. 2. When a nurse observes the theft of an opioid, it is the responsibility of the nurse to report the incident to the supervisor of the unit. The supervisor of the unit can confront the coworker and notify the hospital's chief of security about the incident. In some situations, the drug-abusing coworker may be offered drug counseling. In situations in which the drugs are being sold, the police should be notified. The nurse should not confront the coworker because this may put the nurse in danger. It is not the responsibility of the nurse to notify federal drug agents about the incident.

CN: Management of care; CL: Synthesize

206. 2. The nurse should teach the client and family the importance of not discontinuing benztropine abruptly. Rather, the drug should be tapered slowly over a 1-week period. Benztropine should not be used with over-the-counter cough and cold preparations because of the risk of an additive anticholinergic effect. Antacids delay the absorption of benztropine, and alcohol in combination with benztropine causes an increase in central nervous system depression; concomitant use should be avoided.

CN: Pharmacological and parenteral therapies; CL: Synthesize

207. 3. The nurse needs to focus on adverse effects that can be seen or felt, using a simple, brief, written description of the benefits of the medication and a list of common adverse effects and how to cope with them. The written format helps the client and family feel more in control by participating in treatment. They also can use the written information as a helpful resource for review. Information about all potential adverse effects, including percentages associated with each, will cause undue anxiety in the client and possibly overwhelm the client and family, negatively affecting compliance. The nurse should use discretion in selecting the content of educational sessions.

CN: Health promotion and maintenance; CL: Synthesize

208. 2. Albumin is a colloid that remains in the intravascular space, pulling fluid out of the intracellular and interstitial space. The client with nephrotic syndrome loses excessive amounts of protein, mainly albumin, in

the urine. Because fluid is drawn into the intravascular space, blood pressure will increase. Crackles in the lung bases and cerebral edema are signs of circulatory overload or fluid volume excess. When edema is present in the lower extremities, the skin feels cool to the touch unless an infection is present.

 CN: Physiological adaptation; CL: Evaluate

209. 3. Although it is not clearly understood why cysts form in polycystic kidney disease, the condition is known to be inherited. Environmental exposures such as smoking and breathing secondhand smoke promote development of bladder cancer. Although drinking alcohol requires the kidneys to excrete the alcohol, it is not thought to cause the kidneys to develop cysts. Exposure to dyes used in foods does not increase the risk for polycystic disease.

 CN: Physiological adaptation; CL: Synthesize

210. 1, 2, 3. A 3% sodium chloride solution is hypertonic; it will pull fluid into the intravascular compartment and may increase renal perfusion, so intake and output should be monitored. As fluid is pulled into the vasculature, the client may demonstrate signs of fluid overload such as jugular vein distention. Hypernatremia and hyperchloremia will produce neurologic signs and symptoms. Fluids should not be forced in a client with fluid overload. There is no need for an indwelling urinary catheter.

 CN: Reduction of risk potential; CL: Apply

211. 3. The nurse expects the UAP  assigned to several clients in labor to notify the nurse if the UAP observes that one of the clients has evidence of spontaneous rupture of the membranes. When the membranes rupture spontaneously, there is danger of a prolapsed cord, a medical emergency requiring a cesarean birth. Nausea may occur after administration of an epidural anesthetic, but this is not a priority or emergency. Having contractions that are 3 minutes apart and last for 40 seconds is normal during active labor. Because nalbuphine is an analgesic, it is normal for a client to fall asleep after IV administration of this drug.

 CN: Management of care; CL: Evaluate

212. 2. Before teaching a school-age child about a medical or nursing procedure, it is best to become familiar with the child's knowledge level. The nurse can then begin by explaining about the body structure involved in the procedure. Children of this age should be told about the unknown procedures far enough in advance for them to prepare for what is going to happen to them. Showing the child the equipment and explaining what is going to be done during the test should be done after the child is allowed to express what he knows about what is going to happen to him.

CN: Psychosocial integrity; CL: Synthesize

213. 1, 2, 3, 4. Educating women about risk factors for cancers of the reproductive system is important. The nurse should encourage women to do breast and vulva self-exams. Limiting sexual activity during adolescence, using condoms, having fewer sexual partners, and not smoking reduce the risk of cervical cancer. Cancer can be prevented from occurring when screening reveals precancerous conditions of the vulva, cervix, or endometrium. Also, routine screening increases the chance that a cancer will be identified in its early stage. Immunization against HPV is recommended for preteen girls to prevent cervical cancer. Many cancers in women, particularly breast cancer, have a genetic basis, and the woman's genetic history is an important tool in identifying risk.

CN: Health promotion and maintenance; CL: Create

214. 3. The client should be encouraged to keep up with the school work. The developmental task of the school-age child is industry versus inferiority. Keeping up with the peers is very important to this age-group. Watching television does provide rest, but it does not lead to a feeling of accomplishment. Coloring pictures is not an appropriate pastime for this age-group. Making crafts may be too strenuous of an activity for a client on bed rest.

CN: Health promotion and maintenance; CL: Synthesize

215. 4. Clients receiving TPN are at risk for a number of complications, including fluid imbalances such as fluid overload and hyperosmolar diuresis. Other common complications include hyperglycemia, sepsis, pneumothorax, and air embolism. Hypostatic pneumonia, pulmonary hypertension, and

orthostatic hypotension are not complications of TPN.

CN: Pharmacological and parenteral therapies; CL: Analyze

216. 1, 2, 4. Heparin dosage in children is based on the child's weight. A bolus of heparin is administered by the IV route, and the onset of action is immediate. The PTT is an indicator of the effectiveness of heparin. Following the heparin with a continuous infusion of heparin would cause life-threatening anticoagulation in this child. Penicillin and cephalosporins potentiate the effects of heparin, so the heparin must be carefully titrated to obtain maximum effect without causing an overdose. However, the antibiotic should not be discontinued.

CN: Pharmacological and parenteral therapies; CL: Synthesize

217. 1. Propantheline bromide is an anticholinergic drug. Common adverse effects include urine retention and constipation; flushed, dry skin; and dry mouth, nose, and throat. Orthostatic hypotension may also occur. Diarrhea and diaphoresis are adverse effects of cholinergic drugs.

CN: Pharmacological and parenteral therapies; CL: Analyze

218. 1. Applying a tourniquet obstructs venous blood flow and, as a result, distends the veins. A tourniquet does not stabilize veins or immobilize the arm, nor is it applied to occlude arterial circulation.

CN: Pharmacological and parenteral therapies; CL: Apply

219. 1. Prochlorperazine is administered postoperatively to control nausea and vomiting. Prochlorperazine is also used in psychotherapy because of its effects on mood and behavior. It is not used to treat dizziness, abdominal spasms, or abdominal distention.

CN: Pharmacological and parenteral therapies; CL: Evaluate

220. 1, 2, 3, 4. Cough and dyspnea can be present at the time of diagnosis of bone cancer, indicating that the cancer has metastasized to the lungs. About one-quarter of all adolescents with bone cancer have lung metastasis at the time of diagnosis. Pain and swelling result from the inflammation caused by the bone tumor and the increased vascularity of the tumor. At the time of diagnosis, fever, anorexia, and decreased range of motion have not occurred.

The tumor involves the bone, so there is pain when pressure is exerted on the involved bone, but range of motion is not affected. Fever and anorexia can occur if extensive metastasis has occurred.

CN: Health promotion and maintenance; CL: Analyze

221. 1. The priority assessment is that the client has a firm fundus when gentle massage is used. This indicates that the client's fundus may be soft or "boggy" when it is not massaged. The receiving nurse should assess the client's fundus soon after admission and continue to monitor the client's fundus, lochia, and pulse rate. Postpartum hemorrhage is associated with uterine atony. Maternal-infant bonding is a process that usually starts on day 2 and ends at week 1. A 12-hour labor is normal. The temperature and pulse are within normal limits.

CN: Management of care; CL: Analyze

222. 2. Assuming cultural appropriateness of eye contact with the client and his wife, this body language would make the nurse's nonverbal message congruent with the nurse's verbal message and demonstrate empathy. Directing the eyes only toward the client, rather than including the wife, ignores the wife. Avoiding eye contact with the client and wife or shifting the gaze between the client and wife conveys a lack of assurance about the nurse's focus and comments.

CN: Psychosocial integrity; CL: Apply

223. 4. Colleagues can be a source of suggestions and validation of communication strategies. The nurse has identified difficulty with the relationship and should seek assistance before discussing improved involvement with the client because improved involvement may not be the most appropriate approach. Positive and negative interactions occur in relationships. The frequency of both types of interactions determines the quality of an interpersonal relationship. In a therapeutic relationship, both parties contribute to the relationship; neither one should dominate or be submissive.

CN: Psychosocial integrity; CL: Synthesize

224. 3. The nurse on the postpartum unit should discuss with the client

what her wishes are and mutually agree on a location. The charge nurse better understands the current and future needs of the client experiencing this type of loss as the client may or may not be thinking well or clearly at the moment. The postpartum unit is full of sounds of infants, and although being in a room by herself may support the need for separation, it is often in the best interest of the client to locate her away from the noise of the babies. Placing the client on another unit will remove her from the support she is seeking. On the other hand, she will not be hearing crying infants. This has often been the location for someone experiencing a loss. Discharging the mother home as soon as she is stable physically is also a possibility, but the nurse must also assess the client's emotional stability and preferences for grieving.

CN: Management of care; CL: Synthesize

225. 2. *Haemophilus influenzae* is a bacterium that can cause severe disease in children younger than 5 years, but it does not cause influenza. Yearly vaccination for influenza is recommended to begin at 6 months. The live vaccine is not recommended for children younger than 2 years or with respiratory disease. A second vaccine 4 weeks after the first is recommended the first time a child younger than 9 years receives the flu vaccine.

CN: Health promotion and maintenance; CL: Apply

226. 3. Confidentiality and privacy are critical developmental needs for the adolescent. These needs are important to enable the nurse to establish a relationship of trust with the adolescent. A sexual history should be conducted with a teen without parents. Therefore, the nurse should not ask the mother to provide information or put the daughter in a position of having to make a decision about her mother remaining in the room. Inform the adolescent that this information is confidential and will not be shared with the parent. Inform the adolescent that issues of abuse or life-threatening issues are required by law to be disclosed to the authorities, and all other information is private.

CN: Management of care; CL: Synthesize

227. 4. It is critical for medication safety to know the name, dosage, and times of administration of the medication taken at home. The family should

bring the medication bottles to the hospital. The nurse should document the medication on the **medical record**  from the bottles to ensure accuracy before the medication is prescribed and administered. The pharmacist is a helpful resource, but the safest way to identify the medication is in its original container. It is not safe to assume the client could correctly identify the medications from a drug book. The medication regimen may have changed since the record 2 years ago.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

228. 3, 4, 5. The additional fluids should run through a separate line using a Y-connector. The nurse must contact the surgeon to clarify if the client should receive the additional 100 mL/h of IV fluids containing potassium chloride during the bolus infusion. Rapid infusion of potassium chloride can cause hyperkalemia with adverse cardiac outcomes such as arrhythmias. Bolus infusions of IV fluids should be run via an infusion pump to avoid excess fluid administration. Increasing the current IV infusion rate or adding additional fluids to the existing infusion is not safe because the current infusion contains potassium.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

229. 1. The nurse should notify the hospital's security staff about anyone who appears unusual. Typically, the abductor is an older woman who wishes to have a baby. The nurse should take only one baby at a time to a mother to prevent the neonate being taken to the wrong mother. Infants should never be left in the hallway. When in the mother's room, the infant should be placed away from the doorway to prevent or minimize the risk of abduction of the neonate. If an exit alarm is triggered, it is possible that an abductor is running away with an infant. Staff members should investigate the alarm immediately and stop the potential abductor. Hospital security can be alerted if someone is seen exiting the unit carrying a large bag or an infant.

 CN: Management of care; CL: Apply

230. 1. The client needs specific information about the effects of the drug, specifically that the drug can cause agranulocytosis. The statement about weekly blood tests to determine safe dosage and monitoring for effects on the blood gives the client specific information to ensure follow-up with the

required protocol for clozapine therapy. Lack of accurate knowledge can lead to noncompliance with necessary follow-up procedures and noncompliance with medication. The supply of medication is not dependent on blood testing. Telling the client that the **HCP** 📖 wants to know the progress does not provide specific information for this client. The blood tests are not required by the drug company.

🔑 CN: Pharmacological and parenteral therapies; CL: Synthesize

231. 4. A properly administered intradermal injection shows evidence of a bleb at the injection site. There should be no leaking of medication from the bleb; it needs to be absorbed into the tissue. Lack of swelling at the injection site means that the injection was given too deeply. The presence of tissue pallor does not indicate that the injection was given correctly.

🔑 CN: Pharmacological and parenteral therapies; CL: Evaluate

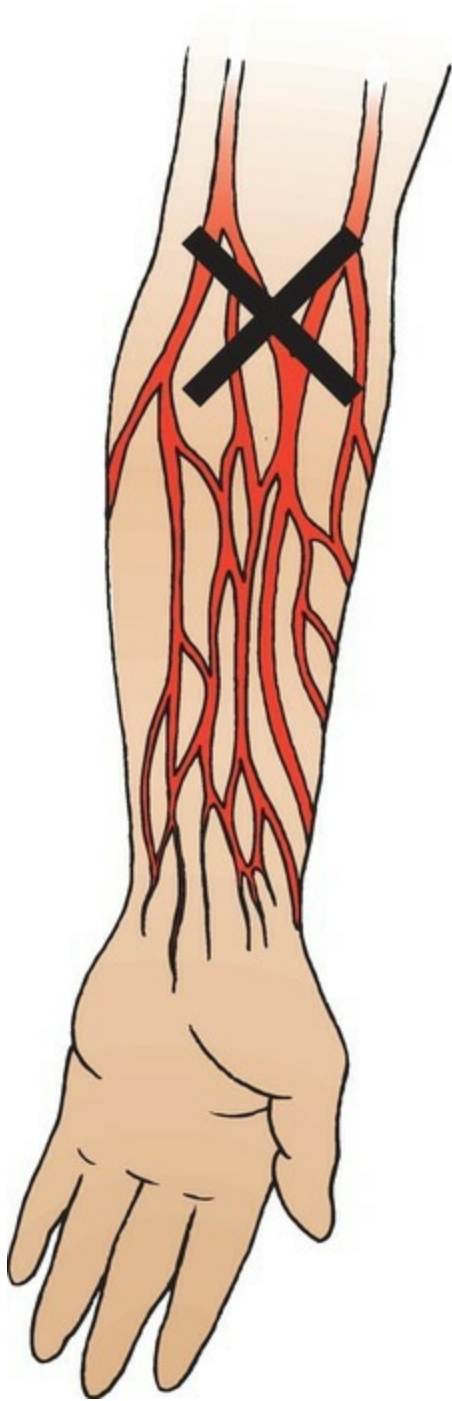

232. 1. A serious complication of IV therapy is fluid overload. Noisy respirations can develop as a result of pulmonary congestion. Additional symptoms of fluid overload include dyspnea, crackles, hypertension, bounding pulse, and distended neck veins.

🔑 CN: Pharmacological and parenteral therapies; CL: Analyze

233. 2. Only isotonic (normal) saline should be used when administering a blood transfusion. The use of dextrose or lactated Ringer's solution will cause the hemolysis of red blood cells.

🔑 CN: Pharmacological and parenteral therapies; CL: Apply

234. 3. The median cubital vein is located in the approximate center of the antecubital space.

 CN: Pharmacological and parenteral therapies; CL: Apply

235. 2. Telling the mother that excess saliva is a common adverse effect of the drug is most helpful because it gives her information about the problem, thereby helping to decrease her anxiety about what is occurring with her son. By offering the paper cup, the nurse also demonstrates concern for the client,

thereby leading to increased trust. Saying “I wonder if he is having an adverse reaction to the medicine” shows the nurse’s lack of knowledge about the drug, decreases confidence in the nurse, and indicates poor judgment. Saying “Do not worry about it, it is only a minor inconvenience compared to its benefits” or telling the mother that the nurse has seen this happening to other clients is insensitive and does not assuage the mother’s anxiety.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

236. 1, 3, 4. The nurse should write down the prescription, read the prescription back to the **HCP**,  and receive confirmation from the provider that the prescription is correct as understood by the nurse. It is not necessary for the HCP to come to the hospital to write the prescription on the **medical record**  or to have the nursing supervisor cosign the telephone prescription.

 CN: Safety and infection control; CL: Apply

237. 2. Giving the client finger foods that have protein, carbohydrates, and calories supplies energy and allows the client to eat while on the move. A salad or soup is very difficult for the client to eat while moving and may not supply the nutrients needed. Favorite foods from home may or may not be appropriate to eat while walking.

 CN: Basic care and comfort; CL: Apply

238. 2. Protamine sulfate is a heparin antagonist. It is administered intravenously very slowly (over at least 10 minutes). Warfarin sodium and ASA have anticoagulant properties and would be contraindicated. Atropine sulfate is an anticholinergic drug and would not be effective in treating a heparin overdose.

 CN: Pharmacological and parenteral therapies; CL: Apply

239. 2. Aminophylline, a bronchodilator that relaxes smooth muscles in the bronchioles, is used in the treatment of emphysema to improve ventilation by dilating the bronchioles. Aminophylline does not have an effect on the diaphragm or the medullary respiratory center and does not promote pulmonary circulation.

 CN: Pharmacological and parenteral therapies; CL: Evaluate

240. 1. Seven-year-olds like to play with friends of the same sex. In early school-age years, children enjoy the company of same-sex friends. Relatives become second-choice friends to those from school. Team games can be competitive, and the ego of a 7-year-old may be too fragile to endure losing the game without losing self-confidence. Infants enjoy solitary play. The school-age child enjoys cooperative play with friends of the same sex and age.

CN: Health promotion and maintenance; CL: Analyze

241. 2. Trying something new is usually frightening for a 7-year-old. Separation anxiety is the most common fear between the ages of 5 months and 5 years of age. Injury and pain are a common fear of the preschool child. Fear of the opposite sex is common during adolescence.

CN: Health promotion and maintenance; CL: Analyze

242. 3. Valproic acid causes sedation as well as nausea, vomiting, and indigestion. Sedation is important because the client needs to be cautioned about driving or operating machinery that could be dangerous while feeling sedated from the medication. Valproic acid does not cause increased urination, slowed thinking, or weight loss. However, some clients may experience weight gain.

CN: Pharmacological and parenteral therapies; CL: Synthesize

243. 4. The client is experiencing signs of thrombophlebitis. The nurse should notify the **HCP**  because emboli formation is a potential risk. Massaging the area may cause the thrombus to dislocate and become an embolus. Warm compresses will increase circulation to the area and may precipitate embolus formation. Ankle pump exercises are helpful in preventing thrombophlebitis but will not prevent further risk of embolus formation at this time.

CN: Reduction of risk potential; CL: Synthesize

244. 3. Small-boned, fair-skinned women of northern European descent are at the greatest risk for osteoporosis, not women of African descent. One standard serving of yogurt is the equivalent of one glass of milk. Women who

do not eat dairy products, such as women who are lactose intolerant, should consider using calcium supplements. Inadequate lifetime intake of calcium is a major risk factor for osteoporosis. Estrogen therapy, or some of the newer medications that are not estrogen based, can greatly reduce the incidence of osteoporosis.

 CN: Reduction of risk potential; CL: Evaluate

245. 3, 1, 2, 4. The goal of care for a client who is having a seizure is to prevent respiratory arrest and aspiration. The nurse should first clear the area around the client. Next, the nurse should loosen clothing around the client's neck and turn the client on the side. As needed, the nurse can then suction the airway and administer oxygen.

 CN: Reduction of risk potential; CL: Synthesize

246. 4. There is no cure for metastatic cancer of the liver; palliative nursing care is required. Liver transplants are not recommended for the client with widespread malignant disease. Prescribed medications will not make metastatic lesions shrink. There is nothing to indicate that the client is receiving chemotherapy; therefore, explaining its effects would not be helpful.

 CN: Physiological adaptation; CL: Synthesize

247. 1. During the first week postpartum, the client's pulse rate should be slow, with an average of 60 to 70 bpm. A pulse of 100 bpm warrants further investigation to rule out a possible infectious process or postpartum hemorrhage. An oral temperature of 99°F (37.2°C) is within normal limits. Excessive perspiration and frequent voiding in large amounts are caused by the normal diuresis that occurs as the body returns to its prepregnant state.

 CN: Management of care; CL: Synthesize

248. 4. The nurse should remind the client about meal and activity times so that the ritual can be completed beforehand and not interfere with meals and activities. The client must be allowed to complete the ritual because it keeps anxiety in check. Totally eliminating the client's ritual will increase anxiety and the need for the handwashing. Allowing the client to decide to attend meals and activities is not appropriate or in the client's best interest

because the client must perform the ritual to assuage anxiety. Informing the client that absence from meals and activities is not permitted scolds the client, increasing anxiety and the need for the ritual.

 CN: Psychosocial integrity; CL: Synthesize

249. 4. The nurse should acknowledge that the client feels better but should also remind the client to continue the drug therapy and other self-care activities of rest, exercise, joint protection, and adequate nutrition. Wearing the copper-lined gloves is not harmful, and the nurse should not instruct the client to remove the gloves or label it quackery. Copper does not interfere with salicylate metabolism.

 CN: Psychosocial integrity; CL: Synthesize

250. 1. Lymphedema occurs frequently after radical mastectomy when lymph nodes are removed. Aplasia, or the absence of lymph nodes, prevents proper lymph drainage. The tissue swelling is caused by obstructed lymph flow in the extremity. The blood pressure is taken in the unaffected arm to avoid further accumulation of lymphedema. An IV line should not be started in the affected arm. The nurse would encourage the client to elevate the extremity above the level of the heart. Blood draws in the affected arm should not be allowed.

 CN: Physiological adaptation; CL: Synthesize

251. 4. The child's HCP  should be notified because the maximum daily recommended dosage for ceftriaxone for this child's weight would be 1,500 g/day, and giving this dose would administer 4 g/day. The nurse cannot administer a different dose than that prescribed. There is no therapeutic serum level of ceftriaxone.

 CN: Pharmacological and parenteral therapies; CL: Synthesize

252. 3. One of the staff members needs further instructions when the nurse observes the staff member wearing sterile gloves to bathe a newly delivered neonate. Clean gloves should be worn, not sterile gloves. Sterile gloves are more expensive than clean gloves and are not necessary when bathing a newly delivered neonate. Goggles should be worn when there is a possibility of blood and body fluid spatter. Bloody sheets should be placed in labeled

containers for contaminated linens. Scalpel blades are disposed of in specified containers.

CN: Safety and infection control; CL: Evaluate

253. 2, 3, 4. Maternal intake will need to increase approximately 500 cal/day while breast-feeding. It is true that many drugs taken by the mother cross through breast milk. When any medication is taken by the breast-feeding mom, the medication should be determined to be safe with the OB's or pediatrician's office. Infants who have six to eight wet diapers per day have had an adequate intake of breast milk. If there are fewer, the mother should try to increase the frequency of the infant's feedings. Within the first 24 to 72 hours of life, there will be fewer wet diapers as the mother's milk has not come in yet. Prior to discharge, clients should know how to access community resources to support breast-feeding. After a mother's breast milk is in at about the 3rd day after birth, the infant should be satisfied for approximately 1½ to 3 hours after feeding. There is a need for more frequent feedings with breast-fed infants than bottle-fed as the fat content in the breast milk is lower.

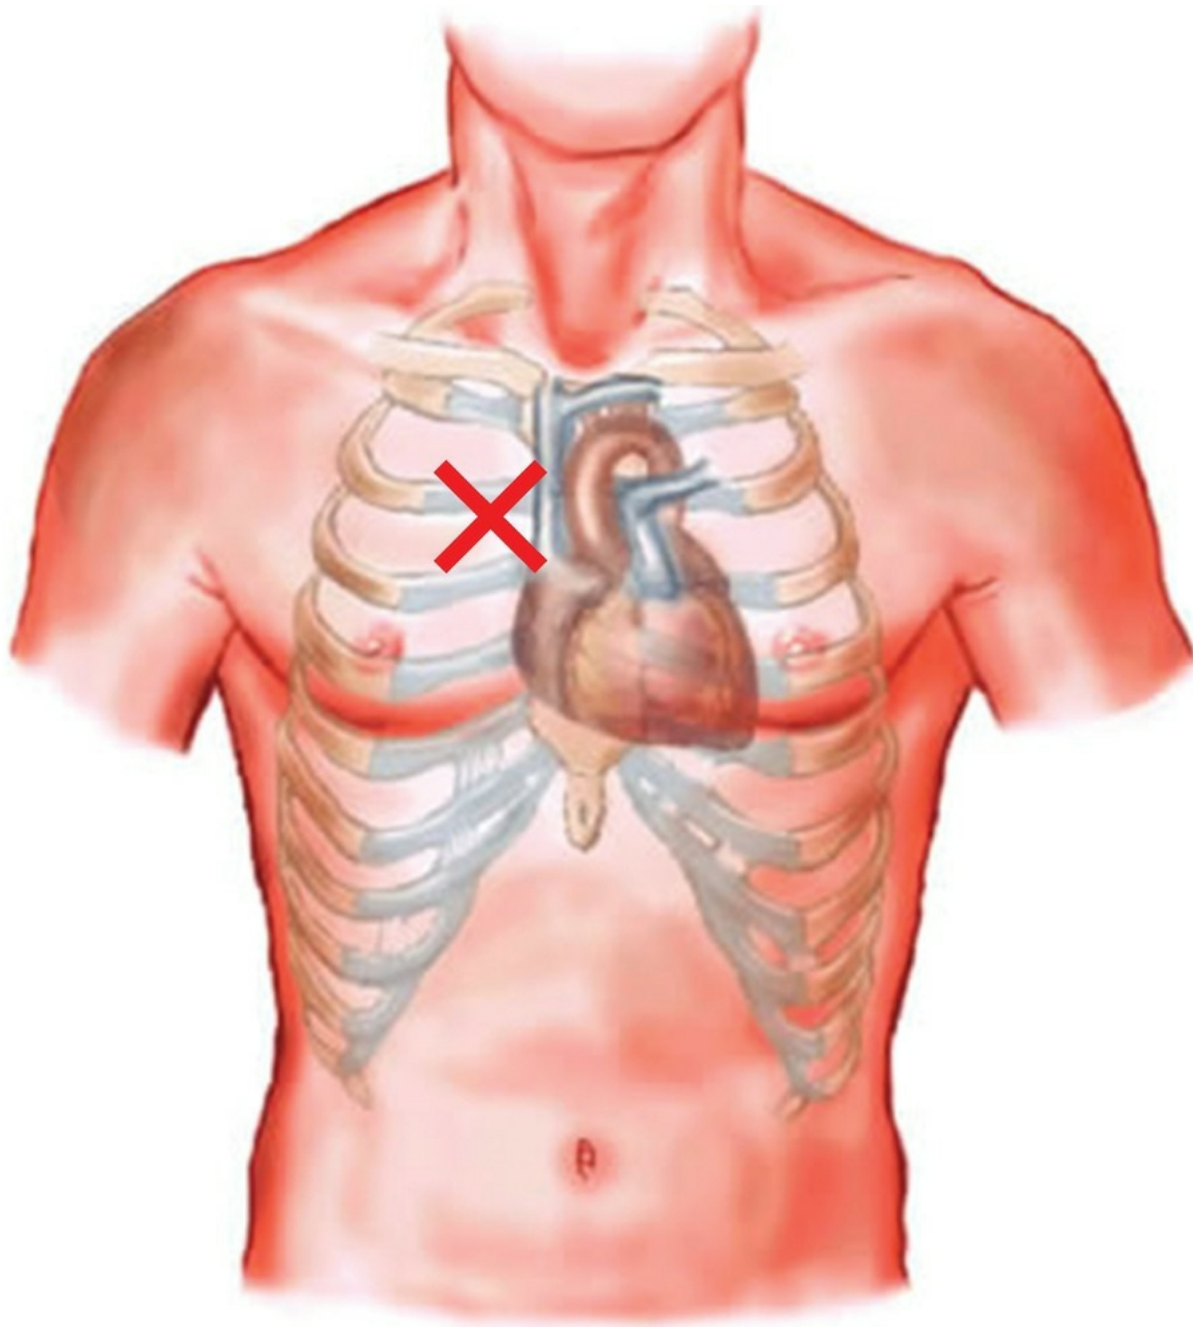

CN: Health promotion and maintenance; CL: Evaluate

254. 3. Three percent saline is a hypertonic solution, which will pull fluid from the interstitial and intracellular spaces into the bloodstream. Its use is usually reserved for severe hyponatremia (sodium <115 mEq/L). If this client were experiencing a fluid volume deficit, this IV solution could worsen the condition. The nurse should consult with the **HCP**  about this prescription. The nurse does not have prescribing rights and cannot change the prescription. The IV rate of 62 may still be dangerous for this client, and the rate was prescribed at 125 mL/h.

CN: Pharmacologic and parenteral therapy; CL: Analyze

255. Correct answer: "X" right of the sternum at the second intercostal space is the best place for listening for the aortic valve sounds.

 CN: Physiological adaptation; CL: Apply

256. 2. Measuring the pH of the aspirated gastric fluid is the most accurate determination of the placement of the NG tube. A pH lower than 4 indicates that the tube is in the stomach. Whether or not the client is gagging or coughing is not an accurate way to determine if the tube is placed correctly. No fluids should be inserted into the tube until the placement has been determined. Inserting air into the tube and listening for the resulting whoosh

can be used, but this is not as accurate as pH measurement.

CN: Reduction of risk potential; CL: Evaluate

257. 2. Alcoholic cirrhosis is associated with excessive alcohol intake. In the early stages, the liver develops fatty changes. If alcohol intake stops, the fatty changes can be reversed. Avoiding overexertion is important in the client with cirrhosis, but it does not reverse the disease. Stopping smoking is a positive, healthy lifestyle change, but it does not have an impact on cirrhosis. A diet high in carbohydrates and low in fat is also recommended for the client with cirrhosis, but the diet does not reverse the pathologic changes that have occurred in the liver.

CN: Reduction of risk potential; CL: Synthesize

258. 1, 2, 3, 5. When emergently managing chest pain, the nurse can use the memory mnemonic MONA to plan care: morphine, oxygen, - nitroglycerin, and aspirin. A Foley catheter is not included in the emergent management of chest pain and can be inserted when the pain has been relieved and the client is stable. Acetaminophen is not used to manage chest pain.

CN: Physiologic adaptation; CL: Synthesize

259. 3. In rheumatic fever, the joints—especially the knees, ankles, elbows, and wrists—are painful, swollen, red, and hot to the touch. Limiting movement of the affected joints typically minimizes pain. Massaging the joints likely will not aid in pain relief because the pain is due to the disease process and subsequent inflammation in the joint. Applying ice to the affected joints likely will not aid in pain relief because the inflammation, edema, and effusion are too deep in the joint tissue. Exercise should be avoided because of the increased workload placed on the heart muscle. This is in contrast to usual recommendations for clients with other forms of arthritis. Despite joint involvement in rheumatic fever, permanent deformities do not occur.

CN: Basic care and comfort; CL: Synthesize

260. 3. Minimizing urinary catheter use and duration of use in all clients, particularly those at higher risk for CAUTI or mortality from catheterization

such as women, the elderly, and clients with impaired immunity, will reduce the opportunity for infection. The nurse should avoid the use of urinary catheters for clients who are incontinent; a bladder training program and frequent use of the toilet are preferred; external catheters may be used if necessary in incontinent clients. The nurse should not clean the periurethral area with antiseptics; cleansing the meatal surface during daily bathing or showering is appropriate. Using sterile technique to help reduce CAUTI is not necessary. Hand hygiene immediately before and after insertion or any manipulation of the catheter device or site is sufficient.

CN: Reduction of risk potential; CL: Synthesize

261. 2. Clarification is the process of confirming the appropriate medication and doses for any client. Verification is the process of collecting medication history. Reconciliation is the process of documenting medication prescription changes for a client across the continuum of care. Documentation is included as a step in the three steps of a formal medication reconciliation program.

CN: Management of care; CL: Apply

262. 2, 3, 5, 6. The client is hyponatremic; the nurse should notify the HCP,  restrict fluids, and prepare to insert a Foley catheter to ensure accurate intake and output. Side rails should be up in order to maintain client safety; it is not safe for the client to be ambulating in the hallway with family at this time. Encouraging fluids would not be beneficial and could be harmful.

CN: Physiological adaptation; CL: Synthesize

263. 2. While it is important to present options and help find solutions to the client's financial concerns, the nurse must first listen carefully to those concerns and allow the client to verbalize related emotions in order to identify the client's needs. Reminding the client to focus on getting well does not address the client's concerns or needs. Arranging a meeting with the case manager is premature as the nurse needs to first determine what the client's needs are. Until the nurse understands the client's needs, the nurse should not encourage the spouse to discuss the client's bill with the business office.

 CN: Management of care; CL: Synthesize

264. 1. The nurse is ultimately responsible to coordinate the client's care while hospitalized; therefore, it is the nurse's responsibility to arrange a care conference to help get the client's questions, concerns, and frustrations addressed. Assuring the client that the **HCPs**  know what they are doing does not address the client's concern or frustration with receiving conflicting information. While it is true that the client is ultimately responsible for health, asking the client to accept the consequences is a form of blaming the client. The HCPs' progress notes will not provide information that will address the client's concern or resolve the conflicting courses of action that the two HCPs are proposing.

 CN: Management of care; CL: Synthesize

265. 3, 1, 4, 2. The nurse should first assess the client, and then, if there is no acute injury, help the client get back into bed. The nurse must notify the **HCP**  and the family of the fall and finally, document the event on the client's health record.

 CN: Safety and infection control; CL: Synthesize

Health Problems

Andrews, M., & Boyle, J. (2012). *Transcultural concepts in nursing care* (6th ed.). Philadelphia, PA: Lippincott Williams & Wilkins.

Boyd, M. A. (2015). *Psychiatric nursing: Contemporary practice* (5th ed.). Philadelphia, PA: Lippincott Williams & Wilkins.

Karch, A. (2014). *Lippincott's nursing drug guide*. Philadelphia, PA: Lippincott Williams & Wilkins.

Videbeck, S. (2014). *Psychiatric mental health nursing* (6th ed.). Philadelphia, PA: Lippincott Williams & Wilkins.

Content Mastery and Test-Taking Skill Self-Analysis

Use the chart below to identify the subject matter and the reason you missed the question. Place a check mark in the columns for questions you did not answer correctly and why, and then total each column. The key (🔑) to effective review is to understand your knowledge deficits and focus additional review on those subjects and reasons for not answering the question.

Review Strategies

Test Number	Subject (Care of childbearing family, care of children, care of adults, care of clients with psychiatric disorders and mental health problems)	Score

Total number of questions missed:

Use the chart below to identify the subject matter and the reason you missed the question. Use the following codes to note the client need area of the question you missed:

MC = Management of care; SI = Safety and infection control; HM = Health promotion and maintenance; PA = Physiological adaptation; PI = Psychosocial integrity; PP = Pharmacological and parenteral therapies; RR = Reduction of risk potential; BC = Basic care and comfort

- How many questions in each area of client needs did you miss?
- How does this compare with other exam results from this review?

Lower _____ Same _____ Higher _____ NA

If you missed questions because you misread questions, missed key words, or changed answers, review Lippincott's Q&A for NCLEX-RN Part I.

If you missed questions because you did not remember or understand the content, review that content in Lippincott's Q&A for NCLEX-RN Part II and your other nursing references.

If you missed questions because you did not pace yourself, practice taking timed test questions and pacing yourself to allow for sufficient time for all questions.

What is the pattern of the types of questions you are missing?

What is your action plan for further study?
